RFP TABLE OF CONTENTS

This Request for Proposal (RFP) consists of six parts:
Part 1: contains typical contractual forms, procedures, bidding instructions, bond information, clauses and wage decisions.

Part 2: contains general contract administrative and execution requirements including, but not limited to safety, design criteria & process, quality control, security, schedule, invoicing, temporary facilities, and design and construction oversight processes.

Part 3: lists the project requirements, specific scope items, and expected quality level above and beyond those outlined in Part 4.

Part 4: contains Performance Specifications and minimum quality requirements.

Part 5: contains prescriptive specifications.

Part 6: contains background project information, references, and other project-specific requirements.

PART 1 PROPOSAL FORMS AND DOCUMENTS
PART 2 GENERAL REQUIREMENTS

01 14 00	Work Restrictions
01 20 00.05 20	Price and Payment Procedures for Design-Build
01 30 00.05 20	Administrative Requirements for Design-Build
01 30 01.00 22	Design, Procurement, And Installation of Furniture, Fixtures, and Equipment
01 31 19.05 20	Post Award Meetings
01 31 23.13 20	Electronic Construction and Facility Support Contract Management System
01 32 17.00 20	Cost-Loaded Network Analysis Schedules (NAS)
01 33 00.05 20	Construction Submittal Procedures
01 33 10.05 20	Design Submittal Procedures
01 33 29.05 20	Sustainability Reporting for Design-Build
01 35 13.05 20	Special Project Procedures for Design-Build
01 35 26.05 20	Government Safety Requirements for Design-Build
01 42 00	Sources for Reference Publications
01 45 00.05 20	Design and Construction Quality Control
01 45 35.05.20	Special Inspections for Design-Build
01 50 00.05 20	Temporary Facilities and Controls for Design-Build
01 57 19	Temporary Environmental Controls
01 57 19.01 20	Supplemental Temporary Environmental Controls
01 60 00.00 22	Requirements for Pesticide and Herbicide Coordination
01 74 19.05 20	Construction and Demolition Waste Management For Design-Build
01 78 00	Closeout Submittals
01 78 23	Operation and Maintenance Data
01 78 24.00 20	Facility Electronic Operation and Maintenance Support Information (eOMSI)
01 78 30.00 22	GIS Data Deliverables
01 91 00.15 12	Total Building Commissioning for Project P-1512
01 91 00.15 27	Total Building Commissioning for Project P-1527
01 91 00.15 38	Total Building Commissioning for Project P-1338

PART 3 STATEMENT OF WORK/PROJECT PROGRAM

A. P1338F: II MEF SIMULATION/TRAINING CENTER REPLACEMENT

1. Project Description
2. Project Objectives
3. Site Analysis
4. Building Requirements
5. Room Requirements
6. Engineering Systems Requirements

B. P1512F: MCCSSS LOG OPS SCHOOL

B.1 LOG OPS SCHOOL

1. Project Description
2. Project Objectives
3. Site Analysis
4. Building Requirements
5. Room Requirements
6. Engineering Systems Requirements

B.2 P1512F: JOINT RECEPTION CENTER

1. Project Description
2. Project Objectives
3. Site Analysis
4. Building Requirements
5. Room Requirements
6. Engineering Systems Requirements

B.3 P1512F: RENOVATE M107

1. Project Description
2. Project Objectives
3. Site Analysis
4. Building Requirements
5. Room Requirements
6. Engineering Systems Requirements

C. P1527F: LOGCOM CSP WAREHOUSE REPLACEMENT

1. Project Description
2. Project Objectives
3. Site Analysis
4. Building Requirements
5. Room Requirements
6. Engineering Systems Requirements

PART 4 PERFORMANCE TECHNICAL SPECIFICATIONS (PTS)

A10 Foundations
A20 Basement Construction
B10 Superstructure
B20 Exterior Enclosure
B30 Roofing
C10 Interior Construction
C20 Stairs
C30 Interior Finishes
D10 Conveying
D20 Plumbing
D30 HVAC
D40 Fire Protection
D50 Electrical
E10 Equipment
E20 Furnishings
F10 Special Construction
F20 Selective Building Demolition
G10 Site Preparations
G20 Site Improvements
G30 Site Civil/Mechanical Utilities
G40 Site Communication & Security
Z10 General Performance Technical Specification

PART 5 PRESCRIPTIVE TECHNICAL SPECIFICATIONS

02 82 16 Removal and Disposal of Asbestos Materials (Camp Lejeune Complex)
02 82 33.12 Preparation of Surfaces Coated with Contaminated Paint
02 82 33.13 Removal and Disposal of Materials Coated with Lead-Containing Paint
07 26 23.19 Brownfield Membrane and Vent System
07 61 15.00 20 Aluminum Standing Seam Roofing
08 91 00 Metal Wall Louvers
23 05 93.00 22 Testing, Adjusting, and Balancing for Mechanical Systems
23 09 00.00 22 Instrumentation and Control for HVAC
23 09 13.00 22 Instrumentation and Control Devices for HVAC
23 09 23.02 22 BACnet Direct Digital Control Systems for HVAC and Other Building Control Systems
23 24 00 Hydronic Pipe Cleaning and Flushing Procedures
25 05 11 Cybersecurity for Facility-Related Control Systems
27 10 00.00 22 Building Telecommunications Cabling Systems
33 82 00.00 22 Telecommunications Outside Plant

PART 6 ATTACHMENTS

GENERAL

Attachment No. **Description**

1. Camp Lejeune Base Exterior Architectural Plan
2. Investigation and Remediation Waste Management Plan
3. USMC Finding of No Significant Impact for the Environmental Assessment for Demolition of Historic Properties
4. Camp Lejeune Mechanical Design Guidance
5. Camp Lejeune Specifications

07 31 13	Asphalt Roof Shingles
07 52 00	Modified Bituminous Membrane
07 61 15.00 20	Aluminum Stand Seam
08 33 23	Roll Up Doors
08 91 00	Wall Louvers
09 67 23.13	Epoxy Flooring
10 14 00.20	Interior Signage
10 14 00.20a	MCBLNC Signs Standards Graphics
10 22 13	Wire Mesh Partitions
11 24 24	Roof Fall Protection
28 31 76	Interior Fire Alarm and Mass Notification System
33 71 01.00 22	Overhead Transmission and Distribution
33 71 02.00 22	Underground Electrical Distribution

6. Water and Electrical Meter Information
7. MCB Electrical Policies & Criteria
8. Mass Notification to Basewide
9. Life Cycle Cost Analysis Report (Will be Provided by the Government)
10. Performance Assessment Plan
11. Permits Record of Decision (PROD)
12. Best Value Determination Guidelines (Enclosure 1)
13. Best Value Determination Guidelines (Enclosure 2)
14. Project Sign Details
15. Open Burning of Vegetative Debris

P1338F – MEF SIMULATION TRAINING BUILDING

Attachment No. Description

1. Demolition Drawings
2. Existing Site and Building Photographs
3. As-Built Drawings for Demolition Buildings
4. Site Utility Drawings for Demolition
5. Hazardous Materials Report
6. Site Utility Maps
7. Site OSP Telecom Pathways Map
8. Site Bubble Diagrams
9. Topographic Drawings
10. Geotechnical Report
11. Hydrant Flow Tests
12. NEPA DM
13. Site Approval Form
14. DD-1354 Transfer and Acceptance of DoD Real Property
15. Disposal of DoN Real Property Form
16. FF&E and A/V Cost Forms

P1512F – LOG OPS SCHOOL

GENERAL

Attachment No. Description

1. Demolition Drawings
2. Existing Site and Building Photographs
3. As-Built Drawings for Demolition Buildings
4. Site Utility Drawings for Demolition
5. P1512F LOG OPS School Preliminary Construction Phasing Plan
6. Hazardous Materials Reports
7. Site OSP Telecom Pathways Map
8. P1512F A/V Requirements
9. NEPA DM
10. Disposal of DoN Real Property Form
11. Industrial Equipment to Relocate from M107 to the new LOG OPS School
12. FF&E and A/V Cost Forms (LOG OPS School, JRC, M107)

LOG OPS SCHOOL

Attachment No. Description

1. Existing Site and Building Photographs
2. Site Utility Drawings for Demolition
3. Site Bubble Diagram
4. Geotechnical Report
5. Hydrant Flow Tests
6. DD-1354 Transfer and Acceptance of DoD Real Property

P1512F – JOINT RECEPTION CENTER

Attachment No. Description

1. Existing Site and Building Photographs
2. Site Utility Drawings for Demolition
3. Electrical Manhole Location Map
4. Site Bubble Diagrams
5. Geotechnical Report
6. Hydrant Flow Tests
7. DD-1354 Transfer and Acceptance of DoD Real Property
8. Historic Preservation Information

P1512F – RENOVATE M107

Attachment No. Description

1. Existing Site and Building Photographs
2. Site Utility Drawings for Demolition
3. As-Built Drawings
4. Site Bubble Diagrams
5. Hydrant Flow Tests
6. DD-1354 Transfer and Acceptance of DoD Real Property
7. Tenant Diagrams (Government Provided Information)

P1527F – LOGCOM CSP WAREHOUSE

Attachment No. **Description**

1. Demolition Drawings
2. Existing Site and Building Photographs
3. As-Built Drawings for Demolition Buildings
4. Site Utility Drawings for Demolition
5. Hazardous Materials Report
6. Building 1601 IR Plume and LUCs Maps
7. Site OSP Telecom Pathways Map
8. Site Bubble Diagrams
9. Geotechnical Report
10. Hydrant Flow Tests
11. NEPA DM
12. DD-1354 Transfer and Acceptance of DoD Real Property
13. Disposal of DoN Real Property Form
14. FF&E and A/V Cost Forms

PART 1 – PROPOSAL FORMS & DOCUMENTS

This Page Intentionally Left Blank

ATTACHMENT F – PRICE PROPOSAL FORM

1.1 CONTRACT LINE ITEMS

The terms Offeror and Bidder and versions thereof (offer/bid) have the same definition as used within this contract.

Provide the CLIN lump sum price for the following items:

CLIN 0001 – P1338F 2ND MEF SIMULATION TRAINING CENTER BASE PRICE: Price includes the following:

Price for the Total Amount for CLIN 0001 for shall provide the full project scope, excluding other Base Bids (CLIN 0002, 0003), complete and in-place in accordance with the Design Build RFP even if not specifically listed below.

0001: P1338F 2ND MEF Simulation Training Center:
Price for provision of all work for P1338F complete.

Basis of Bid for CLIN 0001 shall be the Total Amount for CLIN 0001, but not including the work indicated or specified to be provided under any other CLIN.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0001AA	All work complete in accordance with the RFP for CLIN 0001 including 0001AB, and 0001AC.	1	LS	$_____
0001AB	Complete work for the facility inside the 5 foot line	1	LS	$_____
0001AC	Complete work for the site work outside the 5 foot line	1	LS	$_____
0001AD	Design	1	LS	$_____

Total CLIN 0001 (0001AA+0001AD): $_____

CLIN 0002 – P1512F MCCSSS LOG OPS SCHOOL: Price includes the following:

Price for the Total Amount for CLIN 002, P1512F MCCSSS LOG OPS SCHOOL shall provide the full project scope, excluding other Base Bids (CLIN 0001, 0003), complete and in place in accordance with the Design Build RFP even if not specifically listed below.

0002: P1512F MCCSSS LOG OPS SCHOOL Price for provision of all work for P1512F complete.

Basis of Bid for CLIN 0002 shall be the Total Amount for CLIN 0002, but not including the work indicated or specified to be provided under any other CLIN.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0002AA	All work complete in accordance with the RFP for CLIN 0002 including 0002AB, 0002AC, 0002AD and 0002AE.	1	LS	$_____
0002AB	Complete work for the facility inside the 5 foot line	1	LS	$_____
0002AC	Complete work for P1512F Joint Reception Center inside the 5 foot line	1	LS	$_____
0002AD	Complete work for P1512F M107 Renovation to the 5 foot line	1	LS	$_____
0002AE	Complete work for the site work outside the 5 foot line	1	LS	$_____
0002AF	Design	1	LS	$_____

Total CLIN 0002 (0002AA + 0002AF): $_____

CLIN 0003 – P-1527F LOG COM CSP Warehouse BASE PRICE: Price includes the following:

Price for the Total Amount for CLIN 0003 for P-1527F LOG COM CSP Warehouse shall provide the full project scope, excluding other Base Bids (CLIN 0001, 0002), complete and in-place in accordance with the Design Build RFP even if not specifically listed below

0003: P-1527F LOG COM CSP Warehouse:
Price for provision of all work for P1527F complete.

Basis of Bid for CLIN 0003 shall be the Total Amount for CLIN 0003, but not including the work indicated or specified to be provided under any other CLIN.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0003AA	All work complete in accordance with the RFP for CLIN 0003 including 0003AB and 0003AC.	1	LS	$_____
0003AB	Complete work for the facility inside the 5 foot line	1	LS	$_____
0003AC	Complete work for the site work outside the 5 foot line	1	LS	$_____
0003AD	Design	1	LS	$_____

Total CLIN 0003 (0003AA + 0003AD): $_____

Refer to paragraph 1.3 for Planned Modification Bid notes.

CLIN 0004– PLANNED MODIFICATION FOR P1338F – Price includes the following:

Price to procure and supervise installation of the Furniture, Fixtures, and Equipment (FF&E) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT FF&E ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT FF&E ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0006 (GOVT FF&E ESTIMATE + HAR AMOUNT)
0004	FF&E	$		$_____	$_____

CLIN 0005– PLANNED MODIFICATION FOR P1338F – Price includes the following:

Price to procure and supervise installation of the Audio/Visual System (AV) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT AV ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT FF&E ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0006 (GOVT FF&E ESTIMATE + HAR AMOUNT)
0005	AV	$		$_____	$_____

CLIN 0006– PLANNED MODIFICATION FOR P1338F – Price includes the following:

Price to procure and supervise installation of the Electronic Security System (ESS) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT ESS ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT ESS ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0007 (GOVT ESS ESTIMATE + HAR AMOUNT)
0006	ESS	$		$_____	$_____

CLIN 0007 – OPTION 1 for P1338F, Demolition and Disposal:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0007	Demolition and disposal of Building Foundations (outside footprint)	1	LS	$_____

CLIN 0008 – OPTION 2 for P1338F, Demolition and Disposal:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0008	Demolition and disposal of Buildings, Complete (Outside Footprint)	1	LS	$_____

CLIN 0009 – OPTION 3 for P1338F, Parking areas to be gravel:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0009	Gravel parking areas	1	LS	$_____

CLIN 0010 – OPTION 4 for P1338F:

NOT USED

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0010	Not Used			$_____

CLIN 0011 – OPTION 5 for P1338F, Tilt-up Construction vs Brick Wall Cavity:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0011	Tilt-up Construction	1	LS	$_____

CLIN 0012 – OPTION 6 for P1338F, Terrazzo Flooring for all corridors and main entry:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0012	Terrazzo Flooring	1	LS	$_____

CLIN 0013– PLANNED MODIFICATION FOR P1512F – Price includes the following:

Price to procure and supervise installation of the Furniture, Fixtures, and Equipment (FF&E) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT FF&E ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT FF&E ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0006 (GOVT FF&E ESTIMATE + HAR AMOUNT)
0013	FF&E	$		$_____	$_____

CLIN 0014– PLANNED MODIFICATION FOR P1512F – Price includes the following:

Price to procure and supervise installation of the Audio/Visual Equipment (AV) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT FF&E ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT FF&E ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0006 (GOVT FF&E ESTIMATE + HAR AMOUNT)
0014	AV	$		$_____	$_____

CLIN 0015– PLANNED MODIFICATION FOR P1512F – Price includes the following:

Price to procure and supervise installation of the Electronic Security System (ESS) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT ESS ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT ESS ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0007 (GOVT ESS ESTIMATE + HAR AMOUNT)
0015	ESS	$		$_____	$_____

CLIN 0016 – OPTION 1 for P1512F, Demolition and Disposal:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0016	Demolition and disposal of Building Foundations (outside footprint)	1	LS	$_____

CLIN 0017 – OPTION 2 for P1512F, Demolition and Disposal:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0017	Demolition and disposal of Buildings, Complete (Outside Footprint)	1	LS	$_____

CLIN 0018 – OPTION 3 for P1512F, Parking areas to be gravel:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0018	Gravel parking areas	1	LS	$_____

CLIN 0019 – OPTION 4 for P1512F:

NOT USED

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0019	Not Used			$_____

CLIN 0020 – OPTION 5 for P1512F, Tilt-up Construction vs Brick Wall Cavity:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0020	Tilt-up Construction	1	LS	$_____

CLIN 0021 – OPTION 6 for P1512F, Repair M107 Roof in lieu of Replace:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0021	Repair M107 Roof in lieu of Replace	1	LS	$_____

CLIN 0022 – OPTION 7 for P1512F, M107 Sloped Roof:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0022	M107 Sloped Roof	1	LS	$_____

CLIN 0023 – OPTION 8 for P1512F, Additional pavement for Troop Formations:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0023	Additional pavement for Troop Formations (2 ea)	1	LS	$_____

CLIN 0024 – OPTION 9 for P1512F, Terrazzo flooring at all corridors and Main Entry:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0024	Terrazzo Flooring	1	LS	$_____

CLIN 0025– PLANNED MODIFICATION FOR P1527F – Price includes the following:

Price to procure and supervise installation of the Furniture, Fixtures, and Equipment (FF&E) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT FF&E ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT FF&E ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0006 (GOVT FF&E ESTIMATE + HAR AMOUNT)
0025	FF&E	$		$_____	$_____

CLIN 0026– PLANNED MODIFICATION FOR P1527F – Price includes the following:

Price to procure and supervise installation of the Audio/Visual Equipment (AV) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT AV ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT FF&E ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0006 (GOVT FF&E ESTIMATE + HAR AMOUNT)
0026	AV	$		$_____	$_____

CLIN 0027– PLANNED MODIFICATION FOR P1527F – Price includes the following:

Price to procure and supervise installation of the Electronic Security System (ESS) complete in accordance with the RFP and in accordance with the following schedule:

CLIN	ITEM	GOVERNMENT ESS ESTIMATE	HAR (NTE 5%)	HAR AMOUNT (GOVT ESS ESTIMATE X HAR%)	TOTAL FF&E ESTIMATED AMOUNT FOR CLIN 0007 (GOVT ESS ESTIMATE + HAR AMOUNT)
0027	ESS	$		$_____	$_____

CLIN 0028 – OPTION 1 for P1527F, Demolition and Disposal:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0028	Demolition and disposal of Building Foundations (outside footprint)	1	LS	$_____

CLIN 0029 – OPTION 2 for P1527F, Demolition and Disposal:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0029	Demolition and disposal of Buildings, Complete (Outside Footprint)	1	LS	$_____

CLIN 0030 – OPTION 3 for P1527F, Parking areas to be gravel:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0030	Gravel parking areas	1	LS	$_____

CLIN 0031 – OPTION 4 for P1527F, Metal Panel Exterior Cladding vs Brick Cavity Wall:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0031	Exterior Metal Cladding	1	LS	$_____

CLIN 0032 – OPTION 5 for P1527F, Tilt-up Construction vs Brick Wall Cavity:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0032	Tilt-up Construction	1	LS	$_____

CLIN 0033 – OPTION 6 for P1527F, Membrane Roofing vs Low slope Metal Roofing:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0033	Membrane Roofing vs Low slope Metal Roofing	1	LS	$_____

CLIN 0034 – OPTION 7 for P1527F, Reduce Overall Wall Height & Add Pallet Racks:

Price for Total Amount to provide the full option scope complete and in place in accordance with the RFP even if not specifically listed below. Refer to paragraph 1.2 for explanation of option.

	DESCRIPTION	ESTIMATED QUANTITY	UNIT	TOTAL PRICE
0034	Reduce Overall Wall Height & Add Pallet Racks	1	LS	$_____

1.2 Explanation of CLIN Items

CLIN 0001

Total amount of Base Amount CLIN 0001 shall provide the full project scope, excluding Bid Options defined below, complete in place in accordance with the RFP even if not specifically listed. Explanation of specific work items as defined as follows:

CLIN 0001: P1338F 2ND MEF SIMULATION TRAINING CENTER - includes all P1338F Base Bid Work and includes, but is not limited to, the design and construction of the building and site utilities; providing construction permitting fees, and all incidental and related work.

0001AA: All work complete in accordance with the RFP for CLIN 0001 including 0001AB, and 0001AC.

0001AB: Facility and work inside the 5 foot line, excluding design costs, includes labor, materials, and equipment for construction of the facility and all incidental and related work.

0001AC: Site work outside the 5 foot line, excluding design costs, includes labor, materials, and equipment for grading and drainage, paving, utilities, and all incidental and related work.

0001AD: Design includes provision of all work associated with the site and building design including but not limited to architecture, structural, geotechnical, interior design, civil, mechanical, electrical, and all incidental and related work.

CLIN 0002

Total amount of Base Amount CLIN 0002 shall provide the full project scope, excluding Bid Options defined below, complete in place in accordance with the RFP even if not specifically listed. Explanation of specific work items as defined as follows:

CLIN 0002: P1512F MCCSSS LOG OPS SCHOOL - includes all P1512F Base Bid Work and includes, but is not limited to, the design and construction of the building and site utilities; providing construction permitting fees, and all incidental and related work.

0002AA: All work complete in accordance with the RFP for CLIN 0002 and including the work indicated or specified under 0002AB through 0002AE.

0002AB: Facility and work inside the 5 foot line, excluding design costs, includes labor, materials, and equipment for construction of the facility and all incidental and related work.

0002AC: P1512F Joint Reception Center and work inside the 5 foot line, excluding design costs, includes labor, materials, and equipment for construction of the facility and all incidental and related work.

0002AD: P1512F M107 Renovation and work inside the 5 foot line, excluding design costs, includes labor, materials, and equipment for construction of the facility and all incidental and related work.

0002AE: Site work outside the 5 foot line, excluding design costs, includes labor, materials, and equipment for grading and drainage, paving, utilities, and all incidental and related work.

0002AF: Design includes provision of all work associated with the site and building design including but not limited to architecture, structural, geotechnical, interior design, civil, mechanical, electrical, and all incidental and related work.

CLIN 0003

Total amount of Base Amount CLIN 0003 shall provide the full project scope, excluding Bid Options defined below, complete in place in accordance with the RFP even if not specifically listed. Explanation of specific work items as defined as follows:

CLIN 0003: P-1527F LOG COM CSP Warehouse - includes all P1527F Base Bid Work and includes, but is not limited to, the design and construction of the building and site utilities; providing construction permitting fees, and all incidental and related work.

0003AA: All work complete in accordance with the RFP for CLIN 0003 and including the work indicated or specified under 0003AB through 0003AC.

0003AB: Facility and work inside the 5 foot line, excluding design costs, includes labor, materials, and equipment for construction of the facility and all incidental and related work.

0003AC: Site work outside the 5 foot line, excluding design costs, includes labor, materials, and equipment for grading and drainage, paving, utilities, and all incidental and related work.

0003AD: Design includes provision of all work associated with the site and building design including but not limited to architecture, structural, geotechnical, interior design, civil, mechanical, electrical, and all incidental and related work.

CLIN 0004 – Planned Modification for P1338F

Price to procure and supervise installation of the Furniture, Fixtures, and Equipment (FF&E) complete in accordance with the RFP.

CLIN 0005 – Planned Modification for P1338F

Price to procure and supervise installation of the Audio/Visual Equipment (AV) complete in accordance with the RFP.

CLIN 0006 – Planned Modification for P1338F

Price for provision, installation, testing, and associated training for the Electronic Security System (ESS) complete in accordance with the RFP as necessary for the facility. The ESS includes, but is not limited to, Intrusion Detection System (IDS), Access Control System (ACS), and Closed Circuit Television (CCTV),

boundary switches, electronic latches, motion sensors, electronic entry control, and security monitoring and control workstations. ESS design, design submittals, pathways and electrical power are excluded from this item and shall be priced in the base bid CLIN 0001.

CLIN 0007 – Planned Option 1 for P1338F

Delete the work for the demolition and disposal of building foundations outside of the P1338F II Simulator Training Facility footprint complete in accordance with the RFP.

CLIN 0008 – Planned Option 2 for P1338F

Delete the work for the demolition and disposal of building (including foundations) outside of the P1338F II Simulator Training Facility footprint complete in accordance with the RFP.

CLIN 0009 – Planned Option 3 for P1338F

Delete the work for the asphalt surface course at parking areas for P1338F II Simulator Training Facility. Price for parking areas to be gravel complete in accordance with the RFP.

CLIN 0010 – Planned Option 4 for P1338F

Not used.

CLIN 0011 – Planned Option 5 for P1338F

Delete the work for brick cavity wall assembly over CMU backup. Price for tilt-up wall concrete panel construction complete in accordance with the RFP.

CLIN 0012 – Planned Option 6 for P1338F

Delete the flooring finishes in the corridors and Main Entry (identified in RFP Part 3, Chapter 5 Room Requirements). Price as terrazzo flooring complete in accordance with the RFP.

CLIN 0013 – Planned Modification for P1512F

Price to procure and supervise installation of the Furniture, Fixtures, and Equipment (FF&E) complete in accordance with the RFP.

CLIN 0014 – Planned Modification for P1512F

Price to procure and supervise installation of the Audio/Visual Equipment (AV) complete in accordance with the RFP.

CLIN 0015 – Planned Modification for P1512F

Price for provision, installation, testing, and associated training for the Electronic Security System (ESS) complete in accordance with the RFP as necessary for the facility. The ESS includes, but is not limited to, Intrusion Detection System (IDS), Access Control System (ACS), and Closed Circuit Television (CCTV), boundary switches, electronic latches, motion sensors, electronic entry control, and security monitoring and control workstations. ESS design, design submittals, pathways and electrical power are excluded from this item and shall be priced in the base bid CLIN 0002.

CLIN 0016 – Planned Option 1 for P1512F

Delete the work for the demolition and disposal of building foundations outside of the P1512F LOG OPS School, Joint Reception Facility and M107 Renovation building footprint(s) complete in accordance with the RFP.

CLIN 0017 – Planned Option 2 for P1512F

Delete the work for the demolition and disposal of building (including foundations) outside of the P1512F LOG OPS School, Joint Reception Facility and M107 Renovation building footprint(s) complete in accordance with the RFP.

CLIN 0018 – Planned Option 3 for P1512F

Delete the work for the asphalt surface course at parking areas for P1512F. Price for parking areas to be gravel complete in accordance with the RFP.

CLIN 0019 – Planned Option 4 for P1512F

Not Used.

CLIN 0020 – Planned Option 5 for P1512F

Delete the work for brick cavity wall assembly over CMU backup. Price for tilt-up wall concrete panel construction complete in accordance with the RFP.

CLIN 0021 – Planned Option 6 for P1512F

Delete the work for roof replacement of M107 Renovation included in CLIN 002AD. Price for repairing M107 roof complete in accordance with the RFP.

CLIN 0022 – Planned Option 7 for P1512F

Delete the work for roof replacement of M107 Renovation included in CLIN 002AD. Price for adding a High Slope Roof to M107 roof complete in accordance with the RFP.

CLIN 0023 – Planned Option 8 for P1512F

Price for providing the additional pavement for Troop Formations between existing BEQ Buildings M445 and M446 and between M445 and M450 complete in accordance with the RFP.

CLIN 0024 – Planned Option 9 for P1512F

Delete the flooring finishes in the corridors and Main Entry (identified in RFP Part 3, Chapter 5 Room Requirements. Price as terrazzo flooring complete in accordance with the RFP.

CLIN 0025 – Planned Modification for P1527F

Price to procure and supervise installation of the Furniture, Fixtures, and Equipment (FF&E) complete in accordance with the RFP.

CLIN 0026 – Planned Modification for P1527F

Price to procure and supervise installation of the Audio/Visual Equipment (AV) complete in accordance with the RFP.

CLIN 0027 – Planned Modification for P1527F

Price for provision, installation, testing, and associated training for the Electronic Security System (ESS) complete in accordance with the RFP as necessary for the facility. The ESS includes, but is not limited to, Intrusion Detection System (IDS), Access Control System (ACS), and Closed Circuit Television (CCTV), boundary switches, electronic latches, motion sensors, electronic entry control, and security monitoring and control workstations. ESS design, design submittals, pathways and electrical power are excluded from this item and shall be priced in the base bid CLIN 0003.

CLIN 0028 – Planned Option 1 for P1527F

Delete the work for the demolition and disposal of building foundations outside of the P1527F LOGCOM Warehouse Facility footprint complete in accordance with the RFP.

CLIN 0029 – Planned Option 2 for P1527F

Delete the work for the demolition and disposal of building (including foundations) outside of the P1527F LOGCOM Warehouse Facility footprint complete in accordance with the RFP.

CLIN 0030 – Planned Option 3 for P1527F

Delete the work for the asphalt surface course at parking areas for P1527F LOGCOM Warehouse Facility. Price for parking areas to be gravel complete in accordance with the RFP.

CLIN 0031 – Planned Option 4 for P1527F

Delete the work for brick cavity wall assembly. Price for metal wall panel exterior cladding complete in accordance with the RFP.

CLIN 0032 – Planned Option 5 for P1527F

Delete the work for brick cavity wall assembly over CMU backup. Price for tilt-up wall concrete panel construction complete in accordance with the RFP.

CLIN 0033 – Planned Option 6 for P1527F

Delete the work for low sloped metal roofing. Price for membrane roofing complete in accordance with the RFP.

CLIN 0034 – Planned Option 7 for P1527F

Price to reduce the overall wall height by 5’-4” and add additional pallet racks complete in accordance with the RFP.

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 01 14 00

WORK RESTRICTIONS
11/11

PART 1 GENERAL

1.1 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRCUTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

List of Contact Personnel; G

1.2 SPECIAL SCHEDULING REQUIREMENTS

a. The nearby buildings and utilities will remain in operation during the entire construction period. Conduct operations so as to cause the least possible interference with normal operations of the activity.

b. Permission to interrupt any activity roads, railroads, or utility service must be requiested in writing a minimum of 15 calendar days prior to the desired date of interruption.

c. The work under this contract requires special attention to the scheduling and conduct of the work in connection with existing operations. Identify on the construction schedule each factor which constitutes a potential interruption to operations..

d. Government Telecommunications Contractor Access: The Government Telecommunications Contractor must be allowed access to the facility towards the end of construction (finishes 90 percent complete, rough-in 100 percent complete, Inside Plant (ISP)/Outside Plant (OSP) infrastructure in place) to provide equipment in the telecommunications rooms and make final connections. The Contractor will be required to coordinate their efforts with the Government Telecommunications Contractor to facilitate joint use of building spaces during the final phases of construction and work the coordination effort into the construction schedule. Requirements for Government Telecommunications are specified in Part 4, D50 ELECTRICAL and G40 SITE ELECTRICAL UTILITIES.

1.3 CONTRACTOR ACCESS AND USE OF PREMISES

1.3.1 Activity Regulations

Ensure that Contractor personnel employed on the Activity become familiar with and obey Activity regulations including safety, fire, traffic and security regulations. Keep within the limits of the work and avenues of ingress and egress. To minimize traffic congestion, delivery of materials must be outside of peak traffic hours (6:30 to 8:00

a.m. and 3:30 to 5:00 p.m.) unless otherwise approved by the Contracting Officer. Wear hard hats in designated areas. Do not enter any restricted areas unless required to do so and until cleared for such entry. Mark Contractor equipment for identification.

1.3.1.1 Subcontractors and Personnel Contacts

Provide a list of contact personnel of the Contractor and subcontractors including addresses and telephone numbers for use in the event of an emergency. As changes occur and additional information becomes available, correct and change the information contained in previous lists.

1.3.1.2 Installation Access

Starting March 31, 2019, NCAS/RAPID GATE/MCESS passes will no longer be accepted at Base gates. DBIDS will replace the RAPID GATES passes currently used. This applies to Contractors, vendors, and suppliers requiring access to Navy Installations. Also applies to Designers, Architects and Engineers
performing A/E services at Navy installations. All current Contractors, vendors, suppliers, and A/E's working on projects will need to transition to the new DBIDS system by April 1, 2019. Individuals currently using an NCACS credential for installation access are required to switch to a DBIDS credential no later than April 2019. New and current user of NCACS must visit MCB Camp Lejeune, North Carolina Visitor Control Center Security Office to obtain a DBIDS credential.

Obtain access to Navy installations through participation in the Defense Biometrics Identification System (DBIDS). Requirements for Contractor employee registration, and transition for employees currently under Navy Commercial Access Control System (NCACS), are available at https://www.cnic.navy.mil/om/dbids.html. No fees are associated with obtaining a DBIDS credential.

Participation in the DBIDS is not mandatory, and Contractor personnel may apply for One-Day Passes at the Base Visitor Control Office to access an installation.

1.3.1.2.1 Registration for DBIDS

Registration for DBIDS is available at https://www.cnic.navy.mil/om/dbids.html. Procedure includes:

a. Present a letter or official award document (i.e. DD Form 1155 or SF 1442) from the Contracting Officer, that provides the purpose for access, to the base Visitor Control Center representative.

b. Present valid identification, such as a passport or Real ID Act-compliant state driver's license.

c. Provide completed SECNAV FORM 5512/1 to the base Visitor Control Center representative to obtain a background check. This form is available for download at https://www.cnic.navy.mil/om/dbids.html.

d. Upon successful completion of the background check, the Government will complete the DBIDS enrollment process, which includes Contractor employee photo, finger prints, base restriction and several other assessments.

e. Upon successful completion of the enrollment process, the Contractor employee will be issued a DBIDS credential, and will be allowed to proceed to worksite.

1.3.1.2.2 DBIDS Eligibility Requirements

Throughout the length of the contract, the Contractor employee must continue to meet background screen standards. Periodic background screenings are conducted to verify continued DBIDS participation and installation access privileges. DBIDS access privileges will be immediately suspended or revoked if at any time a Contractor employee becomes ineligible.

An adjudication process may be initiated when a background screen failure results in disqualification from participation in the DBIDS, and Contractor employee does not agree with the reason for disqualification. The Government is the final authority.

1.3.1.2.3 DBIDS Notification Requirements

a. Immediately report instances of lost or stolen badges to the Contracting Officer.

b. Immediately collect DBIDS credentials and notify the Contracting Officer in writing under the following circumstances:

(1) An employee has departed the company without having properly returned or surrendered their DBIDS credentials.

(2) There is a reasonable basis to conclude that an employee, or former employee, might pose a risk, compromise, or threat to the safety or security of the Installation or anyone therein.

1.3.1.2.4 One-Day Passes

Personnel applying for One-Day passes at the Base Visitor Control Office are subject to daily mandatory vehicle inspection, and will have limited access to the installation. The Government is not responsible for any cost or lost time associated with obtaining daily passes or added vehicle inspections incurred by non-participants in the DBIDS.

1.3.1.3 No Smoking Policy

Smoking is prohibited within and outside of all buildings on installation, except in designated smoking areas. This applies to existing buildings, buildings under construction and buildings under renovation. Discarding tobacco materials other than into designated tobacco receptacles is considered littering and is subject to fines. The Contracting Officer will identify designated smoking areas.

1.3.2 Entry to Radiologically Controlled Areas

Contractor personnel must not, under any circumstances, enter a radiologically controlled area or cross any posted radiological boundary. This paragraph applies to all phases of contract work. Radiation areas are posted with signs consistent with OSHA requirements. Ensure that employees are familiar with the radiation signs and symbols. All personnel entering the shipyard for the first time are required to receive radiological indoctrination training.

Should contract workers encounter radiological postings or boundaries which appear to limit their ability to access or carry out their intended work, they must notify their contract administrator for resolution of the problem.

1.3.2.1 Radioactive Materials and Equipment

All testing equipment, containing a radioactive source, must be operated in accordance with an approved radioactive equipment plan. This plan must be submitted to the Contracting Officer and approved by the Radiation Officer (Code 105.5), prior to bringing the equipment into the shipyard. This plan must include:

a. The name and type of equipment.

b. The type and size of radiation source.

c. The dates and locations of the equipment's usage.

d. The radiological controls that the Contractor will use while operating the equipment.

A different radioactive equipment plan will be required for each different type of equipment, type of radioactive source, or size of radioactive source. A data sheet of for each piece of new radioactive equipment must be submitted to the Contracting Officer to forward to the shipyard's Radiation Safety Officer. The data sheet must contain the following information:

a. Name of equipment.

b. Name and address of equipment manufacturer.

c. Type and size of radiation source.

d. The location of the installed radioactive equipment (i.e. building no., floor, code/shop area).

1.3.3 Working Hours

Regular working hours must consist of an 8 1/2 hour period established by the Contracting Officer, between 7 a.m. and 3:30 p.m., Monday through Friday, and 7 a.m. to 11 p.m. on Saturday, excluding Government holidays. Operational hours for all buildings is 6:00 a.m. thru Midnight with the exception of Building P1338F Which operates 24 hours 7 days a week.

1.3.4 Work Outside Regular Hours

Work outside regular working hours requires Contracting Officer approval. Make application 15 calendar days prior to such work to allow arrangements to be made by the Government for inspecting the work in progress, giving the specific dates, hours, location, type of work to be performed, contract number and project title. Based on the justification provided, the Contracting Officer may approve work outside regular hours. During periods of darkness, the different parts of the work must be lighted in a manner approved by the Contracting Officer. Make utility cutovers after normal working hours or on Saturdays, Sundays, and Government holidays unless directed otherwise.

1.3.5 Utility Cutovers and Interruptions

a. Make utility cutovers and interruptions after normal working hours or on Saturdays, Sundays, and Government holidays. Conform to procedures required in paragraph WORK OUTSIDE REGULAR HOURS.

b. Ensure that new utility lines are complete, except for the connection, before interrupting existing service.

c. Interruption to water, sanitary sewer, storm sewer, telephone service, electric service, air conditioning, heating, fire alarm, compressed air, and steam are considered utility cutovers pursuant to the paragraph WORK OUTSIDE REGULAR HOURS. Such interruptions are further limited to four hours. This time limit includes time for deactivation and reactivation.

d. Operation of Station Utilities: The Contractor must not operate nor disturb the setting of control devices in the station utilities system, including water, sewer, electrical, and steam services. The Government will operate the control devices as required for normal conduct of the work. The Contractor must notify the Contracting Officer giving reasonable advance notice when such operation is required.

e. Connection to Existing Sanitary Sewer Line: Provide positive verification that the existing line conveys sanitary sewer; verify line is not incorrectly connected to a storm drain. Obtain Installation's Sanitary Sewer Connection Permit 2 weeks prior to connection and in accordance with Section 33 30 00 SANITARY SEWERAGE.

1.3.5.1 Location of Underground Utilities

Obtain digging permits prior to start of excavation by contacting the Contracting Officer 15 calendar days in advance. Scan the construction site with electromagnetic or sonic equipment, and mark the surface of the ground or paved surface where existing underground utilities or utilities encased in pier structures are discovered. Verify the elevations of existing piping, utilities, and any type of underground or encased obstruction not indicated to be specified or removed but indicated or discovered during scanning in locations to be traversed by piping, ducts, and other work to be conducted or installed.

Notification Prior to Excavation: Notify the Contracting Officer at least 15 days prior to starting excavation work.

1.4 SECURITY REQUIREMENTS

Contract Clause "FAR 52.204-2, Security Requirements and Alternate II," "FAC 5252.236-9301, Special Working Conditions and Entry to Work Area," and the following apply::

1.4.1 Business Access Security Requirements, Camp Lejeune, NC

1.4.1.1 Business Access Definition

Contractor/subcontractor employees requiring installation access to MCB,

Camp Lejeune or MCAS New River, N.C. must obtain a Business Access Identification Badge for that particular installation. Regularly scheduled delivery personnel, to include FEDEX, UPS, pick-up and deliveries, should also follow the Business Access guidelines described below. Personnel requiring Business Access Identification Badges must submit all documentation listed below. Badges are not required if the contracted position requires the employee to obtain a Common Access Card (CAC) which will be identified separately within the Government contract.

1.4.1.2 Installation Security Access Requirements

Accomplish the security requirements below within 10 days after award or prior to performance under the contract.

1.4.1.3 Business Access Identification Badge Requirement

In order to obtain a Business Access Identification Badge for access to MCB, Camp Lejeune, and satellite activities, or MCAS New River, NC, all personnel providing services under this contract will be required to present the documentation below to the following offices, as applicable:

a. MCB, Camp Lejeune, NC and its satellite activities. Report as follows:

1. Identification Card Center, 60 Molly Pitcher Road for badge (910-451-8444).

b. MCAS New River, NC. Report as follows:

1. S-4 (Facilities Office), Bldg AS-211 (1st Deck) for registrationon contractor's list (910-449-6310).

2. Pass and Identification Office, Bldg AS-187 (1st Deck) for badge and vehicle decal (910-449-7695).

1.4.1.4 Documentation

a. Photo ID:

Valid state or federal issued picture identification card. Acceptable documents include state drivers license, DMV issued photo identification, or alien registration card.

b. Proof of Employee Citizenship or Legal Alien Status:

Acceptable documents include birth certificate, Social Security Cards, Immigration and Naturalization Service (INS) forms and passports.

c. Proof of Criminal Records Check:

Proof of a criminal records check from the county or state where the employee has resided for the previous two years (or length of legal residence for foreign nationals in the U.S. for less than two years). Criminal background records checks must be from a credible source. Many credible sources exist, but some examples include the County Courthouse, Infolink Screening Services, Inc. (www.infolinkscreening.com), IntegraScan Criminal Records Checks (www.integrascan.com), Intelius Employee Screening (www.Intelius.com), and Castle Branch www.castlebranch.com).

Subsequent to the initial criminal background records checks, local criminal records checks will be conducted annually prior to renewal of badges for reevaluation.

d. Letter Provided By Contracting Officer Indicating Contract:

Letter provided by Contracting Officer indicating contract, contract period and prime contractor. Proof of employment on a valid Government contract (e.g., a letter on company letterhead from the prime contractor including contract number and term).

1.4.1.5 Denial of Access

Installation access will be denied if it is determined that an employee:

a. Is on the National Terrorist Watch List

b. Is illegally present in the United States.

c. Is subject to an outstanding warrant.

d. Has knowingly submitted an employment questionnaire with false or fraudulent information.

e. Has been issued a debarment order and is currently banned from military installations.

f. Is a Rarsegistered Sexual Offender, or has any Felony Conviction within the past two years.

1.4.1.6 Appeal Process

All appeals should be directed to the Base Inspector's Office for any individual that has been denied access to the Base.

1.4.1.7 Display and Disposition of Badges

Contractors/subcontractors will prominently display their badges on their person at all times. Upon completion/termination of this contract or an individual's employment, collect and turn in to the Pass & ID Office all badges. If the Contractor fails to obtain the employee's badge, the Pass & ID Office must be notified within 24 hours. During the contract performance period contractors will immediately report instances of lost or stolen badges to the issuing pass and identification office.

1.4.1.8 Contractor and Subcontractor Vehicle Requirements

Each vehicle to be used in contract performance must show the Contractor's or subcontractor's name so that it is clearly visible and must always display a valid state license plate and safety inspection sticker. To obtain a vehicle decal, which will be valid for one year or contract period, whichever is shorter, Contractor or subcontractor vehicle operators must provide to the Vehicle Registration Office, 60 Molly Pitcher Road for vehicle decal (910-451-1158):

a. An installation sponsor request forwarded to provost Marshall office.

b. A valid form of Federal or state government I.D.

c. If driving a motor vehicle, a valid driver's license, vehicle registration and proof of insurance.

Upon completion/termination of this contract or an individual's employment, the Contractor must collect and turn in to Vehicle Registration all Government vehicle decals. If any are not collected, notify the Vehicle Registration Office within 24 hours.

1.4.1.9 Security Checks

Contractor personnel and vehicles must only be present in locations relevant to contract performance. All Contractor personnel entering the base must conform to all Government regulations and are subject to such checks as may be deemed necessary to ensure that violations do not occur. Employees will not be permitted on base when such a check reveals that their presence would be detrimental to the security of the base. Subject to security regulations, the Government will allow access to an area for servicing equipment and/or performing required services. Upon request, submit to the Contracting Officer questionnaires and other forms as may be required for security purposes.

1.4.2 Marine Corps Base (MCB) Camp Lejeune, North Carolina

No employee or representative of the Contractor will be admitted to the work site unless he furnishes satisfactory proof that he is a citizen of the United States or is specifically authorized admittance by the OICC.

a. Identification Badges - A list of all employees to be engaged in the performance of work shall be furnished to the Security Department in conformance with Section 1.4.1.3 Business Access Identification Badge Requirement. In the event employees are hired or discharged, a corrected list of employees shall be furnished reflecting the change in personnel and documentation at least five (5) days in advance of needing to access the worksite. Identification badges for the Contractor and his employees shall be furnished by the Security Department, Marine Corps Base Camp Lejeune, North Carolina. Immediately report instances of lost or stolen badges to the Contracting Officer. Upon completion of the contract and/or termination of the service of any employee, the Contractor shall return the badges to the Security Pass Office. Compliance with this requirement is mandatory and certification thereof to the Contracting Officer is required prior to submitting final invoices. Failure to return badges will hold up Contractor's final payment.

b. Vehicles and Equipment - In addition to other conditions and requirements set forth herein before, vehicles and equipment admitted to the Marine Corps Base Camp Lejeune, North Carolina will be required to meet standards established by the Station Safety Department prior to any use of such equipment on Station. The vehicular and/or equipment conditions shall satisfactorily meet the following provisions:

    1. Steering mechanism must be satisfactory and safe condition.

    2. Horns and warning devices must be operable.

    3. Windshield wipers must be satisfactory in place, clean and unbroken.

4. Rearview mirrors must be satisfactory in place, clean and unbroken.

5. General body conditions: Body must be satisfactory tight including fenders, bumpers, doors and latches thereto, and other parts which might become dislocated during travel.

6. Lights: All lights required by the type of vehicle/equipment in use shall be functional with satisfactory bulbs and lenses.

7. Exhaust Systems: Exhaust systems shall be completely functional with no leaks.

8. Fuel system must be free of leaks and show no evidence of loss of fuel and/or fumes.

9. Brakes: All brakes shall be functional and give evidence of the ability to halt the loaded vehicles within safe distances.

10. Tires need not be new but shall contain sufficient tread to indicate safety at operating speed with vehicle loaded.

11. Electric Wiring: All wiring shall be completed insulated as required and in cases considered appropriate waterproofing of wiring shall be required.

12. Motors shall be reasonably clean from excess grease, dust, and dirt, and if required shall be steam cleaned to the satisfaction of the inspection personnel.

13. Where applicable, inspection will include other such items as gauges, thermometers, controls, relief valves, piping, mechanical locks, limit switches, connectors, and other safety related devices associated with vehicles and equipment admitted to the Station.

U.S. ARMY CORPS OF ENGINEERS (USACE)

EP 1110-1-8	(2016) Construction Equipment Ownership and Operating Expense Schedule

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Earned Value Report; G

1.3 EARNED VALUE REPORT

1.3.1 Data Required

This contract requires the use of a cost-loaded Network Analysis Schedule (NAS). The information required for the Schedule of Prices will be entered as an integral part of the Network Analysis Schedule. Within 15 calendar days of notice of award, prepare and deliver to the Contracting Officer an Earned Value Report (construction contract) as directed by the Contracting Officer. Provide a detailed breakdown of the contract price, giving quantities for each of the various kinds of work, unit prices, and extended prices. Costs must be summarized and totals provided for each construction category.

1.3.2 Schedule Instructions

Payments will not be made until the Earned Value Report from cost-loaded NAS has been submitted to and accepted by the Contracting Officer. For design phase progress payment(s), the Schedule of Prices or Earned Value Report from the Cost Loaded CPM must include detailed design activities and general (summarized) approach for the construction phase(s) of the project. The Schedule of Prices or Earned Value Report must be fully developed with detailed construction line items as design progresses. The complete design and construction Schedule of Prices or Earned Value Report must be submitted and accepted prior to starting construction work.

For Fast-Tracked or Critical Path Submittals of construction projects, the Earned Value Report must include detailed design and construction line items for each fast-tracked/ critical path phase(s), submitted to and accepted by the Contracting Officer during the Post Award Kickoff Meetings and confirmed prior to starting construction work in that phase. Additionally, the Earned Value Report must be separated as follows:

a. Primary Facility/s Cost Breakdown:

Defined as work on the primary facility/s out to the 5 foot line. Work out to the 5 foot line includes construction encompassed within a theoretical line 5 foot from the face of exterior walls and includes attendant construction, such as pad mounted HVAC equipment, that may extend beyond the 5 foot line.

Provide a cost breakout for all Primary Facility features that support Low Impact Development (LID), such as vegetated roof and rainwater harvesting features. The sum of the Primary Facility Cost above - a. and these Primary Facility LID sub-items - (1) must equal the total Primary Facility cost. Provide a subtotal cost of all Primary Facility LID sub-items on the Earned Value Report at design complete and project closeout.

b. Supporting Facilities Cost Breakdown:

Defined as site work, including incidental work, outside the 5 foot line.

Provide a cost breakout for all Supporting Facilities features that support LID, such as bioswales, permeable paving, infiltration basins, tree box filters, etc.. The sum of the Supporting Facilities Cost above - b. and these Supporting Facilities LID sub-items - (1) must equal the total Supporting Facilities cost. Provide a subtotal cost of all Supporting Facilities LID sub-items on the Earned Value Report at design complete and project closeout.

1.3.3 Real Property Assets

Provide the Draft and Interim DD Form 1354, Transfer and Acceptance of Military Real Property filled in with the appropriate Real Property Unique Identifiers (RPUID) and related construction Category Codes. Provide the Draft DD Form 1354 that uses the appropriate division of the RPUIDs/ Category Codes to represent the designed real property assets that apply to this contract and include all associated cost. The Contractor must meet with the Contracting Officer and the Real Property Accounting Officer during the Post Award Kickoff Meeting and the Project Closeout Meetings to modify and include any necessary changes to the DD Form 1354. The Contractor shall provide the Interim DD Form 1354 that uses the appropriate division of the RPUIDs/ Category Codes to represent the final constructed facility and include all associated cost. Coordinate the Contractor's Price and Payment structure with the structure of the RPUIDs / Category Codes.

Divide detailed asset breakdown into the RPUIDs and related construction Category Codes and populate associated costs which represent all aspects of the work. Where assets diverge into multiple RPUID/ Category Codes, divide the asset and provide the proportion of the assets in each RPUID/ Category Code. Assets and related RPUID/ Category Codes may be modified by the Contracting Officer as necessary during the course of the work. Coordinate identification and proportion of these assets with the Government Real Property Accounting Officer.

Cost data accumulated under this section are required in the preparation of DD Form 1354. Coordinate with Section 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES in paragraph titled "DD Form 1354".

1.3.4 Schedule Requirements for HVAC TAB

The field work requirements of TAB work required by RFP Part 4 D30, HVAC must be broken down in the Earned Value Report from the cost-loaded NAS by separate line items which reflect measurable deliverables. Specific payment percentages for each line item will be determined on a case by case basis for each contract. The line items are as follows:

a. Approval of Design Review Report: The TABS Agency is required to conduct a review of the project plans and specifications to identify any feature, or the lack thereof, that would preclude successful testing and balancing of the project HVAC systems. The resulting findings shall be submitted to the Government to allow correction of the design. The progress payment will be issued after review and approval of the report.

b. Approval of the pre-field engineering report: The TABS Agency submits a report which outlines the scope of field work. The report must contain details of what systems will be tested, procedures to be used, sample report forms for reporting test results and a quality control checklist of work items that must be completed before TABS field work commences.

c. Season I field work: Incremental payments are issued as the TABS field work progresses. The TABS Agency mobilizes to the project site and executes the field work as outlined in the pre-field engineering report. The HVAC water and air systems are balanced and operational data must be collected for one seasonal condition (either summer or winter depending on project timing).

d. Approval of Season I report: On completion of the Season I field work, the data is compiled into a report and submitted to the Government. The report is reviewed, and approved, after ensuring compliance with the pre-field engineering report scope of work.

e. Completion of Season I field QA check: Contract QC and Government representatives meet the TABS Agency at the jobsite to retest portions of the systems reported in the Season I report. The purpose of these tests are to validate the accuracy and completeness of the previously submitted Season I report.

f. Approval of Season II report: The TABS Agency completes all Season II field work, which is normally comprised mainly of taking heat transfer temperature readings, in the season opposite of that under which Season I performance data was compiled. This data must be compiled into a report and submitted to the Government. On completion of submittal review to ensure compliance with the pre-field engineering report scope, progress payment is issued. Progress payment is less than that issued for the Season I report since most of the water and air balancing work effort is completed under Season I.

1.4 CONTRACT MODIFICATIONS

In conjunction with the Contract Clause "DFARS 252.236-7000, Modification

Proposals-Price Breakdown," and where actual ownership and operating costs of construction equipment cannot be determined from Contractor accounting records, equipment use rates will be based upon the applicable provisions of the EP 1110-1-8.

1.5 CONTRACTOR'S INVOICE AND CONTRACT PERFORMANCE STATEMENT

1.5.1 Content of Invoice

Requests for payment will be processed in accordance with the Contract. Clause FAR 52.232-27, Prompt Payment Construction Contracts and FAR 52.232-5, Payments Under Fixed-Price Construction Contracts. The Requests for payment must include the documents listed below:

a. The Contractor's invoice, on NAVFAC Form 7300/30 furnished by the Government, showing in summary form, the basis for arriving at the amount of the invoice. Form 7300/30 must include certification by Quality Control (QC) Manager as required by the contract.

b. The Earned Value Report from the cost-loaded NAS, showing in detail: the estimated cost, percentage of completion, and value of completed performance for each of the construction categories stated in this contract. Use NAVFAC Form 4330/110 on NAVFAC contracts when a Monthly Estimate for Voucher is required.

c. Updated Project Schedule and reports required by the contract

d. Contractor Safety Self Evaluation Checklist

e. Other supporting documents as requested

f. Updated copy of submittal register.

g. Invoices not completed in accordance with contract requirements will be returned to the Contractor for correction of the deficiencies.

h. Subcontractor and supplier payment certification.

i. Materials on Site.

j. Affidavit to accompany invoice (LANTDIV NORVA Form 4-4235/4 (Rev.5/81)).

1.5.2 Submission of Invoices

If DFARS Clause 252.232-7006 is included in the contract, the documents listed in paragraph CONTENT OF INVOICE above must be provided in their entirety as an attachment in Wide Area Work Flow (WAWF) for each invoice submitted. The maximum size of each WAWF attachment is two megabytes, but there are no limits on the number of attachments. If a document cannot be attached in WAWF due to system or size restriction it must be provided as instructed by the Contracting Officer. All other paper invoices must be forwarded with specific marking on the envelope. This marking must be in the front lower left hand corner, in large letters, "INVOICES - ENCLOSED."

Monthly invoices and supporting forms for work performed through the anniversary award date of the contract must be submitted to the Contracting Officer within 5 calendar days of the date of invoice For example, contract award date is the 7th of the month, the date of each

monthly invoice must be the 7th and the invoice must be submitted by the 12th of the month.

1.5.3 Final Invoice

a. A final invoice must be accompanied by the certification required by DFARS 252.247.7023 TRANSPORTATION OF SUPPLIES BY SEA, and the Contractor's Final Release. If the Contractor is incorporated, the Final Release must contain the corporate seal. An officer of the corporation must sign and the corporate secretary must certify the Final Release.

b. For final invoices being submitted via WAWF, the original Contractor's Final Release Form and required certification of Transportation of Supplies by Sea must be provided directly to the respective Contracting Officer prior to submission of the final invoice. Once receipt of the original Final Release Form and required certification of Transportation of Supplies by Sea has been confirmed by the Contracting Officer, the Contractor must then submit final invoice and attach a copy of the Final Release Form and required certification of Transportation of Supplies by Sea in WAWF.

c. Final invoices not accompanied by the Contractor's Final Release and required certification of Transportation of Supplies by Sea will be considered incomplete and will be returned to the Contractor.

1.6 PAYMENTS TO THE CONTRACTOR

Payments will be made on submission of itemized requests by the Contractor which comply with the requirements of this section, and will be subject to reduction for overpayments or increase for underpayments made on previous payments to the Contractor.

1.6.1 Obligation of Government Payments

The obligation of the Government to make payments required under the provisions of this contract will, at the discretion of the Contracting Officer, be subject to reductions and/or suspensions permitted under the FAR and agency regulations including the following in accordance with "FAR 32.503-6:

a. Reasonable deductions due to defects in material or workmanship;

b. Claims which the Government may have against the Contractor under or in connection with this contract;

c. Unless otherwise adjusted, repayment to the Government upon demand for overpayments made to the Contractor; and

d. Failure to provide up to date record drawings not current as stated in Contract Clause "FAC 5252.236-9310, Record Drawings."

1.6.2 Payment for Onsite and Offsite Materials

Progress payments may be made to the contractor for materials delivered on the site, for materials stored off construction sites, or materials that are in transit to the construction sites under the following conditions:

a. FAR 52.232-5(b) Payments Under Fixed Price Construction Contracts.

b. Materials delivered on the site but not installed, including completed preparatory work, and off-site materials to be considered for progress payment must be major high cost, long lead, special order, or specialty items, not susceptible to deterioration or physical damage in storage or in transit to the construction site. Examples of materials acceptable for payment consideration include, but are not limited to, structural steel, non-magnetic steel, non-magnetic aggregate, equipment, machinery, large pipe and fittings, precast/prestressed concrete products, plastic lumber (e.g., fender piles/curbs) and high-voltage electrical cable. Materials not acceptable for payment include consumable materials such as nails, fasteners, conduits, gypsum board, glass, insulation, and wall coverings.

c. Materials to be considered for progress payment prior to installation must be specifically and separately identified in the Contractor's estimates of work submitted for the Contracting Officer's approval in accordance with Earned Value Report requirement of this contract. Requests for progress payment consideration for such items must be supported by documents establishing their value and that the title requirements of the clause at FAR 52.232-5 have been met.

d. Materials are adequately insured and protected from theft and exposure.

e. Provide a written consent from the surety company with each payment request for offsite materials.

f. Materials to be considered for progress payments prior to installation must be stored either in Hawaii, Guam, Puerto Rico, or the Continental United States. Other locations are subject to written approval of the Contracting Officer.

SECTION 01 30 00.05 20

ADMINISTRATIVE REQUIREMENTS FOR DESIGN-BUILD
03/13

PART 1 GENERAL

1.1 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Insurance

1.2 MINIMUM INSURANCE REQUIREMENTS

Procure and maintain during the entire period of performance under this contract the following minimum insurance coverage:

a. Comprehensive general liability: $500,000 per occurrence

b. Automobile liability: $200,000 per person, $500,000 per occurrence for bodily injury, $20,000 per occurrence for property damage

c. Workmen's compensation as required by Federal and State workers' compensation and occupational disease laws.

d. Employer's liability coverage of $100,000, except in States where workers compensation may not be written by private carriers,

e. Others as required by the State.

Refer to Section 01 33 00.05 20, CONSTRUCTION SUBMITTAL PROCEDURES for typical preconstruction submittals similar to insurance.

1.3 CONTRACTOR PERSONNEL REQUIREMENTS

1.3.1 Subcontractor Special Requirements

1.3.1.1 Asbestos Containing Material

All contract requirements of PART 4, F20 SELECTIVE BUILDING DEMOLITION, assigned to the Private Qualified Person (PQP) must be accomplished directly by a first tier subcontractor.

1.3.1.2 HVAC TAB

All contract requirements of TAB work required by PART 4 D30, HVAC, must be accomplished directly by a first tier subcontractor. No TAB work required by PART 4, D30, HVAC, is allowed to be accomplished by a second tier subcontractor.

1.3.1.3 Qualified Testing Organization

All contract requirements of work required to be performed by a Qualified Testing Organization in PART 4, D50 ELECTRICAL and G40 SITE ELECTRICAL UTILITIES, must be accomplished directly by a first tier subcontractor. No work to be performed by a Qualified Testing Organization, required by PART 4, D50 and G40 is allowed to be accomplished by a second tier subcontractor.

1.4 SUPERVISION

Have at least one qualified supervisor capable of reading, writing, and conversing fluently in the English language on the job site during working hours. In addition, the Quality Control (QC) representative must also have fluent English communication skills.

1.5 SUPERVISION

Provide at least one (1) qualified Project Manager and one (1) on-site Project Superintendent per construction site (not including demolition only sites)capable of reading, writing, and conversing fluently in English. The Project Manager must have a minimum 10 years experience as a Project Manager or Superintendent on projects like this contract or similar in size and complexity. The Project Superintendent must have a minimum of 10 years experience as a Superintendent on projects similar in size and complexity.

The Project Manager in this context shall mean the individual with the responsibility for the overall management of the project and the Project Superintendent shall mean the individual with the responsibility for quality and production. Both the Project Manager and Project Superintendent are subject to removal by the Contracting Officer for non-compliance with requirements specified in the contract and for failure to manage the project to insure timely completion. Furthermore, the Contracting Officer may issue an order stopping all or part of the work until satisfactory corrective action has been taken. No part of the time lost due to such stop orders is allowed to be made the subject of claim for extension of time for excess costs or damages by the Contractor.

Approval of Project Manager and on-site Project Superintendent is required prior to start of construction. Provide resumes for the proposed Project Manager and on-site Project Superintendent describing their experience with references and qualifications to the Contracting Officer for approval. The Contracting Officer reserves the right to interview the proposed Project Manager and on-site Project Superintendent at any time in order to verify the submitted qualifications.

1.6 AMERICAN PREFERENCE POLICY

This policy precludes the award of construction contract estimated by the Government to exceed $1,000,000 to a foreign contractor; unless the lowest responsive bid of a U.S. contractor exceeds the lowest responsible and responsive bid of a foreign contractor by greater than 20 percent. To qualify as a U.S. contractor, the firm (or if a joint venture, all members of he joint venture) must be incorporated in the U.S. and comply with the following: (a) the corporate headquarters must be in the U.S,; (b) the

firm must have filed corporate franchise and employment tax returns (if required) in the U.S. for a minimum of 2 years, must have filed state and federal income tax returns (if required) for a minimum of 2 corporate years, and paid any taxes determined to be due as a result of such filings; and (c) the firm must employ U.S. citizens in key management positions.

1.7 CLEANUP

Leave premises "broom clean." Clean interior and exterior glass surfaces exposed to view; remove temporary labels, stains and foreign substances; polish transparent and glossy surfaces; vacuum carpeted and soft surfaces. Clean equipment and fixtures to a sanitary condition. Replace filters of operating equipment. Clean debris from roofs, gutters, downspouts and drainage systems. Sweep paved areas and rake clean landscaped areas. Remove waste and surplus materials, rubbish and construction facilities from the site.

1.3 GENERAL REQUIREMENTS

The Furnishings, Fixtures, and Equipment (FF&E) Packages may include, but are not limited to; systems and modular furniture, workstations, seating, storage, filing, visual display items, accessories, artwork, command graphics, training and conference furniture, soft window treatments (draperies, valances, and cornices), shop equipment, fitness equipment, Child Development Center furniture/furnishings, appliances, portable

weapons cabinets and dorm and quarters furnishings and other miscellaneous items to support facility functions. The FF&E Package must be fully integrated with the building systems and finishes. FF&E may also include specialty items for which the customer activity is be responsible for specifying.

The Interior Design Services for the design and specification of the FF&E Package must be included in the Construction Base Bid Construction Line Item Number (CLIN). This project contract/task order Contract Pricing Schedule contains separate CLINs for the Construction Base Bid and FF&E Planned Modification CLIN(s). The purchase and installation of the FF&E Package will be funded separately as the FF&E Planned Modification CLIN . The Government FF&E Package budget and A/V Package budget identified on the Contract Pricing Schedule does include the Contractor's Handling and Administration Rate (HAR). This Government FF&E estimate and A/V estimate must not be altered by Contractors during the bid process.

All FF&E items are subject to the Buy American Act.

1.4 INTERIOR DESIGN SERVICES

1.4.1 Qualifications and Affiliations

Per UFC 3-120-10, The Interior Designer of Record, hereafter referred to as the Contractor's Interior Designer, must have attained National Council for Interior Design Qualification (NCIDQ) certification or state licensure, certification or registration. The Contractor's Interior Designer, Design Firm owners, and any Specialists must NOT have any affiliation with any furniture, fixture, or equipment products, any furniture dealership or any manufacturers in order to avoid any potential organizational conflict of interest. Provide documentation of the Contractor's Interior Designer's qualifications and significant interior design experience on similar type projects to the Government. NAVFAC reserves the right to approve/disapprove the Contractor's Interior Designer.

1.4.2 Concept FF&E Package

Concept FF&E package, prepared by the A/E's Interior Designer, indicating the salient characteristics of all required FF&E items and CADD drawings, will be provided to the Contractor. The Contractor must provide the services of a Certified Interior Designer, other than the A/E's Interior Designer, to function as the Contractor's Interior Designer, to prepare and provide the Final, Best Valued FF&E Package and procurement data based on the Concept FF&E package.

All fixed and movable furnishings selections must be closely coordinated with the final construction documents and interior finishes. The Contractor's Interior Designer is required to validate all FF&E requirements with the Activity, make any necessary changes to the FF&E and interior building finishes. Per UFC 3-120-10, the (FF&E) includes the design, selection, specification, color coordination, and procurement documentation of the required items necessary to meet the functional, operational, sustainability, and aesthetic needs of the facility. The FF&E package must be fully integrated with the design, construction, and schedule of all building finishes and all building systems (HVAC, Plumbing, Fire Protection, Communications, Electrical, Data, Architecture, etc. All outlets, switches, fire extinguishers, thermostats, etc. must be fully accessible. All sprinkler heads, ADA, etc. clearances must be

accommodated.

The Contractor's Interior Designer must also attend walk-throughs, coordinate mock-ups, and attend any and all required meetings to accomplish this task. The Contractor's Interior Designer and equipment specialists must be responsible for designing and providing specifications for procurement of all FF&E, to include delivery and installation, for the facilities built under this contract as directed by the NAVFAC Interior Designer. FF&E specifications must be based on Navy Blanket Purchase Agreements (BPA's), GSA schedules, and other Federal contracts and complying with priorities found in FAR Part 8.404. The utilization of the current Navy BPA list is required for BVD Analysis Request for Pricing. The current Navy BPA list is available at:

http://www.wbdg.org/ffc/navy-navfac/collateral-equipment

1.4.3 Audio Visual (A/V) and/or other Specialty Furniture or Equipment

A Concept A/V package, prepared by the A/E's A/V Specialist, indicating the salient characteristics of all required A/V items and CADD drawings, will be provided to the Contractor. When A/V, or other specialty furniture or equipment, i.e. shop equipment, kitchen equipment, fitness equipment, high density storage, etc., is required in the project, the Contractor must obtain the services of equipment specialists to provide design and specifications for the specialty equipment. A Certified Technology Specialist-Design (CTS-D) is required for the design and preparation of A/V packages. The Equipment Specialist must validate all A/V requirements with the Activity, make any necessary changes, and provide separate Best Value Determinations (BVDs) for this equipment,. This Final package must be in accordance with the general interior design requirements in UFC 3-120-10 and as required for all areas as developed during the client FF&E and A/V programming.

The A/V package must be prepared by the Contractor's ID and A/V Certified Technology Specialist-Design (CTS-D) as a separate package. The design, procurement, and installation of the A/V package must comply with all of the same requirements as those defined for the FF&E package in this specification section. Additionally provide A/V floor plans indicating equipment locations and A/V riser diagrams for all A/V systems, and coordinate equipment locations and power requirements with power plans. The A/V and specialty packages must be fully integrated into the design, construction, and schedule of all building finishes and all building systems (HVAC, Pluming, Fire Protection, Communications, Electrical, Data, Architecture, etc.) All outlets, switches, thermostats, fire extinguishers, etc. must be fully accessible. All sprinkler heads, fire extinguishers, ADA, etc. clearances must be accommodated.

1.5 FURNISHINGS, FIXTURES, AND EQUIPMENT (FF&E) SUBMITTALS FOR THE INTERIOR DESIGN SERVICES

Develop design as described and in accordance with the Activity requirements. Include in the design all loose furnishings required to produce an optimum functional facility, consistent with quality commercial design. This project also includes the preparation of specific detailed information for each selected item. Each submittal must demonstrate thorough interaction with the Activity requirements and complete coordination with the facility design and the Structural Interior Design (SID).

a. The Activity will supply the Contractor's Interior Designer with a complete list of all existing FF&E, to include sizes, utility requirements, weight, etc., to be relocated to the new facility

b. The Contractor's Interior Designer must be responsible for inventorying existing FF&E to be relocated to the new facility and incorporating the existing FF&E into the FF&E plan.

c. For all projects, including fast track projects, the Contractor must be responsible for sufficiently scheduling all FF&E and any revisions to SID submittals early enough to obtain the required government approvals, and meet all ordering and installation lead times to complete the project by the contract completion date.

These are minimum requirements and the Contractor must be prepared to provide any/all additional meetings and submittals that may be necessary to support the Interior Design effort/ and FF&E coordination.

1.5.1 FF&E Requirements (Interior Design Orientation) Meeting

This meeting must occur at NAVFAC LANT, located in Norfolk, VA prior to the FF&E "Over the Shoulder" Review and the development of the FF&E package. The NAVFAC Interior Designer will provide the Contractor's Interior Designer a sample format of the FF&E submittal, review the Best Value Determination (BVD) process, discuss the number of Best Value Determinations required and discuss Blanket Purchase Agreement (BPAs), GSA or other mandatory sources to consider. Minutes of this meeting must be submitted to the NAVFAC Interior Designer within 7 business days.

NAVFAC Interior Design Collateral Equipment Policy and templates may be accessed at http://www.wbdg.org/ffc/navy-navfac/collateral-equipment.

1.5.2 FF&E "Over the Shoulder" Review

Prior to the FF&E Concept Presentation and Best Value Determination (BVD) Analysis, the Contractor's Interior Designer must meet with the NAVFAC Interior Designer for an "over-the-shoulder" review to present preliminary FF&E options. These can be presented in a "loose" format for preliminary approval prior to the Activity presentation. The "over-the-shoulder" review meeting must be held at NAVFAC LANT, located in Norfolk, VA.

1.5.3 FF&E Concept Presentation

The Contractor's Interior Designer must present the NAVFAC approved Preliminary (Pre-final) FF&E package to the Activity, located at MCB VCamp Lejeune, for approval. This presentation must include loose format samples and catalog cuts. Sample boards are not required.

1.5.4 Best Value Determination(BVD) Analysis "Over the Shoulder Review"

Prior to issuing the Best Value Determination (BVD) Analysis, the Contractor's Interior Designer must meet with the NAVFAC Interior Designer for an "over-the-shoulder" review of the solicitation package and request a copy of the most current Navy BPA vendor list. The "over-the-shoulder" review meeting must be held at NAVFAC LANT, located in Norfolk, VA. The Contractor's Interior Designer must provide a copy of the BVD Analysis Request for Pricing cover letter to the Contractor for review and comment prior to the BVD Analysis "Over the Shoulder Review" meeting.

BVD Analysis Solicitation must include the following:

a. Copy of the BVD Analysis Request for Pricing cover letter.

b. BVD Analysis Request for Pricing Spreadsheet/Questionnaire with "basis of design" item product numbers, photos & descriptions.

c. Technical Specification to establish minimum acceptable FF&E requirements.

d. Project Specific Room/Furniture Typicals.

e. Furniture Plans with Legends coded to the BVD Analysis RFP (PDF format).

1.5.5 BVD Submittal and "Over the Shoulder Review"

The Contractor's Interior Designer must submit one (1) copy of the Preliminary BVA BVD package to the NAVFAC Interior Designer and one (1) copy to IDD/Base Property for Marine Corps projects. An electronic copy must be sent to the NAVFAC Contracting Officer. The "over-the-shoulder" review meeting must be held at NAVFAC LANT, located in Norfolk, VA to review the results of the solicitation and determine a best value recommendation. The BVD Submittal must be in a 3-ring binder and must include the following items for review and approval:

a. Cover Title Page (project name, project #, location, submittal date, submittal title)

b. Table of Contents.

c. Point of Contact List.

d. Narrative of Interior Designer Objectives.

e. BVD Analysis Request for Pricing Spreadsheet/Questionnaire completed by all bidders and completed Questionnaire.

f. Copy of all information sent to bidders and documentation that all required sources were contacted.

g. Back-up Information submitted by each bidder (cut sheets/highlighted pricing sheets/technical specifications, pricing, dealer and manufacturer qualification for each product showing that products meets all requirements). Provide in CD format and include within each binder.

h. Response(s) from UNICOR.

i. BVD Analysis Pricing Evaluation Spreadsheet comparing bidder quotes/responses.

j. Contractor's Interior Designer recommendation for the Best Value vendor and justifications.

1.5.6 BVD Analysis FF&E Mock-Up

The Contractor's Interior Designer must coordinate a mock-up for best value review of IDENTIFY LIKELY REQUIRED TYPICAL WORKSTATIONS AND OTHER FF&E AS DETERMINED BY NAVFAC by at least the top three (3) BPA vendors

submitting the highest rated FF&E proposals, as determined by NAVFAC. The reviewers must include the NAVFAC Interior Designer, Contracting Officer, IDD/Base Property, and the Activity.

1.5.7 Preliminary FF&E Submittal

The Preliminary FF&E submittal must be presented to the Activity and NAVFAC in loose format at a meeting to occur at NAVFAC, located in Norfolk, VA.. Five (5) submittals will be required; (1) for the NAVFAC Project Manager, (3) for the FEAD/ROICC and IDD/Base Property, and (1) for the Activity.

Submit the following in a 3-ring binder (with the exception of the 16x20 color boards for the Activity only) for review and approval:

a. Cover Title Page (project name and number, submittal date and title).

b. Table of Contents.

c. Point of Contact List (includes contact info for recommended Best Value BPA Holder(s) vendors and subcontractors).

d. Preliminary FF&E list (Cost Summary) to include shipping, freight, handling, professional installation, project management, HAR and applicable sales tax.

e. Preliminary Procurement Data Spec Sheets for each product indicating general appearance as well as proposed finish and fabric selections.

f. Furniture placement plans coded to the FF&E list and Procurement Data Spec Sheets.

g. Technical Specifications used in bid request for all furniture, fixtures and equipment etc..

h. 16x20 inch color boards of furniture and finishes specified for Activity presentation to indicate overall design intent (1 copy required for Activity only).

i. Final Finish/Fabric Selections and Samples attached to boards in 8" x 10" binder format using edge-reinforced, heavy-duty plastic sheet protectors for each board/sheet.

j. Copy of Quote(s)/Bill of Materials (BOM) on letterhead from the vendor(s) determined to be the best value. Code BOM line items to FF&E Cost Summary Item Codes.

k. 8x10 color photographs of the color boards.

1.5.8 Final FF&E Mock-Up

The Contractor and the Contractor's Interior Designer must coordinate an on-site mock-up and review of IDENTIFY LIKELY REQUIRED TYPICAL WORKSTATIONS AND OTHER FF&E AS DETERMINED BY NAVFAC with the selected, best-valued BPA vendor(s). Building finishes and fixtures must be installed in the affected area(s) to the greatest extent practicable in order to assess building systems/fixture coordination. The reviewers must include the NAVFAC Interior Designer and Construction Manager, The Contractor's Interior Designer, IDD, Base Property, and the Activity. The

BPA vendor(s) must be available on-site to respond to questions. The mock-up exercise must be completed prior to the submittal of the Final FF&E submittal and award of the modification for turnkey furniture procurement.

1.5.9 Final FF&E Submittal

The Final FF&E submittal must be due 10 months prior to BOD following the receipt of review comments on the preliminary FF&E submittal and must include furniture, furnishings, artwork, and equipment and must be in the format described below or the format provided by the NAVFAC Interior Designer and the UFC 3-120-10 Interior Design.

These are minimum requirements and the Contractor must be prepared to provide any additional meetings and submittals that may be necessary to support the Interior Design effort and FF&E coordination.

The Final FF&E Submittal must be submitted in a 3-ring binder for review and approval. The number of final submittals required must be:

Five (5) total; One each for the NAVFAC Project Manager and the Activity. Three to be shared between the FEAD/ROICC and IDD/Base Property.

The Final FF&E Submittal and must include the following:

a. Cover Title Page with project name, project #, submittal date, submittal title identified on binder cover and spine.

b. Table of Contents.

c. Point of Contact List which includes contact info for recommended Best Value BPA Holder(s) vendors and subcontractors.

d. Final FF&E list (Cost Summary) to include shipping, handling, freight, professional installation, project management, HAR and any applicable sales tax.

e. Final Procurement Data Spec Sheets for each product indicating final finish and fabric selections.

f. Final Finish Selections and Memo Samples for the FF&E submitted in 8 x 10 binder format, using heavy-duty plastic sheet protectors.

g. Copy of Final Quote(s)/Bill of Materials (BOM) on letterhead from the vendor(s) determined to be the Best Value. Code BOM line items to FF&E Cost Summary Item Codes.

h. Best Value Determination Guidelines sheets; completed and signed by the Contactor's Interior Designer.

i. Final Furniture Placement Plans coded to the FF&E list, Procurement Data Sheets and specifications.

j. CD copy of the final FF&E binder.

1.5.10 Punch List:

See section 2.1.13 Punch List.

1.5.11 FF&E and Interior Finish Construction Submittals

Submit any revisions or deviations caused by discontinued items or NAVFAC required changes to the Contracting Officer for approval by the NAVFAC Interior Designer. All submittal due dates for the FF&E, A/V, and specialty equipment must be reflected in the Contractor's construction schedule. Changes to the FF&E schedule must be submitted to the government Interior Designer for approval. The Final FF&E package must be submitted no later than 9 months prior to the contract completion date.

1.6 BEST VALUE DETERMINATION (BVD)

For purposes of this specification, the term, "procurement", is defined as any one purchase to a specific vendor for items in a FF&E package. In order to provide a complete FF&E package, multiple vendors, and therefore multiple BVDs, from BPAs, GSA and/or Open Market may be required. It is mandatory for the Navy to use the Navy Furniture Spiral III BPAs as one of the first sources of supply for the acquisition of office, dormitory and quarters furniture. The Navy must also comply with Mandatory Sources guidance.

Reference: NAVFAC Interior Design Policy: Best Value Determinations and NAVFAC Interior Design Policy: Navy Blanket Purchase Agreements.

Per Federal Acquisition Regulation 8.002, customers shall satisfy requirements for supplies (in this case furniture), from or through the sources listed below in descending order of priority:

a. Inventories of the requiring activity

b. Excess from other agencies

c. Federal Prison Industries/UNICOR

d. Supplies which are on the Procurement List maintained by The Committee for Purchase from People Who Are Blind or Severely Disabled (Ability One)

e. Wholesale supply sources, such as stock programs

If the Interior Designer is unable to satisfy the furniture requirement from one of the above Mandatory Sources then the Navy Furniture BPAs shall be used to meet the requirement.

The Mandatory Sources section of the Best Value Determination Guidelines - Micro-Purchase Threshold (MPT), currently ($10,000 - Simplified Acquisition Threshold (SAT), currently $250,000 and/or Best Value Determination Guidelines - Greater than SAT form(s), completed and signed by the Interior Designer, will serve as documentation to the Contracting Officer and Contract Specialist that the effort to utilize the Mandatory Sources has been satisfied.

The Navy Furniture BPAs are not mandatory for OCONUS (to include Hawaii and Guam). The NAVSUP policy memo, NAVSUP Enterprise Acquisition Policy Regarding Furniture Procurement Outside the United States, 1May2015, gives activities exercising NAVSUP contracting authority outside the United States exemption from the mandatory use policy and are authorized to purchase furniture, for use outside the United States, from local sources.

A Best Value Determination (BVD) is required by FAR 8.404 when placing procurement orders against Federal Supply Schedules for the selection of furniture and furnishings. Best Value is defined in FAR 2.101 as ensuring that the order to be placed under a Federal Supply Schedule results in the lowest overall cost alternative (considering price, special features, administrative costs and client's needs) to meet the government's needs.

a. A (BVD) must be performed on a minimum of three manufacturers for orders exceeding a total procurement of the MPT from an individual manufacturer. Multiple BVDs may be required in order to complete the final FF&E and A/V packages.

b. The required quantity of BVD's to be performed will be determined by the NAVFAC Interior Designer during the design phase and is dependent on the appropriate Navy BPA category(s) to be utilized and specific project requirements.

c. Documentation must be provided to the Government with the final FF&E package. Specific Documentation is indicated in the Preliminary BVA Submittal and "Over the Shoulder Review." The BVD Statement must be completed and signed by the contractor's interior designer.

The Contractor's Interior Designer is responsible for the following written BVD justifications:

1.6.1 Total procurement greater than the SAT

The Interior Designer must always review products and pricing from all mandatory sources per FAR 8.002. The Interior Designer must prepare and distribute a BVD Request for Pricing Package to all BPA holders in the applicable category or SIN and Region for FF&E procurements greater than the SAT. FPI/UNICOR must always be solicited via email if they hold a BPA in the applicable SIN; documentation is required. The Interior Designer must confirm the pricing with the vendor and the vendor must provide a written quote or documentation. Allow a minimum of 30 calendar days for responses if the project schedule permits. The BVD form Best Value Determination Guidelines - Greater than the SAT (Attachment 9) must be completed and submitted to the Contracting Officer and Contract Specialist for all FF&E procurements greater than the SAT (FAR 2.101). Manufacturer's quotes and a summary of all proposals must be attached.

1.6.2 UNICOR

Federal Prison Industries (UNICOR) must be considered as part of all BVDs. This must be done by sending an e-mail with the requirements and evaluation criteria. If they are not comparable in one or more areas of price, quality, and time of delivery, the designer can specify product under Navy BPA or GSA schedule.

1.6.3 Evaluation Factors

The Best Value determination Determination must address issues such as:

a. Space planning; human factors data related to anthropometrics (reach, clearance, adjustability), space, and acoustics.

b. Ergonomics.

c. Product quality (including construction and materials); sustainability features, product warranties; history of the product and/or manufacturer.

d. Ability to service products through dealers or others within a certain geographical range of the project.

e. Price (including freight).

f. Aesthetics.

g. Appropriateness; and lighting, power and telecommunications systems management and/or coordination as related to the facility (when applicable); and other project specific factors as identified and/or required.

h. Emphasis must be to create a fully integrated design solution by providing quality products to meet the functional needs of the customer. Customer preferences must be considered. The focus must be on the best overall value. Use the NAVFAC Best Value Determination forms provided by the NAVFAC Interior Designer.

PART 2 FF&E TURNKEY EFFORT

2.1 FF&E PLANNED MODIFICATION

FF&E Planned Modification: As a planned modification, provide procurement and installation coordination of the complete and usable Final FF&E package. The FF&E Package must include shipping, freight, handling, installation and the Contractor's FF&E Handling and Administration Rate (HAR) percentage as applied to the final FF&E total cost.

a. The Audio Visual (AV) Equipment will be identified as a separate line item, priced separately from the FF&E and funded as a planned modification. The A/V Package must include shipping, freight, handling, installation, applicable state sales tax, and the Contractor's A/V Handling and Administration Rate (HAR) percentage as applied to the final A/V total cost (excluding taxes).

2.1.1 Authorization

The Government will provide separate funding for procurement and installation coordination of the FF&E and A/V packages. Construction funds will not be used. Upon receipt of required funding, the Contractor must be authorized by the Contracting Officer, as a planned modification to the construction contract, to procure and install all Final FF&E utilizing Navy Blanket Purchase Agreements (BPA's), GSA schedules, and other Federal contracts and complying with priorities found in FAR Part 8.404. The Contractor will be expected to procure and coordinate the installation of the approved Final FF&E package exactly as specified. The amount of the modification will be the actual cost of these items from the Federal Government price schedules (Navy BPAs and/or GSA), including any freight and installation charges from the furniture supplier as well as the Contractor's HAR and any applicable state sales tax. The HAR includes all of the Contractor's effort related to storage, coordination, handling, administration of subcontractors including but not limited to the use of elevators,, and all other associated costs and profit for the procurement and installationof FF&E.

The Government will indicate the FF&E estimates based on the Concept Design in the contract solicitation Price Proposal Form (Bid Schedule). These Government estimates must not be altered by Contractors during the bid process.

Contractors must propose a Handling and Administration Rate (HAR) only. The Contractor will propose the FF&E HAR in the contract solicitation. The Contractor's proposed HAR may not exceed 5 percent of the total FF&E costs, as noted on the bid schedule. The HAR must not include costs associated with the Interior Design Services required in the Interior Design Services.

All supplies under the FF&E Planned Modification CLIN are subject to the rules and regulations governing the acquisition of foreign supplies, e.g., Buy American Act (BAA) (FAR 25.1). This also includes all supplies procured through Government Supply Sources, such as Navy Furniture BPAs and GSA Schedules. GSA solicitations are required to meet the Trade Agreement Act (TAA) Designated Countries (FAR 25.4), as part of the BAA. The Construction Contractor is responsible for ensuring the FF&E is in compliance with the BAA/TAA.

2.1.2 Procurement and Installation

The Contractor must coordinate the building completion date with the installation dealer(s) specified in the FF&E Package. The Contractor must anticipate possible manufacturer price increases if order placement is delayed. It is recommended to order the FF&E product once the planned modification is awarded and funds are received to avoid incurring additional costs. Delayed production and delivery dates can be noted at the time of order placement to coincide with the contract completion date. Any costs incurred due to manufacturer price increases will be the burden of the Contractor.

2.1.3 Use of Blanket Purchase Agreements (BPA) and GSA Schedules

The Contractor will receive a letter of authorization from the Contracting Officer citing the name of the furniture dealer(s) and other information to use when accessing the Federal Government supply sources.

2.1.4 Deposits

The Contractor should anticipate providing a deposit of between 30 percent and 50 percent of the FF&E costs when placing the orders with the manufacturer's dealerships.

The Contractor must also anticipate possible manufacturer price increases. Recommend ordering FF&E product once Funds are received to avoid incurring additional cost. Delayed production and delivery dates can be noted at the time of order placement to coincide with building completion dates. Any cost incurred due to manufacturer price increases will be the burden of the Contractor.

2.1.5 Davis Bacon Wages

Davis Bacon wages do not apply to the FF&E installer from the Government supply sources. The workforce for the FF&E installation and delivery must be separate and distinct from the labor workforce performing under the construction contract.

2.1.6 Taxes

2.1.6.1 Exemptions

Exemptions for certain State or local taxes may be available to the Construction Contractor and/or its subcontractors. The Construction Contractor must take maximum advantage of all exemptions, including obtaining a resale permit from State and Local taxation authorities whether available directly to the Construction Contractor or based on an exemption afforded the Government. The responsibility for paying applicable taxes rests with the Construction Contractor. Applicable state and local taxes to the FF&E package must be included with the subcontractor's quote, if required by the state or locality.

2.1.6.2 Construction Contract Requirements

As prescribed in FAR 29.401-3, the Contracting Officer must insert FAR clause 52.229-3, Federal, State and Local Taxes, in the construction contract. In accordance with this clause:

1. The contract price includes all applicable Federal, State, and local taxes and duties; and

2. The Government must, without liability, furnish evidence appropriate to establish exemption from any Federal, State, or local tax when the Construction Contractor requests such evidence and a reasonable basis exists to sustain the exemption.

2.1.7 Performance and Payment Bonds

1. No Bond Requirement for FF&E at Time of Construction Contract Award FAR 28.102-1(a) requires that performance and payment bonds be included in all construction contracts exceeding the SAT, except under the conditions listed. Since the FF&E Planned Modification CLIN is not part of the original contract award, the Construction Contractor must not be required to secure bond for the FF&E at the time the basic contract is awarded.

2. Additional Bond at FF&E Planned Modification CLIN Award FAR 28.102-2(d) requires the Government to secure additional bond from the Construction Contractor for any contract price increases. An increase to the original contract bond is required at the time of the FF&E Planned Modification CLIN award to protect the Government against the Construction Contractor not providing FF&E ordered and to ensure that the FF&E vendor(s) receive payment if the Construction Contractor goes out of business. The increased cost of the Government required bond must come from the FF&E funding source and is not a part of the Construction Contractor's HAR.

3. Bonds Required by the Construction Contractor If the Construction Contractor requires bonding from the FF&E subcontractor(s), the cost must be covered in the Construction Contractor's HAR.

2.1.8 Unique Item Identification (IUID) and Valuation

Item Unique Identification (IUID) and valuation is a system of marking and valuing items delivered to DoD that enhances logistics, contracting, and financial business transactions. The IUID policy is mandatory for all DoD

contracts that require the delivery of items. An item is a single article or a single unit formed by a grouping of subassemblies, components or constituent parts. In accordance with DFARS 211.274-2, IUID is required for all delivered items for which the Government's unit acquisition cost is $5,000 or more. Items identified by the requiring activity to be serially managed, mission essential, controlled inventory or for other reasons requiring permanent identification, must be marked with a unique item identifier.

2.1.8.1 IUID

The two main steps involved in IUID requirements are:

1. Item marking and

2. Delivery of data about items as a part of the acceptance and delivery process.

2.1.8.2 Data Matrix Requirements

Item marking requires that qualifying items contain a data matrix either directly inscribed on the individual item or on a permanent label or data plate attached to the item. Delivery of data is executed by submitting to the IUID Registry information such as: description of the item, its value, and the date of acceptance by the government. The IUID Registry is the repository established to capture and store all IUID data.

2.1.8.3 Government's Unit Acquisition Cost

In accordance with DFARS 211.274-3, Construction Contractors must be required to identify the Government's unit acquisition cost for all items delivered even if none of the criteria for placing a unique item identification mark applies.

PART 3 EXECUTION

3.1 INSTALLATION

The FF&E package includes the installation of all furniture and furnishings as specified in the FF&E package. The FF&E installation dealer(s) specified in the FF&E package must receive, store as required, transport to the project site, off load, inside deliver, unpack, assemble, place/install, clean, and dispose of all the trash for all furniture and furnishings. It is the Contractor's responsibility to coordinate the building completion, occupancy, and furniture installation dates with the installation dealer(s) specified in the FF&E package. Any costs associated with or delaying furniture shipments is the responsibility of the Contractor.

The Contractor must provide and coordinate all Building Systems (HVAC, Plumbing, Fire Protection, Communications, Electrical, Data, Architectural, etc. with the furniture plans and furniture installation. All outlets, switches, thermostats, etc. must be fully accessible. All sprinkler heads, fire extinguishers, ADA, etc., clearances must be accommodated.

3.2 INSTALLATION WARRANTY

All movable furnishings must be installed in accordance with the

manufacturer's instructions and warranty requirements. All movable furnishings must be level and aligned. All doors, drawers and accessories must be level and aligned to open, close and otherwise operate smoothly and securely.

All furniture must be installed by the furniture manufacturer's dealer of record and not the Contractor. The Government reserves the right to approve/disapprove the Contractor's FF&E installers. In addition, installation dealer(s) must be located within a 100 mile radius of the project site unless approved by the Government Interior Designer. The Contractor must repair, to the Government's satisfaction, any/all damage to any facility finish that is a result of the furniture installation and correct all punch list items for the furniture/furnishings. The Contractor must obtain services of equipment specialists to install the electrical equipment, to include but not limited to televisions, Video Teleconference Equipment, ceiling mounted projectors, and mission essential electronic equipment included in the FF&E package.

3.3 ORDERING DOCUMENTATION

After award of the FF&E and A/V packages, of all ordering documentation, including but not limited to, quotes, purchase orders, factory order numbers (FO), and warranty information for all products, must be provided to the Contracting Officer at the final FF&E walk-thru.

3.4 POST AWARD CHANGES

3.4.1 Requests for Price Changes

After award of the FF&E Planned Modification, any requests to change the FF&E items in that modification must be submitted in writing for approval by the Contracting Officer before purchase/installation. The FF&E Planned Modification has been priced, negotiated, and awarded based on specific line items as detailed in the approved Final FF&E Submittal. These items have been agreed to considering color, specific type and quality of material, price, usable life, etc. The Government will expect and require the Construction Contractor to provide exactly those items

3.4.2 Requests for Item Changes

Should changes become necessary, careful consideration is required to ensure that equivalent quality, price and other aspects of the item is maintained, otherwise price adjustments must be negotiated. BVD documentation is required for each item to be substituted if the extended cost for the item exceeds the MPT. If multiple items from the same SIN must be substituted, all can be included in the same BVD. Unexpired vendor quotes from the original FF&E Request for Pricing may be used in the new BVD, provided that they are the same SIN and all quotes are from the same procurement category, i.e. BPA, GSA or Open Market. The Contracting Officer must obtain approval from the NAVFAC Interior Designer/Collateral Equipment Manager, in consultation with the client, for any changes to the FF&E.

3.4.3 Validation of Pricing

The Construction Contractor must validate pricing prior to contract modification. Cost increases due to authorized BPA/GSA schedule price increases must be allowed prior to the contract modification to purchase the FF&E. Reimbursement for cost increases after contract modification

will not be considered.

3.4.4 Progress Payments

Per FAR 52.232-5, Payments under Fixed-Price Construction Contracts, the Contracting Officer may authorize a progress payment on the FF&E ordered as material delivered to the Contractor, at locations other than the site if:

1. Consideration is specifically authorized by this contract; and

2. The Construction Contractor furnishes satisfactory evidence, including a copy of the order acknowledgment and proof of payment, that it has acquired title to such material, the material is stored in a secure, climate controlled location, and that the material will be used to perform this contract.

3.5 PUNCH LIST

The Contractor, his Interior Designer (and A/V consultant or other specialty consultants, if applicable) must attend at least two punch list site visits with the installation dealer(s), NAVFAC Interior Designer and the Base Representative/Activity Contact. The first site visit must identify all punch list items (at installation dealer's 98 percent completion) and the second (at 100 percent completion) will confirm that all punch list items have been resolved.

3.6 INTERIOR PHOTOGRAPHY SUBMITTAL

Upon completion of the FF&E installation, the Contractor must provide professional Interior Photography of the completed interior. The photographer must be in the business of specializing in architectural and interior photography. The submittal must be a minimum of 6 photos. "Before" and "After" photos are required for all renovation projects. Permission for publishing and using the photos by NAVFAC is required. Images to be submitted on a CD as a JPEG or PDF with a resolution of no less than 300 dpi as well as 8" x 10" matte photographs. The photographs must be taken prior to occupancy and staged with accessories as needed. Additional lighting may be needed to ensure quality images.

3.7 BEST VALUE DETERMINATION

A best value determination has been performed on the final FF&E package. A best value determination is required by FAR 8.404 when placing orders against Federal Supply Schedules for the selection of furniture and furnishings. Best Value is defined in FAR 2.101 as ensuring that the order to be placed under a Federal Supply Schedule results in the lowest overall cost alternative (considering price, special features, administrative costs and client's needs) to meet the government's needs.

SECTION 01 31 19.05 20

POST AWARD MEETINGS
09/15

PART 1 GENERAL

1.1 SUMMARY

This document includes post-award requirements for project kickoff and subsequent design and preconstruction meetings.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Design Submittal Packaging Proposal; G

Design Baseline NAS; G

Construction Baseline NAS; G

Performance Assessment Plan (PAP); G

Design Presentation Concept Site and Floor Plans; G

CDW Facilitator Experience Resume; G

CDW Preliminary Concept Design; G

CDW Cost Estimate; G

Concept Design Workshop Report; G

1.3 POST AWARD KICKOFF MEETING

The Post Award Kickoff (PAK) meeting is made up of Contract Administration, Design Presentation, Partnering, and Scheduling. If mutually beneficial to the Contractor and the Government, these four elements may be addressed in a single multi day meeting, but most often multiple scheduled meetings are required. Schedule a separate meetings to accomplish the Concept Design Workshops(CDW).

1.3.1 PAK Meeting Schedule and Location

Within 30 calendar days after contract award, and prior to commencing work, meet with the Contracting Officer for the PAK meeting(s). The meeting will be located at a specific time and place to be determined by the Contracting Officer.

1.3.2 PAK Meeting Outcomes

The meeting(s) outcomes are:

a. Integrate the Contractor and all client representatives into the project team.

b. Achieve consensus from the project team on any issues and concerns with the Contractor's technical proposal and the User's functional requirements. Confirm the design is within the project budget.

c. Establish and explain policies and procedures for completion of a successful project.

d. Establish clear lines of communication and points of contact for Government and Contractor team members.

e. Establish project design schedule, design submittal packaging, and preliminary construction schedule in accordance with Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULE (NAS). Discuss design milestones and events that will be included in the Quality Control Communication Plan.

f. Establish clear expectations and schedules for facility turnover, providing DD Form 1354 asset management records, eOMSI submittals, Guiding Principle Validation, Third Party Certification (if applicable), and training of Government maintenance personnel.

g. Establish procedure for design packages reviews, Contractor's resolution to comments, and Government's role in review of packages.

h. Establish clear expectations for the Concept Design Workshop.

i. Establish clear expectations for Design Model presentations for projects implementing Building Information Management/Modeling (BIM).

1.3.3 PAK Meeting Contractor Attendees

The following Contractor key personnel must attend the PAK: Principal, Project Manager, Project Scheduler, Design principals, Lead Designer-of-Record (DOR), Design Staff responsible for each architectural/engineering discipline when facility design is discussed Superintendent, QC Manager,and the DQC Manager. Optional attendees include: Assistant Project Manager, major subcontractors and specialized supplemental QC personnel.

1.3.4 Contract Administration

Contract administration roles and responsibilities will be addressed.

1.3.5 Concept Design Workshop (CDW)

Provide a CONCEPT DESIGN WORKSHOP that meets the following requirements;

1.3.5.1 CDW General Requirements

a. Methodology. Conduct a CDW for this project. This effort will examine project functions and requirements, quality and life safety costs, analyze alternate design concepts, expose and resolve project issues,

and develop the final conceptual design.

b. Facilitator. Provide a Facilitator who is experienced in conducting Concept Design Workshops. Submit a CDW Facilitator Experience Resume to the Contracting Officer describing his experience. He or she will be responsible for leading the team in a timely manner, making sure that issues are pursued and resolved to the maximum extent possible, documenting meetings, organizing the design concept documents for on-site approval, and providing the Concept Design Workshop Report.

c. Contractor's Design Team. The primary functions of the Design Team will be to investigate, develop and present alternate design solutions. The entire Design Team must participate in all phases of the Concept Design Workshop effort and provide assistance to the Facilitator in development of the Concept Design Workshop Report, including most of the required documentation.

d. Concept Design Workshop Report. Produced almost entirely on-site, the Concept Design Workshop Report must summarize the final conceptual design.

e. Award Amount. At each contract stage, the Contractor must verify that the concept is within the contract award amount.

f. Schedule. The involvement of USMC installation personnel in design development is key to the success of this contract. The Hurricane Florence MILCON Program will require large amount of time and coordination from installation personnel. The Contractor shall coordinate directly with the Contracting Officer's Representative to ensure CDWs are scheduled to accommodate and maximize Government involvement. The Government intends to hold the first CDW as soon as possible after contract award and the PAK meeting. The Government reserves the right to shift the start of the first CDW up to 90 days after award in an effort to ensure stakeholder availability. Additional CDWs must follow a minimum of 30 calendar days after the previous CDW. A minimum of 2 CDWs shall be conducted, but based on number of projects, additional CDWs shall be considered in order to support involvement from Government stakeholders from all disciplines.

1.3.5.2 CDW Procedures

a. Preliminary Work.

The Contractor's Design Team must complete the following prior to the on-site workshop:

(1) Review the contract documents and references explaining the project scope and history.

(2) Prepare and submit, at least 14 days in advance of the CDW, 6 hard copies and 2 electronic copies of a CDW Preliminary Concept Design (Concept #1), a Basis of Design, and a statement that the concept provided is within the award amount.

(3) Make arrangements for and provide an appropriate conference room convenient to the project site and Users for use by the Design Team and government participants during the workshop.

(4) Incorporate government comments in a revised Concept #1 and

produce at least 30 copies of the revised Concept #1 documents for distribution at the workshop.

(5) Facilitator conducts meeting with NAVFAC representatives before the CDW to review preparations, relationships, and the status of work to be accomplished.

b. On-Site Workshop.

The Design Team must accomplish the following items during the on-site phase of the CDW. (Typically conducted in four to six working days, minimizing breaks so as to maintain momentum. The Design Team should expect longer than normal workdays.)

(1) On the first day of the workshop, meet with the using activity, Station and other Government representatives. The Facilitator will describe the CDW process and review the workshop agenda. The user(s) will provide a functional presentation. This is to reiterate to all participants the User(s) needs and desires. The intent is to make the design solution and issue resolution function-oriented.

(2) Present the revised Concept #1 and respond to questions.

(3) Participate in a comment/creative session to generate ideas to improve this project in the areas of function, quality and total life cycle cost, issue resolution and sustainable design within the award amount. It is often helpful to request User comments in writing so they may be considered, responded to, and presented at subsequent presentations.

(4) Create a new concept design. Design concepts must include drawings, sketches, and other graphics as necessary to fully describe the concept. Prepare at least 20 copies for distribution at all presentations.

(5) Repeat applicable steps as necessary. Usually, three concepts are required. The final concept must be within the contract award amount.

(6) The final concept must include the following:

(a) Site Plan: Show the layout of the proposed facility in relation to major landmarks. Show all buildings, access roads, parking, pedestrian walkways, roads, sidewalks, landscaping, and major utilities. Indicate major dimensions and orientation. Provide a building code analysis, relating the proposed building site, size, and construction type to maximum allowable limits of the International Building Code.

(b) Building Floor Plans: Provide floor plans depicting functional utilization of spaces and furniture and equipment layout. Show room sizes or dimensions. Provide a Life Safety Code analysis with the floor plan to identify required life safety and egress features.

(c) Perspective Sketches: Provide at least one sketch to show a perspective of major buildings. The sketch should not be elaborate but must show the proposed form and massing, colors to

be used, and an indication of materials used.

(d) Mechanical Plans: Provide plans as necessary to show the essential work and intent of the design. Suggestions include equipment layouts, zones, etc.

(e) Electrical Plans: Provide plans as necessary to show the essential work and intent of the design. Suggestions include special light fixture types, locations, switching, power outlets and panelboard location. Provide electrical distribution single line diagram.

(f) Cost Estimate: Provide a CDW Cost Estimate and statement that the concept presented can be constructed within the award amount.

(g) Basis of Design: Describe the intent of the design by discipline. Address material quality, energy efficiency and life cycle costs.

(h) Sustainable Design: Demonstrate ability to achieve identified Guiding Principle sustainability goals and also Third Party Certification sustainability goals, if applicable. Provide Preliminary Sustainable Notebook, refer to Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD for requirements.

(i) System Safety Engineering

(7) Prepare 20 copies of the final concept (drawings, basis of design and statement that the concept is within the award amount) for distribution at the final presentation.

(8) Dependent upon the project, the Concept Design Workshop Report is provided by the Facilitator, includes all items included in the final concept design and the following:

(a) Endorsements: Include a copy of the signature/endorsement sheet.

(b) Comments: Include comments and resolutions concerning the final concept design.

(c) Executive Summary: Summarize the workshop, including how the various concepts differed and were improved during the workshop.

(d) Special Design Features: Identify and describe unique project needs and features, e.g., pile foundations, physical security, intrusion detection systems, access control, construction in humid climates, pollution abatement, tempest, HEMP, etc.

(e) Architectural Compatibility Statement: Identify architectural style, materials, and color scheme; and indicate their compatibility with installation planning and design concepts established in the Base Exterior Architectural Plan.

(f) Environmental Summary: Provide a summary of environmental issues, listing completed actions and items requiring further coordination, waivers or permits.

(g) Supporting Project Documentation: Include data to support the

development of the concept design, layout, and special features. Items should include: project scope discussion, minutes of meetings, function analysis work sheets, and economic and technical analyses if alternatives evaluated.

(9) Except for final comments, responses and endorsements, the final report should be completed (electronically) on site, before the final presentation. Present up to 10 hard copies of the report at the conclusion of the workshop.

(10) Conduct a "front-to-back" comprehensive presentation of the final concept. Obtain user signatures on a conceptual design endorsement sheet, signifying approval of the concept design, subject to the final comments and their resolutions agreed to at the final presentation meeting.

1.3.5.3 Concept Design Workshop Report

Within 14 calendar days of completion of the on-site Concept Design Workshop, the Design Team must submit to the NAVFAC Project Manager an electronic copy of the Concept Design Workshop Report as one file in .PDF format.

1.3.5.4 CDW Meeting Attendees

The following Contractor key personnel must attend the CDW: Project Manager, Project Scheduler, Cost Estimator, Lead Designer of Record, Design Staff representing each architectural/engineering discipline and Major Subcontractors when facility design is discussed.

1.3.6 Partnering

To most effectively accomplish this contract, the Government requires the formation of a cohesive partnership within the Project Team whose members are from the Government, Contractor and its Subcontractors. Key Personnel from the Supported Command, End User (who will occupy the facility), NAVFAC (Echelon III and/or IV), Navy Region/Installation, Contractor and Subcontractors and the Designer of Record will be invited to participate in the Partnering process. The Partnership will draw on the strength of each organization in an effort to achieve a project without any safety mishaps, conforming to the Contract, within budget and on schedule.

Information on the Partnering Process and a list of Key and Optional personnel who should attend the Partnering meeting are available from the Contracting Officer.

1.3.6.1 Formal Partnering

a. The Contractor must host the Partnering sessions with Key personnel of the Project Team, including Contractor's personnel and Government personnel. The Contractor pays all costs associated with the Partnering effort including the Facilitator, meeting room and other incidental items.

b. Before a Partnering session, the contractor must coordinate with the Facilitator all requirements for incidental items (audio-visual equipment, easels, flipchart paper, colored markers, note paper, pens/pencils, colored flash cards, etc.) and have these items available at the Partnering session. The contractor must copy

documents for distribution to all attendees. The participants must bear their own costs for meals, lodging and transportation associated with Partnering.

c. The Facilitator must be experienced in conducting Partnering Workshops and acceptable to both the Government and Contractor. The Facilitator is responsible for leading the team in a timely manner and making sure that issues are identified and resolved. A list of Partnering Facilitators is available from the Contracting Officer.

d. The Initial Partnering Session must be a duration of one day minimum. It must be located at a place off the construction site as agreed to by the Contracting Officer and the Contractor. It may take place concurrently with the Pre Construction Meeting.

e. The Follow-on Partnering Session(s) generally lasts a half day or less. They must be scheduled at three to six month intervals or when needed. Participants are encouraged to utilize electronic means to expedite meetings. Meetings may be held at a location off Base, at the project site, or in a Government Facility on Base. Follow-on meetings may be held concurrently with other scheduled meetings. Attendees need only be those required to resolve current issues. The same Facilitator used in the Initial Partnering session is recommended to achieve best results and for continuity.

1.3.6.2 Executive Partnering

a. The Contractor must attend a Partnering session with Key personnel of the Project Team, including Contractor's Principle, Design Principle, Government personnel, Navy leadership and Marine Corps leadership.

b. This meeting will include team members for all Hurricane Florence MILCON Contractors. The participants must bear their own costs for meals, lodging and transportation associated with Partnering.

c. The Government will provide a location in the vicinity of Camp Lejeune, NC, and a facilitator.

d. The Executive Partnering Session shall be a one day duration and occur within 120 days of award.

1.3.7 Performance Assessment Plan (PAP)

The Performance Assessment Plan (PAP) will be used to document design innovation and budget management, provide performance feedback to the Contractor, and as a basis for interim and final evaluations in the Construction Contractor Appraisal Support System (CPARS) on-line database.

It is the intent of the Government to establish the PAP based on tangible, measurable indicators of outstanding contractor performance, and on commitments made in the Contractor's proposal. The initial PAP may be found on the NAVFAC Design-Build Request for Proposal Website in RFP PART 6 Attachments. Review and finalize the initial PAP during the Partnering Session. During the initial Partnering Session, the Government, the Contractor, the Designer-of-Record, and the Client will establish the PAP. Following the establishment of the PAP, the Contractor will present it, with his input, for update and discussion at projects meetings which

discuss project performance. Submit an updated PAP on a monthly basis with the invoice for that period as a minimum.

1.3.8 Design Baseline NAS and Construction Baseline NAS

Provide in accordance with Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS).

1.4 DESIGN QUALITY ASSURANCE MEETINGS

After Government Quality Assurance (QA) of each Design Submittal has been completed, meet with the Government for a one-day conference to discuss review comments for the specific design submittal.

Provide consolidated copies of all Government comments with annotations of Contractor's action beside them. Notify the Contracting Officer in writing within five (5) days after receipt of Government's comments if the Contractor disagrees with comments technically or interprets comments to exceed the requirements of the contract.

1.4.1 Design QA Meeting Attendees

The following Contractor key personnel must attend the design QA meetings: Project Manager, QC Manager, and Contractor's Design Staff (architect and engineering disciplines related to topics to be discussed).

1.4.2 Design QA Meeting Location

Meetings shall be located at the office of the Contracting Officer's QA Team or may be conducted at other locations or by other electronic means if mutually acceptable to all parties.

1.4.3 Minimum Design QA Meeting Agenda

Address all Government comments that are unresolved and present clarification or supporting information requested by the Contracting Officer's QA team during the previous meeting.

1.5 PRECONSTRUCTION MEETING

Meet with the Contracting Officer at each construction site to discuss construction items of concern to the Government and the Contractor such as outages, storage, trailer location, disposal of construction debris, and safety, at a location to be determined by the Contracting Officer. Conduct the Preconstruction meeting prior to mobilization and commencement of any construction work at the site and at a date mutually agreed upon with the Contracting Officer.

Discuss Cybersecurity of building control system requirements and submittals to facilitate the Designer of Record (DOR) selections and edits to Section25 50 00.00 20 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS.

1.6 RECURRING MEETINGS

1.6.1 Quality Control and Production Meetings

Quality Control and Production Meetings in accordance with Section 01 45 00.05 20 DESIGN AND CONSTRUCTION QUALITY CONTROL.

1.6.2 Safety Meetings

Safety Meetings in accordance with Section 01 35 26.05 20 GOVERNMENT SAFETY REQUIREMENTS FOR DESIGN-BUILD.

1.6.3 eOMSI Meetings

Refer to Section 01 78 24.00 20 FACILITY ELECTRONIC OPERATIONS AND MAINTENANCE INFORMATION (eOMSI) for requirements.

1.6.4 Sustainability Documentation Progress Meetings

Most sustainability documentation progress meetings may be combined with other design, construction, and project closeout meetings; however additional meetings are required post-design and post-construction. Refer to Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD for meeting requirements.

1.7 FACILITY TURNOVER PLANNING MEETINGS (NAVFAC RED ZONE - NRZ)

Meet with the Government to identify strategies to ensure that eachproject is carried to expeditious closure and turnover to the Client. Start the turnover process at the PAK meeting with a discussion of the NAVFAC Red Zone (NRZ) process and convene at regularly scheduled NRZ Meetings. Include the following in the facility Turnover effort:

1.7.1 NRZ Checklist

a. Contracting Officer's Technical Representative (COTR) will provide the Contractor a copy of the NRZ Checklist template prior to 75 percent completion.

b. Prior to 75 percent completion add/delete critical activities to the NRZ Checklist template as necessary to match the project scope, and schedule critical activities and insert planned completion dates in the NRZ checklist for each critical activity. Present the NRZ Checklist to COTR and review during a regularly scheduled QC Meeting.

1.7.2 Meetings

a. Upon Government acceptance of the NRZ Checklist, the Project Superintendent is required to lead regular NRZ Meetings beginning at approximately 75 percent project completion, or three to six months prior to Beneficial Occupancy Date (BOD), whichever comes first.

b. The Contracting Officer will determine the frequency of the meetings, which is expected to increase as the project completion draws nearer.

c. Using the NRZ Checklist as a Plan of Action and Milestones (POAM) and basis for discussion, review upcoming critical activities and strategies to ensure work is completed on time.

d. Coordinate with the COTR any upcoming activities that require Government involvement.

e. Maintain the NRZ Checklist by documenting the actual completion dates as work is completed and update the NRZ Checklist with revised planned completion dates as necessary to match progress. Distribute copies of

the current NRZ Checklist to attendees at each NRZ Meeting.

f. Assign responsibility and schedule for the provision of all information necessary to complete the Final eOMSI Data and Documents Submittals for facility turnover.

g. Assign responsibility and schedule for the provision of all documentation necessary to achieve Guiding Principle Validation and also Third Party Certification, if applicable.

h. Schedule and coordinate the facility training of Government maintenance personnel in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

1.7.3 Facility Turnover NRZ Meeting Attendees

The following key personnel must attend the Facility Turnover Meetings as needed to accomplish meeting requirements: Contractor QC Manager, Design Quality Control Manager, Superintendent, Major Subcontractors, Designer-of-Record, Contracting Officer's Representative, Project Sponsor, Representative(s) of NAVFAC, the Facility Owner/ Real Property Accounting Officer, Public Works Facility Maintenance Specialist, and the Client.

SECTION 01 31 23.13 20

ELECTRONIC CONSTRUCTION AND FACILITY SUPPORT CONTRACT MANAGEMENT SYSTEM
05/17

PART 1 GENERAL

1.1 CONTRACT ADMINISTRATION

Utilize the Naval Facilities Engineering Command's (NAVFAC's) Electronic Construction and Facility Support Contract Management System (eCMS) for the transfer, sharing and management of electronic technical submittals and documents. The web-based eCMS is the designated means of transferring technical documents between the Contractor and the Government. Paper media or e-mail submission, including originals or copies, of the documents identified in Table 1 are not permitted, except where eCMS is unavailable, non-functional or specifically requested in addition to electronic submission. Contact the Contracting Officer's Representative (COR) regarding availability of eCMS training and reference materials.

1.2 USER PRIVILEGES

The Contractor will be provided access to eCMS. All technical submittals and documents must be transmitted to the Government via the COR. Project roles and system roles will be established to control each user's menu, application, and software privileges, including the ability to create, edit, or delete objects.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

List of Contractor's Personnel;

1.4 SYSTEM REQUIREMENTS AND CONNECTIVITY

1.4.1 General

The eCMS requires a web-browser (platform-neutral) and Internet connection. Obtain from an approved vendor an External Certification Authority (ECA), Primary Key Infrastructure (PKI) certificate, or other similar digital identification to support two-factor authentication and access to eCMS. Provide and maintain computer hardware and software for the eCMS access throughout the duration of the contract for all Contractor-designated users. Provide connectivity, speed, bandwidth, and access to the Internet to ensure adequate functionality. Neither upgrading of the Contractor's computer system nor delays associated from the usage of the eCMS will be justification or grounds for a time extension or cost adjustment to the Contract.

1.4.2 Contractor Personnel List

Within 20 calendar days of contract award, provide to the Contracting Officer a list of Contractor's personnel who will have the responsibility for the transfer, sharing and management of electronic design, technical submittals and documents and will require access to the eCMS. Project personnel roles to be filled in the eCMS include the Contractor's Project Manager, Designer of Record, Superintendent, Quality Control (QC) Manager, and Site Safety and Health Officer (SSHO). Personnel must be capable of electronic document management. Notify the COR immediately of any personnel changes to the project. The Contracting Officer reserves the right to perform a security check on all potential users. Provide the following information:

First Name
Last Name
E-mail Address
Office Address
Project Role (e.g. Project Manager, QC Manager, Superintendent)

1.4.3 Field Administration

Within 30 days of Contract Award, provide a tablet computer with a Common Access Card (CAC) reader at each project job site for Government use only. The tablet computer must have a web-browser, built-in camera, and cellular data connectivity. Provide tablet computer with a rugged case suitable for use in a construction environment. The tablet computer must be fully charged and made available at all times for Government use to facilitate the input of construction data at the job site. After completion of the work, reset the tablet computer to factory default settings. The tablet computer remains the property of the Contractor and must be removed from the site. There are restrictions on use of WIFI on military bases. Cellular data connectivity and availability, and use of WIFI requires coordination with and approval by the Contracting Officer.

1.5 SECURITY CLASSIFICATION

In accordance with Department of Navy guidance, all military construction contract data are unclassified, unless specified otherwise by a properly designated Original Classification Authority (OCA) and in accordance with an established Security Classification Guide (SCG). Refer to the project's OCA when questions arise about the proper classification of information.

The eCMS and tablet computer must only be used for the transaction of unclassified information associated with construction projects. In conformance with the Freedom of Information Act (FOIA), Department of Defense Manual 5200.01-V4: DoD Information Security Program: Controlled Unclassified Information (CUI), and DoD requirements, any unclassified project documentation uploaded into the eCMS must be designated either "U - UNCLASSIFIED" (U) or "FOUO - UNCLASSIFIED-FOR OFFICIAL USE ONLY" (FOUO).

1.6 ECMS UTILIZATION

Establish, maintain, and update data and documentation in the eCMS throughout the duration of the contract.

Personally Identifiable Information (PII) transmittal is not permitted in the eCMS.

1.6.1 Information Security Classification/Identification

The eCMS must be used for the transmittal of the following documents. This requirement supersedes conflicting requirements in other sections, however, submittal review times in Section 01 33 00 SUBMITTAL PROCEDURES remain applicable. Table 1 - Project Documentation Types provides the appropriate U and FOUO designations for various types of project documents. Construction documents requiring FOUO status must be marked accordingly. Apply the appropriate markings before any document is uploaded into eCMS. Markings are not required on U documents.

Table 1 also identifies which eCMS application is to be used in the transmittal of data (these are subject to change based on the latest software configuration). If a designated application is not functional within 4 hours of initial attempt, defer to the Submittal application and submit the required data as an uploaded portable document (e.g. PDF), word processor, spreadsheet, drawing, or other appropriate format. Hard copy or e-mail submission of these items is acceptable only if eCMS is documented to be not available or not functional. After uploading documents to the Submittal application, transmit the submittals and attachments to the COR via the Transmittal application. For Submittals, select the following:

Preparation by = Contractor personnel assigned to prepare the submittal
Approval by = Contracting Officer Representative (COR)
Returned by = Design Lead/Manager
Forwarded to = Contractor project manager

Table 1 - Project Documentation Types

SUBJECT/NAME	CLASS	REMARKS	ECMS APPLICATION
As-Built Drawings	U	Locations of sensitive areas must be labeled as either "Controlled Area" or "Restricted Area" and may be shown on unclassified documents with the approval from Site Security Manager	Submittals and Transmittals
Building Information Modeling (BIM)	U	1. Locations of sensitive areas must be labeled as either "Controlled Area" or "Restricted Area" and may be shown on unclassified documents with the approval from Site Security Manager 2. Design reviews will be performed in existing "Dr Checks"	Submittals and Transmittals
Construction Permits	U	Refer to rules of the issuing activity, state or jurisdiction	Submittals and Transmittals

SUBJECT/NAME	CLASS	REMARKS	ECMS APPLICATION
Construction Schedules (Activities and Milestones)	U	After the schedule submittal is approved by the COR, import the schedule file into the scheduling application, and select "Approve" to establish a new schedule baseline	Submittals, Transmittals and Scheduling App
Construction Schedules (Cost-Loaded)	FOUO	After the schedule submittal is approved by the COR, import the schedule file into the scheduling application, and select "Approve" to establish a new schedule baseline	Submittals, Transmittals and Scheduling App
Construction Schedules (3-Week Lookahead)	U	Import the schedule file into the scheduling application, and select "Approve" to establish a new schedule baseline	Scheduling App
DD 1354 Transfer of Real Property	U		Submittals and Transmittals
Daily Production Reports	FOUO	Provide weather conditions, crew size, man-hours, equipment, and materials information	Daily Report
Daily Quality Control (QC) Reports	FOUO	Provide QC Phase, Definable Features of Work Identify visitors	Daily Report
Designs and Specifications	U	1. Locations of sensitive areas must be labeled as either "Controlled Area" or "Restricted Area" and may be shown on unclassified documents with the approval from Site Security Manager 2. Design reviews will be performed in existing "Dr Checks"	Submittals and Transmittals

SUBJECT/NAME	CLASS	REMARKS	ECMS APPLICATION
Quality Assurance Reports	FOUO		Checklists (Government initiated)
Non-Compliance Notices	FOUO		Non-Compliance Notices (Government initiated)
Other Government-prepared documents	FOUO		GOV ONLY
All Othere Documents	FOUO	Refer to FOIA guidelines and contact the FOIA official to determine whether exemptions exist	As applicable

1.6.2 Markings on FOUO documents

a. Only FOUO documents being electronically uploaded into the eCMS (.docx, .xlsx, .pptx, .pdf, .jpg, .zip, and others as appropriate), and associated paper documents described in the paragraph CONTRACT ADMINISTRATION require FOUO markings as indicated in the subparagraphs below.

b. FOUO documents that are originally created within the eCMS application using the web-based forms (RFIs, Daily Reports, and others as appropriate) will be automatically watermarked by the eCMS software, and these do not require additional markings.

c. FOUO documents must be marked "UNCLASSIFIED//FOR OFFICIAL USE ONLY" at the bottom of the outside of the front cover (if there is one), the title page, the first page, and the outside of the back cover (if there is one).

d. FOUO documents must be marked on the internal pages of the document as "UNCLASSIFIED//FOR OFFICIAL USE ONLY"' at top and bottom.

e. Where Installations require digital photographs to be designated FOUO, place the markings on the face of the photograph.

f. For visual documentation, other than photographs and audio documentation, mark with either visual or audio statements as appropriate at both the beginning and end of the file.

1.7 QUALITY ASSURANCE

Requested Government response dates on Transmittals and Submittals must be in accordance with the terms and conditions of the Contract. Requesting response dates earlier than the required review and response time, without concurrence by the Government COR, may be cause for rejection.

Incomplete submittals will be rejected without further review and must be resubmitted. Required Government response dates for resubmittals must reflect the date of resubmittal, not the original submittal date.

-- End of Section --

SECTION 01 32 17.00 20

COST-LOADED NETWORK ANALYSIS SCHEDULES (NAS)
05/18

PART 1 GENERAL

1.1 DEFINITIONS

The cost-loaded Network Analysis Schedule (NAS) is a tool to manage the project, both for Contractor and Government activities. The NAS is also used to report progress, evaluate time extensions, and provide the basis for progress payments.

For consistency, when scheduling software terminology is used in this section, the terms in Primavera's scheduling programs are used.

1.2 SCHEDULE REQUIREMENTS PRIOR TO THE START OF WORK

1.2.1 Preliminary Scheduling Meeting

Before preparation of the Project Baseline Schedule, and prior to the start of work, meet with the Contracting Officer to discuss the proposed schedule and the requirements of this section.

1.2.2 Project Baseline Schedule

1.2.2.1 Baseline NAS

Submit and present the Baseline NAS at the Post-Award Kickoff (PAK) Meeting. The Baseline NAS must include detailed design activities, general (summarized) approach for the construction phase(s) of the project and required milestone activities. Separate schedules are required for each project site as well as an overall package schedule. If the project is being Fast-Tracked or allows Early Start of construction, the Baseline NAS must include all fast-tracked design construction phases, including the required or proposed critical path design submittals within each phase that will occur during the duration of the project. The most current updated design schedule must accompany each design submittal.

The acceptance of a Baseline NAS is a condition precedent to processing Contractor's pay request(s) for design activities/items of work. Government review comments on the Contractor's schedule(s) do not relieve the Contractor from compliance with requirements of the Contract Documents. Only bonds may be paid prior to acceptance of the Baseline NAS. The acceptance of a Baseline NAS is a condition precedent to:

a. The Contractor starting work on the demolition or construction stage(s) of the contract.

b. Processing Contractor's invoices(s) for construction activities/items of work.

c. Review of any schedule updates.

1.2.2.2 Construction Baseline NAS

Develop the Construction Baseline Schedule, as design progresses, with

detailed construction activities. If design must be completed and accepted prior to construction, submit the complete design and construction network analysis schedule and obtain acceptance prior to starting construction work. If the project is Fast-Tracked, each construction stage must be detailed and built upon the previous Fast-Tracked Baseline Schedule (including any interim updates) and accepted prior to starting that stage of the construction work. Payment for completed work is dependent on an accepted, detailed schedule for that portion of work.

Submittal of the Construction Baseline NAS, and subsequent schedule updates, is understood to be the Contractor's certification that the submitted schedule meets all of the requirements of the Contract Documents, represents the Contractor's plan on how the work must be accomplished, and accurately reflects the work that has been accomplished and how it was sequenced (as-built logic).

1.3 THREE-WEEK LOOK AHEAD SCHEDULE

1.3.1 Weekly CQC Coordination and Production Meeting

Deliver three hard copies and one electronic file of the 3-Week Look Ahead Schedule to the Contracting Officer no later than 8 a.m. each Monday, for review during the weekly CQC Coordination or Production Meeting.

1.3.2 Look Ahead Schedule Requirements

Prepare and issue a 3-Week Look Ahead schedule to provide a more detailed day-to-day plan of upcoming work identified on the Project Network Analysis Schedule. Requirements include:

a. Key the work plans mapped to NAS activity numbers and updated each week to show the planned work for the current and following two-week period.

b. Include upcoming outages, closures, field evaluation tests, preparatory meetings, and initial meetings.

c. Identify critical path activities on the Three-Week Look Ahead Schedule.

d. The detail work plans are to be bar chart type schedules, derived from but maintained separately from the Project NAS on an electronic spreadsheet program and printed on 8-1/2 by 11 inch sheets as directed by the Contracting Officer.

e. Activities must not exceed 5 working days in duration and have sufficient level of detail to assign crews, tools and equipment required to complete the work.

1.4 MONTHLY NETWORK ANALYSIS

1.4.1 Monthly Network Analysis Updates

Meet with Government representatives at monthly intervals to review and agree on the information presented in the updated project schedule. The submission of an acceptable, updated schedule to the Government is a condition precedent to the processing of the Contractor's invoice. Submit an acceptable, updated schedule to the Government regardless of whether a

Contractor's invoice is submitted for the given period. The Contractor and Government must consent to agree on unit quantities of work completed equating to a percentage of payment for each activity progressed during the update period. Monthly update schedules must incorporate as-built events as they occurred and provide ongoing status of anticipated finish dates. As-built events must correspond to contemporaneous records including but not limited to submittals, daily production reports and quality control reports.

Provide the following with each Schedule submittal:

a. Time-Scaled Logic Diagram.

b. Reports listed in paragraph REQUIRED TABULAR REPORTS.

c. Data disks containing the project schedule. Include the back-up native .xer program files.

1.4.2 As-Built Schedule

As a condition precedent to the release of retention and making final payment, submit an "As-Built Schedule," as the last schedule update showing all activities at 100 percent completion. This schedule must reflect the exact manner in which the project was actually constructed.

1.5 CORRESPONDENCE AND TEST REPORTS

Reference Schedule activity IDs that are being addressed in each correspondence (e.g., letters, Requests for Information (RFIs), e-mails, meeting minute items, Production and QC Daily Reports, material delivery tickets, photographs) and test report (e.g., concrete, soil compaction, weld, pressure).

1.6 ADDITIONAL SCHEDULING REQUIREMENTS

References to additional scheduling requirements, including systems to be inspected, tested and commissioned, that are located throughout the remainder of the Contract Documents, are subject to the requirements of this section.

1.7 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Designated Project Scheduler; G

Baseline NAS; G

Construction Baseline NAS; G

SD-07 Certificates

Monthly Network Analysis Updates; G

SD-11 Closeout Submittals

As-Built Schedule; G

1.8 SOFTWARE

Prepare and maintain project schedules using Primavera P6 software in a version compatible with Government's current version. Importing data into P6 using data conversion techniques or third party software is cause for rejection of the submitted schedule.

1.9 DESIGNATED PROJECT SCHEDULER

Submit to the Contracting Officer for approval an individual who will serve as the Designated Project Scheduler. Include a copy of the candidate's resume with qualifications. The Contracting Officer may remove the Designated Project Scheduler, and require replacement, if the scheduler does not effectively fulfill their duties in accordance with the contract requirements. Payment request will not be processed without an approved Designated Project Scheduler.

1.9.1 Qualifications

The Designated Project Scheduler must have prepared and maintained at least three previous construction schedules, of similar size and complexity to this contract, using Primavera P6.

1.9.2 Duties

Duties of the Designated Project Scheduler:

a. Prepare Baseline NAS.

b. Prepare monthly schedule updates.

c. Prepare tabular reports.

d. Prepare Time Impact Analysis (TIA) as necessary.

e. Provide certification that NAS and TIA submittals conform to the contract requirements.

f. Participate with the Prime Contractor and Government Representative in a monthly meeting at the job site in-person, and scheduled with sufficient time to support the Monthly Network Analysis Updates process, to discuss project status, schedule updates, critical activities, potential delays, and contract modifications impacting the schedule.

1.10 NETWORK SYSTEM FORMAT

The system must include time-scaled logic diagrams and specified reports.

Prepare the schedule in accordance with the following Primavera P6 settings and parameters. Deviation from these settings and parameters, without prior consent of the Contracting Officer, is cause for rejection of schedule submission.

1.10.1 Diagrams

Provide 11 by 17 inch hard-copy of Time-scaled Logic Diagram in color and landscape-oriented. Clearly show activities on the longest path. Include the following information for each activity and include accompanying Gantt chart:

a. Activity ID

b. Activity Name

c. Original Duration in Work Days

d. Remaining duration in Work Days

e. Physical Percent Complete

f. Start Date

g. Finish Date

h. Total Float

1.10.2 Schedule Activity Properties and Level of Detail

1.10.2.1 Design-Build Schedules

Logically incorporate design and construction for the entire project in a single schedule. Unless otherwise indicated, the Contractor may begin construction when design is signed, stamped and submitted to the Government via the Contractor's quality control organization. If Government approval is required for any portion of a final signed and sealed design package prior to construction, include that review time in the schedule.

1.10.2.2 Activity Identification and Organization

a. Identify design and construction activities planned for the project and other activities that could impact project completion if delayed in the NAS.

b. Identify administrative type activity/milestones, including all pre-construction submittal and permit requirements prior to demolition or construction stage.

c. Include times for procurement, Contractor quality control and construction, acceptance testing and training in the schedule.

d. Include the Government approval time required for the submittals that require Government Approval prior to construction, as indicated in Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES.

e. Create separate activities for each Phase, Area, Floor Level and Location the activity is occurring.

f. Do not use construction category activity to represent non-work type reference (e.g. Serial Letter, Request for Information) in NAS. Place Non-work reference within the P6 activity details notebook.

Activity categories included in the schedule are specified below.

1.10.2.3 Activity Logic

a. With the exception of the Contract Award and Contract Completion Date (CCD) milestone activities, activity must not be open-ended; each activity must have predecessor and successor ties.

b. Activities must not have open start or open finish (dangling) logic.

c. Do not use lead or lag logic without Contracting Officer prior approval.

d. Minimize redundant logic ties.

e. Once an activity exists on the schedule it must not be deleted or renamed to change the scope of the activity and must not be removed from the schedule logic without approval from the Contracting Officer.

(1) While an activity cannot be deleted, where said activity is no longer applicable to the schedule, but must remain within the logic stream for historical record, change the activity to a milestone and clearly label "NO LONGER REQUIRED" after the activity name. Redistribute accordingly any remaining budget associated with that activity.

(2) Document any such change in the milestone's "Notebook," including a date and explanation for the change.

(3) The ID number for a "NO LONGER REQUIRED" activity must not be re-used for another activity.

1.10.2.4 Critical and Near Critical Activity Baseline Limitation

For P6 settings, critical activities are defined as being on the Longest Path. "Near Critical" is defined as having total float, of up to 14 days more, than the greatest float value found on the Longest Path. Longest Path (Critical) and Near Critical Activities must not make up more than 20 percent of all activity within the Baseline Schedule.

1.10.2.5 Assigned Calendars

All NAS activity must be assigned calendars that reflect required and anticipated non-work days.

1.10.2.6 Activity Categories

1.10.2.6.1 Design Activities

Design activities must include design decision points and design submittal packages, including critical path submittals for Fast Tracked Phases. Review times for design development packages must be included in the schedule. Refer to Section 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES FOR DESIGN-BUILD, for specific requirements.

1.10.2.6.2 Pre-construction Activities

Examples of pre-construction activities include, but are not limited to,

bond approval, permits, pre-construction submittals and approvals. Include pre-construction activities that are required to be completed prior to the Contractor starting the demolition or construction stage of work.

1.10.2.6.3 Procurement Activities

Examples of procurement activities include, but are not limited to: Material/equipment submittal preparation, submittal and approval of material/equipment; material/equipment fabrication and delivery, and material/equipment on-site. As a minimum, separate procurement activities must be provided for critical items, long lead items, items requiring Government approval and material/equipment procurement for which payment will be requested in advance of installation. Show each delivery with relationship tie to the Construction Activity specifically for the delivery.

1.10.2.6.4 Government Activities

Government and other agency activities that could impact progress must be clearly identified. Government activities include, but are not limited to; Government approved submittal reviews, Government conducted inspections/tests, environmental permit approvals by State regulators, utility outages, Design Start, Construction Start (including Design/Construction Start for each Fast-Track Phase, and delivery of Government Furnished Material/Equipment.

1.10.2.6.5 Construction Quality Management (CQM) Activities

The Preparatory and Initial Phase meetings for each Definable Feature of Work identified in the Contractor's Quality Control Plan must be included in the Three-Week Look Ahead Schedule. Preparatory and Initial phase meetings are not required in the NAS, but can be represented by a start milestone linked to successor parent Construction Activity. The Follow-up Phase must be represented by the Construction Activities themselves in the NAS.

1.10.2.6.6 Construction Activities

No on-site construction activity may have a duration in excess of 20 working days. Contractor activities must be driven by calendars that reflect Saturdays, Sundays and all Federal Holidays as non-work days, unless otherwise defined in this contract.

1.10.2.6.7 Turnover and Closeout Activities

Include activities or milestones for items on the NAVFAC Red Zone Checklist/POAM that are applicable to this project. As a minimum, include required Contractor testing, required Government acceptance inspections on equipment, Pre-Final Inspection, Punch List Completion, Final Inspection and Acceptance. Add an unconstrained start milestone for the initial NAVFAC Red Zone - Facility Turnover Planning Meeting at approximately 75 percent construction contract completion or six months prior to Contract Completion Date (CCD), whichever is sooner.

1.10.2.6.8 Testing of HVAC - DALT, TAB, and PVT Activities

Include in the baseline schedule, activities and milestones associated with Government acceptance of Duct Air Leakage Test (DALT), Testing,

Adjusting, and Balancing (TAB) and Performance Verification Test (PVT) as required and in accordance with Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC and Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

a. Identify the general area or location(s) for Government Acceptance Testing of DALT, TAB and PVT.

b. Incorporate into the baseline schedule, time periods required for advance notification of work, and Government submittal review in accordance with Section 23 05 93 TESTING, ADJUSTING AND BALANCING FOR HVAC, paragraph DALT AND TAB SUBMITTAL AND WORK SCHEDULE.

c. Include the following as schedule activities or milestones:

(1) Pre-DALT/TAB/PVT Meeting

(2) TAB Design Review Report, Government review

(3) TAB Pre-Field Engineering Report, Government review

(4) DALT Field Work

(5) DALT Field Acceptance Testing

(6) Certified Final DALT Report, Government review

(7) Control Contractors PVT Plan, Government review

(8) Equipment Suppliers PVT Plan, Government review

(9) Season I TAB Field Work

(10) Season I Certified Final TAB Report, Government review

(11) Endurance Testing, Government review

(12) PVT Field Work

(13) PVT Report, Government review

(14) Season I TAB Field Acceptance Testing

(15) Season II TAB Field Work

(16) Season II Certified Final TAB Report, Government review

(17) Season II TAB Field Acceptance Testing

(18) Post-Occupancy Endurance Testing Government review

(19) Post-Occupancy PVT Field Work

1.10.2.6.9 Commissioning Activities

Include in the baseline schedule activities and milestones associated with Commissioning.

a. Identify the general area or location(s) of systems for Commissioning

Inspection and Testing

b. Incorporate into the baseline schedule time periods for Government submittal review

1.10.2.7 Contract Milestones and Constraints

1.10.2.7.1 Project Start Date Milestones

Include as the first activity on the schedule a start milestone titled "Contract Award," which must have a Mandatory Start constraint equal to the Contract Award Date.

1.10.2.7.2 NAVFAC Red Zone - Facility Turnover Planning Meeting Milestones

See paragraph TURNOVER AND CLOSEOUT ACTIVITIES above.

1.10.2.7.3 Substantial Completion Milestone

Include an unconstrained finish milestone on the schedule titled "Substantial Completion." Substantial Completion is defined as the point in time the Government would consider the project ready for beneficial occupancy wherein by mutual agreement of the Government and Contractor, Government use of the facility is allowed while construction access continues in order to complete remaining items (e.g. punch list and other close out submittals). Include a separate Substantial Completion Milestone for each phase if the contract requires construction to be completed in phases.

1.10.2.7.4 DD-1354 Finish Milestone

Add unconstrained finish milestone, titled "DD-1354" and scheduled 30 calendar days prior to Substantial Completion, whenever a Form DD-1354 is required in accordance with Section 01 20 00.00 20 PRICE AND PAYMENT PROCEDURES.

1.10.2.7.5 Projected Completion Milestone

Include an unconstrained finish milestone on the schedule titled "Projected Completion." Projected Completion is defined as the point in time all contract requirements are complete and verified by the Government with a successful Final Inspection in accordance with Section 01 45 00.05 20 DESIGN AND CONSTRUCTION QUALITY CONTROL. This milestone must have the Contract Completion Date (CCD) milestone as its only successor.

1.10.2.7.6 Contract Completion Date (CCD) Milestone

Last schedule entry must be an unconstrained finish milestone titled "Contract Completion (CCD: DD-MM-YY)." DD-MM-YYYY is the current contract completion date at data date, day-month-year corresponding to P6 Must Finish Date. NAS milestone updates of Project Completion finish date for longest path must reflect calculated float as positive or negative based on CCD. Calculation of schedule updates must be such that if the finish of the "Projected Completion" milestone falls after the contract completion date, then negative float is calculated on the longest path. If the finish of the "Projected Completion" milestone falls before the contract completion date, the float calculation must reflect positive float on the longest path.

1.10.2.8 Work Breakdown Structure & Activity Code

At a minimum, establish a Work Breakdown Structure (WBS) and provide activity codes identified as follows:

1.10.2.8.1 Work Breakdown Structure (WBS)

Group all activities and milestones within appropriate WBS categories including, at a minimum, the following:

a. Project Milestones:

    (1) Management Milestones

    (2) Project Administrative Meetings

    (3) Permits

b. Pre-Construction Phase:

    (1) Submittals and Reviews

    (2) Procurement

    (3) Mobilization

c. Construction Phase: Create multiple sub-sections in accordance with project specific categories of work including in WBS descending order as follows:

    (1) General Area

        (a) Type of Work Item

            1. Location

d. Commissioning & Testing:

    (1) Specific area/locations of commissioning

    (2) Final Testing

    (3) Training

d. Project Closeout: Include activity items such as Punchlist, Demobilization, O&M, As-built Drawings, Training, and As-built NAS.

e. Modifications: Create sub-category of Conformed and Non-Conformed under Modification WBS. Create multiple sub-sections as the project progresses identified by issue and Fragnet placed in Conformed for modifications issued prior data date, or Non-Conformed for issues not modified to contract prior data date.

f. Removed Activity: Activity "removed" by remaining within logic sequence and changing to Finish Milestone. Actualize finish date to date activity removed from schedule and provide reason(s) for removal explained in Activity Notebook.

1.10.2.8.2 Responsibility Code

All activities in the project schedule must be identified with the party responsible for completing the task. Activities must not belong to more than one responsible party.

1.10.2.8.3 Activity Category Code

Provide user defined "CAT" codes for Project Level activity codes. Use the following codes:

a. Assign "Procure" to Procurement type activity

b. Assign "Construct" Construction type activity

c. Assign "Close Out" to dedicated Commissioning, Testing & Close Out type activity.

d. Assign "Other" to other activity not otherwise designated.

1.10.2.8.4 Construction Specification Institute (CSI) Masterformat Code

Identify all activities in the project schedule with its respective Specification Section number. Activities must not belong to more than one Section number. If an activity does not have an applicable CSI Code (e.g. Mobilize), the code must be "0000".

1.10.2.8.5 Drawing Code

Identify all activities in the project schedule with its respective Drawing Code. The Drawing Code is the Sheet Number on the primary project drawing which indicates work to be performed. If an activity does not have an applicable Drawing Code (e.g. Mobilize), the code must be "0000".

1.10.2.9 Anticipated Weather Lost Work Days

Use the National Oceanic and Atmospheric Administration's (NOAA) Summary of Monthly Normals report to obtain the historical average number of days each month with precipitation, using a nominal 30-year, greater than 0.10 inch precipitation amount parameter, as indicated on the Station Report for the NOAA location closest to the project site as the basis for establishing a "Weather Calendar" showing the number of anticipated non-workdays for each month due to adverse weather, in addition to Saturdays, Sundays and all Federal Holidays as non-work days.

Assign the Weather Calendar to any activity that could be impacted by adverse weather. The Contracting Officer will issue a modification in accordance with the contract clauses, giving the Contractor a time extension for the difference of days between the anticipated and actual adverse weather delay if the number of actual adverse weather delay days exceeds the number of days anticipated for the month in which the delay occurs and the adverse weather delayed activities are critical to contract completion. A lost workday due to weather conditions is defined as a day in which the Contractor cannot work at least 50 percent of the day on the impacted activity.

1.10.2.10 Anticipated Restricted Delays

Unless otherwise noted or defined in Section 01 14 00.05 20 WORK

RESTRICTIONS FOR DESIGN-BUILD, allow in the schedule one lost workday for every two months of project duration for instances where base access is not permitted or where work areas are temporarily not accessible for security reasons which causes a delay in the work. Use Anticipated Restricted Delays as basis for establishing a "Security Calendar" showing the number of anticipated non-workdays for each month due to anticipated restrictions, in addition to anticipated adverse weather, Saturdays, Sundays and all Federal Holidays as non-work days. Assign the Security Calendar to any activity that could be impacted by restriction delays. The Contracting Officer will issue a modification in accordance with the contract clauses, giving the Contractor a time extension for the difference of days between the anticipated and actual lost work days if the number of actual restriction delay days exceeds the number of anticipated for the month in which the delay occurs and the restriction delayed activities are critical to contract completion. A lost workday due to restriction delay is defined as a day in which the Contractor cannot work at least 50 percent of the day on the impacted activity.

1.10.2.11 Cost Loading

The Project Network Analysis Schedule (NAS) must be cost-loaded and will provide the basis for progress payments. Earned Value Reports must be derived from and correspond to cost loaded NAS. Use the Critical Path Method (CPM) and the Precedence Diagram Method (PDM) to satisfy time and cost applications.

1.10.2.11.1 Cost Loading Activities

Assign Material and Equipment Costs, for which payment will be requested in advance of installation, to their respective procurement activity (i.e., the material/equipment on-site activity). Assign cost for material/equipment, paid for after installation; labor; and construction equipment to their respective Construction Activities. Provide breakdown of definable features of work for cost loaded activities comprising Mobilization and De-Mobilization (Lump sum not allowed). The value of commissioning, testing and closeout WBS section may not be less than 10 percent of the total costs for Procurement and Construction Activities. Evenly disperse overhead and profit to each activity over the duration of the project.

1.10.2.11.2 Partial Payment

Breakdown unit of measure and cost must be defined within P6 Activity Detail Expenses for partial payment of any cost loaded activity. Lump sum cost loaded activity will not be partially paid.

1.10.3 Schedule Software Settings and Restrictions

a. Activity Constraints: Date/time constraint(s), other than those required by the contract, are not allowed unless accepted by the Contracting Officer. Identify any constraints proposed and provide an explanation for the purpose of the constraint in the Narrative Report as described in paragraph REQUIRED TABULAR REPORTS.

b. Default Progress Data Disallowed: Actual Start and Actual Finish dates on the CPM schedule must match the dates on the Contractor Quality Control and Production Reports.

c. Software Settings: Handle schedule calculations and Out-of-Sequence

progress (if applicable) through Retained Logic, not Progress Override. Show all activity durations and float values in days. Show activity progress using Remaining Duration. Set default activity type to "Task Dependent".

d. At a minimum, include the following settings and parameters in P6 Schedule preparation:

(1) General: Define or establish Calendars and Activity Codes at the "Project" level, not the "Global" level.

(2) Admin Drop-Down Menu, Admin Preferences, Time Periods Tab:

(a) Set time periods for P6 to 8.0 Hours/Day, 40.0 Hours/Week, 172.0 Hours/Month and 2000.0 Hours/Year.

(b) Use assigned calendar to specify the number of work hours for each time period: Must be checked.

(3) Admin Drop-Down Menu, Admin Preferences, Earned Value Tab:

(a) Earned Value Calculation: Use "Budgeted values with current dates".

(4) Project Level, Dates Tab:

(a) Set "Must Finish By" date to "Contract Completion Date", and set "Must Finish By" time to 05:00pm.

(5) Project Level, Defaults Tab:

(a) Duration Type: Set to "Fixed Duration & Units".

(b) Percent Complete Type: Set to "Physical".

(c) Activity Type: Set to "Task Dependent".

(d) Calendar: Set to "Standard 5 Day Workweek". Calendar must reflect Saturday, Sunday and all Federal holidays as non-work days. Alternative calendars may be used with Contracting Officer approval.

(6) Project Level, Calculations Tab:

(a) Activity percent complete based on activity steps: Must be Checked.

(b) Reset Remaining Duration and Units to Original: Must be Checked.

(c) Subtract Actual from At Completion: Must be Checked.

(d) Recalculate Actual units and Cost when duration percent complete changes: Must be Checked.

(e) Link Actual to Date and Actual This Period Units and Cost: Must be Checked.

(f) Price/Unit: Set to "$1/h".

(g) Update units when costs change on resource assignments: Must be Unchecked.

(7) Project Level, Settings Tab:

(a) Define Critical Activities: Check "Longest Path".

(8) Work Breakdown Structure Level, Earned Value Tab:

(a) Technique for Computing Performance Percent Complete: "Activity percent complete" is selected.

(b) Technique for Computing Estimate to Complete (ETC): "PF = 1" is selected.

1.10.4 Required Tabular Reports

Include the following reports with the Baseline, Monthly Update and any other required schedule submittals:

a. Log Report: P6 Scheduling/Leveling Report.

b. Narrative Report: Identify and justify:

(1) Progress made in each area of the project;

(2) Longest Path;

(3) Date/time constraint(s), other than those required by the contract

(4) Listing of all changes made between the previous schedule and current updated schedule include: added or deleted activities, original and remaining durations for activities that have not started, logic (sequence constraint lag/lead), milestones, planned sequence of operations, longest path, calendars or calendar assignments, and cost loading;

(5) Any decrease in previously reported activity Earned Amount;

(6) Pending items and status thereof, including permits, changes orders, and time extensions;

(7) Status of Contract Completion Date and interim milestones;

(8) Current and anticipated delays (describe cause of delay and corrective actions(s) and mitigation measures to minimize);

(9) Description of current and potential future schedule problem areas.

Each entry in the narrative report must cite the respective Activity ID and Activity Name, the date and reason for the change, and description of the change.

c. Earned Value Report: Derive from and correspond to P6 cost loaded schedule. List all activities having a budget amount cost loaded. Compile total earnings on the project from notice to proceed to current progress payment request. Show current budget, previous physical percent complete, to-date physical percent complete, previous

earned value, to-date earned value and cost to complete on the report for each activity.

d. Schedule Variance Control (SVC) Diagram: With each schedule submission, provide a SVC diagram showing 1) Cash Flow S-Curves indicating planned project cost based on projected early and late activity finish dates and 2) Earned Value to-date. Revise Cash Flow S-Curves when the contract is modified, or as directed by the Contracting Officer.

e. Daily Reported Production Activity: Submit on a monthly basis, in electronic spreadsheet (format provided by the Government), summary of daily reported production activity for the reporting month in the update schedule. Use the following columns for reporting:

(1) Date

(2) Activity ID

(3) Work Description

(4) Contractor

(5) Billable Hours

1.11 CONTRACT MODIFICATION

1.11.1 Time Impact Analysis (TIA)

Submit a Time Impact Analysis with each cost and time proposal for a proposed change. TIA must illustrate the influence of each change or delay on the Contract Completion Date or milestones. No time extensions will be granted nor delay damages paid unless a delay occurs which consumes all available Project Float, and extends the Projected Completion beyond the Contract Completion Date.

a. Each TIA must be in both narrative and schedule form. The narrative must define the scope and conditions of the change; provide start and finish dates of impact, successor and predecessor activity to impact period, responsible party; describe how it originated, and how it impacts the schedule. The schedule submission must consist of three native files:

(1) Fragnet used to define the scope of the changed condition

(2) Most recent accepted schedule update as of the time of the proposal or claim submission that has been updated to show all activity progress as of the time of the impact start date.

(3) The impacted schedule that has the fragnet inserted in the updated schedule and the schedule "run" so that the new completion date is determined.

b. For claimed as-built project delay, the inserted fragnet TIA method must be modified to account for as-built events known to occur after the data date of schedule update used.

c. All TIAs must include any mitigation, and must determine the apportionment of the overall delay assignable to each individual

delay. Apportionment must provide identification of delay type and classification of delay by compensable and non-compensable events. The associated narrative must clearly describe analysis methodology used, and the findings in a chronological listing beginning with the earliest delay event.

(1) Identify and classify types of delay defined as follows:

(a) Force majeure delay (e.g. weather delay): Any delay event caused by something or someone other than the Government or the Contractor, or the risk of which has not been assigned solely to the Government or the Contractor. If the force majeure delay is on the longest path, in absence of other types of concurrent delays, the Contractor is granted an extension of contract time, classified as a non-compensable event.

(b) A Contractor-delay: Any delay event caused by the Contractor, or the risk of which has been assigned solely to the Contractor. If the contractor-delay is on the longest path, in absence of other types of concurrent delays, Contractor is not granted extension of contract time, and classified as a non-compensable event. Where absent other types of delays, and having impact to project completion, Contractor must provide to Contracting Officer a Corrective Action Plan identifying plan to mitigate delay.

(c) A Government-delay: Any delay event caused by the Government, or the risk of which has been assigned solely to the Government. If the Government-delay is on the longest path, in absence of other types of concurrent delays, the Contractor is granted an extension of contract time, and classified as a compensable event.

(2) Functional theory must be used to analyze concurrent delays, where: separate delay issues delay project completion, do not necessarily occur at same time, rather occur within same monthly schedule update period at minimum, or within same as-built period under review. If a combination of functionally concurrent delay types occurs, it is considered Concurrent Delay, which is defined in the following combinations:

(a) Government-delay concurrent with contractor-delay: excusable time extension, classified non-compensable event.

(b) Government-delay concurrent with force majeure delay: excusable time extension, classified non-compensable event.

(c) Contractor-delay concurrent with force majeure delay: excusable time extension, classified non-compensable event.

(3) Pacing delay reacting to another delay (parent delay) equally or more critical than paced activity must be identified prior to pacing. Contracting Officer will notify Contractor prior to pacing. Contractor must notify Contracting Officer prior to pacing. Notification must include identification of parent delay issue, estimated parent delay time period, paced activity(s) identity, and pacing reason(s). Pacing Concurrency is defined as follows:

(a) Government-delay concurrent with contractor-pacing: excusable time extension, classified compensable event.

(b) Contractor-delay concurrent with Government-pacing: inexcusable time extension, classified non-compensable event

d. Submit Data disks containing the narrative and the source schedule files used in the time impact analysis.

e. All as-built and known planned activity must be included in NAS. Add cost loading or change Contract Completion Date to NAS in accordance to conformed contract modifications issued prior to Data Date of NAS update.

1.11.2 No Reservation of Rights

All direct costs, indirect cost, and time extensions will be negotiated and made full, equitable and final at the time of modification issuance.

1.12 PROJECT FLOAT

Project Float is the length of time between the Contractor's Projected Completion Milestone and the Contract Completion Date Milestone. Project Float available in the schedule will not be for the exclusive use of either the Government or the Contractor.

The use of Resource Leveling or other techniques used for the purpose of artificially adjusting activity durations to consume float and influence critical path is prohibited.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

Not used.

-- End of Section --

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 01 33 00.05 20

CONSTRUCTION SUBMITTAL PROCEDURES
05/14

PART 1 GENERAL

1.1 RELATED REQUIREMENTS

This section covers construction submittals that are not included in the design submittals. Submit design submittals in accordance with 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES. When using Unified Facility Guide Specifications (UFGS) sections that reference Section 01 33 00 SUBMITTAL PROCEDURES, change reference to this section, Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES.

1.2 SUBMITTAL DESCRIPTIONS (SD)

Submittal requirements are specified in UFGS in Part 2, GENERAL REQUIREMENTS; in references in Part 4 PERFORMANCE TECHNICAL SPECIFICATIONS; and in UFGS in Part 5, PRESCRIPTIVE SPECIFICATIONS. Submittals that are identified by SD numbers use descriptions of items included in submittal packages and titles as follows:

SD-01 Preconstruction Submittals

Certificates of insurance.

Surety bonds.

List of proposed subcontractors.

List of proposed products.

Construction progress schedule.

Network Analysis Schedule (NAS)

Submittal register.

Schedule of prices or earned value report.

Health and safety plan.

Work plan.

Quality control plans.

Environmental protection plan.

SD-02 Shop Drawings

Drawings, diagrams and schedules specifically prepared to illustrate some portion of the work.

Diagrams and instructions from a manufacturer or fabricator for use in producing the product and as aids to the Contractor for integrating the product or system into the project.

Drawings prepared by or for the Contractor to show how multiple systems and interdisciplinary work will be coordinated.

SD-03 Product Data

Catalog cuts, illustrations, schedules, diagrams, performance charts, instructions and brochures illustrating size, physical appearance and other characteristics of materials or equipment for some portion of the work.

Samples of warranty language when the contract requires extended product warranties.

Manufacturer's data certifying and demonstrating that specific product, process, and/or conditions complies with applicable Guiding Principle GP) or Third Party Certification (TPC) criteria.

SD-04 Samples

Physical examples of materials, equipment or workmanship that illustrate functional and aesthetic characteristics of a material or product and establish standards by which the work can be judged.

Color samples from the manufacturer's standard line (or custom color samples if specified) to be used in selecting or approving colors for the project.

Field samples and mock-ups constructed on the project site establish standards by which the ensuing work can be judged. Includes assemblies or portions of assemblies which are to be incorporated into the project and those which will be removed at conclusion of the work.

SD-05 Design Data

Calculations, mix designs, analyses or other data pertaining to a part of work.

SD-06 Test Reports

Report signed by authorized official of testing laboratory that a material, product or system identical to the material, product or system to be provided has been tested in accord with specified requirements. (Testing must have been within three years of date of contract award for the project.)

Report which includes findings of a test required to be performed by the Contractor on an actual portion of the work or prototype prepared for the project before shipment to job site.

Report which includes finding of a test made at the job site or on sample taken from the job site, on portion of work during or after installation.

Investigation reports.

Daily checklists.

Final acceptance test and operational test procedure.

SD-07 Certificates

Statements signed by responsible officials of manufacturer of product, system or material attesting that product, system or material meets specification requirements. Must be dated after award of project contract and clearly name the project.

Document required of Contractor, or of a supplier, installer or subcontractor through Contractor, the purpose of which is to further quality of orderly progression of a portion of the work by documenting procedures, acceptability of methods or personnel qualifications.

Confined space entry permits.

Text of posted operating instructions.

SD-08 Manufacturer's Instructions

Preprinted material describing installation of a product, system or material, including special notices and Material Safety Data sheets concerning impedances, hazards and safety precautions.

SD-09 Manufacturer's Field Reports

Documentation of the testing and verification actions taken by manufacturer's representative to confirm compliance with manufacturer's standards or instructions.

Factory test reports.

SD-10 Operation and Maintenance Data

Data that is furnished by the manufacturer, or the system provider, to the equipment operating and maintenance personnel. This data is needed by operating and maintenance personnel for the safe and efficient operation, maintenance and repair of the item.

SD-11 Closeout Submittals

Documentation to record compliance with technical or administrative requirements or to establish an administrative mechanism.

Special requirements necessary to properly close out a construction contract. For example, Record Drawings, As-built drawings, DD Form 1354, Guiding Principles Validation or Sustainability Third Party Certification (TPC), Sustainability Notebook (including all of components) and eOMSI submittals. Also, submittal requirements necessary to properly close out a major phase of construction on a multi-phase contract.

1.3 SUBMITTALS

The use of a "G" following a submittal indicates that an approval action is required, either by the Government or by the Contractor's Designer of Record (DOR) or QC Specialist.

The use of an "S" following a submittal indicates separate but simultaneous submittal is required as part of federally mandated sustainability requirements. Refer to Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD for "S" submittal requirements.

Submit the following in accordance with the requirements of this section.

SD-01 Preconstruction Submittals

Submittal Register Format; G

1.3.1 Submittal Register

The submittal register must be prepared during the initial design stages of the project and indicate each design and construction submittal. Maintain an electronic version of the submittal register as work progresses. The DOR must assist the DQC in preparing the submittal register by determining all project submittals that require DOR approval. The Contractor proposed submittal register format must include all types of information pertinent to the submittal process and be approved by the Contracting Officer prior to the first submission.

1.4 CONSTRUCTION QUALITY CONTROL

1.4.1 Contractor Reviewing, Certifying, Approving Authority

The QC organization is responsible for reviewing and certifying that submittals are in compliance with the contract requirements.

a. In RFP PART 4 PERFORMANCE TECHNICAL SPECIFICATIONS (PTS), there are UFGS specification sections required to be submitted as part of the design submittal. Unless specified otherwise in this section, the Contractor's DOR is the approving authority for submittals listed in these specifications with a "G" designation, unless the DOR delegates to Contractor Quality Control approval. RFP Part 4 PTS sections also include submittals identified for DOR approval that are not denoted with a "G" designation, these submittals cannot be delegated for Contractor Quality Control approval.

b. If RFP PART 5 PRESCRIPTIVE SPECIFICATIONS are utilized in this RFP, the Contractor's DOR is the approving authority for submittals listed with a "G" designation, unless the DOR delegates to Contractor Quality Control approval.

c. DOR must approve construction submittals that are incorporated in the design submittal prior to being submitted to the Government for design submittal approval. Indicate approval of these construction submittals on the accompanying submittal transmittal forms and the submittal register for each design submittal package. In addition, the DOR professional stamp on the final design submittal indicates approval of construction submittals combined with the design submittal.

d. Submittal items identified in RFP PARTS 2, 4, and 5 that are not identified with a "G" designation or not designated for DOR approval (in RFP Part 4) are for Contractor Quality Control approval.

e. Construction submittals that are approved by the DOR or certified by the QC are not required to be submitted to the Government for

surveillance, except when the RFP requires the design and construction submittals to be combined in Section 01 33 10.05 20, DESIGN SUBMITTAL PROCEDURES or where specified in the paragraph SUBMITTALS RESERVED FOR GOVERNMENT SURVEILLANCE of this section.

f. In addition to other approvals that may be required, provide review and approval of Guiding Principles Validation and TPC Submittals by Design-Build team's Sustainability or TPC Professional. Provide this approval prior to including in any Government-reviewed submittal.

1.4.2 Submittals Reserved for Government Surveillance

Surveillance submittals are approved by the Contractor in accordance with paragraph CONTRACTOR REVIEWING, CERTIFYING, AND APPROVING AUTHORITY, but provide the Government the opportunity to oversee critical project issues.

If during the Government surveillance of construction submittals, items are brought to the Contractor's attention as non-compliant, the Contractor must correct the submittal and construction to comply with the requirements of the RFP. Stamp surveillance submittals "APPROVED" by the DOR or QC Specialist and "FOR SURVEILLANCE ONLY." Submit the following Government surveillance submittals, prior to starting work for construction submittal items, and after the completion of the work for reports submittals items.

a. Submit fire protection related submittals pertaining to spray-applied fire proofing and fire stopping, exterior fire alarm reporting systems, interior fire alarm and detection systems, and fire suppression systems including fire pumps and standpipe systems.

b. Submit geotechnical related submittals pertaining to the soils investigations (reports and soils analysis), foundations (shallow and deep), pavements structure design, test pile and production pile testing and installation.

c. Submit conveying related submittals pertaining to elevators, escalators, weight handling equipment, lifts, and conveyors.

d. Submit roofing submittals pertaining to materials and systems used to make up the roof system.

e. Submit HVAC Testing, Adjusting, and Balancing required submittals.

f. Submit telecommunications shop drawings, as described in Part 4, D50 ELECTRICAL, for coordination with the G6 Government personnel.

g. Submit Performance Verification and Acceptance Testing submittals listed in the PTS and referenced UFGS.

h. Submit all Interim Special Inspection Reports on a bi-weekly basis until work requiring special inspections is complete.

i. Submit all Structural Observation Reports and the Final Report of Special Inspections.

j. Submit Final Guiding Principle Validation and TPC sustainability documentation.

k. Submit the exterior enclosure barrier drawings.

l. Submit building enclosure testing results for air tightness and the infrared thermography results if air barrier deficiencies are identified. Describe actions taken to correct building enclosure deficiencies at each location.

1.4.3 Submittals Reserved for Government Approval

The Government is the approving authority for submittals with a "G" designation in RFP Part 2 GENERAL REQUIREMENTS specification sections. Comply with additional Government approval requirements for Environmental submittals, as specified in RFP Part 2, Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS and Section 01 57 19.01 20, SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS.

In addition to the Government approvals required by RFP Part 2, GENERAL REQUIREMENTS, the following submittals must be certified by the QC Manager and the DOR, and approved by the Contracting Officer.

a. Substations

b. Transformers

c. Medium Voltage Switchgear

d. Medium Voltage Cable

e. 400-Hz Converters

f. Emergency Generators

g. Automatic Transfer Switches

h. Uninterruptible Power Supplies

i. Electronic Security Systems

j. Section 23 09 13 and Section 23 09 23.02

k. Section 23 05 93

l. Submit fire protection related submittals pertaining to spray-applied fire proofing and fire stopping, exterior fire alarm reporting systems, interior fire alarm and detection systems, and fire suppression systems including fire pumps and standpipe systems.

Section 27 10 00 BUILDING TELECOMMUNICATIONS CABLING SYSEM: All Submittals. Provide an information copy of all submittals to Base Telephone through the Contracting Officer. Base Telephone will coordinate their review and approval through the OICC

SEction 33 82 00 TELECOMMUNICATIONS OUTSIDE PLANT (OSP): All submittals. Provide an information copy of all submittals to Base Telephone through the Contracting Officer. Base Telephone will coordinate their review and approval through the OICC

1.4.3.1 Scheduling for Government Approved Submittals

Except as specified otherwise, allow review period, beginning when Government receives submittal from the QC organization, of 21 calendar days for return of submittal to the Contractor. Period of review for submittals with Contracting Officer approval begins when Government receives submittal from QC organization. Period of review for each resubmittal is the same as for initial submittal.

1.4.3.2 Government Approval Defined

Submittals marked "approved" indicate a quality assurance (QA) review has been performed. Government review or approval of any portion of the submittal does not relieve the Contractor from responsibility for meeting the contract requirements or for any error that may exist, because under the Quality Control (QC) requirements of this contract, the Contractor is responsible for ensuring information contained within each submittal accurately conforms with the requirements of the contract documents. Furthermore, Government review or approval of a submittal is not to be construed as a complete check.

1.4.4 Constraints

a. Submittals must be complete for each definable feature of work; submit components of definable feature interrelated as a system at the same time.

b. Approval of a separate material, product, or component does not imply approval of assembly in which item functions.

1.4.5 Design Change and Variation

The Contractor must limit change and variation to items that will be advantageous to the Government. Submit proof that the change or variation is needed and provide the same or better level of quality as the design that the Government originally reviewed or approved. Design change is considered prior to Government approval of the final design and variation is considered after Government approval of final design.

1.4.5.1 Design Changes

Design changes must meet the minimum requirements of the solicitation and the accepted proposal. Any changes to the design from what was previously reviewed by the Government during any phase of the design process prior to Government approval of the Final Design must be approved by the DOR and Government before the design change may be incorporated into the design documents. Design changes must be requested in accordance with Section 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES.

1.4.5.2 Variations

Variations from contract requirements including the solicitation, the accepted proposal, and the final design, require Government approval. Variations must be approved by the DOR prior to submitting written request to the Government for approval.

a. Considering Variations

Discuss the proposed variation with the Contracting Officer after consulting with the DOR prior to submission to help ensure functional and quality requirements are met and minimize potential rejections and re-submittals. When contemplating a variation which results in lower cost, consider submitting the variation as a Value Engineering Change Proposal (VECP) in accordance with FAR 52.248-3. Specifically point out variations from contract requirements in transmittal letters as applicable. Failure to receive prior Government approval for deviations may result in the Government requiring rejection and removal of such work at no additional cost to the Government.

b. Submitting Variations

When submitting a variation, deliver the written request to the Contracting Officer in the form of a Request for Information (RFI) to include documentation illustrating the nature and features of the variation including any necessary technical submittals and why the variation is desirable and beneficial to Government. Request must also include any savings to the government and documented approval from the DOR.

The Contracting Officer will indicate an approval or disapproval of the variation request; and if not approved as submitted, will indicate the Government's reasons therefor. Any work done before such approval is received is performed at the Contractor's risk.

c. Warranting Variations Are Compatible

When proposing a variation for approval, the Contractor, including its Designer(s) of Record, warrants that the contract documents have been reviewed to establish that the variation, if incorporated, is compatible with the design intent and operational requirements.

1.4.6 Contractor's Responsibilities

Ensure no work has begun until submittals for that work have been "approved" or "approved as noted."

1.4.7 QC Organization Responsibilities

Stamp each sheet of each submittal with QC certifying statement or approving statement, except that data submitted in bound volume or on one sheet printed on two sides may be stamped on the front of the first sheet only.

a. When approving authority is Contracting Officer, QC organization will certify submittals, assure proper signatures, and forward to Contracting Officer with the following certifying statement:

"I hereby certify that the (equipment) (material) (article) shown and marked in this submittal is that proposed to be incorporated with contract Number (insert contract number here), is in compliance with the contract documents, can be installed in the allocated spaces, and is submitted for Government approval.

RFP Part Two Submittals:

Certified by QC Manager _____, Date _____
(QC Manager)

RFP Part Four and Part Five Submittals:

Certified by DOR _____, Date _____

Certified by QC Manager _____, Date _____"

(1) Sign certifying statement or approval statement. The person signing certifying statements must be QC organization member designated in the approved QC plan. The signatures must be in original ink. Stamped signatures are not acceptable.

(2) Update submittal register database as submittal actions occur and maintain the submittal register at project site until final acceptance of all work by Contracting Officer.

(3) Retain a copy of approved submittals at project site, including Contractor's copy of approved samples.

b. When the Approving Authority is the Designer of Record, the DOR must approve, professionally stamp, sign, and date submittals. DOR stamp on construction submittals or submission of design documents that include construction submittals indicates DOR approval for construction. QC organization must certify submittals, assure proper signatures, and forward to Contracting Officer with the following certifying statement:

"I hereby certify that the (equipment) (material) (article) shown and marked in this submittal is that proposed to be incorporated with contract Number (insert contract number here), is in compliance with the contract requirements, can be installed in the allocated spaces, and is submitted for DOR approval.

RFP Part Four and Part Five Submittals:

Approved by DOR _____, Date _____

Certified by QC Manager _____, Date _____"

(1) Sign certifying statement or approval statement. The person signing certifying statements must be QC organization member designated in the approved QC plan. The signatures must be in original ink. Stamped signatures are not acceptable.

(2) Update submittal register database as submittal actions occur and maintain the submittal register at project site until final acceptance of all work by Contracting Officer.

(3) Send copies of final DOR or QC Specialist approved and signed submittals that are identified in this section for Government surveillance to the Contracting Officer. Stamp copies "For Surveillance Only."

1.4.8 Government's Responsibilities

When approving authority is the Contracting Officer, the Government will:

a. Note date on which submittal was received from QC Manager, on each submittal.

b. Review submittals for compliance with contract documents.

1.4.8.1 Government Actions

Submittals will be returned with one of the following notations:

a. Submittals marked "approved" or "approved as submitted" authorize Contractor to proceed with work covered.

b. A submittal marked "not reviewed" will be returned with an explanation of the reason it was not reviewed.

c. Submittals marked "approved as noted" or "approval except as noted; resubmission not required" authorize Contractor to proceed with work as noted provided Contractor takes no exception to the notations.

d. Submittals marked "revise and resubmit" or "disapproved" indicate submittal is incomplete or does not comply with design concept or requirements of the contract documents and must be resubmitted with appropriate changes. No work is allowed to proceed for this item until resubmittal is approved.

e. Submittals required for surveillance will be returned only if corrective actions are required.

1.5 FORMAT OF SUBMITTALS

1.5.1 Transmittal Form

Transmit submittals with transmittal form prescribed by Contracting Officer and standard for the project.

1.5.1.1 Combined Design and Construction Submittal Notification

Indicate on the design submissions transmittal form, which construction submittals have been combined with the design documents. Coordinate transmittal form list of combined design and construction submittals with submittal register to indicate DOR approval of all combined submittals.

1.5.1.2 Sustainable Design and Construction Submittals

On all projects, provide sustainability submittals in accordance with requirements of this document, specification Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD and FC 1-300-09N, "Navy and Marine Corps Design Procedures". Specific submittal requirements are also identified in technical sections of the specifications. Separate out data demonstrating compliance with construction sustainability requirements and submit separately but concurrently.

1.5.2 Identifying Submittals

When submittals are provided by a Subcontractor, the Prime Contractor is to prepare, review and stamp with Contractor's approval all specified submittals prior to submitting for Government approval.

Identify submittals, except sample installations and sample panels, with the following information permanently adhered to or noted on each separate component of each submittal and noted on transmittal form. Mark each copy

of each submittal identically, with the following:

a. Project title and location.

b. Construction contract number.

c. Date of the drawings and revisions.

d. Name, address, and telephone number of subcontractor, supplier, manufacturer and any other subcontractor associated with the submittal.

e. Section number of the specification section by which submittal is required.

f. Submittal description (SD) number of each component of submittal.

g. When a resubmission, add alphabetic suffix on submittal description, for example, submittal 18 would become 18A, to indicate resubmission.

h. Product identification and location in project.

1.5.3 Format for SD- 02 Shop Drawings

a. Shop drawings are not to be less than 8 1/2 by 11 inches nor more than 30 by 42 inches, except for full size patterns or templates. Prepare drawings to accurate size, with scale indicated, unless other form is required. Drawings are to be suitable for reproduction and be of a quality to produce clear, distinct lines and letters with dark lines on a white background.

b. Present 8 1/2 by 11 inches sized shop drawings as part of the bound volume for submittals required by section. Present larger drawings in sets.

c. Include on each drawing the drawing title, number, date, and revision numbers and dates, in addition to information required in paragraph IDENTIFYING SUBMITTALS of this section.

d. Number drawings in a logical sequence. Each drawing is to bear the number of the submittal in a uniform location adjacent to the title block. Place the Government contract number in the margin, immediately below the title block, for each drawing.

e. Reserve a blank space, no smaller than 4 inches the right-hand side of each sheet for the Government disposition stamp.

f. Dimension drawings, except diagrams and schematic drawings; prepare drawings demonstrating interface with other trades to scale. Use the same unit of measure for shop drawings as indicated on the contract drawings. Identify materials and products for work shown.

g. Include the nameplate data, size and capacity on drawings. Also include applicable federal, military, industry and technical society publication references.

1.5.4 Format of SD - 03 Product Data and SD - 08 Manufacturer's Instructions

a. Present product data submittals for each section as a complete bound volume. Include table of contents, listing page and catalog item numbers for product data.

b. Indicate, by prominent notation, each product which is being submitted; indicate specification section number and paragraph number to which it pertains.

c. Supplement product data with material prepared for project to satisfy submittal requirements for which product data does not exist. Identify this material as developed specifically for project, with information and format as required for submission of SD-07 Certificates.

d. Provide product data in metric dimensions. Where product data are included in preprinted catalogs with English units only, submit metric dimensions on separate sheet.

e. Include the manufacturer's name, trade name, place of manufacture, and catalog model or number on product data. Also include applicable federal, military, industry and technical society publication references. Should manufacturer's data require supplemental information for clarification, submit as specified for SD-07 Certificates.

f. Where equipment or materials are specified to conform to industry and technical society reference standards of the organizations such as American National Standards Institute (ANSI), ASTM International (ASTM), National Electrical Manufacturer's Association (NEMA), Underwriters Laboratories (UL), and Association of Edison Illuminating Companies (AEIC) submit proof of such compliance. The label or listing by the specified organization is acceptable evidence of compliance. In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the Contracting Officer. State on the certificate that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

g. Collect required data submittals for each specific material, product, unit of work, or system into a single submittal and marked for choices, options, and portions applicable to the submittal. Mark each copy of the product data identically. Partial submittals will not be accepted for expedition of construction effort.

h. Submit manufacturer's instructions prior to installation.

1.5.5 Format of SD - 04 Samples

Furnish samples in sizes below, unless otherwise specified or unless the manufacturer has prepackaged samples of approximately same size as specified:

a. Sample of Equipment or Device: Full size.

b. Sample of Materials Less than 2 by 3 inches: Built up to 8 1/2 by 11

inches.

c. Sample of Materials Exceeding 8 1/2 by 11 inches: Cut down to 8 1/2 by 11 inches and adequate to indicate color, texture, and material variations.

d. Sample of Linear Devices or Materials: 10 inch length or length to be supplied, if less than 10 inches. Examples of linear devices or materials are conduit and handrails.

e. Sample of Non-Solid Materials: 1.6 pints. Examples of non-solid materials are sand and paint.

f. Color Selection Samples: 2 by 4 inches. Where samples are specified for selection of color, finish, pattern, or texture, submit the full set of available choices for the material or product specified. Sizes and quantities of samples are to represent their respective standard unit.

g. Sample Panel: 4 by 4 feet.

h. Sample Installation: 100 square feet.

i. Samples Showing Range of Variation: Where variations in color, finish, pattern, or texture are unavoidable due to nature of the materials, submit sets of samples of not less than three units showing extremes and middle of range. Mark each unit to describe its relation to the range of the variation.

j. Reusable Samples: Incorporate returned samples into work only if so specified or indicated. Incorporated samples are to be in undamaged condition at time of use. Recording of Sample Installation: Note and preserve the notation of area constituting sample installation but remove notation at final clean-up of project.

When color, texture or pattern is specified by naming a particular manufacturer and style, include one sample of that manufacturer and style, for comparison.

1.5.6 Format of SD - 05 Design Data and SD - 07 Certificates

Provide design data and certificates on 8 1/2 by 11 inches paper. Provide a bound volume for submittals containing numerous pages.

1.5.7 Format of SD-06 Test Reports and SD - 09 Manufacturer's Field Reports

Provide reports on 8 1/2 by 11 inches paper in a complete bound volume. Indicate by prominent notation, each report in the submittal. Indicate specification number and paragraph number to which it pertains.

1.5.8 Format of SD - 10 Operation and Maintenance Data (O&M)

Comply with the requirements specified in Section 01 78 23 OPERATION AND MAINTENANCE DATA for O&M Data format.

1.5.9 Format of SD - 01 Preconstruction Submittals and SD - 11 Closeout Submittals

When submittal includes a document, which is to be used in project or

become part of project record, other than as a submittal, do not apply Contractor's approval stamp to document, but to a separate sheet accompanying document.

Provide all dimensions in administrative submittals in English .

1.6 QUANTITY OF SUBMITTALS

1.6.1 Quantity of Submittals Reserved for Government Approval

Submit by mail four copies of submittals of shop drawings requiring review and approval by Contracting Officer.

1.6.2 Quantity of Submittals Reserved for Government Surveillance

Submit by mailthree copies of submittals specified for surveillance to the Contracting Officer. Submit two additional copies of elevator submittals directly to the NAVFAC Elevator Specialist responsible for the NAVFAC elevator certification of the project.

1.6.3 Electronic Submittals

Where practicable, in lieu of hard copy copies, construction submittals may be transmitted electronically with approval from the Contracting Officer.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

Not used.

-- End of Section --

SECTION 01 33 10.05 20

DESIGN SUBMITTAL PROCEDURES
05/17

PART 1 GENERAL

1.1 SUMMARY

This section includes requirements for Contractor-originated design documents and design submittals.

1.2 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only. The latest version of the publication at time of RFP issuance must be used.

U.S. DEPARTMENT OF DEFENSE (DOD)

FC 1-300-09N	(2014; with Change 4 2018) Navy and Marine Corps Design Procedures
UFC 1-200-01	(2019) DoD Building Code (General Building Requirements)
UFC 1-300-08	(2009, with Change 2) Criteria for Transfer and Acceptance of DoD Real Property
UFC 4-010-06	(2016; with Change 1) Cybersecurity of Facility-Related Control Systems

1.3 UFC 1-200-02

UFC 1-200-01 requires compliance with UFC 1-200-02, "High Performance and Sustainable Building Requirements".

1.4 GENERAL DESIGN REQUIREMENTS

Contractor-originated design documents must provide a project design that complies with the Request For Proposal (RFP), FC 1-300-09N, UFC 1-200-01, the Core UFCs, and other UFC's listed above.

1.5 SUBMITTALS

Submit design submittals, including shop drawings used as design drawings, to the Government for approval. The use of a "G" following a submittal indicates that a Government approval action is required. Submit the following in accordance with this section and Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES.

Submittals with an "S" are for inclusion in the Sustainability Notebook in conformance to Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD for "S" submittal requirements. Submit the following in accordance with this section and Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES.

SD-01 Preconstruction Submittals

Final Record Model; G

1.6 DESIGN QUALITY CONTROL

1.6.1 Contractor Reviewing and Certifying Authority

The QC organization is responsible for reviewing and certifying that design submittals are in compliance with the contract requirements.

1.6.2 Government Approving Authority

The Contracting Officer is the approving authority for design submittals.

1.6.3 Designer of Record Certifying Authority

The Designer of Record (DOR), as registered and defined in FC 1-300-09N, is the design certifying authority. The DOR accepts responsibility for design of work in each respective design discipline, by stamping and approving final construction drawings submitted to the Government approval authority.

1.6.4 Contractor Construction Actions

Upon submission of sealed and signed design documents certified by the DOR, Design Quality Control (DQC) Manager and the Quality Control (QC) Managers, the Contractor may proceed with material and equipment purchases, fabrication and construction of any elements covered by that submittal.

1.6.4.1 Exception to Contractor Construction Actions

The Government will approve the following final submittals before the Contractor shall be allowed to proceed with construction:

a. Any design submittal that includes or will be impacted by a design change to the contract. Final Government approval of the design change is required before construction can begin on the work included in that design submittal.

1.6.5 Contractor's Responsibilities

a. Designate a lead licensed architect or engineer to be in responsible charge to coordinate the design effort of the entire project. This lead architect or engineer must coordinate all design segments of the project to assure consistency of design between design disciplines.

b. With the Designer of Record, verify site information provided in the RFP. In addition, provide additional field investigations and verification of existing site conditions as may be required to support the development of design and construction of the project.

c. Indicate on the transmittal form accompanying submittal which design submittals are being submitted as shop drawings.

d. Advise Contracting Officer of variations, as required by paragraph VARIATIONS.

e. Provide an updated, cumulative submittal register with each design package that identifies the design and construction submittals required by that design package and previous submittals.

f. Refer to Section 01 33 29.05 20, SUSTAINABILITY REPORTING FOR DESIGN-BUILD for Contractor's responsibilities for Guiding Principle Validation [and Third Party Certification].

g. Refer to Section 01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI) for Contractor's eOMSI responsibilities.

1.6.6 QC Organization Responsibilities

a. The QC Manager must certify design submittals for compliance with the

contract documents. The DOR stamp on drawings indicates approval from the DOR.

b. QC organization must certify submittals forwarded by the Designer of Record (DOR) to the Contracting Officer with the following certifying statement:

"I hereby certify that the (equipment) (material) (article) shown and marked in this submittal is that proposed to be incorporated with Contract Number (insert contract number here), is in compliance with the contract documents, and is submitted for Government approval.

Certified by Design Quality Control (DQC) Manager
_____, Date _____
Certified by QC Manager_____,
Date _____"

c. Sign certifying statement. The persons signing certifying statements must be the QC organization members designated in the approved QC plan. The signatures must be in original ink. Stamped signatures are not acceptable.

d. Update submittal register as submittal actions occur and maintain the submittal register at project site until final approval of all work by Contracting Officer.

e. Retain a copy of approved submittals at project site.

1.6.7 Government Responsibilities

The Government will:

a. Note date on which submittal was received from QC manager, on each submittal.

b. Perform a quality assurance (QA) review of submittals. Government will notify Contractor when comments for that design package are posted and ready for Contractor evaluation and resolution.

c. Upon submittal of final design package and resolution of comments by the Contractor, the Government will sign final design package, when approved, and return electronic copy of signed design documents to the Contractor.

d. Upon Government receipt and acceptance of the Designer of Record signed and stamped final design submission for all work, a no-cost unilateral modification will be issued to incorporate the final design into the contract.

1.6.7.1 Actions Possible

Submittals will be returned with one of the following notations:

a. Submittals may be marked "approved." Submittals marked "approved" indicate a quality assurance (QA) review has been performed. Government review or approval of any portion of the proposal or final design does not relieve the Contractor from responsibility for meeting the contract requirements or for any error that may exist, because under the Quality Control (QC) requirements of this contract, the

Contractor is responsible for ensuring information contained within each submittal accurately conforms with the requirements of the contract documents. Furthermore, Government review or approval of a submittal is not to be construed as a complete check.

b. Submittals marked "not reviewed" indicate submittal has been previously reviewed and approved, is not required, does not have evidence of being reviewed and certified by Contractor, or is not complete. Submittal will be returned with an explanation of the reason it is not reviewed. Resubmit submittals returned for lack of review by Contractor or for being incomplete, with appropriate action, coordination, or change.

c. Submittals marked "revise and resubmit" or "disapproved" indicate submittal is incomplete or does not comply with design concept or requirements of the contract documents and must be resubmitted with appropriate changes. If work has been started on the unacceptable portion of the design submittal, the Contractor must propose corrective action. No further work is allowed to proceed until the issue is resolved in a manner satisfactory to the Government.

1.7 DESIGN DOCUMENTS

Provide design documents that include basis of design, design drawings, and design specifications, reports, and submittal register in accordance with FC 1-300-09N, Navy and Marine Corps Design Procedures.

The Contractor is encouraged to make product, material, and system selections during the project design and indicate these choices on the design documents. Accomplish this by submitting design drawings and specifications that include proprietary submittal information such as manufacturers name, product names, model numbers, product data, manufactures information, provided optional features, appropriate connections, fabrication, layout, and product specific drawings. Adherence to RFP submittal requirements and provision of DOR approved construction submittal information on the design submittals - eliminates the need for follow-on traditional construction submittals after the final design is approved.

The Contractor is required to submit proprietary information to describe the construction submittal information in the design documents for all products, materials, and systems submittals listed below:

a. All building enclosure components.

b. All roof components.

c. Major mechanical and electrical equipment such as chillers , transformers,generators,and Boilers.

d. Interior finishes.

Refer to Section 01 33 00.05 20, CONSTRUCTION SUBMITTAL PROCEDURES for requirements pertaining to Contractor proposed design changes or variations.

1.8 DESIGN DRAWINGS

Prepare, organize, and present design drawings in accordance with the requirements of FC 1-300-09N, Navy and Marine Corps Design Procedures.

Submit all CAD files for the final drawings on CD-ROM or DVD disks in AutoCAD 2013 format. Drawing files must be full files, uncompressed and unzipped.

1.8.1 Design Drawings Used as Shop Drawings

Design drawings may be prepared more like shop drawings to minimize construction submittals after final design is approved. If the Contractor chooses or is required to include the construction submittal information on the design documents, indicate proprietary information on the design drawings as necessary to describe the products, materials, or systems that are to be used on the project. Construction submittal information included directly in the design drawings must be approved by the DOR. All design documents must be professionally signed in accordance with FC 1-300-09N, Navy and Marine Corps Design Procedures.

1.8.2 Drawing Format For Design Drawings Used as Shop Drawings

The Contractor-originated drawings will be used as the basis for the record drawings. Shop drawings included as design documents must comply with the same drawing requirements such as drawing form, sheet size, layering, lettering, and title block used in design drawings.

1.8.3 Identification of Design Drawings Used as Shop Drawings

The Contractor's transmittal letter and submittal register must indicate which design drawings are being submitted as shop drawings.

1.8.4 Naval Facilities (NAVFAC) Engineering Command Drawing Numbers

Number the final Contractor-originated design drawings consecutively with NAVFAC drawing numbers. Determine the total number of sheets required for the complete set of drawings before requesting the NAVFAC drawing numbers from the Contracting Officer.

1.8.5 Seals and Signatures on Documents

All final Contractor-originated design drawings must be signed, dated, and bear the seal of the registered architect or the registered engineer of the respective discipline in accordance with FC 1-300-09N. This seal must be the seal of the Designer of Record for that drawing, and who is professionally registered for work in that discipline. A principal or authorized licensed or certified employee must electronically sign and date final drawings and cover sheet, in accordance with FC 1-300-09N. The design drawing coversheets must be sealed and signed by the lead licensed architect or engineer of the project design team. Indicate the Contractor's company name and address on the drawing coversheets of each design submittal. Application of the electronic seal and signature accepts responsibility for the work shown thereon.

1.8.6 Units of Measure

Utilize English Inch-Pound units of measure on the design documents

1.9 BUILDING INFORMATION MANAGEMENT/MODELING (BIM)

Include BIM submittals as required by and complying with FC 1-300-09N:

a. BIM Project Execution Plan (PxP)

b. Design Model

c. Visual Review Report

d. Clash Detection Report

e. Record Model (With Record Documents)

1.10 SPECIFICATIONS

Provide a Contractor-originated design specification that in conjunction with the drawings, demonstrates compliance with requirements of the RFP. The specified products, materials, systems, and equipment that are approved by the DOR; submitted to the Government by the Contractor; and reviewed by the Contracting Officer must be used to construct the project. UFGS sections contained in RFP Part 2 become a part of the Contractor-originated Division 01 specification without modification. Specification Sections contained in RFP Part 5 become a part of the Contractor-originated specification without modification.

1.10.1 Specifications Components and Format

The Contractor must prepare design specifications that include a UFGS specification for each product, material, or system on the project. If the Contractor chooses or is required above to combine design and construction submittal information on the design documents, provide a UFGS specification and also proprietary information such as catalog cuts and manufacturers data that demonstrates compliance with the RFP. Organize the specifications using Construction Specification Institute (CSI) Masterformat™ unless the Contracting Officer requires a Uniformat organization. Navy's use of system specifications takes precedence over CSI Masterformat component breakdown and related component specifications. Provide project specifications to include the following:

a. Provide the specification cover sheet with the professional seal and signature of the lead licensed architect or engineer of the project design team. Indicate the Contractor's company name and address on the specification coversheet.

b. Table of contents for entire specification.

c. Individual UFGS specification sections for each product, material, and system required by the RFP. Edit UFGS sections in accordance with RFP Part 4, PTS Section Z-10, Design Submittals.

d. If proprietary information is provided or required, include a coversheets for the product, material, or system information that is being proprietarily specified. This information is to follow the related UFGS specification.

e. If proprietary information is provided or required, include highlighted and annotated Catalog Cuts, Manufacturer's Product Data, Tests, Certificates, Manufactures information and letters for each

product, material, or system that is being proprietary specified.

f. Coordinated submittal register for all products, materials and systems with each design submittal. Provide a cumulative register that identifies the design and construction submittals required by each design package along with previous design submittals. The DOR must assist in developing the submittal register by determining which submittal items are required to be approved by the DOR. Complete all fields in the final submittal register in order to obtain Government approval of the final design. Submittal register to include separate but simultaneous delivery and approval of design or data required to fulfill sustainability requirements by Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD.

1.10.2 Specifications Section Source Priority

Choose UFGS sections that describe the products, materials, and systems that are used on the project. Use current UFGS sections that are available on the Whole Building Design Guide website (available at this website: http://www.wbdg.org/ffc/dod) and give priority to the Unified Tri-Service UFGS sections (no spec number suffix) and UFGS that are prepared by NAVFAC (.00 20 suffix). Only use a UFGS section prepared by another DoD Component (.00 10, and .00 30 suffix), if an applicable NAVFAC prepared specification section does not exist. Do not use Army (.00 10 suffix) and NASA (.00 40 suffix) electrical and mechanical specifications. If no applicable UFGS technical specification exists to meet your project requirements, consult with the NAVFAC Component for guidance and create a new UFGS specification in accordance with UFC 1-300-02, Unified Facilities Guide Specifications (UFGS) Format Standard.

1.10.3 Fire Protection Specifications

Specifications pertaining to spray-applied fire proofing and fire stopping, exterior fire alarm reporting systems, interior fire alarm and detection systems, and fire suppression systems, including fire pumps and standpipe systems must be either prepared by, or reviewed and approved by the Fire Protection DOR.

1.10.4 Identification of Manufacturer's Product Data Used with Specifications

Provide complete and legible catalog cut sheets, product data, installation instructions, operation and maintenance instructions, warranty, and certifications for products and equipment for which final material and equipment choices have been made. Indicate, by prominent notation, each product that is being submitted including optional manufacturer's features, and indicate where the product data shows compliance with the RFP.

Coordinate with Section 01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI) for Contractor's eOMSI responsibilities.

1.10.5 Specification Software

Submit the final specification source files in SpecsIntact.

1.11 BASIS OF DESIGN

Prepare, organize, and present basis of design in accordance with the requirements of FC 1-300-09N. The basis of design must be a presentation of facts at the Concept Design Workshop to demonstrate the concept of the project is fully understood and the design is based on sound engineering principles. Provide design analyses for each discipline and include the following:

a. Basis of design that includes:

(1) An introductory description of the project concepts that addresses the salient points of the design;

(2) An orderly and comprehensive documentation of criteria and rationale for system selection; and

(3) The identification of any necessary licenses and permits that are anticipated to be required as a part of the design or construction process. The "Permits Record of Decision" (PROD) form provided must be used for recording permits.

b. Code and criteria search must identify all applicable codes and criteria and highlight specific requirements within these codes and criteria for critical issues in the facility design.

c. Calculations as specified and as needed to support this design.

d. Sustainability Notebook: Analysis and calculations relative to sustainable design requirements. Refer to Section 01 33 29.05 20, SUSTAINABILITY REPORTING FOR DESIGN-BUILD and FC 1-300-09N for requirements.

e. Completed Draft and Final High Performance and Sustainable Building (HPSB) Checklist, also known as the NAVFAC Sustainable and Energy Data Record Card (NSEDRC). Template can be found at: http://www.wbdg.org/ffc/navy-navfac/sustainable-development-program/required-track

f. Provide an exterior enclosure vapor pressure analysis, hygrothermal analysis, and written/graphic descriptions for each unique wall and roof assembly used as part of exterior enclosure barriers.

g. Section titled "Antiterrorism" that documents the antiterrorism features

h. Fall Protection Analysis

i. Draft and Interim DD Form 1354 that document the real property assets of the project. Refer to RECORD DOCUMENTS paragraphs in this section for requirements.

j. eOMSI Facility Data Workbook (FDW)

k. BIM PxP

m. Section titled "Cybersecurity" that documents the cybersecurity design and construction of facility-related control system requirements.

1.11.1 Basis of Design Format

The basis of design for each design discipline must include a cover page indicating the project title and locations, contract number, table of contents, tabbed separations for quick reference, and bound in separate volumes for each design discipline.

1.11.2 Design Calculations

Place the signature and seal of the designer responsible for the work on the cover page of the calculations for the respective design discipline.

1.11.3 Historic Preservation and Planning Commission Submission

Prepare the presentation materials required to obtain approval from the Historic Preservation and Planning Commissions having jurisdiction over the site location. The submission of the materials to the agencies will be accomplished by the Government. Consult with the NAVFAC Region Historic Preservation Officer and prepare a submittal in accordance with the 36 CFR 800.11, DOCUMENT STANDARDS. The Contractor is responsible for preparing the submittal package, presenting the project in public meeting, if called upon by the Government; and to modify the submittal and contract documents to incorporate the comments of the agencies having jurisdiction to obtain project approval.

1.11.4 Fall Protection Analysis

Eliminate fall hazards in the facility or if not feasible provide control measures to protect personnel conducting maintenance work after completion of the project. Identify fall hazards in the Basis of Design with the Design Development and Prefinal submittals. The analysis must describe how fall hazards are considered, eliminated, prevented or controlled to prevent maintenance personnel from exposure to fall hazards while performing work at heights. Refer to RFP Part 2, Section 01 35 26.05 20, GOVERNMENT SAFETY REQUIREMENTS FOR DESIGN-BUILD for fall hazard protection requirements.

1.11.5 Cybersecurity Basis of Design

Provide a single submittal indicating criteria and describe requirements for integrating cybersecurity in the design and construction of the facility-related control systems in accordance with UFC 4-010-06. The basis of design must describe specific guidance for control systems with the assigned Confidentiality, Integrity and Availability (C-I-A) impact ratings and shall list the security controls with recommendations and justifications for future tailoring of the security control set.

1.12 PROJECT RENDERING

Provide a full color photo-realistic architectural rendering of the primary facade or facades of the facility. Depict the final, approved facility design and accurately illustrate the proposed final constructed facility including but not limited to, massing, fenestration pattern, material selections, colors, textures, landscaping, paving, and to the extent directed - the surrounding context.

Renderings created using traditional casein painted techniques or computer generated renderings are acceptable. Develop computer generated renderings using a current rendering engine suitable to produce

photo-realistic images. Renderings created solely in BIM or CAD authoring software are not acceptable.

Renderings must include realistic advanced lighting characteristics (natural and synthetic) and true ambient lighting and shading characteristics. Provide images that are sharp in detail and resolution through proper anti-aliasing techniques. Material maps must be comprised of advanced techniques and practices to ensure materials are an exact representation of the facility product/finish selections.

1.12.1 Preliminary Rendering Planning

Provide planning PDF drawings of the facility to exhibit the proposed rendering appearance. Submit not less than 3 alternative views for review and approval to determine the most advantageous view. The Preliminary rendering submittal must display the following characteristics of the final rendering;

a. Selection of primary facade(s)

b. Point of view (aerial, eye-level, elevated, etc.)

c. Close-up or wide angle

d. Extent of surrounding context

Adjust view and resubmit if an alternative to the submitted views is required for the rendering planning approval. Submit rendering planning submittal during the Preliminary Design Submittal.

1.12.2 Prefinal Rendering

Submit an electronic copy of the prefinal rendering to indicate compliance with planning decisions, establish level of detail and rendering elements to be employed such as people, cars, vegetation/trees. Indicate proposed colors, textures, foreground and background. Use processes and printing equipment that will be used on the final rendering. Submit Prefinal rendering submittal for approval with the Prefinal Design Submittal.

1.12.3 Final Rendering

Provide the final rendering submission that complies with the following requirements:

a. The rendering must be a full vignette and fully developed. Approximate finished size must be a minimum of 24 by 30 inches with a 16 by 20 inches minimum inside mat dimension.

b. Provide final original color rendering, three full size high resolution reproductions of the original rendering, and two sets of the digital master images on DVD media. Original and reproductions must be mounted on acid free heavy illustration board and double-matted with complimentary colored, acid free mat boards. Frame rendering(s) with contemporary polished metal frames and single strength, non-glare glass. Print the Project name, location, Architect/Engineer firm's name on the matting. On the back of the renderings and reproductions, indicated the project name, the location, the contract number, and the date of reproduction.

c. Match the exterior color scheme approved for the facility.

d. Provide photo-realistic quality rendering elements such as people, cars, vegetation/trees, etc.

e. Provide digitally reproductions of the rendering using a minimum 600 dpi resolution for print reproduction on 24 by 36 inch stock with no loss of fidelity, quality or detail from the master image.

f. Provide each set of digital master images in both TIF and JPEG formats. Save JPEG images using the highest quality setting (minimum compression). Provide the following as a minimum;

(1) One set including the unit insignia(s) for the tenant activity, the service insignia (Navy, Marine Corps, Army, or Air Force), the name of the facility, name of installation, and the names of the contractor and design professional.

(2) One set including the image only, without any identifying information other than that which may be depicted as a part of the building signage within the rendering.

g. Submit the final rendering for approval 30 days after the Final Design Submittal approval. Ship the rendering, the digital copies and the digital files in resilient packaging to ensure damage free delivery. Deliver to: OICC Florence

1.13 RECORD DOCUMENTS

1.13.1 Record Drawings

The as-built modifications must be accomplished by electronic drafting methods on the Contractor-originated. DWG design drawings to create a complete set of record drawings. In addition to the requirements of FAC 5252.236-9310, RECORD DRAWINGS, survey the horizontal and vertical location of all provided underground utilities to within 0.1 feet relative to the station datum. All pipe utilities must be surveyed at each fitting and every 100 LF of run length. Electrical and communication duct bank, direct buried conduit, and direct buried conductor must be surveyed every 100 LF and at each change of direction. Record locations and elevations on the Record Drawings.

a. For each record drawing, provide CAD drawing identical to signed Contractor-originated PDF drawing, that incorporates modifications to the as-built conditions. In addition, copy initials and dates from the Contracting Officer approved .PDF documents to the title block of the record CAD.DWG drawings. The RFP reference or definitive drawings are not required for inclusion in the record set of drawings.

b. After all as-built conditions are recorded on the CAD.DWG files, produce a PDF file of each individual record drawing in conformance with FC 1-300-09N. Electronic signatures are not required on record drawings.

c. Provide a searchable electronic copy of the photo documentation used in the QC Daily Reports. Refer to Section 01 45 00.05 20, DESIGN AND CONSTRUCTION QUALITY CONTROL.

1.13.2 Source Documents

Provide the specifications, basis of design, reports, surveys, record model, calculations, and any other contracted documents on the CD-ROM or DVD disk with the record drawings.

1.13.3 DD Form 1354

Prepare a Draft and Interim DD Form 1354, TRANSFER AND ACCEPTANCE OF MILITARY REAL PROPERTY, in accordance with UFC 1-300-08. Coordinate the identification of quantities of appropriate asset construction categories with the Contracting Officer and the RPAO.

a. The Government will provide the Initial Draft DD Form 1354, Transfer and Acceptance of Military Real Property filled in with the appropriate Real Property Unique Identifiers (RPUID) and related construction Category Codes to summarize the designed real property assets that apply to this contract. Modify and include any necessary changes to the DD Form 1354 when meeting with the Contracting Officer and the Real Property Accounting Officer during the Pre Construction Meeting and the Project Closeout Meetings. The Contractor must provide the Interim DD Form 1354 that uses the appropriate division of the RPUIDs/ Category Codes to represent the final constructed facility and include all associated cost.

    (1) Coordinate the Contractor's Price and Payment structure with the structure of the RPUIDs/ Category Codes.

    (2) Divide detailed asset breakdown into the RPUIDs and related construction Category Codes and populate associated costs which represent all aspects of the work. Where assets diverge into multiple RPUID/Category Codes, divide the asset and provide the proportion of the assets in each RPUID/ Category Code. Assets and related RPUID/ Category Codes may be modified by the Contracting Officer as necessary during course of the work.

    (3) Coordinate identification and proportion of these assets with the Government Real Property Accounting Officer.

    (4) Cost data accumulated under this section are required in the preparation of DD Form 1354.

b. After award of the contract but prior to commencement of any work, meet with the Contracting Officer to discuss and develop a clear understanding relative to the administration of the Draft and Interim DD Form 1354 Submittal.

c. Draft DD Form 1354. DOR must determine quantities of applicable real property assets broken out by construction categories and submit a "Draft DD Form 1354" for Government approval as a part of the Basis of Design included with the Prefinal Design submittal. "Draft DD Form 1354" must include all quantities and units of measure, but does not require cost breakdown. The Real Property Accountable Officer (RPAO) will provide the first draft of the DD1354 to the contractor with RPUIDs and CCNS on it.

d. Interim DD Form 1354. Coordinate with the DOR and update the Draft DD Form 1354 submission to include any additional assets, improvements, or alterations that occurred during construction. Use the Draft DD

Form 1354 and the Section 01 20 00.05 20, PRICE AND PAYMENT PROCEDURES to identify costs. Submit Interim DD Form 1354 to the Government for approval 30 days prior to the Beneficial Occupancy Date (BOD). Attach completed NAVFAC High Performance and Sustainable Building (HPSB) Checklist to DD1354, in accordance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. If modifications to the Interim DD Form 1354 are required by the Government, the corrected version must be submitted prior to the BOD.

Submit the completed Checklist for Form DD1354 of Government-Furnished and Contractor-Furnished/Contractor Installed items. Attach this list to the Interim DD Form 1354. Instructions for completing the form and a blank checklist may be obtained from UFC 1-300-08.

Coordinate with Section 01 20 00.05 20, PRICE AND PAYMENT PROCEDURES for construction categories and associated category codes. The Contractor's Schedule of Prices must allocate the total cost of construction to the appropriate category codes.

When documenting demolition work, the DD Form 1354 must list the quantitative data associated with this work as a negative value to show the cost should be deleted from the Navy asset data store. Coordinate with the Installation Real Property POC to assist in determining the negative value for demolition work.

There are two ways to account for the demolition portion of the project and to document the reduction of real property: (1) attach an Authorization for Demolition form 18 (Service-specific) to the DD Form 1354 to document category codes and quantities of demolished real property. These should be listed separately from constructed/transferred item numbers; or, (2) indicate, as additional DD Form 1354 item numbers, all demolished real property facility numbers and category codes using negative numbers (shown in parenthesis) for units of measure, and in block 18 indicate N/A for costs. Disposal cost within the footprint of the project is added into total construction cost of new facility prompting the demolition.

Within 5 days of the completion of demolition, the contractor responsible will submit a completed NAVFAC disposal form to the NAVFAC Construction Manager and Real Property Accountability Officer (RPAO). For assistance in completing the form, contact the RPAO, Amanda Dawsey, amanda.dawsey@usmc.mil. FORM attached.

1.13.4 Record Model

Provide Record Model in accordance with FC 1-300-09N.

PART 2 PRODUCTS

2.1 CONSOLIDATED RFP DOCUMENTS

Within 21 calendar days after contract award, provide one electronic and 4 hard copies of consolidated RFP documents incorporating the Contractor's Proposal and all RFP amendments and revisions that are contained in the contract award. Identify the changes to the RFP with the "Red-lining" or "Track Changes" feature of SpecsIntact or MS Word to highlight the pre-award modifications to the contract. Identify the amendment source at each addition and deletion by annotation, such as footnote or reference in parenthesis.

2.2 DESIGN SUBMITTALS

Complete the Contractor-originated design submittals as defined by this contract, and coordinate with the approved design network analysis schedule.

Refer to Section 01 33 29.05 20, SUSTAINABILITY REPORTING FOR DESIGN-BUILD for sustainable design submittals.

2.2.1 Design Submittal Packages

The Government prefers to review for Quality Assurance (QA) as few submittal packages as possible. Site and Building Design Submittal Packages are required, however Critical Path Design Submittals are acceptable if they are substantiated as having an impact to the critical path in the Government approved Network Analysis Schedule. A Critical Path submittal must include all design analyses, drawings, specifications and product data required to fully describe the project element for Government review.

Examples of project elements that may be submitted as Critical Path Design Submittal Packages are: Master Plan Design, Demolition Design, Foundation Design, Structural Design, Building Enclosure Design, Remaining Work Design, Furniture/Equipment Design, long lead items, or any other construction activity or project element that can be organized into a submittal package that can be reviewed and approved by the Government without being contingent upon subsequent design submittals.

2.2.1.1 Site Design

The Site Design typically includes the following components:

a. Master Site Plan

b. Demolition

c. Site work

d. Geotechnical

2.2.1.2 Building Design

The Building Design typically includes the following components:

a. Foundation

b. Structural

c. Building Enclosures

d. Remaining Work

e. Furniture/Equipment

2.2.2 Required Design Submittals

Provide the following Design Submittal packages. Provide comprehensive, multi-discipline design packages that include design documentation for

project elements, fully developed to the design stage indicated, and in accordance with FC 1-300-09N, except where specified otherwise.

a. Concept Design presented at Concept Design Workshop

b. Design Development in-progress, - Government Progress QA. 21 calendar day Government review time.

c. Prefinal (100 percent) Design - Government Progress QA. 21 calendar day Government review time.

d. Final Design - Government QA. 21 calendar day Government review time for submittals requiring Government approval prior to construction.

2.2.3 Critical Path Design Submittals

Provide Critical Path Design Submittals that include design documents for the project elements involved. Include and provide full documentation that would normally have been provided in earlier submittal stages, such as Design Development Phase.

a. 100 percent (Prefinal) Design - Government Progress QA. 21 calendar day Government review time.

b. Final Design - Government QA. 21 calendar day Government review time for submittals requiring Government approval prior to construction.

2.2.4 Review Copies of Design Submittal Packages

a. Provide bound copies of each design submittal package for review to the following reviewers. Addresses for mailing will be furnished at the PAK meeting.

(1) 8 paper copies to the NAVFAC component and 1 electronic copies of the Final submittals.

(2) 8 paper copies to IDD.

(3) 3 paper copies to the OICC and 1 electronic copy of the Final submittals.

b. Provide the same quantities of copies for resubmittals, as required for each design submittal.

2.2.5 Design Submittal Review Schedule

Use the time frames for Government submittal review identified in the RFP. For construction scheduling purposes add additional time to the identified minimum review time periods to allow for the following scheduling conditions:

(1) Submittals received after noon will be logged in on the following business day.

(2) Federal holidays, including the period between Christmas and New Year's Day, will be considered non-working days for Government personnel in reviewing design submittals and attending design related meetings.

(4) Postpone delivery when heightened security restricts access to the Base. Coordinate heightened security requirements in advance with the CM.

(5) Period of review for a resubmittal is the same as the initial submittal. Review time for resubmittals caused by non-conformance, do not result in a change in contract duration or cost.

2.2.6 Distribution of Approved Final Design Drawings and Specification to Government Representatives

Submit within 14 calendar days of receiving the Government Approved Final Design Documents, which includes any Critical Path Final Design Document Packages, electronic and hardcopy(s) of these final documents to Government representatives for use during the construction of the project. If Critical Path Submittal Packages are used, provide coversheets and index to identify each sheet and how this Critical Path Submittal Package fits into the overall project. Provide the number and type of copies of the final design documents to the following Government representative by mail:

a. Two electronic and Eight hard copy(s) to the Project Manager (OICC Florence)

b. Two electronic and two hard copy(s) to IDD

c. Two electronic and Two hard copy(s) to the Construction Manager

d. One electronic and one hard copy(s) to the Contracting Officer

e. One electronic and one hard copy(s) to the Public Works Officer

2.3 IDENTIFICATION OF DESIGN SUBMITTALS

Provide a title sheet to clearly identify each submittal, the completion status, and the date. The title sheet must use the standard format indicated in the FC 1-300-09N for title sheets. The title sheet must be unique to a particular design submittal. Submit the project title sheet with design status and date for the design submittals.

2.3.1 Critical Path Submittal Title Sheet

Identify Critical Path submittals as such and include a title sheet indicating the type of critical path submittal, the level of completion of the individual drawings, and which drawings are approved for construction.

2.3.2 Construction Document Validation

All CAD design documents used to construct the facility must bear a visible and legible AutoCAD generated plotstamp in the lower right-hand margin of each drawing. The plotstamp information on the jobsite construction documents must match the plotstamp information contained on the following development stages of the design documents:

a. The Final Critical Path Submittal or the Final Design Submittal professionally signed by the DOR and submitted for Government approval.

b. The Final Critical Path Submittal or the Final Design Submittal drawings that have been approved by the Government. This development stage may be combined with "c." below, if issued at the same time.

c. The Final Critical Path or Final Design drawings that have been included in the contract by modification.

d. The Final Critical Path or Final Design drawings which include subsequent revisions to the design documents that have been included in the contract by modifications.

Issue new drawings for construction which bear the current plotstamp once a new development stage of the design documents has been accomplished. Design documents which do not bear a plotstamp that matches the corresponding plotstamp exhibited on the design documents described above, are not allowed to be used for the construction of the project. The plotstamp must bear the date and time of the plot, at a minimum. Maintain a plotstamp record at the jobsite that lists the applicable plotstamp information for each drawing through each stage of development described above.

PART 3 EXECUTION

3.1 CONTRACTOR'S RESOLUTION OF COMMENTS

Provide written responses to all written comments by the Government. Resubmittal of an unacceptable design submittal must be a complete package that includes all the required, specified components of that design submittal. When required by the Government, Contractor resubmittal of design package, due to nonconformance to the contract, is not a delay in the contract.

3.2 DESIGN CHANGE AND VARIATIONS

A design change is when the design is revised from what was reviewed by the Government during any phase of the design process prior to Government approval of the Final Design. A variation is any portion of the design that differs from the requirements of the solicitation, accepted proposal, or final design after Government approval of the Final Design. Design changes and variations require Government approval and only variations that are advantageous to the Government will be considered. Refer to Section 01 33 00.05 20, CONSTRUCTION SUBMITTAL PROCEDURES for further explanation and requirements of design change and variation.

The Contractor must immediately notify the Government of all potential design changes and variations via a Request for Information (RFI) to the Contracting Officer. Design changes or variations that the Contractor asserts will require a contract modification to adjust the cost/price or schedule are not allowed to be incorporated in the design during any phase of the design process without prior documented approval from the Contracting Officer. Contractors will not receive compensation for any unauthorized design changes or variations which have been included in the Government approved Final Design. Include the following information in the design change and variation RFIs:

a. Indicate the RFP Parts, sections, and paragraphs affected by this design change or variation,

b. The scope of work of the design change or variation,

c. The reason for the proposed change,

d. Explanations of how the variation is advantageous to the Government.

d. Indicate which upcoming design submittal will be affected by the subject design change,

e. Explanation of contract cost/price and schedule impacts or provide an affirmative statement indicating that the design change or variation will not have an impact on the contract cost/price or schedule.

f. Coordination measures proposed to incorporate the design change or variation into the construction.

g. Upon request by the Contracting Officer, submit a cost proposal prepared using the Uniformat Work Breakdown Structure for all design changes and variations that have cost or schedule impacts. Submit a proposal that provides cost breakdown of each Uniformat system or subsystem that is applicable to the design change or variation. Utilize the units of measure indicated in the Uniformat Structure at the NAVFAC DB RFP website, http://www.wbdg.org/ndbm/uniformat.php.

3.3 THE CONTRACT AND ORDER OF PRECEDENCE

3.3.1 Contract Components

The contract consists of the solicitation, the approved proposal, and the final design.

3.3.2 Order of Precedence

In the event of conflict or inconsistency between any of the below described portions of the conformed contract, precedence must be given in the following order:

a. Any portions of the proposal or final design that exceed the requirements of the solicitation.

(1) Any portion of the proposal that exceeds the final design.

(2) Any portion of the final design that exceeds the proposal.

(3) Where portions within either the proposal or the final design conflict, the portion that most exceeds the requirements of the solicitation has precedence.

b. The requirements of the solicitation, in descending order of precedence:

(1) Standard Form 1442, Price Schedule, and Davis Bacon Wage Rates.

(2) Part 1 - Contract Clauses.

(3) Part 2 - General Requirements.

(4) Part 3 - Project Program Requirements.

(5) Part 6 - Attachments (excluding Concept Drawings)

(6) Part 5 - Prescriptive Specifications exclusive of performance specifications.

(7) Part 4 - Performance Specifications exclusive of prescriptive specifications.

(8) Part 6 - Attachments (Concept Drawings).

c. Within Part 3 - Project Program Requirements Section 5.0 ROOM REQUIREMENTS provides detailed requirements on a room by room basis that further defines requirements that are in addition to the ENGINEERING SYSTEMS REQUIREMENTS SECTION.

3.3.2.1 Government Review or Approval

Government review or approval of any portion of the proposal or final design does not relieve the Contractor from responsibility for errors or omissions with respect thereto.

U.S. NATIONAL ARCHIVES AND RECORDS ADMINISTRATION (NARA)

10 CFR 433.300	Subpart C - Green Building Certification for Federal Buildings
40 CFR 247	Comprehensive Procurement Guideline for

1.2 SUMMARY

This specification includes general requirements and procedures for projects to be designed, constructed, and documented per the federally mandated High Performance and Sustainable Building or "HPSB Guiding Principles" (GP), Third Party Certification (TPC) requirements, UFC 1-200-02 High Performance and Sustainable Building Requirements, and other requirements identified in this specification.

1.3 SUBMITTALS

Submittals requirements are specified in the technical sections using Submittal Description (SD) numbers and titles. Submittals requiring Government approval use a "G" or submittal designator in the UFGS sections. In addition, submit the GPV and TPC-required sustainability documentation in this specification as "S" submittals. Submittals not having a "G" designation are for Contractor Quality Control approval.

Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with the requirements of this Section.

Government approval is required for submittals in RFP Part 2 with a "G" designation Additional construction submittals reserved for Government approval are listed in the Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES. Submittals with a "G" designation found in the sections used by the Contractor to create construction specification, require DOR approval. DOR approved submittals are also listed in the "Construction Submittals" paragraph in each RFP PART 4, Performance Technical Specifications. Provide required certification or validation submittals in accordance with Section 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES, Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES, FC 1-300-09N, Navy and Marine Corps Design Procedures, and as identified below.

SD-01 Preconstruction Submittals

Preliminary High Performance and Sustainable Building Checklist; G

Sustainability Action Plan

Preliminary Sustainability eNotebook; G

SD-05 Design Data

Final Design High Performance and Sustainable Building Checklist; G

Final Design Sustainability eNotebook; G

SD-11 Closeout Submittals

Final High Performance and Sustainable Building Checklist; G

Final Sustainability eNotebook; G

Amended Final Sustainability eNotebook; G

Amended Final High Performance and Sustainable Building Checklist; G

Third Party Certification or Validation; G

1.4 GUIDING PRINCIPLES VALIDATION (GPV)

Provide sustainability documentation to verify achievement of HPSB Guiding Principles Validation (GPV).

Provide the following for GPV:

a. Refer to Attachment 1, HPSB Checklist at the end of this specification section. (Multiple checklists indicate multiple buildings that require HPSB tracking.)

b. Obtain approval of the HPSB Checklist from the Contracting Officer at the Post Award Kick-Off Meetings. Contracting Officer's approval establishes identified HPSB Guiding Principles Requirements as the project's sustainability goals.

   No variations or substitutions to the HPSB Checklist are allowed without written consent from the Contracting Officer. Immediately bring to the attention of the Contracting Officer any project changes that impact meeting the approved HPSB Guiding Principles Requirements for this project and Contractor must demonstrate that change will not incur additional construction cost or increase the life cycle cost.

c. Provide all work, including "S" submittals, required to incorporate the applicable HPSB Guiding Principles Requirements indicated on the HPSB Checklist and in this contract.

d. Provide Sustainable Action Plan.

e. Provide design and construction related documentation for the project Sustainability eNotebook, and keep updated with regularly-scheduled construction meetings. Include design and construction related documentation containing the following components;

   (1) HPSB Checklist

   (2) Sustainability Action Plan

   (3) Documentation illustrating HPSB Guiding Principle Requirements compliance (including "S" submittals)

1.4.1 Sustainability Action Plan

Include the following information in the Sustainability Action Plan;

a. Planned method to achieve each GP requirement.

b. For each designated HPSB Guiding Principles Requirement that is not achieved, provide narrative explaining how mission or activity precludes achieving specific sustainability requirement or goal. Provide analysis of particular requirement and level to which project is able to comply. Final government approved narrative(s) must be included in the HPSB Checklist submittal.

c. Name and contact information for: Contractor's POC ensuring sustainability goals are accomplished and documentation is assembled.

d. Include the Indoor Air Quality plan with the Sustainability Action Plan.

1.4.2 Costs

Bear all costs associated with designing, constructing and demonstrating that project complies with approved HPSB Guiding Principles Requirements.

1.4.3 Calculations

Provide all design data, calculations, product data, labels and certifications required in this specification to demonstrate compliance with the HPSB Guiding Principles Requirements.

1.4.4 Third Party Certification (TPC) Documentation

1.4.4.1 TPC Registration Required

Register and achieve Third Party Certification (TPC), by meeting all TPC and project requirements of the UFCs . An equivalent TPC organization must demonstrate equivalency for Government consideration and meet the requirements of 10 CFR 433.300, prior to use on the project. Third Party Certification is met when Government receives TPC organization certificate or validation

Third Party Certification or validation requirements are in addition to all requirements under header above GUIDING PRINCIPLES VALIDATION (GPV).

Register project with TPC organization using the following format and content:

a. Project Title First Line: US Army, US Air Force, US Navy or US Marine Corps, Building Name (if known)

b. Project Title Second Line: MILCON P#, DD1391 Project Name

c. Project Address: UIC (Installation code), Category code, RPUID (Real Property Unique Identifier) Number

d. Project Owner Organization: US Army, US Air Force, US Navy or US Marine Corps

e. Primary Contact, Owner: Agency Project Manager

f. Building Owner Organization: US Navy or US Marine Corps

g. Additional Contact, Building Owner: Public Works Officer or Designee

1.4.4.2 TPC Management and Certification

The TPC Certification or validation requires the following:

a. Refer to Attachment 2, TPC Checklist at the end of this specification section. (Multiple checklists indicate multiple buildings that require TPC.)

b. Obtain approval of the TPC Checklist from the Contracting Officer at the Post Award Kick-Off Meetings. Contracting Officer's approval

establishes identified TPC Requirements as part of the project's sustainability goals.

No variations or substitutions to the TPC Checklist are allowed without written consent from the Contracting Officer. Immediately bring to the attention of the Contracting Officer any project changes that impact meeting the approved TPC Requirements for this project. Demonstrate that change will not: incur additional construction cost; increase the life cycle cost; or impact achieving required TPC certification or validation level.

c. Complete all design and construction work to incorporate the applicable TPC Requirements.

d. Maintain the design and construction related information, and provide replacement pages, in the Sustainability eNotebook pertaining to additions and changes to the approved sustainability requirements. Maintain the Sustainability eNotebook in electronic format. Refer to explanation in the paragraph SUSTAINABILITY eNOTEBOOK. Provide the following components in the Sustainability eNotebook, in addition to the GPV components listed above:

(1) TPC Checklist

(2) Completed TPC Online forms for each identified prerequisite and credit. Upload onto the TPC Online documentation website.

(3) Copy of all correspondence with the TPC organization. Provide proof of TPC registration.

(4) Documentation illustrating compliance with TPC requirements and additional documentation as requested by the Third Party certifier.

(5) TPC Award Certificate or validation

e. Provide the following information in the Sustainability Action Plan. Provide this TPC information in addition to the Sustainability Action Plan items above:

(1) Planned method to achieve each TPC requirement.

(2) For each of the TPC credit that is attempted but not achieved, provide narrative explaining how mission or activity precludes achieving specific sustainability requirement or goal. Provide analysis of particular requirement and level to which project is able to comply.

(3) Provide names and contact information for: Contractor sustainability POC and other names of sustainability professionals on the Contractor's Staff responsible for ensuring TPC sustainability goals are accomplished and documentation is assembled.

f. Bear all costs associated with designing, constructing, and demonstrating that project complies with approved TPC requirements, including but not limited to:

(1) Registration, review, certification or validation and plaque fees.

(2) Online (or offline with secure facilities) TPC management and documentation.

(3) Obtaining TPC certification or validation based on Government-approved sustainability goals.

(4) Design and construction work required to incorporate TPC prerequisites and credits.

(5) Submittals required to demonstrate compliance with Government approved TPC checklists.

g. Provide all design data, calculations, product data, and certifications required in this specification to demonstrate compliance with the TPC Requirements.

h. Provide all online (or offline, with secure facilities) TPC management and documentation.

i. Provide all required responses to TPC.

j. Provide TPC Plaque and Certificates or validation. Use the following format to create the Plaque, Certificate, and Letter of Congratulations. Forward to parties designated by Contracting Officer:

(1) Plaque:

Name: Final Building Name. If unknown, use the Form DD1391 Project Name.

(2) Certificate or Validation:

Project title, first line: P-(X); (1391 Project Name). Project title, second line: UIC (installation code)

(3) Letter of Congratulation (when provided):

Address letter to the Facility's Installation Commander Name. Address the letter to an individual person.

k. Once Final Certification is achieved, turn over Administrative rights to online TPC to the Public Works Office or designee, provided by the Contracting Officer.

1.5 SUSTAINABILITY SUBMITTALS

Provide updated HPSB Checklist and other documentation in the Sustainability eNotebook to indicate compliance with the sustainability requirements of the project.

1.5.1 High Performance Sustainable Building (HPSB) Checklist

Provide documentation that provides proof of and supports compliance with the completed HPSB Checklist. Prepopulated HPSB checklist may be obtained from the Government Project Manager.

1.5.1.1 HPSB Checklist Submittals

Submit updated HPSB Checklist with each Sustainability eNotebook

submittal. Attach final HPSB Checklist to draft final DD1354 Real Property Record Submittal.

1.5.2 "S" Submittals for Sustainability Documentation

Submit the GPV and TPC sustainability documentation required in this specification as "S" submittals in all affected UFGS Sections. Highlight GPV and TPC compliance data in "S" submittal.

1.5.3 Sustainability eNotebook

Prepare and maintain a comprehensive Sustainability eNotebook to document compliance with the sustainability requirements identified in the approved HPSB and TPC Checklists. Sustainability eNotebook must contain all required data to support full compliance with the HPSB Guiding Principles Requirements, including HPSB checklist, Sustainable Action Plan, calculations, labels, certifications and TPC requirements. Sustainability eNotebook is in the form of an Adobe PDF file; bookmarked at each HPSB Guiding Principles Requirement, TPC requirement,and sub-bookmarked at each document. Match format to HPSB Guiding Principles numbering system indicated herein. Maintain up to date information, spreadsheets, templates, etc. with each current submittals. For TPC projects, provide a second Table of contents using TPC numbering system, for maintaining documentation unique to TPC.

Contracting Officer may deduct from the monthly progress payment accordingly if Sustainability eNotebook information is not current, until information is updated and on track per project goals.

1.5.3.1 Sustainability eNotebook Submittal Schedule

Provide Sustainability eNotebook Submittals at the following milestones of the project:

a. Preliminary Sustainability eNotebook

Submit preliminary Sustainability eNotebook for approval at the Pre-construction conference. Include Preliminary High Performance and Sustainable Building Checklist and TPC checklist.

b. Final Design Sustainability eNotebook

Submit updated Sustainability eNotebook no later than 60 days after final design complete submission. Identify any outstanding issues in writing, relating to achieving the sustainability goals of the project and incomplete documentation requirements. Obtain DOR approval and submit electronic copies of the Final Design Sustainability eNotebook on DVDs to the Government. Include Final Design High Performance and Sustainable Building Checklist.

c. Construction Progress Meetings.

Update GP and TPC documentation in the Sustainability eNotebook and TPC Online tool for each meeting.

d. Final Sustainability eNotebook

Submit updated Sustainability eNotebook at Beneficial Occupancy Date (BOD). Final progress payment retainage may be held by Contracting

Officer until Final Sustainability construction phase documentation is complete. Obtain DOR approval and submit electronic copies of the Final Sustainability eNotebook on DVDs to the Government. Include Final High Performance and Sustainable Building Checklist.

e. Amended Final Sustainability eNotebook

Amend and resubmit the Amended Final Sustainability eNotebook to include post-occupancy corrections, updates, and requirements. Include Amended Final High Performance and Sustainable Building Checklist. Final progress payment retainage may be held by Contracting Officer until amended final sustainability documentation is complete. Submit final electronic copies of the Amended Final Sustainability eNotebook Submittal on DVDs to the Government no longer than 30 days after the GP,TPC designated data collection period.

1.6 DOCUMENTATION REQUIREMENTS

a. Incorporate each of the following HPSB Guiding Principles requirements into project and provide documentation that proves compliance with each listed requirement. Items below are organized by HPSB Guiding Principles. For life-cycle cost analysis requirements, one document with all analyses is acceptable, with Contracting Officer approval.

b. For each of the following paragraphs that require the use of products listed on Government-required websites, provide documentation of the process used to select products, or process used to determine why listed products do not meet project performance requirements.

1.6.1 Integrated Design Process

For the submittal documentation below, Follow the steps of design optimization, as applicable, in ASHRAE 189.1 Section F1.1.1 (Charrette Process), with the exception that subparagraph b. does not apply.

1.6.1.1 Design Submittal Documentation

a. Provide listing the sustainability integrated design team, and a description of their roles in all stages of a project's planning and delivery:

(1) Include Contractor's Sustainability Coordinators; Architecture and Engineering disciplines involved on the project, and the DOR in charge of the overall project and each discipline; Construction Subcontractors and the company representatives that align with each architectural and engineering discipline, Planning, Public Works, Environmental Specialist and other appropriate installation personnel.

(2) Describe their roles and responsibilities and plan-of-action for how each team member will be involved to achieve the project sustainability requirements, and how the Contractor will coordinate with Government personnel.

(3) Maintain the list and descriptions up-to-date throughout the project.

b. Provide narratives that:

(1) Indicate performance goals for siting, energy, water, materials, and indoor environmental quality along with other comprehensive design goals and ensures incorporation of these goals throughout the design and lifecycle of the building.

(2) Demonstrate integration of the goals into design and construction.

(3) Demonstrate collaboration with other providers, such as Commissioning Authority and Third Party Certification.

1.6.2 Commissioning (Cx)

Develop and incorporate Commissioning requirements into the documents as required by Section 01 91 00.15 22 TOTAL BUILDING COMMISSIONING.

1.6.3 Optimize Energy Performance

For Commercial and Multi-Family High-Rise Residential Buildings, meet the requirements of ASHRAE 90.1 - IP, and achieve at least 30 percent energy efficiency below baseline, when life cycle cost effective.

Reduce measured building energy use by at least 30 percent compared to building energy use in 2003 or a year thereafter with metered energy use data.

1.6.3.1 Design Submittal Documentation

a. Narrative that provides a summary of:

(1) The decision making process leading to the selection of at least three energy-efficient solutions (for each individual building energy system) to be analyzed; and the selected design solution(s)

(2) The specific energy standard and version utilized; and the software used in the analysis

(3) The calculated energy consumption and energy use intensity (EUI in kBTU/sf/yr) of the baseline building and the proposed design alternatives

b. A minimum of the following energy modeling files and summaries for the baseline and proposed alternatives:

(1) Input, schedules and libraries; and output

(2) Calculated energy use by energy type

(3) Calculated energy use by building system

c. The life-cycle cost-analysis input and out files for the baseline and the proposed alternatives

1.6.3.2 Construction Submittal Documentation

Provide revised energy modeling for actual system constructed.

1.6.4 Energy Efficient Products

Provide only energy-using products that are Energy Star rated, or have Federal Energy Management Program (FEMP) recommended efficiency. Where Energy Star or FEMP recommendations have not been established, provide most efficient product available. Provide only energy using product that meets FEMP requirements for low standby power consumption. Energy efficient products can be found at: http://www1.eere.energy.gov/femp/ and http://www.energystar.gov/.

For construction submittal documentation, provide proof that product is labeled energy efficient and complies with the cited requirements.

1.6.5 Building-level Power Metering

Provide building-level meters for electricity, natural gas (and steam where applicable) use.

For design submittal documentation, provide design drawings that highlight meter locations on the site.

1.6.6 Indoor Water Use

a. Meet the requirements of ASHRAE 189.1 Section 6.3.2 (Building Water Use Reduction), which incorporates USEPA WaterSense-labeled products. Water closet replacements in renovations may have a flush value of up to 1.6 GPF (6.1 LPF) to accommodate existing plumbing capacity.

b. Meet the requirements of ASHRAE 189.1 Section 6.4.2 (Building Water Use Reduction).

c. Meet the requirements of ASHRAE 189.1 Section 6.4.3 (Special Water Features).

1.6.6.1 Construction Submittal Documentation

Provide proof that fixtures are labeled EPA WaterSense or Energy Star, for products available with EPA WaterSense or Energy Star labeling; for all other fixtures, proof they comply with the cited efficiency requirements.

1.6.7 Indoor Water Metering

Provide building-level meters for potable water use.

For design submittal documentation, provide design drawings that highlight meter locations on the site.

1.6.8 Outdoor Water Use

Potable water use is prohibited for irrigating new landscaping, other than for plant establishment. When non-potable water is life cycle cost effective and is used for new, permanent irrigation, provide the following:

1.6.8.1 Design Submittal Documentation

a. Provide design drawings and analysis that identify the non-potable water source used and demonstrate the non-potable water source is appropriate for landscape irrigation.

b. Provide life cycle cost analysis (LCCA).

1.6.9 Outdoor Water Meters

Provide building-level meters for potable water used for existing irrigation systems using potable water and serving more than 25,000 square feet of landscape, when life-cycle cost effective.

1.6.9.1 Design Submittal Documentation

a. Provide design drawings that highlight meter locations on the site.

b. Provide life cycle cost analysis (LCCA).

1.6.10 Alternative Water

Use alternative sources of water to replace potable water usage, when life-cycle cost effective and to the extent permitted by local laws and regulations.

1.6.10.1 Design Submittal Documentation

a. Provide design drawings and calculations that demonstrate the alternative water sources used, potable water savings as compared to non-alternative water sourcing, and projected annual potable water savings.

b. Provide life cycle cost analysis (LCCA).

1.6.11 Stormwater Management

Develop and incorporate stormwater requirements into the documents. Submit design and construction documentation required by UFC 3-210-10 and Agency processes, as proof of this tracking requirement.

1.6.12 Ventilation and Thermal Comfort

Meet the requirements of UFC 3-410-01.

1.6.12.1 Design Submittal Documentation

a. Provide design drawings and calculations that demonstrate HVAC systems and the building envelope have been designed to meet the requirements.

1.6.13 Moisture Control

Meet the requirements of ASHRAE 189.1 Section 10.3.1.5 (Moisture Control), UFC 3-410-01, Chapter 3, Sections 3-2 and 3-3 (Ventilation Air), and UFC 3-101-01 Chapter 3 (Building Envelope Requirements).

1.6.13.1 Design Submittal Documentation

a. Provide drawings of building envelope details and HVAC humidity controls.

b. Provide plan for construction material storage and protection, humidity controls during construction, and operation and maintenance plan for ongoing building moisture control.

1.6.14 Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)

Meet the requirements of Table 3-1 at the end of this specification.

For Construction submittal documentation, provide certifications or labels that demonstrate compliance with cited requirements, based on the attached TABLE 3-1.

1.6.15 Indoor Air Quality During Construction

Prior to construction, create indoor air quality plan. Develop and implement an IAQ construction management plan during construction and flush building air before occupancy.

For new construction and for renovation of unoccupied existing buildings, meet the requirements of ASHRAE 189.1 Section 10.3.1.4 (Indoor Air Quality (IAQ) Construction Management), with maximum outdoor air consistent with achieving relative humidity no greater than 60 percent.

Provide documentation showing that after construction ends and prior to occupancy, HVAC filters were replaced and building air was flushed out in accordance with the cited standard.

1.6.16 Recycled Content

Comply with 40 CFR 247. Refer to: https://www.epa.gov/smm/comprehensive-procurement-guideline-cpg-program for assistance identifying products cited in 40 CFR 247. Selected products must comply with non-proprietary requirements of the Federal Acquisition Regulation, and must meet performance requirements.

1.6.16.1 Construction Submittal Documentation

a. Provide manufacturers' documents stating the recycled content by material, or written justification for claiming one of the exceptions allowed on the cited website.

b. Substitutions: Submit for Government approval for proposed alternative products or systems that provide equivalent performance and appearance and have greater contribution to project recycled content requirements. For all such proposed substitutions, submit with the Sustainability Action Plan accompanied by product data demonstrating equivalence.

1.6.17 Bio-Based Products

Provide products and materials composed of the highest percentage of bio-based materials (including rapidly renewable resources and certified sustainably harvested products), consistent with FSRIA 9002 USDA BioPreferred Program, to the maximum extent possible without jeopardizing the intended end use or detracting from the overall quality delivered to the end user. Use only supplies and materials of a type and quality that conform to applicable specifications and standards. Comply with FSRIA 9002 USDA BioPreferred Program. Refer to www.biopreferred.gov for the product categories and BioPreferred Catalog.

For construction submittal documentation, provide USDA BioPreferred label for each product; for bio-based products used on project but not listed

with Biopreferred program, provide bio-based content and percentage.

1.6.18 Ozone Depleting Substances

Meet the requirements of ASHRAE 189.1 Section 9.3.3 Refrigerants for no CFC-based refrigerants in heating ventilation, air conditioning and refrigeration systems (except for fire suppression system requirements, covered elsewhere in this specification). Use products from U.S. EPA Significant New Alternatives Policy (SNAP) (http://www.epa.gov/snap) or meet the criteria of SNAP.

1.6.18.1 Construction Submittal Documentation

a. Provide SDS sheets for all refrigerants.

b. Provide label for each product meeting the cited standards.

1.6.19 Waste Material Management (Recycling – Design)

Meet the requirements of ASHRAE 189.1 Section 9.3.4.1 (Storage and Collection of Recyclables – Recyclables), where markets or onsite recycling exist.

For design submittal documentation, provide drawing showing an appropriately sized and placed storage area has been dedicated for recyclables.

1.6.20 Waste Material Management (Recycling – Construction)

Divert construction debris from landfill disposal where markets or on-site recycling exists, where markets or on-site recycling exists.

Submit in accordance with Section 01 74 19.05 20 CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT FOR DESIGN-BUILD.

1.6.21 Address Climate Change Risk

When project scope includes Government-provided projections of climate-change or floodplain risk, provide building design solutions responsive to the scope.

For design submittal documentation, provide narrative of decisions for design associated with scoped requirements.

1.6.22 Validation and Certification Restrictions

The purchase of renewable energy credits (RECs) specifically to meet project sustainability goals is prohibited.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 SUSTAINABILITY COORDINATION

3.1.1 Coordinating Sustainability Documentation Progress

Provide sustainability focus and coordination at the following meetings to achieve sustainability goals. In addition to requirement below, the following meetings requirements are further described in other parts of the RFP documents. The designated TPC accredited sustainability professional responsible for GP and TPC documentation must participate in these meetings to coordinate documentation completion.

3.1.1.1 Design Review Meetings

Review progress towards meeting Sustainability requirements in the Sustainability Action Plan,and completeness of Sustainability eNotebook, and TPC Online submission at the following meetings:

a. Post Award Kick-Off Meeting: Refer to Section 01 31 19.05 20 POST AWARD MEETINGS. Discuss the following: TPC and HPSB Checklists, Sustainability Action Plan, Design submittal and Construction submittal requirements and schedule, individuals responsible for achieving each Guiding Principle Requirement and TPC prerequisite and credit.

b. Design Quality Assurance Meetings: Refer to Section 01 31 19.05 20 POST AWARD MEETINGS for requirements. Discuss progress toward accomplishing Sustainability goals and obtaining sustainability documentation at each design submittal review. Refer to RFP Part 2 Section 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES for designated design submittals.

c. Design Complete Review Meetings (No later than 60 days after final design complete submission): Review HPSB Checklist, Sustainability eNotebook, and TPC submission for completeness and identify any outstanding issues relating to final score and documentation requirements.

3.1.1.2 Construction Progress Meetings

Review GP and TPC sustainability requirements with project team including contractor and sub-contractor representatives. Demonstrate HPSB Checklist and TPC documentation is being collected and updated to the Sustainability eNotebook and TPC Online tool.

a. Facility Turnover Meetings: Refer to Section 01 31 19.05 20 POST AWARD MEETINGS for further requirements. Review HPSB Checklist, Sustainability eNotebook, and TPC Online submission for completeness and identify any outstanding issues relating to final documentation requirements.

b. Final Sustainability eNotebook Review

3.2 THIRD PARTY CERTIFICATION OR VALIDATION

Finalize the sustainability certification or validation process and obtain the TPC Certification Plaque and Certificates or validation, indicating completion of the projects sustainability goals.

Provide and hang Plaque in accordance with contract documents. Provide one original framed copy of the certificate or validation, mounted in 1 inch deep metal frames, with double matt, and wire hangers, in location approved by Contracting Officer. Provide one original certificate or validation, and deliver to Contractor Officer, unless otherwise instructed. Provide and hang Plaque in a prominent interior location approved by the Contracting Officer.

3.2.1 Third Party Certification Plaque and Certificates

Provide one original framed copy of the certificate, mounted in 1 inch deep metal frames, with double matt, and wire hangers, in location approved by Contracting Officer. Provide original certificates, and deliver to Contractor Officer, unless otherwise instructed. Provide and hang Plaque in a prominent interior location approved by the Contracting Officer.

3.3 TABLE 3-1 VOLATILE ORGANIC COMPOUNDS (VOC) (LOW EMITTING MATERIALS) REQUIREMENTS

Refer to following table for compliance criteria for paragraph titled "Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)", based on ASHRAE 189.1 section 8.4.2 (Materials).

TABLE 3-1 Volatile Organic Compounds (VOC) (Low Emitting Materials) Requirements

UFGS 01 33 29.05 20, Paragraph "Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)" Submittal Requirements (Interior Applications Only)

MATERIAL CATEGORY	EMISSIONS REQUIREMENT		MATERIALS WITH ADDED VOC REQUIREMENT	MATERIAL CATEGORY
Adhesives and Sealants	**CDPH/EHLB/Standard method V1.1 (California Section 01350)** (Use "office" or "classroom" space limits for all applications)	or	Adhesives (carpet, resilient, wood flooring; panel; primers) Sealants (acoustical; firestop; HVAC Air duct; primers) Caulks	**SCAQMD Rule 1168** (Use "other" category for HVAC duct sealant) (for firestop adhesive, UFC 3-600-01 overrides conflicting requirements)
			Aerosol adhesives	**Section 3 of Green Seal Standard GS-36** (except: cleaners, solvent cements, and primers used with plastic piping and conduit in plumbing, fire suppression, and electrical systems; HVAC air duct sealants when the application space air temp is less than 40 F (4.5 C).
Paints and Coatings	**CDPH/EHLB/Standard method V1.1 (California Section 01350)** (Use "office" or "classroom" space limits for all applications)	or	Flat and nonflat topcoats, primers, undercoaters, and anti-corrosive coatings	**Green Seal Standard GS-11**

TABLE 3-1 Volatile Organic Compounds (VOC) (Low Emitting Materials) Requirements

UFGS 01 33 29.05 20, Paragraph "Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)" Submittal Requirements (Interior Applications Only)

MATERIAL CATEGORY	EMISSIONS REQUIREMENT		MATERIALS WITH ADDED VOC REQUIREMENT	MATERIAL CATEGORY
Paints and Coatings	**CDPH/EHLB/Standard method V1.1 (California Section 01350)** (Use "office" or "classroom" space limits for all applications)	or	Concrete/masonry sealers (waterproofing concrete/masonry sealers), concrete curing compounds, dry fog coatings, faux finishing coatings, fire resistive coatings, floor coatings, graphic arts (sign) coatings, industrial maintenance coatings, mastic texture coatings, metallic pigmented coatings, multicolor coatings, pretreatment wash primers, reactive penetrating sealers, recycled coatings, shellacs (clear and opaque), specialty primers, stains, wood coatings (clear wood finishes), wood preservatives, and zinc primers	**California Air Resources Board (CARB) Suggested Control Measure for Architectural Coatings** or **SCAQMD Rule 1113**

TABLE 3-1 Volatile Organic Compounds (VOC) (Low Emitting Materials) Requirements

UFGS 01 33 29.05 20, Paragraph "Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)" Submittal Requirements (Interior Applications Only)

MATERIAL CATEGORY	EMISSIONS REQUIREMENT		MATERIALS WITH ADDED VOC REQUIREMENT	MATERIAL CATEGORY
Paints and Coatings	**CDPH/EHLB/Standard method V1.1 (California Section 01350)** (Use "office" or "classroom" space limits for all applications)	or	Basement specialty coatings, high-temperature coatings, low solids coatings, stone consolidants, swimming-pool coatings, tub- and tile-refining coatings, and waterproofing membranes	**California Air Resources Board (CARB) Suggested Control Measure for Architectural Coatings**
Floor Covering Materials	For carpet, all locations: **CDPH/EHLB/Standard Method V1.1 (California Section 01350)** or label for **Section 9** of **CDPH/EHLB/Standard Method V1.1 (California Section 01350)**		none	none

TABLE 3-1 Volatile Organic Compounds (VOC) (Low Emitting Materials) Requirements

UFGS 01 33 29.05 20, Paragraph "Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)" Submittal Requirements (Interior Applications Only)

MATERIAL CATEGORY	EMISSIONS REQUIREMENT		MATERIALS WITH ADDED VOC REQUIREMENT	MATERIAL CATEGORY
Composite Wood, Wood Structural Panel, and Agrifiber Products particleboard medium density fiberboard (MDF) wheatboard strawboard panel substrates door cores **no added urea-formaldehyde resins** including laminating adhesives for composite wood and agrifiber assemblies	Third-party certification (approved by CARB) of **California Air Resource Board's (CARB) regulation**, Airborne Toxic Control Measure to Reduce Formaldehyde Emissions from Composite Wood Products		none	none
	CDPH/EHLB/Standard method V1.1 (California Section 01350) (Use "office" or "classroom" space limits for all applications) (except: Structural panel components such as plywood, particle board, wafer board, and oriented strand board identified as "EXPOSURE 1," "EXTERIOR," or "HUD-APPROVED" are considered acceptable for interior use.)			

TABLE 3-1 Volatile Organic Compounds (VOC) (Low Emitting Materials) Requirements

UFGS 01 33 29.05 20, Paragraph "Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)" Submittal Requirements (Interior Applications Only)

MATERIAL CATEGORY	EMISSIONS REQUIREMENT		MATERIALS WITH ADDED VOC REQUIREMENT	MATERIAL CATEGORY
Office Furniture Systems and Seating installed prior to occupancy	**ANSI/BIFMA X7.1 ANSI/BIFMA X7.1:** (95 percent of installed office furniture system workstations and seating units) **Section 7.6.2 of ANSI/BIFMA e3** (50 percent of office furniture system workstations and seating units)		none	none
Ceiling and Wall Systems ceiling and wall insulation acoustical ceiling panels tackable wall panels gypsum wall board and panels wall coverings	**CDPH/EHLB/Standard method V1.1 (California Section 01350)** (Use "office" or "classroom" space limits for all applications)		none	none

SUSTAINABILITY DATA - GUIDING PRINCIPLES for SUSTAINABLE DEVELOPMENT

Use this form to collect Design Goals information to be recorded on the Sustainable and Energy Tab in eProjects

NOTE: 1. Mark "N/A" only when at least one of the listed justifications is applicable, and mark those justifications. Otherwise, mark "Yes."
2. If project is for more than one building for which tracking is required, complete a separate form for each building.

PRELIMINARY PROJECT INFORMATION

1 How many buildings are included in this project? 1

2 Does at least one building meet one of the following: 1) new construction (new building **or** addition to existing);
- OR - 2) Renovation in an existing building, with construction cost greater than $3M? ☑ Yes ☐ No

3 Identify the building to be tracked in this tab: II MEF Simulat

DESIGN DEVELOPMENT - DOCUMENTATION OF COMPLIANCE WITH GUIDING PRINCIPLES

I. Employ Integrated Design Principles

1 Integrated Design Goals — In Compliance ☑ Yes ☐ N/A

N/A due to
☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

2 Commissioning Goals — In Compliance ☑ Yes ☐ N/A

N/A due to
☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

(i) Systems commissioned

II. Optimize Energy Performance

3. Energy Efficiency Goals — In Compliance ☑ Yes ☐ N/A

N/A due to
☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

(i) Energy Savings Below Baseline % 30.00 *Target Savings - AE2 to determine

(ii) Energy Standard

SECTION 01 35 13.05 20

SPECIAL PROJECT PROCEDURES FOR DESIGN-BUILD
11/07

PART 1 GENERAL

1.1 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 COMPREHENSIVE WORK APPROVAL PERMIT APPLICATION (CWAP)

Submit a CWAP through NAVFAC for all work to be done on NSFIH. Sample CWAP is included in Part 6 of this RFP.

3.2 HAZARDS OF ELECTROMAGNETIC RADIATION TO ORDNANCE (HERO) COMPLIANCE APPROVAL FOR EQUIPMENT IN THE RESTRICTED AREA

Submit for HERO Compliance at theSafety Office. All equipment to be used within the restricted area must be certified for HERO Compliance prior to use on this project.

3.3 WORK APPROVAL PERMIT

Work to be completed within explosive areas requires a Work Approval Permit that the Contractor files with the Indian Head Safety Office Inspector. The Inspector and the NSASP CM will coordinate with the Contractor and the explosive building managers to schedule a time for the Contractor's work to be completed. The Contractor must provide a schedule of work with the permit.

1.2 DEFINITIONS

1.2.1 Competent Person (CP)

The CP is a person designated in writing, who, through training, knowledge and experience, is capable of identifying, evaluating, and addressing existing and predictable hazards in the working environment or working conditions that are dangerous to personnel, and who has authorization to take prompt corrective measures with regards to such hazards.

1.2.2 Competent Person, Confined Space

The CP, Confined Space, is a person meeting the competent person requirements as defined EM 385-1-1 Appendix Q, with thorough knowledge of OSHA's Confined Space Standard, 29 CFR 1910.146, and designated in writing to be responsible for the immediate supervision, implementation and monitoring of the confined space program, who through training, knowledge and experience in confined space entry is capable of identifying, evaluating and addressing existing and potential confined space hazards and, who has the authority to take prompt corrective measures with regard to such hazards.

1.2.3 Competent Person, Cranes and Rigging

The CP, Cranes and Rigging, as defined in EM 385-1-1 Appendix Q, is a person meeting the competent person, who has been designated in writing to be responsible for the immediate supervision, implementation and monitoring of the Crane and Rigging Program, who through training, knowledge and experience in crane and rigging is capable of identifying, evaluating and addressing existing and potential hazards and, who has the authority to take prompt corrective measures with regard to such hazards.

1.2.4 Competent Person, Excavation/Trenching

A CP, Excavation/Trenching, is a person meeting the competent person requirements as defined in EM 385-1-1 Appendix Q and 29 CFR 1926, who has been designated in writing to be responsible for the immediate supervision, implementation and monitoring of the excavation/trenching program, who through training, knowledge and experience in excavation/trenching is capable of identifying, evaluating and addressing existing and potential hazards and, who has the authority to take prompt corrective measures with regard to such hazards.

1.2.5 Competent Person, Fall Protection

The CP, Fall Protection, is a person meeting the competent person requirements as defined in EM 385-1-1 Appendix Q and in accordance with ASSP Z359.0, who has been designated in writing by the employer to be responsible for immediate supervising, implementing and monitoring of the fall protection program, who through training, knowledge and experience in fall protection and rescue systems and equipment, is capable of identifying, evaluating and addressing existing and potential fall hazards and, who has the authority to take prompt corrective measures with regard to such hazards.

1.2.6 Competent Person, Scaffolding

The CP, Scaffolding is a person meeting the competent person requirements in EM 385-1-1 Appendix Q, and designated in writing by the employer to be

responsible for immediate supervising, implementing and monitoring of the scaffolding program. The CP for Scaffolding has enough training, knowledge and experience in scaffolding to correctly identify, evaluate and address existing and potential hazards and also has the authority to take prompt corrective measures with regard to these hazards. CP qualifications must be documented and include experience on the specific scaffolding systems/types being used, assessment of the base material that the scaffold will be erected upon, load calculations for materials and personnel, and erection and dismantling. The CP for scaffolding must have a documented, minimum of 8-hours of scaffold training to include training on the specific type of scaffold being used (e.g. mast-climbing, adjustable, tubular frame), in accordance with EM 385-1-1 Section 22.B.02.

1.2.7 Competent Person (CP) Trainer

A competent person trainer as defined in EM 385-1-1 Appendix Q, who is qualified in the material presented, and who possesses a working knowledge of applicable technical regulations, standards, equipment and systems related to the subject matter on which they are training Competent Persons. A competent person trainer must be familiar with the typical hazards and the equipment used in the industry they are instructing. The training provided by the competent person trainer must be appropriate to that specific industry. The competent person trainer must evaluate the knowledge and skills of the competent persons as part of the training process.

1.2.8 High Risk Activities

High Risk Activities are activities that involve work at heights, crane and rigging, excavations and trenching, scaffolding, electrical work, and confined space entry.

1.2.9 High Visibility Accident

A High Visibility Accident is any mishap which may generate publicity or high visibility.

1.2.10 Load Handling Equipment (LHE)

LHE is a term used to describe cranes, hoists and all other hoisting equipment (hoisting equipment means equipment, including crane, derricks, hoists and power operated equipment used with rigging to raise, lower or horizontally move a load).

1.2.11 Medical Treatment

Medical Treatment is treatment administered by a physician or by registered professional personnel under the standing orders of a physician. Medical treatment does not include first aid treatment even through provided by a physician or registered personnel.

1.2.12 Near Miss

A Near Miss is a mishap resulting in no personal injury and zero property damage, but given a shift in time or position, damage or injury may have occurred (e.g., a worker falls off a scaffold and is not injured; a crane swings around to move the load and narrowly misses a parked vehicle).

1.2.13 Operating Envelope

The Operating Envelope is the area surrounding any crane or load handling equipment. Inside this "envelope" is the crane, the operator, riggers and crane walkers, other personnel involved in the operation, rigging gear between the hook, the load, the crane's supporting structure (i.e. ground or rail), the load's rigging path, the lift and rigging procedure.

1.2.14 Qualified Person (QP)

The QP is a person designated in writing, who, by possession of a recognized degree, certificate, or professional standing, or extensive knowledge, training, and experience, has successfully demonstrated their ability to solve or resolve problems related to the subject matter, the work, or the project.

1.2.15 Qualified Person, Fall Protection (QP for FP)

A QP for FP is a person meeting the requirements of EM 385-1-1 Appendix Q, and ASSP Z359.0, with a recognized degree or professional certificate and with extensive knowledge, training and experience in the fall protection and rescue field who is capable of designing, analyzing, and evaluating and specifying fall protection and rescue systems.

1.2.16 Recordable Injuries or Illnesses

Recordable Injuries or Illnesses are any work-related injury or illness that results in:

a. Death, regardless of the time between the injury and death, or the length of the illness;

b. Days away from work (any time lost after day of injury/illness onset);

c. Restricted work;

d. Transfer to another job;

e. Medical treatment beyond first aid;

f. Loss of consciousness; or

g. A significant injury or illness diagnosed by a physician or other licensed health care professional, even if it did not result in (a) through (f) above.

1.2.17 USACE Property and Equipment

Interpret "USACE" property and equipment specified in USACE EM 385-1-1 as Government property and equipment.

1.2.18 Load Handling Equipment (LHE) Accident or Load Handling Equipment Mishap

A LHE accident occurs when any one or more of the eight elements in the operating envelope fails to perform correctly during operation, including operation during maintenance or testing resulting in personnel injury or death; material or equipment damage; dropped load; derailment;

two-blocking; overload; or collision, including unplanned contact between the load, crane, or other objects. A dropped load, derailment, two-blocking, overload and collision are considered accidents, even though no material damage or injury occurs. A component failure (e.g., motor burnout, gear tooth failure, bearing failure) is not considered an accident solely due to material or equipment damage unless the component failure results in damage to other components (e.g., dropped boom, dropped load, or roll over). Document any mishap that meets the criteria described in the Contractor Significant Incident Report (CSIR).

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

APP - Pre-Design Submittal; G

APP - Pre-Construction Submittal; G

SD-06 Test Reports

Monthly Exposure Reports

Notifications and Reports

Accident Reports; G

LHE Inspection Reports

SD-07 Certificates

Crane Operators/Riggers

Standard Lift Plan; G

Critical Lift Plan ; G

Activity Hazard Analysis (AHA)

Confined Space Entry Permit

Hot Work Permit

Certificate of Compliance

License Certificates

1.4 MONTHLY EXPOSURE REPORTS

Provide a Monthly Exposure Report and attach to the monthly billing request. This report is a compilation of employee-hours worked each month for all site workers, both Prime and subcontractor. Failure to submit the report may result in retention of up to 10 percent of the voucher.

1.5 REGULATORY REQUIREMENTS

In addition to the detailed requirements included in the provisions of this contract, comply with the most recent edition of USACE EM 385-1-1, and the following federal, state, and local laws, ordinances, criteria, rules and regulations. Submit matters of interpretation of standards to the appropriate administrative agency for resolution before starting work. Where the requirements of this specification, applicable laws, criteria, ordinances, regulations, and referenced documents vary, the most stringent requirements govern.

1.6 SITE QUALIFICATIONS, DUTIES, AND MEETINGS

1.6.1 Personnel Qualifications

1.6.1.1 Site Safety and Health Officer (SSHO)

Provide an SSHO that meets the requirements of EM 385-1-1 Section 1. The SSHO must ensure that the requirements of 29 CFR 1926.16 are met for the project. Provide a Safety oversight team that includes a minimum of one (1) person at each project site to function as the Site Safety and Health Officer (SSHO). The SSHO or an equally-qualified Alternate SSHO must be at the work site at all times to implement and administer the Contractor's safety program and government-accepted Accident Prevention Plan. The SSHO and Alternate SSHO must have the required training, experience, and qualifications in accordance with EM 385-1-1 Section 01.A.17, and all associated sub-paragraphs.

If the SSHO is off-site for a period longer than 24 hours, an equally-qualified alternate SSHO must be provided and must fulfill the same roles and responsibilities as the primary SSHO. When the SSHO is temporarily (up to 24 hours) off-site, a Designated Representative (DR), as identified in the AHA may be used in lieu of an Alternate SSHO, and must be on the project site at all times when work is being performed. Note that the DR is a collateral duty safety position, with safety duties in addition to their full time occupation.

1.6.1.2 Contractor Quality Control (QC) Manager:

The Contractor Quality Control Manager cannot be the SSHO on this project, even though the QC has safety inspection responsibilities as part of the QC duties.

1.6.1.3 Competent Person Qualifications

Provide Competent Persons in accordance with EM 385-1-1, Appendix Q and herein. Competent Persons for high risk activities include confined space, cranes and rigging, excavation/trenching, fall protection, and electrical work. The CP for these activities must be designated in writing, and meet the requirements for the specific activity (i.e. competent person, fall protection).

The Competent Person identified in the Contractor's Safety and Health Program and accepted Accident Prevention Plan, must be on-site at all times when the work that presents the hazards associated with their professional expertise is being performed. Provide the credentials of the Competent Persons(s) to the the Contracting Officer for information in consultation with the Safety Office.

1.6.1.3.1 Competent Person for Confined Space Entry

Provide a Confined Space (CP) Competent Person who meets the requirements of EM 385-1-1, Appendix Q, and herein. The CP for Confined Space Entry must supervise the entry into each confined space.

1.6.1.3.2 Competent Person for Scaffolding

Provide a Competent Person for Scaffolding who meets the requirements of EM 385-1-1, Section 22.B.02 and herein.

1.6.1.3.3 Competent Person for Fall Protection

Provide a Competent Person for Fall Protection who meets the requirements of EM 385-1-1, Section 21.C.04, 21.B.03, and herein.

1.6.1.4 Qualified Trainer Requirements

Individuals qualified to instruct the 40 hour contract safety awareness course, or portions thereof, must meet the definition of a Competent Person Trainer, and, at a minimum, possess a working knowledge of the following subject areas: EM 385-1-1, Electrical Standards, Lockout/Tagout, Fall Protection, Confined Space Entry for Construction; Excavation, Trenching and Soil Mechanics, and Scaffolds in accordance with 29 CFR 1926.450, Subpart L.

Instructors are required to:

a. Prepare class presentations that cover construction-related safety requirements.

b. Ensure that all attendees attend all sessions by using a class roster signed daily by each attendee. Maintain copies of the roster for at least five (5) years. This is a certification class and must be attended 100 percent. In cases of emergency where an attendee cannot make it to a session, the attendee can make it up in another class session for the same subject.

c. Update training course materials whenever an update of the EM 385-1-1 becomes available.

d. Provide a written exam of at least 50 questions. Students are required to answer 80 percent correctly to pass.

e. Request, review and incorporate student feedback into a continuous course improvement program.

1.6.1.5 Crane Operators/Riggers

Provide Operators meeting the requirements in EM 385-1-1, Section 15.B for Riggers and Section 16.B for Crane Operators. In addition, for mobile

cranes with Original Equipment Manufacturer (OEM) rated capacities of 50,000 pounds or greater, designate crane operators qualified by a source that qualifies crane operators (i.e., union, a government agency, or an organization that tests and qualifies crane operators). Provide proof of current qualification.

1.6.2 Personnel Duties

1.6.2.1 Duties of the Site Safety and Health Officer (SSHO)

The SSHO must:

a. Conduct daily safety and health inspections and maintain a written log which includes area/operation inspected, date of inspection, identified hazards, recommended corrective actions, estimated and actual dates of corrections. Attach safety inspection logs to the Contractors' daily production report.

b. Conduct mishap investigations and complete required accident reports. Report mishaps and near misses.

c. Use OSHA's Form 300 to log work-related injuries and illnesses occurring on the project site for Prime Contractors and subcontractors. Post and maintain the Form 300 on the site Safety Bulletin Board.

d. Maintain applicable safety reference material on the job site.

e. Attend the pre-construction conference, pre-work meetings including preparatory meetings, and periodic in-progress meetings.

f. Review the APP and AHAs for compliance with EM 385-1-1, and approve, sign, implement and enforce them.

g. Establish a Safety and Occupational Health (SOH) Deficiency Tracking System that lists and monitors outstanding deficiencies until resolution.

h. Ensure subcontractor compliance with safety and health requirements.

i. Maintain a list of hazardous chemicals on site and their material Safety Data Sheets (SDS).

j. Maintain a weekly list of high hazard activities involving energy, equipment, excavation, entry into confined space, and elevation, and be prepared to discuss details during QC Meetings.

k. Provide and keep a record of site safety orientation and indoctrination for Contractor employees, subcontractor employees, and site visitors.

Superintendent, QC Manager, and SSHO are subject to dismissal if the above duties are not being effectively carried out. If Superintendent, QC Manager, or SSHO are dismissed, project work will be stopped and will not be allowed to resume until a suitable replacement is approved and the above duties are again being effectively carried out.

1.6.3 Meetings

1.6.3.1 Prework Conference

a. Contractor representatives who have a responsibility or significant role in accident prevention on the project must attend the Prework Conference. This includes the project superintendent, Site Safety and Occupational Health officer, quality control manager, or any other assigned safety and health professionals who participated in the development of the APP (including the Activity Hazard Analyses (AHAs) and special plans, program and procedures associated with it).

b. Discuss the details of the submitted APP to include incorporated plans, programs, procedures and a listing of anticipated AHAs that will be developed and implemented during the performance of the contract. This list of proposed AHAs will be reviewed at the conference and an agreement will be reached between the Contractor and the Contracting Officer as to which phases will require an analysis. In addition, establish a schedule for the preparation, submittal, and Government review of AHAs to preclude project delays.

c. Deficiencies in the submitted APP, identified during the Contracting Officer's review, must be corrected, and the APP re-submitted for review prior to the scheduling the Prework Conference. Work is not permitted to begin until an APP is established that is acceptable to the Contracting Officer.

1.6.3.2 Safety Meetings

Conduct safety meetings to review past activities, plan for new or changed operations, review pertinent aspects of appropriate AHA (by trade), establish safe working procedures for anticipated hazards, and provide pertinent Safety and Occupational Health (SOH) training and motivation. Conduct meetings at least once a month for all supervisors on the project location. The SSHO, supervisors, foremen, or CDSOs must conduct meetings at least once a week for the trade workers. Document meeting minutes to include the date, persons in attendance, subjects discussed, and names of individual(s) who conducted the meeting. Maintain documentation on-site and furnish copies to the Contracting Officer on request. Notify the Contracting Officer of all scheduled meetings 7 calendar days in advance.

1.7 ACCIDENT PREVENTION PLAN (APP)

1.7.1 Plans and Submissions

1.7.1.1 APP - Pre-Design Submittal

Provide a site-specific Accident Prevention Plan (APP), including Activity Hazard Analyses (AHA), in accordance with the US Army Corps of Engineers Safety and Health Manual EM 385-1-1 Appendix A, paragraph 3.k for the design team to follow during site visits and investigations. For subsequent visits, update the form if there are changes in the personnel who will be attending, or the tasks to be performed. Submit the APP for review and acceptance by the Government at least 15 calendar days prior to the start of the design field work. Field work may not begin until the pre-design APP is accepted by the Contracting Officer.

If the design scope includes borings or other subsurface investigations, as part of the APP identify the type of field investigation and

verification techniques, such as visual, local utility locating service scanning and third party/subcontractor scanning, potholing, or hand digging within two feet of a known utility. Mark underground utilities before starting any ground-disturbing actions. Notify the Contracting Officer 15 days prior to the start of soil borings or sub-surface investigations.

Prior to the start of construction incorporate the Pre-Design APP into the Pre-Construction APP so that one site specific APP exists for the project and submit to the Contracting Officer for acceptance

1.7.1.2 APP - Pre-Construction Submittal

A qualified person must prepare the written site-specific APP. Prepare the APP in accordance with the format and requirements of EM 385-1-1, Appendix A, and as supplemented herein. Cover all paragraph and subparagraph elements in EM 385-1-1, Appendix A. The APP must be job-specific and address any unusual or unique aspects of the project or activity for which it is written. The APP must interface with the Contractor's overall safety and health program referenced in the APP in the applicable APP element, and made site-specific. Describe the methods to evaluate past safety performance of potential subcontractors in the selection process. Also, describe innovative methods used to ensure and monitor safe work practices of subcontractors. The Government considers the Prime Contractor to be the "controlling authority" for all work site safety and health of the subcontractors. Contractors are responsible for informing their subcontractors of the safety provisions under the terms of the contract and the penalties for noncompliance, coordinating the work to prevent one craft from interfering with or creating hazardous working conditions for other crafts, and inspecting subcontractor operations to ensure that accident prevention responsibilities are being carried out. The APP must be signed by an officer of the firm (Prime Contractor senior person), the individual preparing the APP, the on-site superintendent, the designated SSHO, the Contractor Quality Control Manager, and any designated Certified Safety Professional (CSP) or Certified Health Physicist (CHP). The SSHO must provide and maintain the APP and a log of signatures by each subcontractor foreman, attesting that they have read and understand the APP, and make the APP and log available on-site to the Contracting Officer. If English is not the foreman's primary language, the Prime Contractor must provide an interpreter.

Submit the APP to the Contracting Officer 15 calendar days prior to the date of the preconstruction conference for acceptance. Work cannot proceed without an accepted APP. Once reviewed and accepted by the Contracting Officer, the APP and attachments will be enforced as part of the contract. Disregarding the provisions of this contract or the accepted APP is cause for stopping of work, at the discretion of the Contracting Officer, until the matter has been rectified. Continuously review and amend the APP, as necessary, throughout the life of the contract. Changes to the accepted APP must be made with the knowledge and concurrence of the Contracting Officer, project superintendent, SSHO and Quality Control Manager. Incorporate unusual or high-hazard activities not identified in the original APP as they are discovered. Should any severe hazard exposure (i.e. imminent danger) become evident, stop work in the area, secure the area, and develop a plan to remove the exposure and control the hazard. Notify the Contracting Officer within 24 hours of discovery. Eliminate and remove the hazard. In the interim, take all necessary action to restore and maintain safe working conditions in order to safeguard onsite personnel, visitors, the public (as defined by

ASSP A10.34), and the environment.

1.7.2 Names and Qualifications

Provide plans in accordance with the requirements outlined in Appendix A of EM 385-1-1, including the following:

a. Names and qualifications (resumes including education, training, experience and certifications) of site safety and health personnel designated to perform work on this project to include the designated Site Safety and Health Officer and other competent and qualified personnel to be used. Specify the duties of each position.

b. Qualifications of competent and of qualified persons. As a minimum, designate and submit qualifications of competent persons for each of the following major areas: excavation; scaffolding; fall protection; hazardous energy; confined space; health hazard recognition, evaluation and control of chemical, physical and biological agents; and personal protective equipment and clothing to include selection, use and maintenance.

1.7.3 Plans

Provide plans in the APP in accordance with the requirements outlined in Appendix A of EM 385-1-1, including the following:

1.7.3.1 Confined Space Entry Plan

Develop a confined or enclosed space entry plan in accordance with EM 385-1-1, applicable OSHA standards 29 CFR 1910, 29 CFR 1915, and 29 CFR 1926, OSHA Directive CPL 2.100, and any other federal, state and local regulatory requirements identified in this contract. Identify the qualified person's name and qualifications, training, and experience. Delineate the qualified person's authority to direct work stoppage in the event of hazardous conditions. Include procedure for rescue by contractor personnel and the coordination with emergency responders. (If there is no confined space work, include a statement that no confined space work exists and none will be created.)

1.7.3.2 Standard Lift Plan (SLP)

Plan lifts to avoid situations where the operator cannot maintain safe control of the lift. Prepare a written SLP in accordance with EM 385-1-1, Section 16.A.03, using Form 16-2 for every lift or series of lifts (if duty cycle or routine lifts are being performed). The SLP must be developed, reviewed and accepted by all personnel involved in the lift in conjunction with the associated AHA. Signature on the AHA constitutes acceptance of the plan. Maintain the SLP on the LHE for the current lift(s) being made. Maintain historical SLPs for a minimum of 3 months.

1.7.3.3 Critical Lift Plan - Crane or Load Handling Equipment

Provide a Critical Lift Plan as required by EM 385-1-1, Section 16.H.01, using Form 16-3. Critical lifts require detailed planning and additional or unusual safety precautions. Develop and submit a critical lift plan to the Contracting Officer 30 calendar days prior to critical lift. Comply with load testing requirements in accordance with EM 385-1-1, Section 16.F.03.

In addition to the requirements of EM 385-1-1, Section 16.H.02, the critical lift plan must include the following:

a. For lifts of personnel, demonstrate compliance with the requirements of 29 CFR 1926.1400 and EM 385-1-1, Section 16.T.

b. For barge mounted mobile cranes, provide a Naval Architecture Analysis and include an LHE Manufacturer's Floating Service Load Chart in accordance with the criteria from the selected standard in EM 385-1-1, Section 16.L.02. The Floating Service Load Chart must provide a table of rated load versus boom angle and radius. The Floating Service Load Chart must also provide the maximum allowable machine list and trim associated with the tabular loads and radii provided. If the Manufacturer's Floating Service Load Chart is not available, a floating service load chart may be developed and provided by a qualified Registered Professional Engineer (RPE), competent in the field of floating cranes. The Load Chart must be in accordance with the criteria from the selected standard in EM 385-1-1, Section 16.L; provide a table of rated load versus boom angle and radius; provide the maximum allowable machine list and machine trim associated with the tabular loads and radii provided; and be stamped by a RPE qualified and competent in the field of floating cranes. The RPE, competent in the field of floating cranes must stamp and certify (sign) that the Naval Architectural Analysis (NAA) meets the requirements of EM 385-1-1, Section 16.L.03.

c. Multi-purpose machines, material handling equipment, and construction equipment used to lift loads that are suspended by rigging gear, require proof of authorization from the machine OEM that the machine is capable of making lifts of loads suspended by rigging equipment. Demonstrate that the operator is properly trained and that the equipment is properly configured to make such lifts and is equipped with a load chart.

1.7.3.4 Fall Protection and Prevention (FP&P) Plan

The plan must comply with the requirements of EM 385-1-1, Section 21.D and ASSP Z359.2, be site specific, and address all fall hazards in the work place and during different phases of construction. Address how to protect and prevent workers from falling to lower levels when they are exposed to fall hazards above 6 feet. A competent person or qualified person for fall protection must prepare and sign the plan documentation. Include fall protection and prevention systems, equipment and methods employed for every phase of work, roles and responsibilities, assisted rescue, self-rescue and evacuation procedures, training requirements, and monitoring methods. Review and revise, as necessary, the Fall Protection and Prevention Plan documentation as conditions change, but at a minimum every six months, for lengthy projects, reflecting any changes during the course of construction due to changes in personnel, equipment, systems or work habits. Keep and maintain the accepted Fall Protection and Prevention Plan documentation at the job site for the duration of the project. Include the Fall Protection and Prevention Plan documentation in the Accident Prevention Plan (APP).

1.7.3.5 Rescue and Evacuation Plan

Provide a Rescue and Evacuation Plan in accordance with EM 385-1-1 Section 21.N and ASSP Z359.2, and include in the FP&P Plan and as part of the APP. Include a detailed discussion of the following: methods of rescue;

methods of self-rescue; equipment used; training requirement; specialized training for the rescuers; procedures for requesting rescue and medical assistance; and transportation routes to a medical facility.

1.7.3.6 Hazardous Energy Control Program (HECP)

Develop a HECP in accordance with EM 385-1-1 Section 12, 29 CFR 1910.147, 29 CFR 1910.333, 29 CFR 1915.89, ASSP Z244.1, and ASSP A10.44. Submit this HECP as part of the Accident Prevention Plan (APP). Conduct a preparatory meeting and inspection with all effected personnel to coordinate all HECP activities. Document this meeting and inspection in accordance with EM 385-1-1, Section 12.A.02. Ensure that each employee is familiar with and complies with these procedures.

1.7.3.7 Excavation Plan

Identify the safety and health aspects of excavation, and provide and prepare the plan in accordance with EM 385-1-1, Section 25.A and Section 31 00 00 EARTHWORK.

1.7.3.8 Occupant Protection Plan

Identify the safety and health aspects of lead-based paint removal, prepared in accordance with Section 02 83 00 LEAD REMEDIATION.

1.7.3.9 Asbestos Hazard Abatement Plan

Identify the safety and health aspects of asbestos work, and prepare in accordance with Section 02 82 00 ASBESTOS REMEDIATION.

1.7.3.10 Site Safety and Health Plan

Identify the safety and health aspects, and prepare in accordance with Section 01 35 29.13 HEALTH, SAFETY, AND EMERGENCY RESPONSE PROCEDURES FOR CONTAMINATED SITES.

1.7.3.11 PCB Plan

Identify the safety and health aspects of Polychlorinated Biphenyls work, and prepare in accordance with Sections 02 84 33 REMOVAL AND DISPOSAL OF POLYCHLORINATED BIPHENYLS (PCBs) and 02 61 23 REMOVAL AND DISPOSAL OF PCB CONTAMINATED SOILS.

1.7.3.12 Site Demolition Plan

Identify the safety and health aspects, and prepare in accordance with Section 02 41 00 DEMOLITION and referenced sources. Include engineering survey as applicable.

1.8 ACTIVITY HAZARD ANALYSIS (AHA)

Before beginning each activity, task or Definable Feature of Work (DFOW) involving a type of work presenting hazards not experienced in previous project operations, or where a new work crew or subcontractor is to perform the work, the Contractor(s) performing that work activity must prepare an AHA. AHAs must be developed by the Prime Contractor, subcontractor, or supplier performing the work, and provided for Prime Contractor review and approval before submitting to the Contracting Officer. AHAs must be signed by the SSHO, Superintendent, QC Manager and

the subcontractor Foreman performing the work. Format the AHA in accordance with EM 385-1-1, Section 1 or as directed by the Contracting Officer. Submit the AHA for review at least 15 working days prior to the start of each activity task, or DFOW. The Government reserves the right to require the Contractor to revise and resubmit the AHA if it fails to effectively identify the work sequences, specific anticipated hazards, site conditions, equipment, materials, personnel and the control measures to be implemented.

AHAs must identify competent persons required for phases involving high risk activities, including confined entry, crane and rigging, excavations, trenching, electrical work, fall protection, and scaffolding.

1.8.1 AHA Management

Review the AHA list periodically (at least monthly) at the Contractor supervisory safety meeting, and update as necessary when procedures, scheduling, or hazards change. Use the AHA during daily inspections by the SSHO to ensure the implementation and effectiveness of the required safety and health controls for that work activity.

1.8.2 AHA Signature Log

Each employee performing work as part of an activity, task or DFOW must review the AHA for that work and sign a signature log specifically maintained for that AHA prior to starting work on that activity. The SSHO must maintain a signature log on site for every AHA. Provide employees whose primary language is other than English, with an interpreter to ensure a clear understanding of the AHA and its contents.

1.9 DISPLAY OF SAFETY INFORMATION

1.9.1 Safety Bulletin Board

Within one calendar day(s) after commencement of work, erect a safety bulletin board at the job site. Where size, duration, or logistics of project do not facilitate a bulletin board, an alternative method, acceptable to the Contracting Officer, that is accessible and includes all mandatory information for employee and visitor review, may be deemed as meeting the requirement for a bulletin board. Include and maintain information on safety bulletin board as required by EM 385-1-1, Section 01.A.06. Additional items required to be posted include:

a. Confined space entry permit.

b. Hot work permit.

1.9.2 Safety and Occupational Health (SOH) Deficiency Tracking System

Establish a SOH deficiency tracking system that lists and monitors the status of SOH deficiencies in chronological order. Use the tracking system to evaluate the effectiveness of the APP. A monthly evaluation of the data must be discussed in the QC or SOH meeting with everyone on the project. The list must be posted on the project bulletin board and updated daily, and provide the following information:

a. Date deficiency identified;

b. Description of deficiency;

c. Name of person responsible for correcting deficiency;

d. Projected resolution date;

e. Date actually resolved.

1.10 SITE SAFETY REFERENCE MATERIALS

Maintain safety-related references applicable to the project, including those listed in paragraph REFERENCES. Maintain applicable equipment manufacturer's manuals.

1.11 EMERGENCY MEDICAL TREATMENT

Contractors must arrange for their own emergency medical treatment. Government has no responsibility to provide emergency medical treatment.

1.12 NOTIFICATIONS and REPORTS

1.12.1 Mishap Notification

Notify the Contracting Officer as soon as practical, but no more than twenty-four hours, after any mishaps, including recordable accidents, incidents, and near misses, as defined in EM 385-1-1 Appendix Q, any report of injury, illness, load handling equipment (LHE) or rigging mishaps, or any property damage. The Contractor is responsible for obtaining appropriate medical and emergency assistance and for notifying fire, law enforcement, and regulatory agencies. Immediate reporting is required for electrical mishaps, to include Arc Flash; shock; uncontrolled release of hazardous energy (includes electrical and non-electrical); load handling equipment or rigging; fall from height (any level other than same surface); and underwater diving. These mishaps must be investigated in depth to identify all causes and to recommend hazard control measures.

Within notification include Contractor name; contract title; type of contract; name of activity, installation or location where accident occurred; date and time of accident; names of personnel injured; extent of property damage, if any; extent of injury, if known, and brief description of accident (for example, type of construction equipment used and PPE used). Preserve the conditions and evidence on the accident site until the Government investigation team arrives on-site and Government investigation is conducted. Assist and cooperate fully with the Government's investigation(s) of any mishap.

1.12.2 Accident Reports

a. Conduct an accident investigation for recordable injuries and illnesses, property damage, and near misses as defined in EM 385-1-1, to establish the root cause(s) of the accident. Complete the applicable NAVFAC Contractor Incident Reporting System (CIRS), and electronically submit via the NAVFAC Enterprise Safety Applications Management System (ESAMS). The Contracting Officer will provide copies of any required or special forms.

b. Near Misses: For Navy Projects, complete the applicable documentation in NAVFAC Contractor Incident Reporting System (CIRS), and electronically submit via the NAVFAC Enterprise Safety Applications Management System (ESAMS). Near miss reports are considered positive

and proactive Contractor safety management actions.

c. Conduct an accident investigation for any load handling equipment accident (including rigging gear accidents) to establish the root cause(s) of the accident. Complete the LHE Accident Report (Crane and Rigging Gear) form and provide the report to the Contracting Officer within 30 calendar days of the accident. Do not proceed with crane operations until cause is determined and corrective actions have been implemented to the satisfaction of the Contracting Officer. The Contracting Officer will provide a blank copy of the accident report form.

1.12.3 LHE Inspection Reports

Submit LHE inspection reports required in accordance with EM 385-1-1 and as specified herein with Daily Reports of Inspections.

1.12.4 Certificate of Compliance and Pre-lift Plan/Checklist for LHE and Rigging

Provide a FORM 16-1 Certificate of Compliance for LHE entering an activity under this contract and in accordance with EM 385-1-1. Post certifications on the crane.

Develop a Standard Lift Plan (SLP) in accordance with EM 385-1-1, Section 16.H.03 using Form 16-2 Standard Pre-Lift Crane Plan/Checklist for each lift planned. Submit SLP to the Contracting Officer for approval within 15 calendar days in advance of planned lift.

1.13 HOT WORK

1.13.1 Permit and Personnel Requirements

Submit and obtain a written permit prior to performing "Hot Work" (i.e. welding or cutting) or operating other flame-producing/spark producing devices, from the Fire Division. A permit is required from the Explosives Safety Office for work in and around where explosives are processed, stored, or handled. CONTRACTORS ARE REQUIRED TO MEET ALL CRITERIA BEFORE A PERMIT IS ISSUED. Provide at least two 20 pound 4A:20 BC rated extinguishers for normal "Hot Work". The extinguishers must be current inspection tagged, and contain an approved safety pin and tamper resistant seal. It is also mandatory to have a designated FIRE WATCH for any "Hot Work" done at this activity. The Fire Watch must be trained in accordance with NFPA 51B and remain on-site for a minimum of one hour after completion of the task or as specified on the hot work permit.

When starting work in the facility, require personnel to familiarize themselves with the location of the nearest fire alarm boxes and place in memory the emergency Fire Division phone number. REPORT ANY FIRE, NO MATTER HOW SMALL, TO THE RESPONSIBLE FIRE DIVISION IMMEDIATELY.

1.13.2 Work Around Flammable Materials

Obtain services from a NFPA Certified Marine Chemist for "HOT WORK" within or around flammable materials (such as fuel systems or welding/cutting on fuel pipes) or confined spaces (such as sewer wet wells, manholes, or vaults) that have the potential for flammable or explosive atmospheres.

Whenever these materials, except beryllium and chromium (VI), are

encountered in indoor operations, local mechanical exhaust ventilation systems that are sufficient to reduce and maintain personal exposures to within acceptable limits must be used and maintained in accordance with manufacturer's instruction and supplemented by exceptions noted in EM 385-1-1, Section 06.H

1.14 RADIATION SAFETY REQUIREMENTS

Submit License Certificates, employee training records, and Leak Test Reports for radiation materials and equipment to the Contracting Officer and Radiation Safety Office (RSO), and Contracting Oversight Technician (COT) for all specialized and licensed material and equipment proposed for use on the construction project. Maintain on-site records whenever licensed radiological materials or ionizing equipment are on government property.

Protect workers from radiation exposure in accordance with 10 CFR 20, ensuring any personnel exposures are maintained As Low As Reasonably Achievable.

1.14.1 Radiography Operation Planning Work Sheet

Submit a Gamma and X-Ray Radiography Operation Planning Work Sheet to Contracting Officer 14 days prior to commencement of operations involving radioactive materials or radiation generating devices. For portable machine sources of ionizing radiation, including moisture density and XRF, use and submit the Portable Gauge Operations Planning Worksheet instead. The Contracting Officer and COT will review the submitted worksheet and provide questions and comments.

Contractors must use primary dosimeters process by a National Voluntary Laboratory Accreditation Program (NVLAP) accredited laboratory.

1.14.2 Site Access and Security

Coordinate site access and security requirements with the Contracting Officer and COT for all radiological materials and equipment containing ionizing radiation that are proposed for use on a government facility. For gamma radiography materials and equipment, a Government escort is required for any travels on the Installation. The Navy COT or authorized representative will meet the Contractor at a designated location outside the installation, ensure safety of the materials being transported, and will escort the Contractor to the job site and return upon completion of the work. For portable machine sources of ionizing radiation, including moisture density and XRF, the Navy COT or Government authorized representative will meet the Contractor at the job site.

Provide a copy of all calibration records, and utilization records to the COT for radiological operations performed on the site.

1.14.3 Loss or Release and Unplanned Personnel Exposure

Loss or release of radioactive materials, and unplanned personnel exposures must be reported immediately to the Contracting Officer, RSO, and Base Security Department Emergency Number.

1.14.4 Site Demarcation and Barricade

Properly demark and barricade an area surrounding radiological operations

to preclude personnel entrance, in accordance with EM 385-1-1, Nuclear Regulatory Commission, and Applicable State regulations and license requirements, and in accordance with requirements established in the accepted Radiography Operation Planning Work Sheet.

Do not close or obstruct streets, walks, and other facilities occupied and used by the Government without written permission from the Contracting Officer.

1.14.5 Security of Material and Equipment

Properly secure the radiological material and ionizing radiation equipment at all times, including keeping the devices in a properly marked and locked container, and secondarily locking the container to a secure point in the Contractor's vehicle or other approved storage location during transportation and while not in use. While in use, maintain a continuous visual observation on the radiological material and ionizing radiation equipment. In instances where radiography is scheduled near or adjacent to buildings or areas having limited access or one-way doors, make no assumptions as to building occupancy. Where necessary, the Contracting Officer will direct the Contractor to conduct an actual building entry, search, and alert. Where removal of personnel from such a building cannot be accomplished and it is otherwise safe to proceed with the radiography, position a fully instructed employee inside the building or area to prevent exiting while external radiographic operations are in process.

1.14.6 Transportation of Material

Comply with 49 CFR 173 for Transportation of Regulated Amounts of Radioactive Material. Notify Local Fire authorities and the site Radiation Safety officer (RSO) of any Radioactive Material use.

1.14.7 Schedule for Exposure or Unshielding

Actual exposure of the radiographic film or unshielding the source must not be initiated until after 5 p.m. on weekdays.

1.14.8 Transmitter Requirements

Adhere to the base policy concerning the use of transmitters, such as radios and cell phones. Obey Emissions control (EMCON) restrictions.

1.15 CONFINED SPACE ENTRY REQUIREMENTS.

Confined space entry must comply with Section 34 of EM 385-1-1, OSHA 29 CFR 1926, OSHA 29 CFR 1910, OSHA 29 CFR 1910.146, and OSHA Directive CPL 2.100. Any potential for a hazard in the confined space requires a permit system to be used.

1.15.1 Entry Procedures

Prohibit entry into a confined space by personnel for any purpose, including hot work, until the qualified person has conducted appropriate tests to ensure the confined or enclosed space is safe for the work intended and that all potential hazards are controlled or eliminated and documented. Comply with EM 385-1-1, Section 34 for entry procedures. Hazards pertaining to the space must be reviewed with each employee during review of the AHA.

1.15.2 Forced Air Ventilation

Forced air ventilation is required for all confined space entry operations and the minimum air exchange requirements must be maintained to ensure exposure to any hazardous atmosphere is kept below its action level.

1.15.3 Sewer Wet Wells

Sewer wet wells require continuous atmosphere monitoring with audible alarm for toxic gas detection.

1.15.4 Rescue Procedures and Coordination with Local Emergency Responders

Develop and implement an on-site rescue and recovery plan and procedures. The rescue plan must not rely on local emergency responders for rescue from a confined space.

1.16 DIVE SAFETY REQUIREMENTS

Develop a Dive Operations Plan, AHA, emergency management plan, and personnel list that includes qualifications, for each separate diving operation. Submit these documents to the District Dive Coordinator (DDC) for review and acceptance at least 15 working days prior to commencement of diving operations. These documents must be at the diving location at all times. Provide each of these documents as a part of the project file.

1.17 SEVERE STORM PLAN

In the event of a severe storm warning, the Contractor must:

a. Secure outside equipment and materials and place materials that could be damaged in protected areas.

b. Check surrounding area, including roof, for loose material, equipment, debris, and other objects that could be blown away or against existing facilities.

c. Ensure that temporary erosion controls are adequate.

PART 2 PRODUCTS

PART 3 EXECUTION

3.1 CONSTRUCTION AND OTHER WORK

Comply with EM 385-1-1, NFPA 70, NFPA 70E, NFPA 241, the APP, the AHA, Federal and State OSHA regulations, and other related submittals and activity fire and safety regulations. The most stringent standard prevails.

PPE is governed in all areas by the nature of the work the employee is performing. Use personal hearing protection at all times in designated noise hazardous areas or when performing noise hazardous tasks. Safety glasses must be worn or carried/available on each person. Mandatory PPE includes:

a. Hard Hat

b. Long Pants

c. Appropriate Safety Shoes

d. Appropriate Class Reflective Vests

3.1.1 Worksite Communication

Employees working alone in a remote location or away from other workers must be provided an effective means of emergency communications (i.e., cellular phone, two-way radios, land-line telephones or other acceptable means). The selected communication must be readily available (easily within the immediate reach) of the employee and must be tested prior to the start of work to verify that it effectively operates in the area/environment. An employee check-in/check-out communication procedure must be developed to ensure employee safety.

3.1.2 Hazardous Material Exclusions

Notwithstanding any other hazardous material used in this contract, radioactive materials or instruments capable of producing ionizing/non-ionizing radiation (with the exception of radioactive material and devices used in accordance with EM 385-1-1 such as nuclear density meters for compaction testing and laboratory equipment with radioactive sources) as well as materials which contain asbestos, mercury or polychlorinated biphenyls, di-isocyanates, lead-based paint, and hexavalent chromium, are prohibited. The Contracting Officer, upon written request by the Contractor, may consider exceptions to the use of any of the above excluded materials. Low mercury lamps used within fluorescent lighting fixtures are allowed as an exception without further Contracting Officer approval. Notify the Radiation Safety Officer (RSO) prior to excepted items of radioactive material and devices being brought on base.

3.1.3 Unforeseen Hazardous Material

Contract documents identify materials such as PCB, lead paint, and friable and non-friable asbestos and other OSHA regulated chemicals (i.e. 29 CFR Part 1910.1000). If material(s) that may be hazardous to human health upon disturbance are encountered during construction operations, stop that portion of work and notify the Contracting Officer immediately. Within 14 calendar days the Government will determine if the material is hazardous. If material is not hazardous or poses no danger, the Government will direct the Contractor to proceed without change. If material is hazardous and handling of the material is necessary to accomplish the work, the Government will issue a modification pursuant to FAR 52.243-4, "Changes" and FAR 52.236-2, "Differing Site Conditions."

3.2 UTILITY OUTAGE REQUIREMENTS

Apply for utility outages at least 15 days in advance. At a minimum, the written request must include the location of the outage, utilities being affected, duration of outage, any necessary sketches, and a description of the means to fulfill energy isolation requirements in accordance with EM 385-1-1, Section 11.A.02 (Isolation). Some examples of energy isolation devices and procedures are highlighted in EM 385-1-1, Section 12.D. In accordance with EM 385-1-1, Section 12.A.01, where outages involve Government or Utility personnel, coordinate with the Government on all activities involving the control of hazardous energy.

These activities include, but are not limited to, a review of HECP and HEC procedures, as well as applicable Activity Hazard Analyses (AHAS). In accordance with EM 385-1-1, Section 11.A.02 and NFPA 70E, work on energized electrical circuits must not be performed without prior government authorization. Government permission is considered through the permit process and submission of a detailed AHA. Energized work permits are considered only when de-energizing introduces additional or increased hazard or when de-energizing is infeasible.

3.3 OUTAGE COORDINATION MEETING

After the utility outage request is approved and prior to beginning work on the utility system requiring shut-down, conduct a pre-outage coordination meeting in accordance with EM 385-1-1, Section 12.A. This meeting must include the Prime Contractor, the Prime and subcontractors performing the work, the Contracting Officer, and the Installation Representative. All parties must fully coordinate HEC activities with one another. During the coordination meeting, all parties must discuss and coordinate on the scope of work, HEC procedures (specifically, the lock-out/tag-out procedures for worker and utility protection), the AHA, assurance of trade personnel qualifications, identification of competent persons, and compliance with HECP training in accordance with EM 385-1-1, Section 12.C. Clarify when personal protective equipment is required during switching operations, inspection, and verification.

3.4 CONTROL OF HAZARDOUS ENERGY (LOCKOUT/TAGOUT)

Provide and operate a Hazardous Energy Control Program (HECP) in accordance with EM 385-1-1 Section 12, 29 CFR 1910.333, 29 CFR 1915.89, ASSP A10.44, NFPA 70E, and paragraph HAZARDOUS ENERGY CONTROL PROGRAM (HECP).

3.4.1 Safety Preparatory Inspection Coordination Meeting with the Government or Utility

For electrical distribution equipment that is to be operated by Government or Utility personnel, the Prime Contractor and the subcontractor performing the work must attend the safety preparatory inspection coordination meeting, which will also be attended by the Contracting Officer's Representative, and required by EM 385-1-1, Section 12.A.02. The meeting will occur immediately preceding the start of work and following the completion of the outage coordination meeting. Both the safety preparatory inspection coordination meeting and the outage coordination meeting must occur prior to conducting the outage and commencing with lockout/tagout procedures.

3.4.2 Lockout/Tagout Isolation

Where the Government or Utility performs equipment isolation and lockout/tagout, the Contractor must place their own locks and tags on each energy-isolating device and proceed in accordance with the HECP. Before any work begins, both the Contractor and the Government or Utility must perform energy isolation verification testing while wearing required PPE detailed in the Contractor's AHA and required by EM 385-1-1, Sections 05.I and 11.B. Install personal protective grounds, with tags, to eliminate the potential for induced voltage in accordance with EM 385-1-1, Section 12.E.06.

3.4.3 Lockout/Tagout Removal

Upon completion of work, conduct lockout/tagout removal procedure in accordance with the HECP. In accordance with EM 385-1-1, Section 12.E.08, each lock and tag must be removed from each energy isolating device by the authorized individual or systems operator who applied the device. Provide formal notification to the Government (by completing the Government form if provided by Contracting Officer's Representative), confirming that steps of de-energization and lockout/tagout removal procedure have been conducted and certified through inspection and verification. Government or Utility locks and tags used to support the Contractor's work will not be removed until the authorized Government employee receives the formal notification.

3.5 FALL PROTECTION PROGRAM

Establish a fall protection program, for the protection of all employees exposed to fall hazards. Within the program include company policy, identify roles and responsibilities, education and training requirements, fall hazard identification, prevention and control measures, inspection, storage, care and maintenance of fall protection equipment and rescue and evacuation procedures in accordance with ASSP Z359.2 and EM 385-1-1, Sections 21.A and 21.D.

3.5.1 Training

Institute a fall protection training program. As part of the Fall Protection Program, provide training for each employee who might be exposed to fall hazards. Provide training by a competent person for fall protection in accordance with EM 385-1-1, Section 21.C. Document training and practical application of the competent person in accordance with EM 385-1-1, Section 21.C.04 and ASSP Z359.2 in the AHA.

3.5.2 Fall Protection Equipment and Systems

Enforce use of personal fall protection equipment and systems designated (to include fall arrest, restraint, and positioning) for each specific work activity in the Site Specific Fall Protection and Prevention Plan and AHA at all times when an employee is exposed to a fall hazard. Protect employees from fall hazards as specified in EM 385-1-1, Section 21.

Provide personal fall protection equipment, systems, subsystems, and components that comply with EM 385-1-1 Section 21.I, 29 CFR 1926.500 Subpart M,ASSP Z359.0, ASSP Z359.1, ASSP Z359.2, ASSP Z359.3, ASSP Z359.4, ASSP Z359.6, ASSP Z359.7, ASSP Z359.11, ASSP Z359.12, ASSP Z359.13, ASSP Z359.14, and ASSP Z359.15.

3.5.2.1 Additional Personal Fall Protection

In addition to the required fall protection systems, other protection such as safety skiffs, personal floatation devices, and life rings, are required when working above or next to water in accordance with EM 385-1-1, Sections 21.O through 21.O.06. Personal fall protection systems and equipment are required when working from an articulating or extendible boom, swing stages, or suspended platform. In addition, personal fall protection systems are required when operating other equipment such as scissor lifts. The need for tying-off in such equipment is to prevent ejection of the employee from the equipment during raising, lowering, travel, or while performing work.

3.5.2.2 Personal Fall Protection Harnesses

Only a full-body harness with a shock-absorbing lanyard or self-retracting lanyard is an acceptable personal fall arrest body support device. The use of body belts is not acceptable. Harnesses must have a fall arrest attachment affixed to the body support (usually a Dorsal D-ring) and specifically designated for attachment to the rest of the system. Snap hooks and carabiners must be self-closing and self-locking, capable of being opened only by at least two consecutive deliberate actions and have a minimum gate strength of 3,600 lbs in all directions. Use webbing, straps, and ropes made of synthetic fiber. The maximum free fall distance when using fall arrest equipment must not exceed 6 feet, unless the proper energy absorbing lanyard is used. Always take into consideration the total fall distance and any swinging of the worker (pendulum-like motion), that can occur during a fall, when attaching a person to a fall arrest system. All full body harnesses must be equipped with Suspension Trauma Preventers such as stirrups, relief steps, or similar in order to provide short-term relief from the effects of orthostatic intolerance in accordance with EM 385-1-1, Section 21.I.06.

3.5.3 Fall Protection for Roofing Work

Implement fall protection controls based on the type of roof being constructed and work being performed. Evaluate the roof area to be accessed for its structural integrity including weight-bearing capabilities for the projected loading.

a. Low Sloped Roofs:

(1) For work within 6 feet of an edge, on a roof having a slope less than or equal to 4:12 (vertical to horizontal), protect personnel from falling by use of personal fall arrest/restraint systems, guardrails, or safety nets. A safety monitoring system is not adequate fall protection and is not authorized. Provide in accordance with 29 CFR 1926.500.

(2) For work greater than 6 feet from an edge, erect and install warning lines in accordance with 29 CFR 1926.500 and EM 385-1-1, Section L.

b. Steep-Sloped Roofs: Work on a roof having a slope greater than 4:1 (vertical to horizontal) requires a personal fall arrest system, guardrails with toe-boards, or safety nets. This requirement also applies to residential or housing type construction.

3.5.4 Horizontal Lifelines (HLL)

Provide HLL in accordance with EM 385-1-1, Section 21.I.08.d.2. Commercially manufactured horizontal lifelines (HLL) must be designed, installed, certified and used, under the supervision of a qualified person, for fall protection as part of a complete fall arrest system which maintains a safety factor of 2 (29 CFR 1926.500). The competent person for fall protection may (if deemed appropriate by the qualified person) supervise the assembly, disassembly, use and inspection of the HLL system under the direction of the qualified person. Locally manufactured HLLs are not acceptable unless they are custom designed for limited or site specific applications by a Registered Professional Engineer who is qualified in designing HLL systems.

3.5.5 Guardrails and Safety Nets

Design, install and use guardrails and safety nets in accordance with EM 385-1-1, Section 21.F.01 and 29 CFR 1926 Subpart M.

3.5.6 Rescue and Evacuation Plan and Procedures

When personal fall arrest systems are used, ensure that the mishap victim can self-rescue or can be rescued promptly should a fall occur. Prepare a Rescue and Evacuation Plan and include a detailed discussion of the following: methods of rescue; methods of self-rescue or assisted-rescue; equipment used; training requirement; specialized training for the rescuers; procedures for requesting rescue and medical assistance; and transportation routes to a medical facility. Include the Rescue and Evacuation Plan within the Activity Hazard Analysis (AHA) for the phase of work, in the Fall Protection and Prevention (FP&P) Plan, and the Accident Prevention Plan (APP). The plan must comply with the requirements of EM 385-1-1, ASSP Z359.2, and ASSP Z359.4.

3.5.7 Fall Prevention During Design Phase

During design phase the Contractor must consider and eliminate fall hazards anticipated during the operation and maintenance evolutions of the facility. If it is not feasible to eliminate or prevent the need to work at heights with the subsequent exposure to fall hazards, control measures must be included in the design to protect personnel conducting maintenance work after completion of the project. In addition to the detailed requirements included in the provisions of this contract, the design work must incorporate the requirements of 29 CFR 1910 and ASSP Z359.0, ASSP Z359.1, ASSP Z359.2, ASSP Z359.3, ASSP Z359.4, ASSP A1264.1, and NFPA 1.

3.6 ERGONOMICS CONSIDERATIONS DURING DESIGN PHASE

Design Facilities, processes, job tasks, tools and materials to reduce or eliminate work-related musculoskeletal (WMSD) injuries and risk factors in the workplace. Ensure that facility maintenance access is designed to reduce WMSD risk factors to the lowest level possible. In addition to the detailed requirements included in the provisions of this contract, the design work must incorporate the requirements of MIL-STD-1472, DoD-HDBK 743 and ANSI/HFES 100.

3.7 WORK PLATFORMS

3.7.1 Scaffolding

Provide employees with a safe means of access to the work area on the scaffold. Climbing of any scaffold braces or supports not specifically designed for access is prohibited. Comply with the following requirements:

a. Scaffold platforms greater than 20 feet in height must be accessed by use of a scaffold stair system.

b. Ladders commonly provided by scaffold system manufacturers are prohibited for accessing scaffold platforms greater than 20 feet maximum in height.

c. An adequate gate is required.

d. Employees performing scaffold erection and dismantling must be qualified.

e. Scaffold must be capable of supporting at least four times the maximum intended load, and provide appropriate fall protection as delineated in the accepted fall protection and prevention plan.

f. Stationary scaffolds must be attached to structural building components to safeguard against tipping forward or backward.

g. Special care must be given to ensure scaffold systems are not overloaded.

h. Side brackets used to extend scaffold platforms on self-supported scaffold systems for the storage of material are prohibited. The first tie-in must be at the height equal to 4 times the width of the smallest dimension of the scaffold base.

i. Scaffolding other than suspended types must bear on base plates upon wood mudsills (2 in x 10 in x 8 in minimum) or other adequate firm foundation.

j. Scaffold or work platform erectors must have fall protection during the erection and dismantling of scaffolding or work platforms that are more than six feet.

k. Delineate fall protection requirements when working above six feet or above dangerous operations in the Fall Protection and Prevention (FP&P) Plan and Activity Hazard Analysis (AHA) for the phase of work.

3.7.2 Elevated Aerial Work Platforms (AWPs)

Workers must be anchored to the basket or bucket in accordance with manufacturer's specifications and instructions (anchoring to the boom may only be used when allowed by the manufacturer and permitted by the CP). Lanyards used must be sufficiently short to prohibit worker from climbing out of basket. The climbing of rails is prohibited. Lanyards with built-in shock absorbers are acceptable. Self-retracting devices are not acceptable. Tying off to an adjacent pole or structure is not permitted unless a safe device for 100 percent tie-off is used for the transfer.

Use of AWPs must be operated, inspected, and maintained as specified in the operating manual for the equipment and delineated in the AHA. Operators of AWPs must be designated as qualified operators by the Prime Contractor. Maintain proof of qualifications on site for review and include in the AHA.

3.8 EQUIPMENT

3.8.1 Material Handling Equipment (MHE)

a. Material handling equipment such as forklifts must not be modified with work platform attachments for supporting employees unless specifically delineated in the manufacturer's printed operating instructions. Material handling equipment fitted with personnel work platform attachments are prohibited from traveling or positioning while personnel are working on the platform.

b. The use of hooks on equipment for lifting of material must be in accordance with manufacturer's printed instructions. Material Handling Equipment Operators must be trained in accordance with OSHA 29 CFR 1910, Subpart N.

c. Operators of forklifts or power industrial trucks must be licensed in accordance with OSHA.

3.8.2 Load Handling Equipment (LHE)

a. Equip cranes and derricks as specified in EM 385-1-1, Section 16.

b. Notify the Contracting Officer 15 working days in advance of any LHE entering the activity, in accordance with EM 385-1-1, Section 16.A.02, so that necessary quality assurance spot checks can be coordinated.Contractor's operator must remain with the crane during the spot check. Rigging gear must comply with OSHA, ASME B30.9 Standards.

c. Comply with the LHE manufacturer's specifications and limitations for erection and operation of cranes and hoists used in support of the work. Perform erection under the supervision of a designated person (as defined in ASME B30.5). Perform all testing in accordance with the manufacturer's recommended procedures.

d. Comply with ASME B30.5 for mobile and locomotive cranes, ASME B30.22 for articulating boom cranes, ASME B30.3 for construction tower cranes, ASME B30.8 for floating cranes and floating derricks, ASME B30.9 for slings, ASME B30.20 for below the hook lifting devices and ASME B30.26 for rigging hardware.

e. Under no circumstance must a Contractor make a lift at or above 90 percent of the cranes rated capacity in any configuration.

f. When operating in the vicinity of overhead transmission lines, operators and riggers must be alert to this special hazard and follow the requirements of EM 385-1-1 Section 11, and ASME B30.5 or ASME B30.22 as applicable.

g. Do not use crane suspended personnel work platforms (baskets) unless the Contractor proves that using any other access to the work location would provide a greater hazard to the workers or is impossible. Do not lift personnel with a line hoist or friction crane. Additionally, submit a specific AHA for this work to the Contracting Officer. Ensure the activity and AHA are thoroughly reviewed by all involved personnel.

h. Inspect, maintain, and recharge portable fire extinguishers as specified in NFPA 10, Standard for Portable Fire Extinguishers.

i. All employees must keep clear of loads about to be lifted and of suspended loads.

j. Use cribbing when performing lifts on outriggers.

k. The crane hook/block must be positioned directly over the load. Side loading of the crane is prohibited.

l. A physical barricade must be positioned to prevent personnel access

where accessible areas of the LHE's rotating superstructure poses a risk of striking, pinching or crushing personnel.

m. Maintain inspection records in accordance by EM 385-1-1, Section 16.D, including shift, monthly, and annual inspections, the signature of the person performing the inspection, and the serial number or other identifier of the LHE that was inspected. Records must be available for review by the Contracting Officer.

n. Maintain written reports of operational and load testing in accordance with EM 385-1-1, Section 16.F, listing the load test procedures used along with any repairs or alterations performed on the LHE. Reports must be available for review by the Contracting Officer.

o. Certify that all LHE operators have been trained in proper use of all safety devices (e.g. anti-two block devices).

p. Take steps to ensure that wind speed does not contribute to loss of control of the load during lifting operations. At wind speeds greater than 20 mph, the operator, rigger and lift supervisor must cease all crane operations, evaluate conditions and determine if the lift may proceed. Base the determination to proceed or not on wind calculations per the manufacturer and a reduction in LHE rated capacity if applicable. Include this maximum wind speed determination as part of the activity hazard analysis plan for that operation.

3.8.3 Machinery and Mechanized Equipment

a. Proof of qualifications for operator must be kept on the project site for review.

b. Manufacture specifications or owner's manual for the equipment must be on-site and reviewed for additional safety precautions or requirements that are sometimes not identified by OSHA or USACE EM 385-1-1. Incorporate such additional safety precautions or requirements into the AHAs.

3.8.4 USE OF EXPLOSIVES

Explosives must not be used or brought to the project site without prior written approval from the Contracting Officer. Such approval does not relieve the Contractor of responsibility for injury to persons or for damage to property due to blasting operations.

Storage of explosives, when permitted on Government property, must be only where directed and in approved storage facilities. These facilities must be kept locked at all times except for inspection, delivery, and withdrawal of explosives.

3.9 EXCAVATIONS

Soil classification must be performed by a competent person in accordance with 29 CFR 1926 and EM 385-1-1.

3.9.1 Utility Locations

Provide a third party, independent, private utility locating company to positively identify underground utilities in the work area in addition to any station locating service and coordinated with the station utility

department.

3.9.2 Utility Location Verification

Physically verify underground utility locations, including utility depth, by hand digging using wood or fiberglass handled tools when any adjacent construction work is expected to come within three feet of the underground system.

3.9.3 Utilities Within and Under Concrete, Bituminous Asphalt, and Other Impervious Surfaces

Utilities located within and under concrete slabs or pier structures, bridges, parking areas, and the like, are extremely difficult to identify. Whenever contract work involves chipping, saw cutting, or core drilling through concrete, bituminous asphalt or other impervious surfaces, the existing utility location must be coordinated with station utility departments in addition to location and depth verification by a third party, independent, private locating company. The third party, independent, private locating company must locate utility depth by use of Ground Penetrating Radar (GPR), X-ray, bore scope, or ultrasound prior to the start of demolition and construction. Outages to isolate utility systems must be used in circumstances where utilities are unable to be positively identified. The use of historical drawings does not alleviate the Contractor from meeting this requirement.

3.10 ELECTRICAL

Perform electrical work in accordance with EM 385-1-1, Appendix A, Sections 11 and 12.

3.10.1 Conduct of Electrical Work

As delineated in EM 385-1-1, electrical work is to be conducted in a de-energized state unless there is no alternative method for accomplishing the work. In those cases obtain an energized work permit from the Contracting Officer. The energized work permit application must be accompanied by the AHA and a summary of why the equipment/circuit needs to be worked energized. Underground electrical spaces must be certified safe for entry before entering to conduct work. Cables that will be cut must be positively identified and de-energized prior to performing each cut. Attach temporary grounds in accordance with ASTM F855 and IEEE 1048. Perform all high voltage cable cutting remotely using hydraulic cutting tool. When racking in or live switching of circuit breakers, no additional person other than the switch operator is allowed in the space during the actual operation. Plan so that work near energized parts is minimized to the fullest extent possible. Use of electrical outages clear of any energized electrical sources is the preferred method.

When working in energized substations, only qualified electrical workers are permitted to enter. When work requires work near energized circuits as defined by NFPA 70, high voltage personnel must use personal protective equipment that includes, as a minimum, electrical hard hat, safety shoes, insulating gloves and electrical arc flash protection for personnel as required by NFPA 70E. Insulating blankets, hearing protection, and switching suits may also be required, depending on the specific job and as delineated in the Contractor's AHA. Ensure that each employee is familiar with and complies with these procedures and 29 CFR 1910.147.

3.10.2 Qualifications

Electrical work must be performed by QP personnel with verifiable credentials who are familiar with applicable code requirements. Verifiable credentials consist of State, National and Local Certifications or Licenses that a Master or Journeyman Electrician may hold, depending on work being performed, and must be identified in the appropriate AHA. Journeyman/Apprentice ratio must be in accordance with State, Local requirements applicable to where work is being performed.

3.10.3 Arc Flash

Conduct a hazard analysis/arc flash hazard analysis whenever work on or near energized parts greater than 50 volts is necessary, in accordance with NFPA 70E.

All personnel entering the identified arc flash protection boundary must be QPs and properly trained in NFPA 70E requirements and procedures. Unless permitted by NFPA 70E, no Unqualified Person is permitted to approach nearer than the Limited Approach Boundary of energized conductors and circuit parts. Training must be administered by an electrically qualified source and documented.

3.10.4 Grounding

Ground electrical circuits, equipment and enclosures in accordance with NFPA 70 and IEEE C2 to provide a permanent, continuous and effective path to ground unless otherwise noted by EM 385-1-1.

Check grounding circuits to ensure that the circuit between the ground and a grounded power conductor has a resistance low enough to permit sufficient current flow to allow the fuse or circuit breaker to interrupt the current.

3.10.5 Testing

Temporary electrical distribution systems and devices must be inspected, tested and found acceptable for Ground-Fault Circuit Interrupter (GFCI) protection, polarity, ground continuity, and ground resistance before initial use, before use after modification and at least monthly. Monthly inspections and tests must be maintained for each temporary electrical distribution system and signed by the electrical CP or QP.

SOURCES FOR REFERENCE PUBLICATIONS
02/19

PART 1 GENERAL

1.1 REFERENCES

Various publications are referenced in other sections of the specifications to establish requirements for the work. These references are identified in each section by document number, date and title. The document number used in the citation is the number assigned by the standards producing organization (e.g. ASTM B564 Standard Specification for Nickel Alloy Forgings). However, when the standards producing organization has not assigned a number to a document, an identifying number has been assigned for reference purposes.

1.2 ORDERING INFORMATION

The addresses of the standards publishing organizations whose documents are referenced in other sections of these specifications are listed below, and if the source of the publications is different from the address of the sponsoring organization, that information is also provided.

EM 385-1-1	(2014) Safety and Health Requirements Manual

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Design Quality Control (DQC) Plan; G

Submit a DQC Plan prior to the Post Award Kickoff Meeting.

Construction Quality Control (CQC) Plan; G

Submit a Construction QC Plan prior to start of construction.

Indoor Air Quality (IAQ) Management Plan; G

SD-05 Design Data

Design Quality Control Documentation; G

SD-07 Certificates

Preliminary Inspections and Final Acceptance Testing; G

Final Life Safety/Fire Protection Certification; G

1.3 QC PROGRAM REQUIREMENTS

Establish and maintain a QC program that is administered by a Design and Construction Quality Control organization, using Quality Control (Design and Construction) Plans, meetings, a Coordination and Mutual Understanding Meeting, three phases of control, submittal review and approval, testing, completion inspections, and QC certifications, independent Special Inspections in accordance with Section 01 45 35.05 20 SPECIAL INSPECTIONS FOR DESIGN-BUILD, and documentation necessary to provide design, materials, equipment, workmanship, fabrication, construction and operations which comply with the requirements of this Contract. The QC program must cover on-site and off-site work. No construction work or testing may be performed unless the QC Manager is on the work site.

1.3.1 QC Plan Meeting

Prior to submission of the QC Plan, the QC Manager may request a meeting with the Contracting Officer to discuss the QC Plan requirements of this Contract.

The purpose of this meeting is to develop a mutual understanding of the QC Plan requirements prior to plan development and submission and to agree on the Contractor's list of Definable Features of Work (DFOWs).

1.3.2 Mutual Understanding Meeting

The purpose of this meeting is to develop a mutual understanding of the QC Plans, including documentation, administration, requirements and procedures, coordination of activities to be performed, and the coordination of the contractor's management, production and QC personnel. At the meeting, the contractor will explain in detail how the three phases of quality control will be implemented for each DFOW.

1.3.3 Design and Construction Quality Control Plans

The contractor must provide a project specific Design Quality Control (DQC) Plan and Construction Quality Control (CQC) Plan, for review and approval by the Contracting Officer. The Contractor must perform no design until the DQC Plan is approved and no construction until the CQC Plan is approved. The Contractor's plans must include the following:

a. The QC organization for this contract, including member resumes.

b. A letter from an officer of the company designating the QC Manager, Alternate QC Manager, DQC Manager, and their authority.

c. QC Manager and DQC Manager qualifications in resume format.

d. Names of the individuals, including their respective firm names, who will be serving as the DOR in their respective design discipline.

e. List of DFOW including list of design submittal packaging. DFOW is a task that is separate and distinct from other tasks and has control requirements and work crews unique to the task.

f. For the CQC Plan, a plan to implement the "Three Phases of Control" for each DFOW.

g. For the CQC Plan, a testing Plan, log and list of personnel and accredited laboratories that will perform tests. Construction materials testing laboratories must be accredited by a laboratory accreditation authority and will be required to submit a copy of the Certificate of Accreditation and Scope of Accreditation with the testing plan.

h. Submittal Register including design submittals, listing personnel who will review submittals and noting submittals for Contracting Officer review.

i. Procedures for submitting and reviewing design changes/ variations prior to submission to the Contracting Officer.

j. As part of the Contractor's DQC plan, a statement of Life Safety and Fire Protection Features Inspections and Testing must be prepared by the Fire Protection Designer of Record (DOR). Examples of life safety and fire protection features include, but are not limited to, water distribution systems including fire pumps and fire hydrants, fire resistive assemblies such as fire rated walls/partitions, through -penetration firestop systems, spray-applied fire proofing of structural components, fire alarm and detection systems, fire suppression and standpipe systems, means of egress components, emergency and exit lighting fixtures. The plan must include a listing of the individuals, approved agencies or firms that will be retained for conducting the required inspections and tests accompanied by a description of individual inspector's experience and a copy of all required certifications. Additional copies of this plan must be submitted to the NAVFAC Fire Protection Engineer and the Installation Fire Chief. This plan must include the following:

   (1) Comprehensive list of systems, components or features to be inspected and tested.

   (2) Description of performance verification testing activities for each system or component.

   (3) Procedures and schedules for functional performance tests of all systems requiring functional testing.

k. For the DQC plan, submit a formal Communication Plan that indicates

the frequency of design meetings and what information is covered in those meetings, key design decision points tied to the Network Analysis Schedule and how the DOR plans to include the Government in those decisions, peer review procedures, interdisciplinary coordination, design review procedures, comment resolution, etc.

The Communication Plan must emphasize key decisions and possible problems the Contractor and Government may encounter during the design phase of the project. Provide a plan to discuss design alternatives and design coordination with the stakeholders at the key decision points as they arise on the project. Identify individual stakeholders and suggested communication methods that will be employed to expedite and facilitate each anticipated critical decision. Communication methods may include: Concept Design Workshop, over-the-shoulder review meetings, presentation at client's office, lifecycle cost analysis presentation, technical phone conversation, and formal review meeting. The design portion of the Communication Plan must be written by the DQC Manager and confirmed during the Post Award Kick off Partnering. Update the Communication Plan at every Partnering meeting.

l. For the DQC Plan, procedures for insuring the design documents are submitted in accordance with FC 1-300-09N, Navy and Marine Corps Design Procedures and other procedures to ensure disciplines have been properly coordinated to eliminate conflicts.

m. For the DQC Plan, provide Quality Control Documentation procedures such as QC review sets and QC comments to demonstrate that cross checking of all engineering disciple's design drawings and specifications has taken place. The QC review documentation must exhibit a checking process of the design documents for completeness, accuracy, and constructability.

n. For the DQC Plan, a list of design subcontractors and the scope of the work which each firm will accomplish.

1.3.4 Special Inspections

Perform all required Special Inspections and structural observations per Section 01 45 35.05 20 SPECIAL INSPECTIONS FOR DESIGN-BUILD, the Statement of Special Inspections and the Schedule of Special Inspections.

1.4 QC ORGANIZATION

The QC Manager must manage the QC organization and must report to an officer of the firm and must not be subordinate to the Project Superintendent or the Project Manager.

1.4.1 QC and Alternate QC Manager

QC and Alternate QC Manager qualifications:

a. Complete the course entitled "Construction Quality Management (CQM) for Contractors" and maintain a current certificate. The QC Manager that does not have a current certification must obtain the CQM for Contractors course certification within 90 days of award. This course is periodically offered by the Naval Facilities Engineering Command and the Army Corps of Engineers. Contact the Contracting Officer for

class schedule information.

b. Familiar with requirements of USACE EM 385-1-1, and experience in the areas of hazard identification and safety compliance.

c. Ten years of combined experience as a Superintendent, QC Manager, Project Manager, or Project Engineer on similar size and type construction contracts, and at least two years' experience as a QC Manager on similiar size and type construction contracts..

QC and Alternate QC Manager responsibilities:

a. Participate in the Post Award Kick-off, Partnering, Preconstruction, Design Development, and Coordination and Mutual Understanding Meetings.

b. Implement the "Three Phase of Control" plan for each DFOW and notify the Contracting Officer at least 3 business days in advance of each Preparatory and Initial Phase meeting. Submit respective checklists to the Contracting Officer the next business day.

c. Ensure that no construction begins before the DOR has finalized the design for that segment of work, and construction submittals are approved as required.

d. Inspect all work and rework, using International Conference of Building Officials certified QC specialists as applicable, to ensure its compliance with contract requirements. Maintain a rework log.

e. Immediately stop any segment of work, which does not comply with the contract requirements and direct the removal and replacement of any defective work.

f. Remove any individual from the site who fails to perform their work in a skillful, safe and workmanlike manner or whose work does not comply with the contract plans and specifications.

g. Prepare daily QC Reports.

h. Provide daily photographic documentation to support the work reported in the Daily Reports. Maintain a file of CD/ DVD disks at the job site that assemble the photographs supporting the daily reports. Organize the supporting photographs into searchable files organized by date and under each date organize the photographs in folders for each definable features of work. Indicate on the disk label and disk holder the date range of pictures contained on each disk. Provide a date stamp on each picture and title each picture with a description of location and viewed components. Provide .jpeg color photograph files that are 300 DPI - printable at 8 inch by 10 inch size.

Photograph construction related to existing work to be covered by contract modifications and required rework as follows;

(1) View of as-is conditions prior to modification / rework.

(2) View of as-is conditions with existing exterior enclosure and interior finishes removed before modification / new work begins.

(3) View of new / modified construction prior to being covered by exterior enclosure and interior finishes.

(4) View of completed new / modified construction.

i. Ensure that Contractor Production Reports are prepared daily.

j. Hold weekly QC meetings with the DQC Manager, DOR (or representative), Superintendent and the Contracting Officer; participation must be suitable for the phase of work. Distribute minutes of these meetings.

k. Ensure that design and construction submittals are reviewed and approved, as required by the contract, prior to allowing material on site and work to proceed with these items. Maintain a submittal register.

l. Update As-built drawings daily, maintaining up-to-date set on site.

m. Maintain a testing plan and log. Ensure that all testing is performed in accordance with the contract. Review all test reports and notify the Contracting Officer of all deficiencies, along with a proposal for corrective action.

n. Maintain rework log on site, noting dates deficiency identified, and date corrected.

o. Certify and sign statement on each invoice that all work to be paid under the invoice has been completed in accordance with contract requirements.

p. Perform Punch-out and participate in Pre-final and Final acceptance Inspections. Submit list of deficiencies to the Contracting Officer for each inspection. Correct all deficiencies prior to the Final inspection. Notify Contracting Officer prior to final inspection to establish a schedule date acceptable by the Contracting Officer.

q. Ensure that all required keys, operation and maintenance manuals, warranty certificates, and the As-built drawings are correct and complete, in accordance with the contract, and submitted to the Contracting Officer.

r. Assure that all applicable tests, and observations required by the contract are performed.

s. Coordinate all factory and on-site testing, Testing Laboratory personnel, QC Specialists, and any other inspection and testing personnel required by this Contract.

t. Notify the Contracting Officer of any proposed changes to the QC plan.

u. Retain a copy of approved submittals at project site, including Contractor's copy of approved samples.

v. Update the Performance Assessment Plan as described in Section 01 31 19.05 20 POST AWARD MEETINGS and discuss monthly at a QC meeting.

w. Coordinate training of Government maintenance personnel with the eOMSI Preparer to assure training materials and training classes are accurate and provide instruction and documentation on critical elements of the products, materials, and systems in the constructed facility. Verify that the Government's operating personnel were

trained.

x. Coordinate scheduled work with Special Inspections required by Section 01 45 35.05 20 SPECIAL INSPECTIONS FOR DESIGN-BUILD, the Statement of Special Inspections and the Schedule of Special Inspections.

y. Supervise all Special Inspectors required by the contract documents and the IBC.

z. Verify the qualifications of all of the Special Inspectors.

aa. Verify the qualifications of fabricators.

bb. Maintain a 3- ring binder for the Special Inspector's daily and biweekly reports. This file must be located in a conspicuous place in the project trailer/office to allow review by the Contracting Officer and the DOR.

1.4.2 DQC Manager

The DQC Manager must be a member of the QC organization, must coordinate actions with the QC Manager , and must not be subordinate to the Project Superintendent or the Project Manager.

DQC Manager qualifications:

a. A minimum of 5 years' experience as a design Architect or Engineer on similar size and type designs / or design-build contracts. Provide education, experience, and management capabilities on similar size and type contracts.

b. Be a registered professional engineer or architect with an active registration. Provide proof of registration as part of the resume submittal package.

c. Complete the US Army Corps of Engineers (USACE) course entitled "Construction Quality Management (CQM) for Contractors."

DQC Manager responsibilities:

a. Be responsible for the design integrity, professional design standards, and all design services required.

b. Be a member of the Designer of Record's (DOR) firm, but may not be the DOR or the person stamping and approving final construction drawings or approving submittals.

c. Be responsible for development of the design portion of the QC Plan, incorporation and maintenance of the approved Design Schedule, and the preparation of DQC Reports and minutes of all design meetings.

d. Participate in the Post Award Kick-Off, all design planning meetings, design presentations, partnering, and QC meetings.

e. Implement the DQC plan and must remain on staff involved with the project until completion of the project.

f. Be cognizant of and assure that all design documents on the project have been developed in accordance with the Contract.

g. Provide Design Quality Control Documentation (DQCD) which indicates design coordination of the engineering disciplines. Submit DQCD with the pre-final and final design submittals as required in Section 01 33 10.05 20, DESIGN SUBMITTAL PROCEDURES.

h. Develop the submittal register. Coordinate with each DOR to determine what items need to be submitted, and who needs to approve.

i. Provide QC certification for design compliance.

j. Certify and sign statement on each invoice that all work to be paid to the DOR under the invoice has been completed in accordance with the contract requirements.

k. Prepare weekly DQC Reports that document the work the design team accomplished that week.

l. Coordinate all training requirements with the QC and in accordance with 01 78 23 OPERATION AND MAINTENANCE DATA.

1.4.3 Designer of Record (DOR) Qualifications

The DOR must be a registered design professional, retained by the prime contractor, responsible for the overall design and review of submittal documents prepared by others. The DOR is registered or licensed to practice their respective design profession as defined by the statutory requirements of the professional registration laws in the state in which the design professional works. The DOR cannot serve as the DQC.

1.4.4 QC Specialists

QC Specialists must assist and report to the QC Manager and may perform production related duties but must be allowed sufficient time to perform their assigned quality control duties. QC Specialists are required to attend the Coordination and Mutual Understanding Meeting, QC meetings and be physically present at the construction site to perform the three phases of control and prepare documentation for each definable feature of work in their area of responsibility at the frequency specified below.

1.4.4.1 Fire Protection QC Specialist

The Fire Protection QC Specialist (FPQC) must be a U.S. registered Professional Engineer and must be an integral part of the Prime Contractor's Quality Control Organization. This FPQC must have no business relationships (owner, partner, operating officer, distributor, salesman, or technical representative) with any fire protection equipment device manufacturers, suppliers or installers for any such equipment provided as part of this project. The Fire Protection Designer of Record may serve as the lead Fire Protection QC Specialist, provided the following qualifications are met.

a. Qualifications/Experience: The FPQC must have obtained their professional registration by successfully completing the Fire Protection Engineering discipline examination. This FPQC must have a minimum of 5 years full time and exclusive experience in every aspect of facility design and construction as it relates to fire protection, which includes, but is not limited to, building code analysis, life safety code analysis, design of automatic detection and suppression

systems, passive fire protection design, water supply analysis, and a multi-discipline coordination reviews, and construction surveillance.

b. Area of Responsibility: The FPQC is responsible for assuring the proper construction and installation of life safety and fire protection features across all disciplines and trades. The FPQC must be responsible for assuring that life safety and fire protection features are provided in accordance with the design documents, approved construction submittals, and manufacturer's requirements. Examples include, but are not limited to, water distribution systems including fire pumps and fire hydrants, fire resistive assemblies such as spray-applied fire proofing of structural components and fire rated walls/partitions, fire alarm and detection systems, fire suppression and standpipe systems, emergency and exit lighting fixtures, etc.

c. Construction Surveillance: The FPQC is responsible for reviewing and implementing the QC Plan developed by the Fire Protection DOR. The FPQC must visit the construction site as necessary to ensure life safety and fire protection systems are being constructed, applied, and installed in accordance with the approved design documents, approved construction submittals, and manufacturer's requirements. Frequency and duration of the field visits are dependent upon particular system components, system complexity, and phase of construction. At a minimum, field visits must occur just prior to installation of suspended ceiling systems to inspect the integrity of passive fire protection features and fire suppression system piping, and required performance verification testing of all life safety and fire protection systems identified below and in Part 4.

(1) Preliminary Inspections and Final Acceptance Testing: FPQC must personally witness all preliminary inspections of fire alarm/detection and suppression systems. Once preliminary inspections have been successfully completed, the FPQC must submit a signed certificate to the QC Manager that systems are ready for final inspection and testing. The Naval Facilities Engineering Command Fire Protection Engineer will witness formal tests and approve all systems before they are accepted. The QC Manager must submit the request for formal inspection at least 15 days prior to the date the inspection is to take place. The QC Manager must provide 10 days advance notice to the Contracting Officer and the activity Fire Inspection Office of scheduled final inspections.

d. QC Documentation and Certifications: The following documentation and certification must be prepared by the FPQC. Additional copies must be submitted to the NAVFAC Fire Protection Engineer and the Installation Fire Chief.

(1) Field visit reports. Submit reports documenting all field visits and summarizing all findings.

(2) Inspection and Test reports and certificates. Submit in accordance with the applicable codes, standards, and this RFP.

(3) Final Life Safety/Fire Protection Certification. Provide FPQC certification that all life safety and fire protection systems have been inspected and in the FPQC's professional judgment, have been installed in accordance with the contract documents, approved submittals, and manufacturer's requirements. This certification must summarize all life safety and fire protection features, and

must bear the professional seal of the fire protection engineer.

1.4.4.2 Building Envelope QC Specialists

Qualification / Experience in Area of Responsibility	Area of Responsibility	Frequency
Roofing Manufacturer's Technical Representative / 5 years minimum with roofing system used.	Installation and testing of roofing.	Once a week during installation, two times a Once a week during flashing installation and full time during roof testing.

1.4.4.3 Special Inspector

The Special Inspector (SI) must be an independent third party hired directly by the Prime Contractor. The SI must not be a company employee of the Contractor or any Sub-Contractor performing the work to be inspected. The qualifications of the SI are defined in Section 01 45 35.05 20 SPECIAL INSPECTIONS FOR DESIGN-BUILD.

1.4.4.4 Electrical and Telecommunications Systems QC Specialists

Provide ICC IBC Special inspections Certification from the following specialists:

Qualification / Experience in Area of Responsibility	Area of Responsibility	Frequency
Electrical Inspector Crew supervision for 10 years minimum. Master Electrician licensed in NC.	Electrical Systems, All Division 26 sections, and Division 33 Elec. Sections	Full time during installation and testing all systems.
Telecommunications Systems Installation Specialist 10 years minimum experience in Telecommunications systems installation.	Telecommunications systems, All Division 27, 28 sections Division 33 Outside Plant (OSP) Work.	Full time during systems installation and testing.

Q

1.5 TESTING

1.5.1 Accreditation Requirements

Construction materials testing laboratories must be accredited by a

laboratory accreditation authority and will be required to submit a copy of the Certificate of Accreditation and Scope of Accreditation. The laboratory's scope of accreditation must include the appropriate ASTM standards (E 329, C 1077, D 3666, D 3740, A 880, E 543) listed in the technical sections of the specifications. Laboratories engaged in Hazardous Materials Testing must meet the requirements of OSHA and EPA. The policy applies to the specific laboratory performing the actual testing, not just the Corporate Office.

1.5.2 Laboratory Accreditation Authorities

Laboratory Accreditation Authorities include the National Voluntary Laboratory Accreditation Program (NVLAP) administered by the National Institute of Standards and Technology at http://ts.nist.gov/ts/htdocs/210/214/214.htm , the American Association of State Highway and Transportation Officials (AASHTO) program at http://www.amrl.net/amrlsitefinity/default/aap.aspx , International Accreditation Services, Inc. (IAS) at http://www.iasonline.org, U. S. Army Corps of Engineers Materials Testing Center (MTC) at http://gsl.erdc.usace.army.mil/SL/MTC/, the American Association for Laboratory Accreditation (A2LA) program at http://www.a2la.org/, the Washington Association of Building Officials (WABO) at http://www.wabo.org/ (Approval authority for WABO is limited to projects within Washington State), and the Washington Area Council of Engineering Laboratories (WACEL) at http://wacel.org/fmi/xsl/wacel/index.xsl (Approval authority by WACEL is limited to projects within Facilities Engineering Command (FEC) Washington geographical area).

1.5.3 Capability Check

The Contracting Officer retains the right to check laboratory equipment in the proposed laboratory and the laboratory technician's testing procedures, techniques, and other items pertinent to testing, for compliance with the standards set forth in this Contract.

1.5.4 Test Results

Cite applicable Contract requirements, tests or analytical procedures used. Provide actual results and include a statement that the item tested or analyzed conforms or fails to conform to specified requirements. If the item fails to conform, notify the Contracting Officer immediately. Conspicuously stamp the cover sheet for each report in large red letters "CONFORMS" or "DOES NOT CONFORM" to the specification requirements, whichever is applicable. Test results must be signed by a testing laboratory representative authorized to sign certified test reports. Furnish the signed reports, certifications, and other documentation to the Contracting Officer via the QC Manager. Furnish a summary report of field tests at the end of each month, in accordance with paragraph INFORMATION FOR THE CONTRACTING OFFICER.

1.5.5 Test Reports and Monthly Summary Report of Tests

Furnish the signed reports, certifications, and a summary report of field tests at the end of each month to the Contracting Officer. Attach a copy of the summary report to the last daily Contractor Quality Control Report of each month. Provide a copy of the signed test reports and certifications to the OMSI preparer for inclusion into the OMSI documentation.

1.6 THREE PHASES OF CONTROL

The Three Phases of Control must adequately cover both on-site and off-site work and must include the following for each DFOW.

1.6.1 Preparatory Phase

Notify the Contracting Officer at least two work days in advance of each preparatory phase meeting. The meeting must be conducted by the QC Manager and attended by the Project Superintendent, QC Specialists, and the foreman responsible for the DFOW. The Special Inspector must also attend if required by Special Inspections, as outlined in the Statement of Special Inspections and Schedule of Special Inspections. When the DFOW will be accomplished by a subcontractor, that subcontractor's foreman must attend the preparatory phase meeting. Document the results of the preparatory phase actions in the daily Contractor Quality Control Report and in the Preparatory Phase Checklist. Perform the following prior to beginning work on each DFOW:

a. Review each paragraph of the applicable specification sections;

b. Review the Contract drawings;

c. Verify that appropriate shop drawings and submittals for materials and equipment have been submitted and approved. Verify receipt of approved factory test results, when required;

d. Review the testing plan and ensure that provisions have been made to provide the required QC testing;

e. Review Special Inspections required by Section 01 45 35.05 20 SPECIAL INSPECTIONS FOR DESIGN-BUILD, the Statement of Special Inspections and the Schedule of Special Inspections.

f. Examine the work area to ensure that the required preliminary work has been completed;

g. Examine the required materials, equipment and sample work to ensure that they are on hand and conform to the approved shop drawings and submitted data;

h. Discuss the specific controls used in construction methods, construction tolerances, workmanship standards, and the approach that will be used to provide quality construction by planning ahead and identifying potential problems for each DFOW; and

i. Review the APP and appropriate Activity Hazard Analysis (AHA) to ensure that applicable safety requirements are met, and that required Safety Data Sheets (SDS) are submitted.

1.6.2 Initial Phase

Notify the Contracting Officer at least two work days in advance of each initial phase. When construction crews are ready to start work on a DFOW, conduct the initial phase with the Project Superintendent, QC Specialists, and the foreman responsible for that DFOW. The Special Inspector must also attend if required by Special Inspections, as outlined in the Statement of Special Inspections and Schedule of Special Inspections. Observe the initial segment of the DFOW to ensure that the work complies

with Contract requirements. Document the results of the initial phase in the daily CQC Report and in Initial Phase Checklist. Repeat the initial phase for each new crew to work on-site, or when acceptable levels of specified quality are not being met. Perform the following for each DFOW:

a. Establish the quality of workmanship required;

b. Resolve conflicts;

c. Ensure that testing is performed by the approved laboratory, and

d. Check work procedures for compliance with the APP and the appropriate AHA to ensure that applicable safety requirements are met.

e. Ensure manufacturer's representative has performed necessary inspections, if required.

f. Coordinate scheduled work with Special Inspections required by the Section 01 45 35.05 20 SPECIAL INSPECTIONS FOR DESIGN-BUILD, the Statement of Special Inspections and the Schedule of Special Inspections.

1.6.3 Follow-Up Phase

Perform the following for on-going work daily, or more frequently as necessary, until the completion of each DFOW and document in the daily CQC Report:

a. Ensure the work is in compliance with Contract requirements;

b. Maintain the quality of workmanship required;

c. Ensure that testing is performed by the approved laboratory; and

d. Ensure that rework items are being corrected.

e. Coordinate scheduled work with Special Inspections required by the Section 01 45 35.05 20 SPECIAL INSPECTIONS FOR DESIGN-BUILD, the Statement of Special Inspections and the Schedule of Special Inspections.

1.6.4 Additional Preparatory and Initial Phases

Additional preparatory and initial phases must be conducted on the same DFOW if the quality of on-going work is unacceptable, if there are changes in the applicable QC organization, if there are changes in the on-site production supervision or work crew, if work on a DFOW is resumed after substantial period of inactivity, or if other problems develop.

1.6.5 Notification of Three Phases of Control for Off-Site Work

Notify the Contracting Officer at least two weeks prior to the start of the preparatory and initial phases.

1.7 COMPLETION INSPECTIONS

The Contractor must perform the necessary punch-out, pre-final, and final inspections, compile punch lists, and correct deficiencies.

1.7.1 Punch-Out Inspection

Near the completion of all work or any increment thereof, established by a completion time stated in the Contract Clause entitled "Commencement, Prosecution, and Completion of Work," or stated elsewhere in the specifications, the QC Manager and the CA must conduct an inspection of the work and develop a "punch list" of items which do not conform to the approved drawings, specifications and Contract. Include in the punch list any remaining items on the "Rework Items List", which were not corrected prior to the Punch-Out Inspection. Include within the punch list the estimated date by which the deficiencies will be corrected. Provide a copy of the punch list to the Contracting Officer. The QC Manager, or staff, must make follow-on inspections to ascertain that all deficiencies have been corrected. Once this is accomplished, notify the Contracting Officer that the facility is ready for the Government "Pre-Final Inspection".

1.7.2 Pre-Final Inspection

The Government and QC Manager will perform this inspection to verify that the facility is complete and ready to be occupied. A Government "Pre-Final Punch List" will be documented by the QC Manager as a result of this inspection. The QC Manager will ensure that all items on this list are corrected prior to notifying the Government that a "Final" inspection with the Client can be scheduled. Any items noted on the "Pre-Final" inspection must be corrected in a timely manner and be accomplished before the contract completion date for the work or any particular increment thereof, if the project is divided into increments by separate completion dates.

1.7.3 Final Acceptance Inspection

Notify the Contracting Officer at least 14 calendar days prior to the date a final acceptance inspection can be held. State within the notice that all items previously identified on the pre-final punch list will be corrected and acceptable, along with any other unfinished Contract work, by the date of the final acceptance inspection. The Contractor must be represented by the QC Manager, the Project Superintendent, the CA, and others deemed necessary. Attendees for the Government will include the Contracting Officer, other FEAD/ROICC personnel, and personnel representing the Client. Failure of the Contractor to have all contract work acceptably complete for this inspection will because for the Contracting Officer to bill the Contractor for the Government's additional inspection cost in accordance with the Contract Clause entitled "Inspection of Construction."

1.8 DOCUMENTATION

Maintain current and complete records of on-site and off-site QC program operations and activities.

1.9 CONSTRUCTION INDOOR AIR QUALITY (IAQ) MANAGEMENT PLAN

Submit an IAQ Management Plan within 15 days after notice to proceed and not less than 10 days before the preconstruction meeting. Revise and resubmit Plan as required by the Contracting Officer. Make copies of the final plan available to all workers on site. Include provisions in the Plan to meet the requirements specified below and to ensure safe, healthy air for construction workers and building occupants.

1.9.1 Requirements During Construction

Provide for evaluation of indoor Carbon Dioxide concentrations in accordance with ASTM D6245. Provide for evaluation of volatile organic compounds (VOCs) in indoor air in accordance with ASTM D6345. Use filters with a Minimum Efficiency Reporting Value (MERV) of 8 in permanently installed air handlers during construction.

1.9.1.1 Control Measures

Meet or exceed the requirements of ANSI/SMACNA 008, Chapter 3, to help minimize contamination of the building from construction activities. The five requirements of this manual which must be adhered to are described below:

a. HVAC protection: Isolate return side of HVAC system from surrounding environment to prevent construction dust and debris from entering the duct work and spaces.

b. Source control: Use low emitting paints and other finishes, sealants, adhesives, and other materials as specified. When available, cleaning products must have a low VOC content and be non-toxic to minimize building contamination. Utilize cleaning techniques that minimize dust generation. Cycle equipment off when not needed. Prohibit idling motor vehicles where emissions could be drawn into building. Designate receiving/storage areas for incoming material that minimize IAQ impacts.

c. Pathway interruption: When pollutants are generated use strategies such as 100 percent outside air ventilation or erection of physical barriers between work and non-work areas to prevent contamination.

d. Housekeeping: Clean frequently to remove construction dust and debris. Promptly clean up spills. Remove accumulated water and keep work areas dry to discourage the growth of mold and bacteria. Take extra measures when hazardous materials are involved.

e. Scheduling: Control the sequence of construction to minimize the absorption of VOCs by other building materials.

1.9.1.2 Moisture Contamination

a. Remove accumulated water and keep work dry.

b. Use dehumidification to remove moist, humid air from a work area.

c. Do not use combustion heaters or generators inside the building.

d. Protect porous materials from exposure to moisture.

e. Remove and replace items which remain damp for more than a few hours.

1.9.2 Requirements after Construction

After construction ends and prior to occupancy, conduct a building flush-out or test the indoor air contaminant levels. Flush-out must be a minimum two-weeks with MERV-13 filtration media as determined by ASHRAE 52.2at 100 percent outside air. Air contamination testing must be

consistent with EPA's current Compendium of Methods for the Determination of Air Pollutants in Indoor Air. After building flush-out or testing and prior to occupancy, replace filtration media. Filtration media must have a MERV of 13 as determined by ASHRAE 52.2.

1.10 Commissioning

Refer to Section 01 91 00.15 22 TOTAL BUILDING COMMISSIONING for commissioning requirements.

-- End of Section --

SECTION 01 45 35.05 20

SPECIAL INSPECTIONS FOR DESIGN-BUILD
09/15

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INTERNATIONAL CODE COUNCIL (ICC)

ICC IBC	(2018) International Building Code

U.S. DEPARTMENT OF DEFENSE (DOD)

UFC 3-301-01	(2019; with Change 3) Structural Engineering

1.2 GENERAL REQUIREMENTS

Perform Special Inspections in accordance with the Statement of Special Inspections, Schedule of Special Inspections and Chapter 17 of ICC IBC.

Special Inspections are to be performed by an independent third party and are intended to ensure that the work of the prime contractor is in accordance with the Contract Documents and applicable building codes. Special inspections do not take the place of the three phases of control inspections performed by the Contractor's QC Manager or any testing and inspections required by other sections of the specifications.

1.2.1 Fabricator Special Inspections

Special Inspections of fabricator's work performed in the fabricator's shop is required to be inspected in accordance with the Statement of Special Inspections and the Schedule of Special Inspections unless the fabricator is certified by the approved agency to perform such work without Special Inspections. Submit the following certifications to the Contracting Officer for information to allow work performed in the fabricator's shop to not be subjected to Special Inspections.

American Institute of Steel Construction (AISC) Certified Fabrication Plant, Category STD.

Truss Plate Institute (TPI) steel truss plant quality assurance program certification.International Accreditation Service, AC472 Accreditation

Steel Joist Institute Membership

Precast Concrete Institute (PCI) Certified Plant, Group C

At the completion of fabrication, submit a certificate of compliance, to be included with the final report of Special Inspections, stating that the materials supplied and work performed by the fabricator are in accordance

the construction documents.

1.2.2 Defective Work

Check work as it progresses. Failure to detect any defective work or materials must in no way prevent later rejection if defective work or materials are discovered, nor obligate the Contracting Officer to accept such work.

1.3 DEFINITIONS

1.3.1 Continuous Special Inspections

Continuous Special Inspections are the constant monitoring of specific tasks by a special inspector. These inspections must be carried out continuously over the duration of the particular tasks.

1.3.2 Periodic Special Inspections

Periodic Special Inspections are Special Inspections by the special inspector who is intermittently present where the work to be inspected has been or is being performed.

1.3.3 Perform

Perform these Special Inspections tasks for each welded joint or member.

1.3.4 Observe

Observe these Special Inspections items on a random daily basis. Operations need not be delayed pending these inspections.

1.3.5 Special Inspector (SI)

A qualified person retained by the contractor and approved by the Contracting Officer as having the competence necessary to inspect a particular type of construction requiring Special Inspections. The SI must be an independent third party hired directly by the Prime Contractor.

1.3.6 Associate Special Inspector (ASI)

A qualified person who assists the SI in performing Special Inspections but must perform inspection under the direct supervision of the SI and cannot perform inspections without the SI on site.

1.3.7 Third Party

A third party inspector must not be company employee of the Contractor or any Sub-Contractor performing the work to be inspected.

1.3.8 Special Inspector of Record (SIOR)

A licensed engineer in responsible charge of supervision of all special inspectors for the project and approved by the Contracting officer. The SIOR must be an independent third party hired directly by the Prime Contractor.

1.3.9 Contracting Officer

The Government official having overall authority for administrative contracting actions. Certain contracting actions may be delegated to the Contracting Officer's Representative (COR).

1.3.10 Contractor's Quality Control (QC) Manager

An individual retained by the prime contractor and qualified in accordance with the requirements of UFGS 01 45 00.05 20 DESIGN AND CONSTRUCTION QUALITY CONTROL having the overall responsibility for the contractor's QC organization.

1.3.11 Designer of Record (DOR)

A registered design professional, retained by the prime contractor, responsible for the overall design and review of submittal documents prepared by others. The DOR is registered or licensed to practice their respective design profession as defined by the statutory requirements of the professional registration laws in state in which the design professional works. The DOR is also referred to as the Engineer of Record (EOR) in design code documents.

1.3.12 Statement of Special Inspections (SSI)

A document developed by the DOR identifying the material, systems, components and work required to have Special Inspections.

1.3.13 Schedule of Special Inspections

A schedule which lists each of the required Special Inspections, the extent to which each special inspection is to be performed, and the required frequency (periodic or continuous)for each in accordance with ICC IBC Chapter 17.

1.3.14 Structural Observations

Specific structural observations performed by the DOR for high wind and seismic loading.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Statement of Special Inspections; G

Structural Observations; G

SIOR Letter of Acceptance; G

Special Inspections Project Manual; G

Special Inspections Agency's Written Practices

NDT Procedures and Equipment Calibration Records

SD-06 Test Reports

Special Inspections Daily Reports

Special Inspections Biweekly Reports

SD-07 Certificates

AISC Certified Fabrication Plant

TPI Steel Truss Plant Quality Assurance

AC472 Accreditation

Steel Joist Institute Membership

PCI Certified Plant

Special Inspector of Record Qualifications; G

Special Inspector Qualifications; G

Qualification Records for NDT Technicians

SD-11 Closeout Submittal

Interim Final Report of Special Inspections

Comprehensive Final Report of Special Inspections; G

Final Report of Structural Observations; G

1.5 SPECIAL INSPECTOR QUALIFICATIONS

Submit qualifications for each special inspector and the special inspector of record.

Certifying Associations

Certifying Associations	
AABC	Associated Air Balance Council

UL	Underwriters Laboratories

1.5.1 Steel Construction and High Strength Bolting

1.5.1.1 Special Inspector

a. ICC Structural Steel and Bolting Special Inspector certificate with one year of related experience, or

b. Registered Professional Engineer with related experience

1.5.1.2 Associate Special Inspector

Engineer-In-Training with one year of related experience.

1.5.2 Welding Structural Steel

1.5.2.1 Special Inspector

a. ICC Structural Welding Special Inspector certificate with one year of related experience, or

b. AWS Certified Welding Inspector

1.5.2.2 Associate Special Inspector

a. AWS Certified Associate Welding Inspector

1.5.3 Nondestructive Testing of Welds

1.5.3.1 Special Inspector

a. NDT Level III Certificate

1.5.3.2 Associate Special Inspector

a. NDT Level II Certificate plus one year of related experience

1.5.4 Cold Formed Steel Framing

1.5.4.1 Special Inspector

a. ICC Structural Steel and Bolting Special Inspector certificate with

one year of related experience, or

b. ICC Commercial Building Inspector with one year of experience, or

c. ICC Residential Building Inspector with one year of experience, or

d. Registered Professional Engineer with related experience

1.5.4.2 Associate Special Inspector

Engineer-In-Training with one year of related experience

1.5.5 Concrete Construction

1.5.5.1 Special Inspector

a. ICC Reinforced Concrete Special Inspector Certificate with one year of related experience, or

b. ACI Concrete Construction Special Inspector, or

c. NICET Concrete Technician Level III Certificate in Construction Materials Testing, or

d. Registered Professional Engineer with related experience

1.5.5.2 Associate Special Inspector

a. ACI Concrete Construction Special Inspector in Training, or

b. Engineer-In-Training with one year of related experience

1.5.6 Prestressed Concrete Construction

1.5.6.1 Special Inspector

a. ICC Pre-stressed Special Inspector Certificate with one year of related experience, or

b. PCI Quality Control Technician/ Inspector Level II Certificate with one year of related experience, or

c. Registered Professional Engineer with related experience

1.5.6.2 Associate Special Inspector

a. PCI Quality Control Technician/ Inspector Level I Certificate with one year of related experience, or

b. Engineer-In-Training with one year of related experience

1.5.7 Masonry Construction

1.5.7.1 Special Inspector

a. ICC Structural Masonry Special Inspector Certificate with one year of related experience, or

b. Registered Professional Engineer with related experience

1.5.7.2 Associate Special Inspector

Engineer-In-Training with one year of related experience

1.5.8 Verification of Site Soil Condition, Fill Placement and Load-Bearing Requirements

1.5.8.1 Special Inspector

a. ICC Soils Special Inspector Certificate with one year of related experience, or

b. NICET Soils Technician Level II Certificate in Construction Material Testing, or

c. NICET Geotechnical Engineering Technician Level II Construction or Generalist Certificate, or

d. Geologist-In-Training with one year of related experience, or

e. Registered Professional Engineer with related experience

1.5.8.2 Associate Special Inspector

a. NICET Soils Technician Level I Certificate in Construction Material Testing with one year of related experience, or

b. NICET Geotechnical Engineering Technician Level I Construction or Generalist Certificate with one year of related experience, or

c. Engineer-In-Training with one year of related experience

1.5.9 Deep Foundations

1.5.9.1 Special Inspector

a. NICET Soils Technician Level II Certificate in Construction Material Testing, or

b. NICET Geotechnical Engineering Technician Level II Construction or Generalist Certificate, or

c. Geologist-In-Training with one year of related experience, or

d. Registered Professional Engineer with related experience

1.5.9.2 Associate Special Inspector

a. NICET Soils Technician Level I Certificate in Construction Material Testing with one year of related experience, or

b. NICET Geotechnical Engineering Technician Level I Construction or Generalist Certificate with one year of related experience, or

c. Engineer-In-Training with one year of related experience

1.5.10 Sprayed Fire Resistant Material

1.5.10.1 Special Inspector

a. ICC Spray-applied Fireproofing Special Inspector Certificate, or

b. ICC Fire Inspector I Certificate with one year of related experience, or

c. Registered Professional Engineer with related experience

1.5.10.2 Associate Special Inspector

Engineer-In-Training with one year of related experience

1.5.11 Mastic and Intumescent Fire Resistant Coatings

1.5.11.1 Special Inspector

a. ICC Spray-applied Fireproofing Special Inspector Certificate, or

b. ICC Fire Inspector I Certificate with one year of related experience, or

c. Registered Professional Engineer with related experience

1.5.11.2 Associate Special Inspector

Engineer-In-Training with one year of related experience

1.5.12 Fire-Resistant Penetrations and Joints

1.5.12.1 Special Inspector

a. Passed the UL Firestop Exam with one year of related experience, or

b. Passed the FM Firestop Exam with one year of related experience, or

c. Registered Professional Engineer with related experience

1.5.12.2 Associate Special Inspector

Engineer-In-Training with one year of related experience

1.5.13 Smoke Control

1.5.13.1 Primary Inspector

a. AABC Technician Certification with one year of related experience, or

b. Registered Professional Engineer with related experience

1.5.13.2 Associate Special Inspector

Engineer-In-Training with one year of related experience

1.5.14 Special Inspector of Record (SIOR)

Registered Professional Engineer

1.6 RESPONSIBILITIES

1.6.1 Special Inspector of Record (SIOR)

a. Supervise all Special Inspectors required by the contract documents and the ICC IBC.

b. Submit a letter to the Contracting Officer attesting to acceptance of the duties of SIOR, signed and sealed by the SIOR.

c. Verify the qualifications of all of the Special Inspectors.

d. Verify the qualifications of fabricators.

e. Submit Special Inspections agency's written practices for the monitoring and control of the agency's operations to include the following:

(1) The agency's procedures for the selection and administration of inspection personnel, describing the training, experience and examination requirements for qualifications and certification of inspection personnel.

(2) The agency's inspection procedures, including general inspection, material controls, and visual welding inspection.

f. Submit qualification records for nondestructive testing (NDT) technicians designated for the project.

g. Submit NDT procedures and equipment calibration records for NDT to be performed and equipment to be used for the project.

h. Prepare a Special Inspections Project Manual, which will cover the following:

(1) Roles and responsibilities of the following individuals during Special Inspections: SIOR, SI, General Contractor, Subcontractors, QC Manager, and DOR.

(2) Organizational chart and/or communication plan, indicating lines of communication.

(3) Contractor’s internal plan for scheduling inspections. Address items such as timeliness of inspection requests, who to contact for inspection requests, and availability of alternate inspectors.

(4) Indicate the government reporting procedures.

(5) Propose forms or templates to be used by SI and SIOR to document inspections.

(6) Indicate procedures for tracking nonconforming work and verification that corrective work is complete.

(7) Indicate how the SIOR and/or SI will participate in weekly QC meetings.

(8) Indicate how Special Inspections of shop fabricated items will be handled when the fabricator’s shop is not certified per paragraph

FABRICATOR SPECIAL INSPECTIONS.

(9) Include a section in the manual that covers each specific item requiring Special Inspections that is indicated on the Schedule of Special Inspections. Provide names and qualifications of each special inspector who will be performing the Special Inspections for each specific item. Provide detail on how the Special Inspections are to be carried out for each item so that the expectations are clear for the General Contractor and the Subcontractor performing the work.

Make a copy of the Special Inspections Project Manual available on the job site during construction. Submit a copy of the Special Inspections Project Manual for approval.

i. Attend coordination and mutual understanding meeting where the information in the Special Inspections Project Manual will be reviewed to verify that all parties have a clear understanding of the Special Inspections provisions and the individual duties and responsibilities of each party.

j. Maintain a 3- ring binder for the Special Inspector's daily and biweekly reports and the SI Project Manual. This file must be located in a conspicuous place in the project trailer/office to allow review by the Contracting Officer and the DOR.

k. Submit a copy of the Special Inspector’s daily reports to the QC Manager.

l. Discrepancies that are observed during Special Inspections must be reported to the QC Manager for correction. If discrepancies are not corrected before the special inspector leaves the site the observed discrepancies must be documented in the daily report.

m. Submit a biweekly Special Inspections report to the Contracting Officer until all work requiring Special Inspections is complete. A report is required for each biweekly period in which Special Inspections activity occurs, and must include the following:

(1) A brief summary of the work performed during the reporting time frame.

(2) Changes and/or discrepancies with the drawings, specifications that were observed during the reporting period.

(3) Discrepancies which were resolved or corrected.

(4) A list of nonconforming items requiring resolution.

(5) All applicable test results including nondestructive testing reports.

n. At the completion of each Definable Feature of Work (DFOW) requiring Special Inspections, submit an interim final report of Special Inspections to the Contracting Officer that documents the Special Inspections completed for that DFOW and corrections of all discrepancies noted in the daily reports. The interim final report of Special Inspections must be signed, dated and bear the seal of the SIOR.

o. At the completion of the project submit a comprehensive final report of Special Inspections that documents the Special Inspections completed for the project and corrections of all discrepancies noted in the daily reports. The comprehensive final report of Special Inspections must be signed, dated and bear the seal of the SIOR.

1.6.2 Quality Control Manager

a. Maintain a rework items list that includes discrepancies noted on the Special Inspectors daily report.

b. Several of the responsibilities for the Quality Control Manager listed in section 01 45 00.05 20 DESIGN AND CONSTRUCTION QUALITY CONTROL are identical to those of the Special Inspector of Record listed herein. Those responsibilities default to the Special Inspector of Record.

1.6.3 Special Inspectors

a. Inspect all elements of the project for which the special inspector is qualified to inspect and are identified in the Schedule of Special Inspections.

b. Attend preparatory phase meetings related to the Definable Feature of Work (DFOW) for which the special inspector is qualified to inspect.

c. Submit Special Inspections agency’s written practices for the monitoring and control of the agency’s operations to include the following:

(1) The agency’s procedures for the selection and administration of inspection personnel, describing the training, experience and examination requirements for qualifications and certification of inspection personnel.

(2) The agency’s inspection procedures, including general inspection, material controls, and visual welding inspection.

d. Submit qualification records for nondestructive testing (NDT) technicians designated for the project.

e. Submit NDT procedures and equipment calibration records for NDT to be performed and equipment to be used for the project.

f. Submit a copy of the daily reports to the QC Manager.

g. Discrepancies that are observed during Special Inspections must be reported to the QC Manager for correction. If discrepancies are not corrected before the special inspector leaves the site the observed discrepancies must be documented in the daily report.

h. Submit a biweekly Special Inspection Report until all inspections are complete. A report is required for each biweekly period in which Special Inspections activity occurs, and must include the following:

(1) A brief summary of the work performed during the reporting time frame.

(2) Changes and/or discrepancies with the drawings, specifications

that were observed during the reporting period.

(3) Discrepancies which were resolved or corrected.

(4) A list of nonconforming items requiring resolution.

(5) All applicable test result including nondestructive testing reports.

i. At the completion of each Definable Feature of Work (DFOW) requiring Special Inspections, submit an interim final report of Special Inspections to the Contracting Officer that documents the Special Inspections completed for that DFOW. Identify the inspector responsible for each item inspected and corrections of all discrepancies noted in the daily reports. The interim final report of Special Inspections must be signed, dated and indicate the certification of the special inspector qualifying them to conduct the inspection.

j. At the completion of the project submit a comprehensive final report of Special Inspections that documents the Special Inspections completed for the project and corrections of all discrepancies noted in the daily reports. The comprehensive final report of Special Inspections must be signed, dated and indicate the certification of the special inspector qualifying them to conduct the inspection

k. Submit daily reports to the SIOR.

1.6.4 Designer of Record

a. Develop the Statement of Special Inspections and the Schedule of Special Inspections as defined in Chapter 17 of ICC IBC. Submit the Statement of Special Inspections and the Schedule of Special Inspections for approval by the Contracting Officer.

The Statement of Special Inspection must include the following information:

(1) List of Architectural Designated Seismic Systems.

(2) List of Mechanical Designated Seismic Systems.

(3) List of the Electrical Designated Seismic Systems.

(4) Define the periodic walk-down inspections required by UFC 3-301-01.

(5) List of elements that are part of the progressive collapse resistance system.

Develop Schedule of Special Inspection using the template located on the Whole Building Design Guide website at: http://wbdg.org/ccb/NAVGRAPH/graphtoc.pdf.

b. Prior to the start of structural observations submit a written statement identifying the frequency and delineation wind/seismic force resisting system requiring structural observations.

c. At the conclusion of the structural observations submit a final report of structural observations indicating that the structural observation site visits have been made and identify any reported deficiencies

which, to the best of the structural observer’s knowledge, have not been resolved.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Traffic Control Plan; G

Construction Site Plan; G

SD-03 Product Data

Backflow Preventers

SD-07 Certificates

Backflow Preventers Certificate of Full Approval

1.3 EPA LISTED ITEMS USED IN CONDUCT OF THE WORK BUT NOT INCORPORATED IN THE WORK

There are many products listed in 40 CFR 247 which have been designated or proposed by EPA to include recycled or recovered materials that may be used by the Contractor in performing the work but will not be incorporated into the work. These products include office products, temporary traffic control products, and pallets. These non-construction products contain the highest practicable percentage of recycled or recovered materials and can be recycled when no longer needed.

1.4 CONSTRUCTION SITE PLAN

Prior to the start of work, submit a site plan showing the locations of temporary facilities (including layouts and details, equipment and material storage area (onsite and offsite), and access and haul routes used for this contract. Show locations of safety and construction fences, site trailers, construction entrances, trash dumpsters, temporary sanitary facilities, and worker parking areas.

1.5 BACKFLOW PREVENTERS CERTIFICATE

Certificate of Full Approval from FCCCHR List, University of Southern California, attesting that the design, size and make of each backflow preventer has satisfactorily passed the complete sequence of performance testing and evaluation for the respective level of approval. Certificate of Provisional Approval is not acceptable.

1.5.1 Backflow Prevention Training Certificate

The Contractor must submit a certificate recognized by the State or local authority that states the Contractor has completed at least 10 hours of training in backflow preventer installations. The certificate must be current.

1.6 TEMPORARY UTILITIES

1.6.1 CONTRACTOR UTILITIES

The Contractor shall provide his own utilities.

1.6.2 UTILITIES AT SPECIAL LOCATIONS

Reasonable amounts of utilities will be made available to the Contractor at the prevailing Government rates. These rates may be obtained upon

application to the Commanding Officer. A refundable security deposit to the Resident Officer in Charge of Construction must be made prior to application for services. The Contractor is responsible for making connections, providing transformers and meters, making disconnections and removing all temporary utilities upon project completion; and for providing backflow preventer devices on connections to domestic water lines. Final taps and tie-ins to the Government utility grid will be made by Base Maintenance who will also provide and seal a 120 or 208 volt, three-wire kWh meter. Tap-in cost, if any, is the responsibility of the Contractor. Tampering or movement of a sealed meter without notification to base maintenance is grounds for discontinuance of electrical service. The Contractor is responsible for providing larger meters required if not available from the Government. The Contractor is responsible for the cost of utility services required until the date of Government acceptance. Under no circumstances will taps to base fire hydrants be allowed for obtaining domestic water.

1.6.3 LOCATION OF UNDERGROUND UTILITIES

See specification section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS paragraph "Location of Underground Utilities".
Location and Protection of underground utilities shall be the responsibility of the Contractor. Where existing-to-remain piping, utilities, and underground obstructions of any type are indicted in locations to be traversed by new piping, ducts, and other excavations the elevations of the existing utilities and obstructions shall be determined before the new work is completed.

a. In addition, the Contractor will be responsible for obtaining the services of a professional utility locator prior to digging. Contractor will provide documentation that the site has been surveyed and checked for underground utilities. All utilities must be located, including but not limited to power, water, sewer, storm drains, fiber optics, T.V. cable, telephone, and intrusion detection wiring. A set of known utility drawings will be available in the ROICC office for review to assist the locator.

b. It is mandatory that the Contractor also contact the Base Telephone Office (451-2531) prior to accomplishing any digging at Camp Lejeune. A telephone office representative will assist in locating telephone lines.

c. It is mandatory that the Contractor also contact Charter Communications, cable TV service prior to accomplishing any digging at Camp Lejeune, to ensure that all buried cable lines are identified. Contact Mr. Olin Criswell at 353-8677 for assistance.

d. It is mandatory that the contractor also contact the North Carolina One-Call Center to coordinate the location of underground natural gas infrastructure. North Carolina 811, Inc. can be reached at 811 on a touch-tone phone in the state of North Carolina or toll-free at 1.800.632.4949 if calling from out of state. Work requests may also be submitted online at www.nc811.org.

1.6.4 DAMAGE TO UNDERGROUND UTILTIES

Immediate notice shall be delivered to the Contracting Officer of any damage. The Contractor shall make temporary repairs immediately, and shall provide permanent repairs as soon as practicable. For any additional work

required by reason of conflict between the new and existing work, an adjustment in contract price will be made in accordance with Contract clause entitled "Differing Site Conditions", if appropriate.

1.7 BACKFLOW TESTER CERTIFICATION

Prior to testing, submit to the Contracting Officer certification issued by the State or local regulatory agency attesting that the backflow tester has successfully completed a certification course sponsored by the regulatory agency. Tester must not be affiliated with any company participating in any other phase of this Contract.

1.8 WEATHER PROTECTION

Take necessary precautions to ensure that roof openings and other critical openings in the building are monitored carefully. Take immediate actions required to seal off such openings when rain or other detrimental weather is imminent, and at the end of each workday.

1.8.1 Building and Site Storm Protection

When a warning of gale force winds is issued, take precautions to minimize danger to persons, and protect the work and nearby Government property. Precautions include, but are not limited to, closing openings; removing loose materials, tools and equipment from exposed locations; and removing or securing scaffolding and other temporary work. Close openings in the work when storms of lesser intensity pose a threat to the work or any nearby Government property.

1.8.1.1 Condition of Readiness

Unless directed otherwise, comply with:

a. Condition FOUR (Sustained winds of 58 mph or greater expected within 72 hours): Normal daily jobsite cleanup and good housekeeping practices. Collect and store in piles or containers all scrap lumber, waste material, and rubbish for removal and disposal at the close of each work day. Maintain the construction site including storage areas, free of accumulation of debris. Stack form lumber in neat piles less than 3.3 feet high. Remove all debris, trash, or objects that could become missile hazards. Review requirements pertaining to "Condition THREE" and continue action as necessary to attain "Condition FOUR" readiness. Contact Contracting Officer for Condition of Readiness (COR) updates and completion of required actions.

b. Condition THREE (Sustained winds of 58 mph or greater expected within 48 hours): Maintain "Condition FOUR" requirements and commence securing operations necessary for "Condition TWO" readiness. Cease all routine activities which might interfere with securing operations. Commence securing and stow all gear and portable equipment. Make preparations for securing buildings. Reinforce or remove formwork and scaffolding. Secure machinery, tools, equipment, materials, or remove from the jobsite. Expend every effort to clear all missile hazards and loose equipment from general base areas. Contact Contracting Officer for weather and COR updates and completion of required actions.

c. Condition TWO (Sustained winds of 58 mph or greater expected within 24 hours): Secure the jobsite, and leave Government premises.

d. Condition ONE (Sustained winds of 58 mph or greater expected within 12 hours): Contractor access to the jobsite and Government premises is prohibited.

1.9 STATION OPERATION AFFECT ON CONTRACTOR OPERATIONS

1.9.1 Special Restrictions Regarding Access of Vehicles and Parking

1.9.1.1 Interruption of Vehicular Traffic

If during the performance of work, it becomes necessary to modify vehicular traffic patterns at any locations, notify the Contracting Officer at least 15 calendar days prior to the proposed modification date, and provide a Traffic Control Plan detailing the proposed controls to traffic movement for approval. The plan must be in accordance with State and local regulations and the MUTCD. Make all notifications and obtain any permits required for modification to traffic movements outside Station's jurisdiction. Provide cones, signs, barricades, lights, or other traffic control devices and personnel required to control traffic. Do not use foil-backed material for temporary pavement marking because of its potential to conduct electricity during accidents involving downed power lines.

1.10 STORAGE AREAS

Contractor is responsible for security of his property. The Contract Clause entitled "FAR 52.236-10, Operations and Storage Areas" and the following apply:

1.10.1 Storage in Existing Buildings

The Contractor will be working around existing buildings; the storage of material will not be allowed in the buildings. Provide 8 foot high security fence with a lockable gate around the storage area. Remove at the completion of work.

1.11 TEMPORARY SANITARY FACILITIES

Provide adequate sanitary conveniences of a type approved for the use of persons employed on the work, properly secluded from public observation, and maintained in such a manner as required and approved by the Contracting Officer. Maintain these conveniences at all times without nuisance. Upon completion of the work, remove the conveniences from the premises, leaving the premises clean and free from nuisance. Dispose of sewage through connection to a municipal, district, or station sanitary sewage system. Where such systems are not available, use chemical toilets or comparably effective units, and periodically empty wastes into a municipal, district, or station sanitary sewage system, or remove waste to a commercial facility. Include provisions for pest control and elimination of odors.

1.12 TEMPORARY BUILDINGS

Temporary facilities (including trailers) must be in like new condition and must be maintained throughout the project. Locate these facilities where directed and within the indicated operations area. Failure to maintain storage trailers or buildings to these standards will result in the removal of non-complying units at the Contractor's expense. A sign

not smaller than 24 by 24 inches must be conspicuously placed on the trailer depicting the company name, business phone number, and emergency phone number. Trailers must be anchored to resist high winds and must meet applicable state of local standards for anchoring mobile trailers. Storage of material/debris under such facilities is prohibited. Contractor is responsible for the security of the stored property.

1.12.1 Maintenance of Temporary Facilities

Suitably paint and maintain the temporary facilities. Failure to do so will be sufficient reason to require their removal.

1.12.2 Quality Control Manager Records and Field Office

Provide on the jobsite an office for the exclusive use of the QC Manager. Provide a door with a cylinder lock and windows with locking hardware. File quality control records in the office and make available at all times to the Government.

PART 2 PRODUCTS

2.1 BACKFLOW PREVENTERS

Reduced pressure principle type conforming to the applicable requirements AWWA C511. Provide backflow preventers complete with 150 pound flanged bronze, or brass mounted gate valve and strainer, 304 stainless steel or bronze, internal parts. The particular make, model/design, and size of backflow preventers to be installed must be included in the latest edition of the List of Approved Backflow Prevention Assemblies issued by the FCCCHR List and must be accompanied by a Certificate of Full Approval from FCCCHR List.

2.2 PROJECT SIGN

Prior to initiating any work on site, provide one project identification sign per site at the location coordinated with the Contracting Officer. Construct the sign in accordance with project sign detail attached at the end of this section. Maintain sign throughout the life of the project. Upon completion of the project, remove the sign from the site. Provide color rendering of the project. Reproduce the rendering on the signboard or enclose a copy of the rendering under a water-proof, transparent cover, and caulk for weather protection. Provide rendering in accordance with Section 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES.

2.2.1 Project Identification Signboard (Navy)

A project identification signboard must be provided in accordance with attached Plates 2MC, 3, 4, and 5. The signboard is to be placed at a conspicuous location on the job site where directed by the Contracting Officer.

a. The field of the sign must consist of a minimum of 4 by 8 foot sheet of exterior plywood.

b. The entire signboard and supports must be painted. The lettering and sign work must be performed by a skilled sign painter using paint known in the trade as bulletin colors. The colors, lettering sizes, and lettering styles must be as indicated.

c. NAVFAC logo must be a sticker/decal with either transparent or white background or paint the logo by stencil onto the sign. The weather resistant sticker/decal film must be rated for a minimum of 2-year exterior vertical exposure. NAVFAC Logo is available at: http://www.navfac.navy.mil/about_us/logos_and_seals.html

d. Sign paint colors

(1) Blue = To match dark blue color in the NAVFAC logo.

(2) White = To match Brilliant White color in the NAVFAC logo.

e. Final signboard artwork (rendering) may be either mounted under plexiglas as indicated in attached Plates 2, or at the Contractor's option may be electrostatically printed on self-adhering, weather resistant, glossy vinyl film and mounted to signboard. Provide film that is capable of full color reproduction of the building rendering and is rated for a minimum of 2 years exterior vertical exposure.

PART 3 EXECUTION

3.1 TEMPORARY PHYSICAL CONTROLS

3.1.1 Access Controls

3.1.1.1 Temporary Barricades

Contractor must provide for barricading around all work areas to prevent public access.

3.1.1.2 Fencing

Fencing must be provided along the construction site at all open excavations and tunnels to control access by unauthorized people. Fencing must be installed to be able to restrain a force of at least 250 pounds against it.

3.1.1.3 Signs

Place warning signs at the construction area perimeter designating the presence of construction hazards requiring unauthorized persons to keep out. Signs must be placed on all sides of the project, with at least one sign every 300 feet. All points of entry must have signs designating the construction site as a hard hat area.

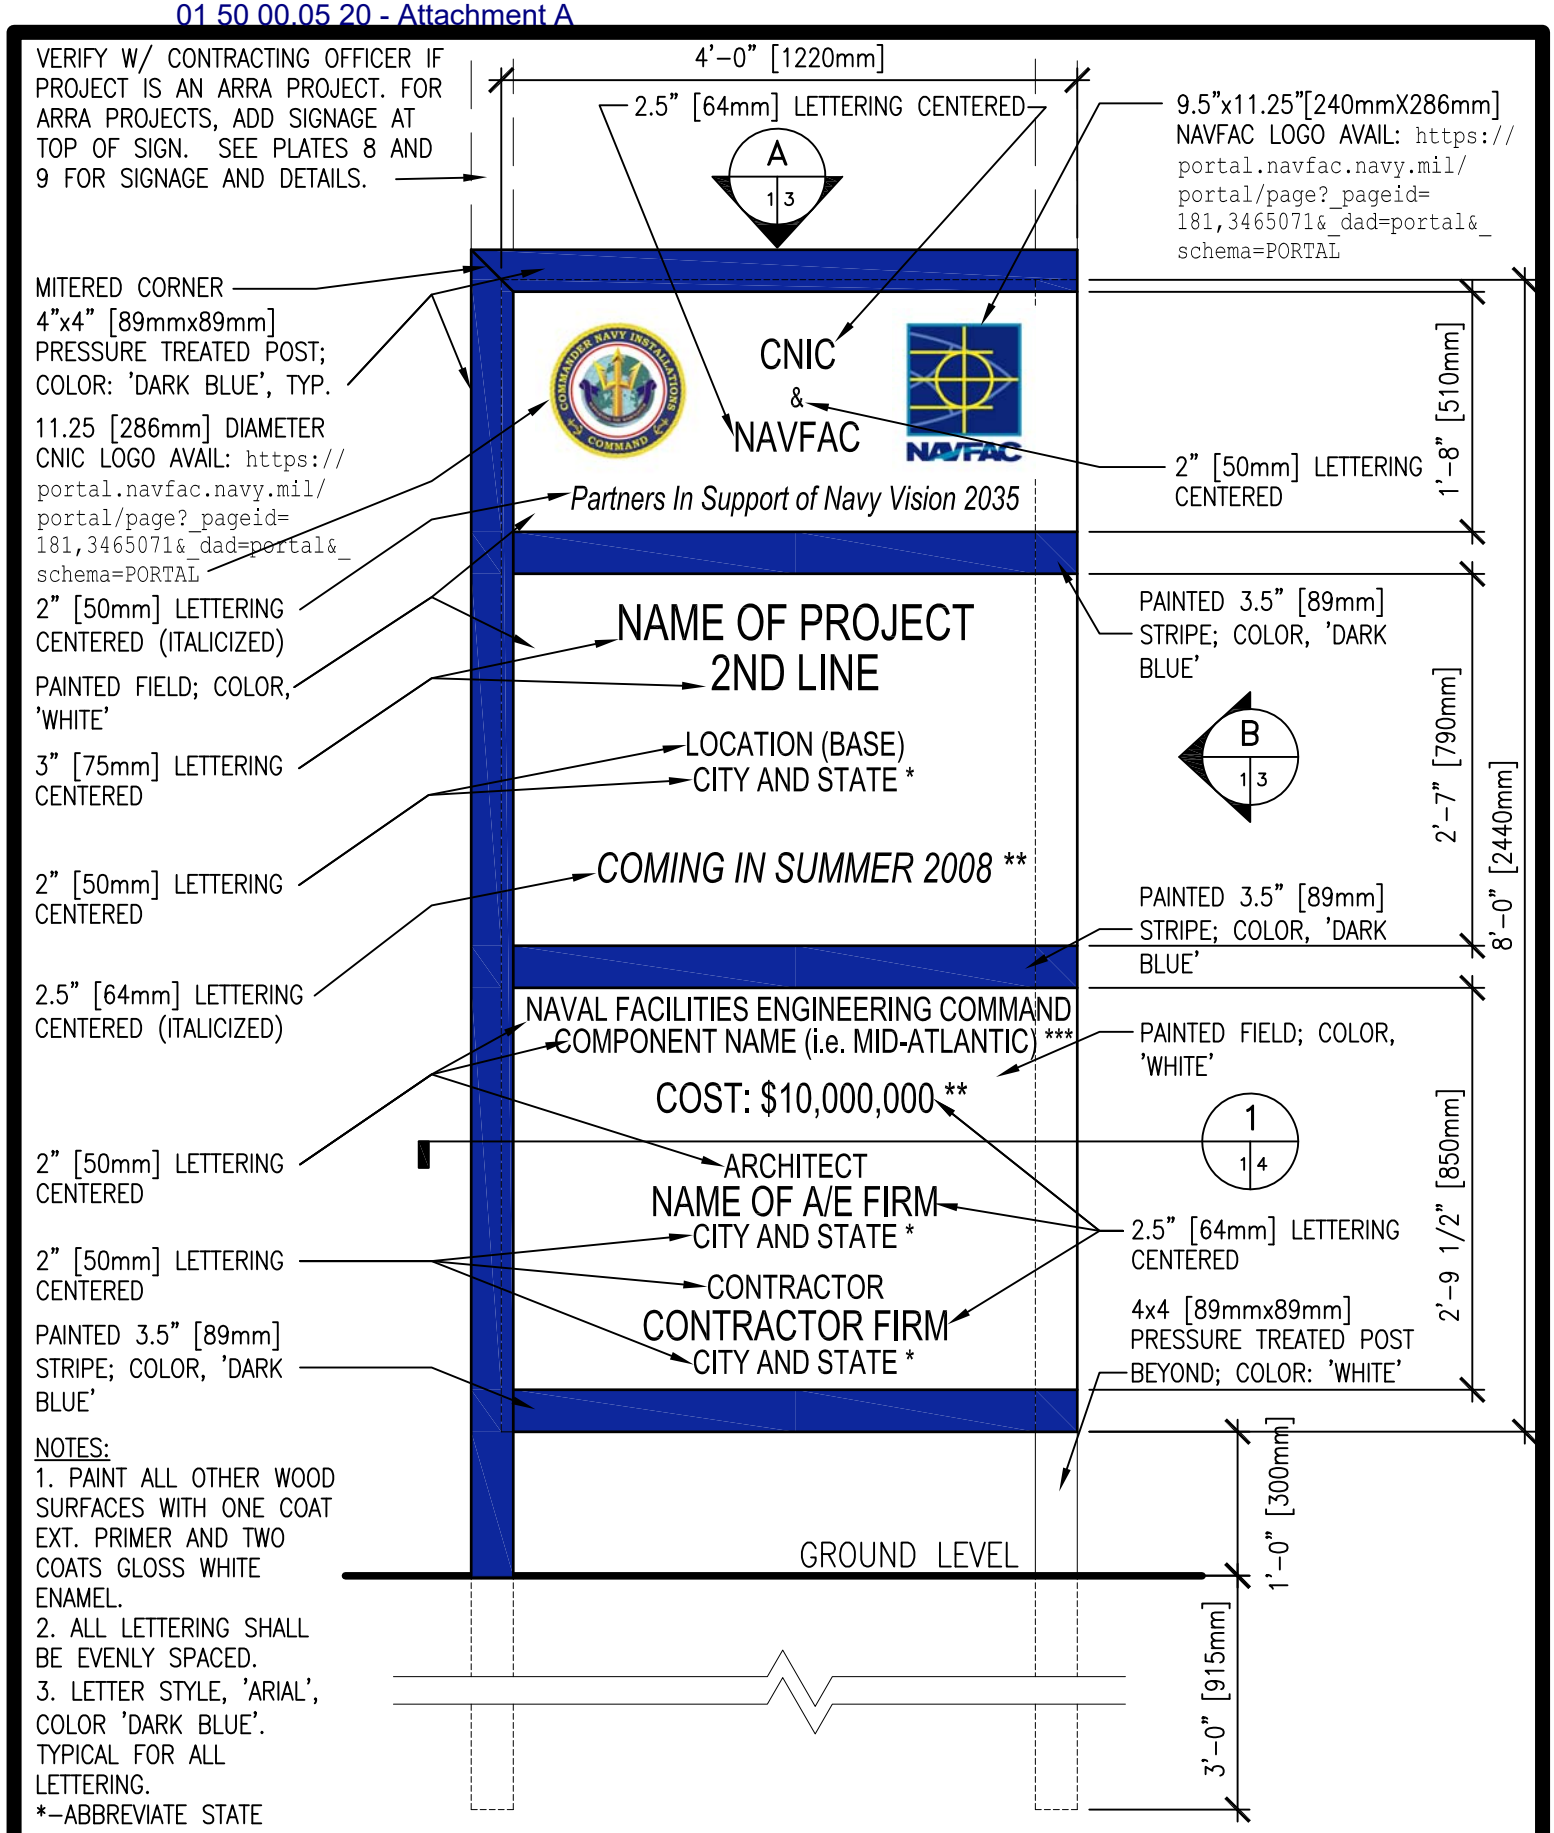
3.1.1.4 Traffic Work

All work around/involving roadways, to include roadway excavations and utility crossings,must be conducted in accordance with Manual of Traffic Control Devices. Contractors must provide and ensure appropriate road closure and detour signs are established as necessary for motor traffic management. All road closures must be coordinated with the Contracting Officer in advance. Self-illuminated (lighted) barricades must be provided during hours of darkness. Brightly-colored (orange) vests are required for all personnel working in roadways. Road closures require a road closure plan showing the location of signage.

3.2 TEMPORARY WIRING

Provide temporary wiring in accordance with NFPA 241 and NFPA 70, Assured Equipment Grounding Conductor Program. Program must include frequent inspection of all equipment and apparatus.

3.3 REDUCED PRESSURE BACKFLOW PREVENTERS



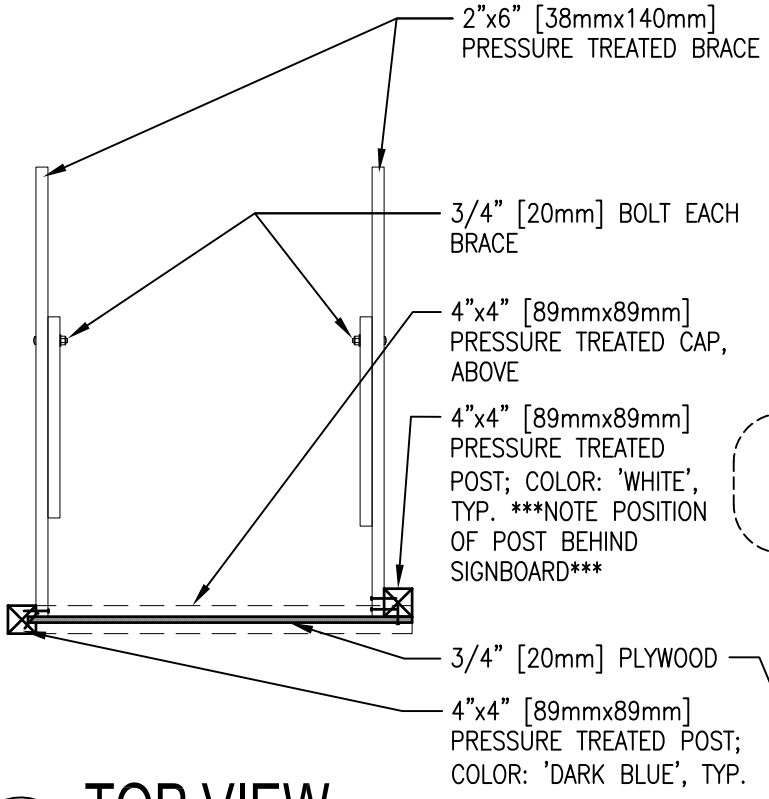
Provide an approved reduced pressure backflow prevention assembly at each location where the Contractor taps into the Government potable water supply.

A certified tester(s) must perform testing of backflow preventer(s) for proper installation and operation and provide subsequent tagging. Backflow preventer tests must be performed using test equipment, procedures, and certification forms conforming to those outlined in the latest edition of the Manual of Cross-Connection Control published by the FCCCHR Manual. Test and tag each reduced pressure backflow preventer upon initial installation (prior to continued water use) and monthly thereafter. Tag must contain the following information: make, model, serial number, dates of tests, results, maintenance performed, and signature of tester. Record test results on certification forms conforming to requirements cited earlier in this paragraph.

3.4 GRASS CUTTING

Cut grass (or annual weeds) within the construction and storage sites as needed to maintain the site in a neat and orderly appearance.

-- End of Section --



NOTES:
1. PAINT ALL OTHER WOOD SURFACES WITH ONE COAT EXT. PRIMER AND TWO COATS GLOSS WHITE ENAMEL.
2. ALL LETTERING SHALL BE EVENLY SPACED.
3. LETTER STYLE, 'ARIAL', COLOR 'DARK BLUE'. TYPICAL FOR ALL LETTERING.

*–ABBREVIATE STATE
**–CONFIRM USE WITH CONTRACTING OFFICER
***–VERIFY NAME WITH CONTRACTING OFFICER.

1.2 DEFINITIONS

1.2.1 Class I and II Ozone Depleting Substance (ODS)

Class I ODS is defined in Section 602(a) of The Clean Air Act. A list of Class I ODS can be found on the EPA website at the following weblink. https://www.epa.gov/ozone-layer-protection/ozone-depleting-substances.

Class II ODS is defined in Section 602(s) of The Clean Air Act. A list of Class II ODS can be found on the EPA website at the following weblink. https://www.epa.gov/ozone-layer-protection/ozone-depleting-substances.

1.2.2 Contractor Generated Hazardous Waste

Contractor generated hazardous waste is materials that, if abandoned or disposed of, may meet the definition of a hazardous waste. These waste streams would typically consist of material brought on site by the Contractor to execute work, but are not fully consumed during the course of construction. Examples include, but are not limited to, excess paint thinners (i.e. methyl ethyl ketone, toluene), waste thinners, excess paints, excess solvents, waste solvents, excess pesticides, and contaminated pesticide equipment rinse water.

1.2.3 Electronics Waste

Electronics waste is discarded electronic devices intended for salvage, recycling, or disposal.

1.2.4 Environmental Pollution and Damage

Environmental pollution and damage is the presence of chemical, physical, or biological elements or agents which adversely affect human health or welfare; unfavorably alter ecological balances of importance to human life; affect other species of importance to humankind; or degrade the environment aesthetically, culturally or historically.

1.2.5 Environmental Protection

Environmental protection is the prevention/control of pollution and habitat disruption that may occur to the environment during construction. The control of environmental pollution and damage requires consideration of land, water, and air; biological and cultural resources; and includes management of visual aesthetics; noise; solid, chemical, gaseous, and liquid waste; radiant energy and radioactive material as well as other pollutants.

1.2.6 Hazardous Debris

As defined in paragraph SOLID WASTE, debris that contains listed hazardous waste (either on the debris surface, or in its interstices, such as pore structure) in accordance with 40 CFR 261. Hazardous debris also includes debris that exhibits a characteristic of hazardous waste in accordance

with 40 CFR 261.

1.2.7 Hazardous Materials

Hazardous materials as defined in 49 CFR 171 and listed in 49 CFR 172.

Hazardous material is any material that: Is regulated as a hazardous material in accordance with 49 CFR 173; or requires a Safety Data Sheet (SDS) in accordance with 29 CFR 1910.120; or during end use, treatment, handling, packaging, storage, transportation, or disposal meets or has components that meet or have potential to meet the definition of a hazardous waste as defined by 40 CFR 261 Subparts A, B, C, or D. Designation of a material by this definition, when separately regulated or controlled by other sections or directives, does not eliminate the need for adherence to that hazard-specific guidance which takes precedence over this section for "control" purposes. Such material includes ammunition, weapons, explosive actuated devices, propellants, pyrotechnics, chemical and biological warfare materials, medical and pharmaceutical supplies, medical waste and infectious materials, bulk fuels, radioactive materials, and other materials such as asbestos, mercury, and polychlorinated biphenyls (PCBs).

1.2.8 Hazardous Waste

Hazardous Waste is any material that meets the definition of a solid waste and exhibit a hazardous characteristic (ignitability, corrosivity, reactivity, or toxicity) as specified in 40 CFR 261, Subpart C, or contains a listed hazardous waste as identified in 40 CFR 261, Subpart D.

1.2.9 Land Application

Land Application means spreading or spraying discharge water at a rate that allows the water to percolate into the soil. No sheeting action, soil erosion, discharge into storm sewers, discharge into defined drainage areas, or discharge into the "waters of the United States" must occur. Comply with federal, state, and local laws and regulations.

1.2.10 Municipal Separate Storm Sewer System (MS4) Permit

MS4 permits are those held by installations to obtain NPDES permit coverage for their stormwater discharges.

1.2.11 National Pollutant Discharge Elimination System (NPDES)

The NPDES permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States.

1.2.12 Oily Waste

Oily waste are those materials that are, or were, mixed with Petroleum, Oils, and Lubricants (POLs) and have become separated from that POLs. Oily wastes also means materials, including wastewaters, centrifuge solids, filter residues or sludges, bottom sediments, tank bottoms, and sorbents which have come into contact with and have been contaminated by, POLs and may be appropriately tested and discarded in a manner which is in compliance with other state and local requirements.

This definition includes materials such as oily rags, "kitty litter" sorbent clay and organic sorbent material. These materials may be land

filled provided that: It is not prohibited in other state regulations or local ordinances; the amount generated is "de minimus" (a small amount); it is the result of minor leaks or spills resulting from normal process operations; and free-flowing oil has been removed to the practicable extent possible. Large quantities of this material, generated as a result of a major spill or in lieu of proper maintenance of the processing equipment, are a solid waste. As a solid waste, perform a hazardous waste determination prior to disposal. As this can be an expensive process, it is recommended that this type of waste be minimized through good housekeeping practices and employee education.

1.2.13 Regulated Waste

Regulated waste are solid wastes that have specific additional federal, state, or local controls for handling, storage, or disposal.

1.2.14 Sediment

Sediment is soil and other debris that have eroded and have been transported by runoff water or wind.

1.2.15 Solid Waste

Solid waste is a solid, liquid, semi-solid or contained gaseous waste. A solid waste can be a hazardous waste, non-hazardous waste, or non-Resource Conservation and Recovery Act (RCRA) regulated waste. Types of solid waste typically generated at construction sites may include:

1.2.15.1 Debris

Debris is non-hazardous solid material generated during the construction, demolition, or renovation of a structure that exceeds 2.5-inch particle size that is: a manufactured object; plant or animal matter; or natural geologic material (for example, cobbles and boulders), broken or removed concrete, masonry, and rock asphalt paving; ceramics; roofing paper and shingles. Inert materials may be reinforced with or contain ferrous wire, rods, accessories and weldments. A mixture of debris and other material such as soil or sludge is also subject to regulation as debris if the mixture is comprised primarily of debris by volume, based on visual inspection.

1.2.15.2 Green Waste

Green waste is the vegetative matter from landscaping, land clearing and grubbing, including, but not limited to, grass, bushes, scrubs, small trees and saplings, tree stumps and plant roots. Marketable trees, grasses and plants that are indicated to remain, be re-located, or be re-used are not included.

1.2.15.3 Material not regulated as solid waste

Material not regulated as solid waste is nuclear source or byproduct materials regulated under the Federal Atomic Energy Act of 1954 as amended; suspended or dissolved materials in domestic sewage effluent or irrigation return flows, or other regulated point source discharges; regulated air emissions; and fluids or wastes associated with natural gas or crude oil exploration or production.

1.2.15.4 Non-Hazardous Waste

Non-hazardous waste is waste that is excluded from, or does not meet, hazardous waste criteria in accordance with 40 CFR 263.

1.2.15.5 Recyclables

Recyclables are materials, equipment and assemblies such as doors, windows, door and window frames, plumbing fixtures, glazing and mirrors that are recovered and sold as recyclable, wiring, insulated/non-insulated copper wire cable, wire rope, and structural components. It also includes commercial-grade refrigeration equipment with Freon removed, household appliances where the basic material content is metal, clean polyethylene terephthalate bottles, cooking oil, used fuel oil, textiles, high-grade paper products and corrugated cardboard, stackable pallets in good condition, clean crating material, and clean rubber/vehicle tires. Metal meeting the definition of lead contaminated or lead based paint contaminated may be included as recyclable if sold to a scrap metal company. Paint cans that meet the definition of empty containers in accordance with 40 CFR 261.7 may be included as recyclable if sold to a scrap metal company.

1.2.15.6 Surplus Soil

Surplus soil is existing soil that is in excess of what is required for this work, including aggregates intended, but not used, for on-site mixing of concrete, mortars, and paving. Contaminated soil meeting the definition of hazardous material or hazardous waste is not included and must be managed in accordance with paragraph HAZARDOUS MATERIAL MANAGEMENT.

1.2.15.7 Scrap Metal

This includes scrap and excess ferrous and non-ferrous metals such as reinforcing steel, structural shapes, pipe, and wire that are recovered or collected and disposed of as scrap. Scrap metal meeting the definition of hazardous material or hazardous waste is not included.

1.2.15.8 Wood

Wood is dimension and non-dimension lumber, plywood, chipboard, hardboard. Treated or painted wood that meets the definition of lead contaminated or lead based contaminated paint is not included. Treated wood includes, but is not limited to, lumber, utility poles, crossties, and other wood products with chemical treatment.

1.2.16 Surface Discharge

Surface discharge means discharge of water into drainage ditches, storm sewers, creeks or "waters of the United States". Surface discharges are discrete, identifiable sources and require a permit from the governing agency. Comply with federal, state, and local laws and regulations.

1.2.17 Wastewater

Wastewater is the used water and solids from a community that flow to a treatment plant.

1.2.17.1 Stormwater

Stormwater is any precipitation in an urban or suburban area that does not evaporate or soak into the ground, but instead collects and flows into storm drains, rivers, and streams.

1.2.18 Waters of the United States

Waters of the United States means Federally jurisdictional waters, including wetlands, that are subject to regulation under Section 404 of the Clean Water Act or navigable waters, as defined under the Rivers and Harbors Act.

1.2.19 Wetlands

Wetlands are those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

1.2.20 Universal Waste

The universal waste regulations streamline collection requirements for certain hazardous wastes in the following categories: batteries, pesticides, mercury-containing equipment (for example, thermostats), and lamps (for example, fluorescent bulbs). The rule is designed to reduce hazardous waste in the municipal solid waste (MSW) stream by making it easier for universal waste handlers to collect these items and send them for recycling or proper disposal. These regulations can be found at 40 CFR 273.

1.3 SUBMITTALS

Government approval is required for all submittals. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Preconstruction Survey
Solid Waste Management Permit; G
Regulatory Notifications; G
Environmental Protection Plan; G
Stormwater Notice of Intent (for NPDES coverage under the general permit for construction activities); G
Dirt and Dust Control Plan; G
Employee Training Records; G
Environmental Manager Qualifications; G

SD-06 Test Reports

Inspection Reports
Solid Waste Management Report; G

SD-07 Certificates

Employee Training Records; G

ECATTS Certificate Of Completion; G
Erosion and Sediment Control Inspector Qualifications

SD-11 Closeout Submittals

Stormwater Pollution Prevention Plan Compliance Notebook; G
Stormwater Notice of Termination (for NPDES coverage under the general permit for construction activities; G
Waste Determination Documentation; G
Disposal Documentation for Hazardous and Regulated Waste; G
Assembled Employee Training Records; G
Solid Waste Management Permit; G
Solid Waste Management Report; G
Contractor Hazardous Material Inventory Log; G
Hazardous Waste/Debris Management; G
Regulatory Notifications; G
Sales Documentation; G
As-Built Topographic Survey
Vapor Intrusion Mitigation System As-Built Drawings; G
O&M/Pm Documentation; G

1.4 ENVIRONMENTAL PROTECTION REQUIREMENTS

Provide and maintain, during the life of the contract, environmental protection as defined. Plan for and provide environmental protective measures to control pollution that develops during construction practice. Plan for and provide environmental protective measures required to correct conditions that develop during the construction of permanent or temporary environmental features associated with the project. Protect the environmental resources within the project boundaries and those affected outside the limits of permanent work during the entire duration of this Contract. Comply with federal, state, and local regulations pertaining to the environment, including water, air, solid waste, hazardous waste and substances, oily substances, and noise pollution.

Tests and procedures assessing whether construction operations comply with Applicable Environmental Laws may be required. Project-specific environmental constraints have been identified and should be incorporated into all design aspects and appropriate deliverables. Refer to supplemental documents in Part 6, specifically the Decision Memorandum(s) and Contractors Environmental Guide (available online at http://www.lejeune.marines.mil/Portals/27/Documents/EMD/Contractor_Environmental_Guide Analytical work must be performed by qualified laboratories; and where required by law, the laboratories must be certified.

1.4.1 Training in Environmental Compliance Assessment Training and Tracking System (ECATTS)

1.4.1.1 Personnel Requirements

The Environmental Manager is responsible for environmental compliance on projects. The Environmental Manager must complete applicable ECATTS training modules (installation specific or general) prior to starting respective portions of on-site work under this Contract. If personnel changes occur for any of these positions after starting work, replacement personnel must complete applicable ECATTS training within 14 days of assignment to the project.

1.4.1.2 Certification

Submit an ECATTS certificate of completion for personnel who have completed the required ECATTS training. This training is web-based and can be accessed from any computer with Internet access using the following instructions.

Register for NAVFAC ECATTS by logging on to https://environmentaltraining.ecatts.com/. Obtain the password for registration from the Contracting Officer.

1.4.1.3 Refresher Training

This training has been structured to allow contractor personnel to receive credit under this contract and to carry forward credit to future contracts. Ensure the Environmental Manager review their training plans for new modules or updated training requirements prior to beginning work. Some training modules are tailored for specific state regulatory requirements; therefore, Contractors working in multiple states will be required to retake modules tailored to the state where the contract work is being performed.

1.4.2 Conformance with the Environmental Management System

Perform work under this contract consistent with the policy and objectives identified in the installation's Environmental Management System (EMS). Perform work in a manner that conforms to objectives and targets of the environmental programs and operational controls identified by the EMS. Support Government personnel when environmental compliance and EMS audits are conducted by escorting auditors at the Project site, answering questions, and providing proof of records being maintained. Provide monitoring and measurement information as necessary to address environmental performance relative to environmental, energy, and transportation management goals. In the event an EMS nonconformance or environmental noncompliance associated with the contracted services, tasks, or actions occurs, take corrective and preventative actions. In addition, employees must be aware of their roles and responsibilities under the installation EMS and of how these EMS roles and responsibilities affect work performed under the contract.

Coordinate with the installation's EMS coordinator to identify training needs associated with environmental aspects and the EMS, and arrange training or take other action to meet these needs. Provide training documentation to the Contracting Officer. The Installation Environmental Office will retain associated environmental compliance records. Make EMS Awareness training completion certificates available to Government auditors during EMS audits and include the certificates in the Employee Training Records. See paragraph EMPLOYEE TRAINING RECORDS.

1.5 SPECIAL ENVIRONMENTAL REQUIREMENTS

Comply with the special environmental requirements listed here and attached at the end of this section.

1.6 QUALITY ASSURANCE

1.6.1 Preconstruction Survey and Protection of Features

This paragraph supplements the Contract Clause PROTECTION OF EXISTING

VEGETATION, STRUCTURES, EQUIPMENT, UTILITIES, AND IMPROVEMENTS. Prior to start of any onsite construction activities, perform a Preconstruction Survey of the project site with the Contracting Officer, and take photographs showing existing environmental conditions in and adjacent to the site. Submit a report for the record. Include in the report a plan describing the features requiring protection under the provisions of the Contract Clauses, which are not specifically identified on the drawings as environmental features requiring protection along with the condition of trees, shrubs and grassed areas immediately adjacent to the site of work and adjacent to the Contractor's assigned storage area and access route(s), as applicable. The Contractor and the Contracting Officer will sign this survey report upon mutual agreement regarding its accuracy and completeness. Protect those environmental features included in the survey report and any indicated on the drawings, regardless of interference that their preservation may cause to the work under the Contract.

1.6.2 Regulatory Notifications

Provide regulatory notification requirements in accordance with federal, state and local regulations. In cases where the Government will also provide public notification (such as stormwater permitting), coordinate with the Contracting Officer. Submit copies of regulatory notifications to the Contracting Officer at least 15 days prior to commencement of work activities. Typically, regulatory notifications must be provided for the following (this listing is not all-inclusive): demolition, renovation, NPDES defined site work, construction, removal or use of a permitted air emissions source, and remediation of controlled substances (asbestos, hazardous waste, lead paint),and construction within an environmental land use controlled (LUC) or land use restricted (LUR) area..

1.6.3 Environmental Brief

Attend an environmental brief to be included in the preconstruction meeting. Provide the following information: types, quantities, and use of hazardous materials that will be brought onto the installation; and types and quantities of wastes/wastewater that may be generated during the Contract. Discuss the results of the Preconstruction Survey at this time.

Prior to initiating any work on site, meet with the Contracting Officer and installation Environmental Office to discuss the proposed Environmental Protection Plan (EPP). Develop a mutual understanding relative to the details of environmental protection, including measures for protecting natural and cultural resources, required reports, required permits, permit requirements (such as mitigation measures), and other measures to be taken.

1.6.4 Environmental Manager

Appoint in writing an Environmental Manager for each project site. The Environmental Manager is directly responsible for coordinating contractor compliance with federal, state, local, and installation requirements. The Environmental Manager must ensure compliance with Hazardous Waste Program requirements (including hazardous waste handling, storage, manifesting, and disposal); implement the EPP; ensure environmental permits are obtained, maintained, and closed out; ensure compliance with Stormwater Program requirements; ensure compliance with Hazardous Materials (storage, handling, and reporting) requirements; ensure appropriate documentation for new air emission sources that need to be added to the Installation's Title V Air Quality Permit is provided to the Installation's Air Quality

Program Manager in a timely manner; ensure POL containing storage tank installations and/or removals are coordinated with the Installation's POL program manager;and coordinate any remediation of regulated substances (lead, asbestos, PCB transformers). This can be a collateral position; however, the person in this position must be trained to adequately accomplish the following duties: ensure waste segregation and storage compatibility requirements are met; inspect and manage Satellite Accumulation areas; ensure only authorized personnel add wastes to containers; ensure Contractor personnel are trained in 40 CFR requirements in accordance with their position requirements; coordinate removal of waste containers; and maintain the Environmental Records binder and required documentation, including environmental permits compliance and close-out. Submit Environmental Manager Qualifications to the Contracting Officer.

1.6.5 Employee Training Records

Prepare and maintain Employee Training Records throughout the term of the contract meeting applicable 40 CFR requirements. Provide Employee Training Records in the Environmental Records Binder. Ensure every employee completes a program of classroom instruction or on-the-job training that teaches them to perform their duties in a way that ensures compliance with federal, state and local regulatory requirements for RCRA Large Quantity Generator. Provide a Position Description for each employee, by subcontractor, based on the Davis-Bacon Wage Rate designation or other equivalent method, evaluating the employee's association with hazardous and regulated wastes. This Position Description will include training requirements as defined in 40 CFR 265 for a Large Quantity Generator facility. Submit these Assembled Employee Training Records to the Contracting Officer at the conclusion of the project, unless otherwise directed.

Train personnel to meet EPA and state requirements. Conduct environmental protection/pollution control meetings for personnel prior to commencing construction activities. Contact additional meetings for new personnel and when site conditions change. Include in the training and meeting agenda: methods of detecting and avoiding pollution; familiarization with statutory and contractual pollution standards; installation and care of devices, vegetative covers, and instruments required for monitoring purposes to ensure adequate and continuous environmental protection/pollution control; anticipated hazardous or toxic chemicals or wastes, and other regulated contaminants; recognition and protection of archaeological sites, artifacts, waters of the United States, and endangered species and their habitat that are known to be in the area. Provide copy of the Erosion and Sediment Control Inspector Certification as required by the state of North Carolina.

1.6.6 Non-Compliance Notifications

The Contracting Officer will notify the Contractor in writing of any observed noncompliance with federal, state or local environmental laws or regulations, permits, and other elements of the Contractor's EPP. After receipt of such notice, inform the Contracting Officer of the proposed corrective action and take such action when approved by the Contracting Officer. The Contracting Officer may issue an order stopping all or part of the work until satisfactory corrective action has been taken. FAR 52.242-14 Suspension of Work provides that a suspension, delay, or interruption of work due to the fault or negligence of the Contractor allows for no adjustments to the contract for time extensions or equitable

adjustments. In addition to a suspension of work, the Contracting Officer may use additional authorities under the contract or law..

1.7 ENVIRONMENTAL PROTECTION PLAN

The purpose of the EPP is to present an overview of known or potential environmental issues that must be considered and addressed during construction. Incorporate construction related objectives and targets from the installation's EMS into the EPP. Include in the EPP measures for protecting natural and cultural resources, required reports, and other measures to be taken. Meet with the Contracting Officer or Contracting Officer Representative to discuss the EPP and develop a mutual understanding relative to the details for environmental protection including measures for protecting natural resources, required reports, and other measures to be taken. Project Specific environmental constraints have been identified and should be incorporated into all design aspects and appropriate deliverables. Refer to supplemental documents in Part 6, specifically the Decision Memorandum(s) and Contractors Environmental Guide (available online at http://www.lejeune.marines.mil/Portals/27/Documents/EMD/Contractor_Environmental_Guide Submit the EPP within 15 days after notice to proceed and not less than 10 days before the preconstruction meeting. Revise the EPP throughout the project to include any reporting requirements, changes in site conditions, or contract modifications that change the project scope of work in a way that could have an environmental impact. No requirement in this section will relieve the Contractor of any applicable federal, state, and local environmental protection laws and regulations. During Construction, identify, implement, and submit for approval any additional requirements to be included in the EPP. Maintain the current version onsite.

The EPP includes, but is not limited to, the following elements:

1.7.1 General Overview and Purpose

1.7.1.1 Descriptions

A brief description of each specific plan required by environmental permit or elsewhere in this Contract such as stormwater pollution prevention plan, spill control plan, solid waste management plan, wastewater management plan, air pollution control plan, contaminant prevention plan, a historical, archaeological, cultural resources, biological resources and wetlands plan, traffic control plan Hazardous, Toxic and Radioactive Waste (HTRW) Plan Non-Hazardous Solid Waste Disposal Plan borrowing material plan, Explosive safety (3R Training), chemical soil vapor mitigation, and management of contaminated soil/groundwater..

1.7.1.2 Duties

The duties and level of authority assigned to the person(s) on the job site who oversee environmental compliance, such as who is responsible for adherence to the EPP, who is responsible for spill cleanup and training personnel on spill response procedures, who is responsible for manifesting hazardous waste to be removed from the site (if applicable), and who is responsible for training the Contractor's environmental protection personnel.

1.7.1.3 Procedures

A copy of any standard or project-specific operating procedures that will

be used to effectively manage and protect the environment on the project site.

1.7.1.4 Communications

Communication and training procedures that will be used to convey environmental management requirements to Contractor employees and subcontractors.

1.7.1.5 Contact Information

Emergency contact information contact information (office phone number, cell phone number, and e-mail address).

1.7.2 General Site Information

1.7.2.1 Drawings

Drawings showing locations of proposed temporary excavations or embankments for haul roads, stream crossings, jurisdictional wetlands, material storage areas, structures, sanitary facilities, storm drains and conveyances, and stockpiles of excess soil.

1.7.2.2 Work Area

Work area plan showing the proposed activity in each portion of the area and identify the areas of limited use or nonuse. Include measures for marking the limits of use areas, including methods for protection of features to be preserved within authorized work areas and methods to control runoff and to contain materials on site, and a traffic control plan.

1.7.2.3 Documentation

A letter signed by an officer of the firm appointing the Environmental Manager and stating that person is responsible for managing and implementing the Environmental Program as described in this contract. Include in this letter the Environmental Manager's authority to direct the removal and replacement of non-conforming work.

1.7.3 Management of Natural Resources

a. Land resources
b. Tree protection
c. Replacement of damaged landscape features
d. Temporary construction
e. Stream crossings
f. Fish and wildlife resources (including known threatened and endangered species)
g. Wetland areas

1.7.4 Protection of Historical and Archaeological Resources

a. Objectives
b. Methods

1.7.5 Stormwater Management and Control

a. Ground cover

b. Erodible soils
c. Temporary measures
    (1) Structural Practices
    (2) Temporary and permanent stabilization
d. Effective selection, implementation and maintenance of Stormwater Control Measures (SCMs).

1.7.6 Protection of the Environment from Waste Derived from Contractor Operations

Control and disposal of solid and sanitary waste. Control and disposal of hazardous waste.

This item consists of the management procedures for hazardous waste to be generated. The elements of those procedures will coincide with the Installation Hazardous Waste Management Plan. The Contracting Officer will provide a copy of the Installation Hazardous Waste Management Plan. As a minimum, include the following:

a. List of the types of hazardous wastes expected to be generated

b. Procedures to ensure a written waste determination is made for appropriate wastes that are to be generated

c. Sampling/analysis plan, including laboratory method(s) that will be used for waste determinations and copies of relevant laboratory certifications

d. Methods and proposed locations for hazardous waste accumulation/storage (that is, in tanks or containers)

e. Management procedures for storage, labeling, transportation, and disposal of waste (treatment of waste is not allowed unless specifically noted)

f. Management procedures and regulatory documentation ensuring disposal of hazardous waste complies with Land Disposal Restrictions (40 CFR 268)

g. Management procedures for recyclable hazardous materials such as lead-acid batteries, used oil, and similar

h. Used oil management procedures in accordance with 40 CFR 279; Hazardous waste minimization procedures

i. Plans for the disposal of hazardous waste by permitted facilities; and Procedures to be employed to ensure required employee training records are maintained.

1.7.7 Prevention of Releases to the Environment

a. Procedures to prevent releases to the environment

b. Notifications in the event of a release to the environment

c. Controls for managing existing contamination from known Environmental Restoration and petroleum remediation sites.

1.7.8 Regulatory Notification and Permits

List what notifications and permit applications must be made. Some permits require up to 180 days to obtain. Demonstrate that those permits have been obtained or applied for by including copies of applicable environmental permits including monitoring well installation and abandonment records. The EPP will not be approved until the permits have been obtained.

1.7.9 Clean Air Act Compliance

1.7.9.1 Haul Route

Submit truck and material haul routes along with a Dirt and Dust Control Plan for controlling dirt, debris, and dust on Installation roadways. As a minimum, identify in the plan the subcontractor and equipment for cleaning along the haul route and measures to reduce dirt, dust, and debris from roadways.

1.7.9.2 Pollution Generating Equipment

Identify air pollution generating equipment or processes that may require federal, state, or local permits under the Clean Air Act. Determine requirements based on any current installation permits and the impacts of the project. Provide a list of all fixed or mobile equipment, machinery or operations that could generate air emissions during the project to the Installation Environmental Office (Air Program Manager).

1.7.9.3 Stationary Internal Combustion Engines

Identify portable and stationary internal combustion engines that will be supplied, used or serviced. Comply with 40 CFR 60 Subpart IIII, 40 CFR 60 Subpart JJJJ, 40 CFR 63 Subpart ZZZZ, and local regulations as applicable. At minimum, include the make, model, serial number, manufacture date, size (engine brake horsepower), and EPA emission certification status of each engine. Maintain applicable records and log hours of operation and fuel use. Logs must include reasons for operation and delineate between emergency and non-emergency operation.

1.7.9.4 Refrigerants

Identify management practices to ensure that heating, ventilation, and air conditioning (HVAC) work involving refrigerants complies with 40 CFR 82 requirements. Technicians must be certified, maintain copies of certification on site, use certified equipment and log work that requires the addition or removal of refrigerant. Any refrigerant reclaimed is the property of the Government, coordinate with the Installation Environmental Office to determine the appropriate turn in location.

1.7.9.5 Air Pollution-engineering Processes

Identify planned air pollution-generating processes and management control measures (including, but not limited to, spray painting, abrasive blasting, demolition, material handling, fugitive dust, and fugitive emissions). Log hours of operations and track quantities of materials used.

1.7.9.6 Compliant Materials

Provide the Government a list of and SDSs for all hazardous materials proposed for use on site. Materials must be compliant with all Clean Air Act regulations for emissions including solvent and volatile organic compound contents, and applicable National Emission Standards for Hazardous Air Pollutants requirements. The Government may alter or limit use of specific materials as needed to meet installation permit requirements for emissions.

1.7.10 Controls for Handling Existing Contamination, Including Munitions, if Applicable.

a. Known site conditions, including types of contaminants and media impacted.

b. Personnel Training Requirements

c. Disposal procedures

d. Notification requirements and procedures, particularly if working in an area with Land Use Controls mandated under CERCLA or RCRA regulations.

1.8 LICENSES AND PERMITS

Obtain licenses and permits required for the construction of the project and in accordance with FAR 52.236-7 Permits and Responsibilities. Notify the Government of all general use permitted equipment the Contractor plans to use on site. This paragraph supplements the Contractor's responsibility under FAR 52.236-7 Permits and Responsibilities.

1.9 ENVIRONMENTAL RECORDS BINDER

Maintain on-site a separate three-ring Environmental Records Binder and submit at the completion of the project. Make separate parts within the binder that correspond to each submittal listed under paragraph CLOSEOUT SUBMITTALS in this section.

1.10 SOLID WASTE MANAGEMENT PERMIT

Provide the Contracting Officer with written notification of the quantity of anticipated solid waste or debris that is anticipated or estimated to be generated by construction. Include in the report the locations where various types of waste will be disposed or recycled. Include letters of acceptance from the receiving location or as applicable; submit one copy of the receiving location state and local Solid Waste Management Permit or license showing such agency's approval of the disposal plan before transporting wastes off Government property.

1.10.1 Solid Waste Management Report

Monthly, submit a solid waste disposal report to the Contracting Officer. For each waste, the report will state the classification (using the definitions provided in this section), amount, location, and name of the business receiving the solid waste.

1.11 FACILITY HAZARDOUS WASTE GENERATOR STATUS

MCAS Cherry Point is designated as a Large Quantity Generator. Meet the regulatory requirements of this generator designation for any work conducted within the boundaries of this Installation. Comply with provisions of federal, state, and local regulatory requirements applicable to this generator status regarding training and storage, handling, and disposal of construction derived wastes.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.1 PROTECTION OF NATURAL RESOURCES

Minimize interference with, disturbance to, and damage to fish, wildlife, and plants, including their habitats. Prior to the commencement of activities, consult with the Installation Environmental Office regarding rare species or sensitive habitats that need to be protected. The protection of rare, threatened, and endangered animal and plant species identified, including their habitats, is the Contractor's responsibility.

Preserve the natural resources within the project boundaries and outside the limits of permanent work. Restore to an equivalent or improved condition upon completion of work that is consistent with the requirements of the Installation Environmental Office or as otherwise specified. Confine construction activities to within the limits of the work indicated or specified.

3.1.1 Flow Ways

Do not alter water flows or otherwise significantly disturb the native habitat adjacent to the project and critical to the survival of fish and wildlife, except as specified and permitted.

3.1.2 Vegetation

Except in areas to be cleared, do not remove, cut, deface, injure, or destroy trees or shrubs without the Contracting Officer's permission. Do not fasten or attach ropes, cables, or guys to existing nearby trees for anchorages unless authorized by the Contracting Officer. Where such use of attached ropes, cables, or guys is authorized, the Contractor is responsible for any resultant damage.

Protect existing trees that are to remain to ensure they are not injured, bruised, defaced, or otherwise damaged by construction operations. Remove displaced rocks from uncleared areas. Coordinate with the Contracting Officer and Installation Environmental Office to determine appropriate action for trees and other landscape features scarred or damaged by equipment operations.

3.1.3 Streams

Stream crossings must allow movement of materials or equipment without violating water pollution control standards of the federal, state, and local governments. Construction of stream crossing structures must be in compliance with any required permits including, but not limited to, Clean

Water Act Section 404, and Section 401 Water Quality.

The Contracting Officer's approval and appropriate permits are required before any equipment will be permitted to ford live streams. In areas where frequent crossings are required, install temporary culverts or bridges. Obtain Contracting Officer's approval prior to installation. Remove temporary culverts or bridges upon completion of work, and repair the area to its original condition unless otherwise required by the Contracting Officer.

3.2 STORMWATER

Do not discharge stormwater from construction sites to the sanitary sewer. If the water is noted or suspected of being contaminated, it may only be released to the storm drain system if the discharge is specifically permitted. Obtain authorization in advance from the Installation Environmental Office for any release of contaminated water.

3.2.1 Construction General Permit

Provide a Construction General Permit as required by 40 CFR 122.26 or the State of North Carolina General Permit. Under the terms and conditions of the permit, install, inspect, maintain BMPs, prepare stormwater erosion and sediment control inspection reports, and submit SWPPP inspection reports. Maintain construction operations and management in compliance with the terms and conditions of the general permit for stormwater discharges from construction activities.

3.2.1.1 Stormwater Pollution Prevention Plan

Submit a project-specific Stormwater Pollution Prevention Plan (SWPPP) to the Contracting Officer for approval, prior to the commencement of work. The SWPPP must meet the requirements of 40 CFR 122.26 and the North Carolina State General Permit for stormwater discharges from construction sites.

Include the following:

a. Comply with terms of the state general permit for stormwater discharges from construction activities. Prepare SWPPP in accordance with state requirements. Use EPA guide Developing your Stormwater Pollution Prevention Plan located at https://www.epa.gov/npdes/developing-stormwater-pollution-prevention-plan-swppp to prepare the SWPPP.

b. Select applicable BMPs from EPA Fact Sheets located at https://www.epa.gov/npdes/national-menu-best-management-practices-bmps-stormwater# or in accordance with applicable state or local requirements.

c. Include a completed copy of the Notice of Intent, BMP Inspection Report Template, and Stormwater Notice of Termination, except for the effective date.

d. Comply with additional requirements provided in Section 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS

3.2.1.2 Stormwater Notice of Intent for Construction Activities

Prepare and submit the Notice of Intent for NPDES coverage under the

general permit for construction activities to the Contracting Officer for review and approval.

Submit the approved NOI and appropriate permit fees onto the appropriate federal or state agency for approval. No land disturbing activities may commence without permit coverage. Maintain an approved copy of the SWPPP at the onsite construction office, and continually update as regulations require, reflecting current site conditions.

Comply with the additional requirements in Section 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS.

3.2.1.3 Inspection Reports

Submit "Inspection Reports" to the Contracting Officer in accordance with the State of North Carolina Construction General Permit. Provide Inspection Reports in accordance with 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS.

3.2.1.4 Stormwater Pollution Prevention Plan Compliance Notebook

Create and maintain a three ring binder of documents that demonstrate compliance with the Construction General Permit. Include a copy of the permit Notice of Intent, proof of permit fee payment, SWPPP and SWPPP update amendments, inspection reports and related corrective action records, copies of correspondence with the North Carolina State Permitting Agency, and a copy of the permit Notice of Termination in the binder. At project completion, the notebook becomes property of the Government. Provide the compliance notebook to the Contracting Officer.

3.2.1.5 Stormwater Notice of Termination for Construction Activities

Submit a Notice of Termination to the Contracting Officer for approval once construction is complete and final stabilization has been achieved on all portions of the site for which the permittee is responsible. Once approved, submit the Notice of Termination to the appropriate state or federal agency. Prepare as-built topographic survey information required by the permitting agency for certification of the stormwater management system, and provide to the Contracting Officer.

3.2.2 Erosion and Sediment Control Measures

Provide erosion and sediment control measures in accordance with state and local laws and regulations. Preserve vegetation to the maximum extent practicable.

Erosion control inspection reports may be compiled as part of a stormwater pollution prevention plan inspection reports.

3.2.2.1 Erosion Control

Prevent erosion by mulching, Compost Blankets, Geotextiles, temporary slope drains,. Stabilize slopes by chemical stabilization, sodding, or such combination of these methods necessary for effective erosion control. Use of hay bales is prohibited.

Provide seeding in accordance with Section 32 92 19 SEEDING.

3.2.2.2 Sediment Control Practices

Implement sediment control practices to divert flows from exposed soils, temporarily store flows, or otherwise limit runoff and the discharge of pollutants from exposed areas of the site. Implement sediment control practices prior to soil disturbance and prior to creating areas with concentrated flow, during the construction process to minimize erosion and sediment laden runoff. Include the following devices: silt fence, temporary diversion dikes, storm drain inlet protection, Location and details of installation and construction are indicated on the drawings.

3.2.3 Work Area Limits

Mark the areas that need not be disturbed under this Contract prior to commencing construction activities. Mark or fence isolated areas within the general work area that are not to be disturbed. Protect monuments and markers before construction operations commence. Where construction operations are to be conducted during darkness, any markers must be visible in the dark. Personnel must be knowledgeable of the purpose for marking and protecting particular objects.

3.2.4 Contractor Facilities and Work Areas

Place field offices, staging areas, stockpile storage, and temporary buildings in areas designated on the drawings or as directed by the Contracting Officer. Move or relocate the Contractor facilities only when approved by the Government. Provide erosion and sediment controls for onsite borrow and spoil areas to prevent sediment from entering nearby waters. Control temporary excavation and embankments for plant or work areas to protect adjacent areas.

3.2.5 Municipal Separate Storm Sewer System (MS4) Management

Comply with the Installation's MS4 permit requirements. Comply with requirements of Section 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS.

3.3 SURFACE AND GROUNDWATER

3.3.1 Cofferdams, Diversions, and Dewatering

Construction operations for dewatering, removal of cofferdams, tailrace excavation, and tunnel closure must be constantly controlled to maintain compliance with existing state water quality standards and designated uses of the surface water body. Comply with the State of North Carolina water quality standards and anti-degradation provisions and the Clean Water Act Section 404. Do not discharge excavation ground water to the sanitary sewer, storm drains, or to surface waters without prior specific authorization in writing from the Installation Environmental Office. Discharge of hazardous substances will not be permitted under any circumstances. Use sediment control BMPs to prevent construction site runoff from directly entering any storm drain or surface waters.

If the construction dewatering is noted or suspected of being contaminated, it may only be released to the storm drain system if the discharge is specifically permitted. Obtain authorization for any contaminated groundwater release in advance from the Installation Environmental Officer and the federal or state authority, as applicable. Discharge of hazardous substances will not be permitted under any

circumstances.

3.3.2 Waters of the United States

Do not enter, disturb, destroy, or allow discharge of contaminants into waters of the United States. The protection of waters of the United States shown on the drawings in accordance with paragraph LICENSES AND PERMITS is the Contractor's responsibility. Authorization to enter specific waters of the United States identified does not relieve the Contractor from any obligation to protect other waters of the United States within, adjacent to, or in the vicinity of the construction site and associated boundaries.

3.4 PROTECTION OF CULTURAL RESOURCES

3.4.1 Archaeological Resources

If, during excavation or other construction activities, any previously unidentified or unanticipated historical, archaeological, and cultural resources are discovered or found, activities that may damage or alter such resources will be suspended. Resources covered by this paragraph include, but are not limited to: any human skeletal remains or burials; artifacts; shell, midden, bone, charcoal, or other deposits; rock or coral alignments, pavings, wall, or other constructed features; and any indication of agricultural or other human activities. Upon such discovery or find, immediately notify the Contracting Officer so that the appropriate authorities may be notified and a determination made as to their significance and what, if any, special disposition of the finds should be made. Cease all activities that may result in impact to or the destruction of these resources. Secure the area and prevent employees or other persons from trespassing on, removing, or otherwise disturbing such resources. The Government retains ownership and control over archaeological resources.

3.5 AIR RESOURCES

Equipment operation, activities, or processes will be in accordance with 40 CFR 64 and state air emission and performance laws and standards.

3.5.1 Preconstruction Air Permits

Notify the Air Program Manager, through the Contracting Officer, at least 6 months prior to bringing equipment, assembled or unassembled, onto the Installation, so that air permits can be secured. Necessary permitting time must be considered in regard to construction activities. Clean Air Act (CAA) permits must be obtained prior to bringing equipment, assembled or unassembled, onto the Installation.

Confirm that these permits have been obtained.

3.5.2 Oil or Dual-fuel Boilers and Furnaces

Provide product data and details for new, replacement, or relocated fuel fired boilers, heaters, or furnaces to the Installation Environmental Office (Air Program Manager) through the Contracting Officer. Data to be reported include: equipment purpose (water heater, building heat, process), manufacturer, model number, serial number, fuel type (oil type, gas type) size (MMBTU heat input). Provide in accordance with paragraph PRECONSTRUCTION AIR PERMITS.

3.5.3 Burning

Burning is prohibited on the Government premises.

3.5.4 Class I and II ODS Prohibition

Class I and II ODS are Government property and must be returned to the Government for appropriate management. Coordinate with the Installation Environmental Office to determine the appropriate location for turn in of all reclaimed refrigerant.

3.5.5 Accidental Venting of Refrigerant

Accidental venting of a refrigerant is a release and must be reported immediately to the Contracting Officer.

3.5.6 EPA Certification Requirements

Heating and air conditioning technicians must be certified through an EPA-approved program. Maintain copies of certifications at the employees' places of business; technicians must carry certification wallet cards, as provided by environmental law.

3.5.7 Dust Control

Keep dust down at all times, including during nonworking periods. Sprinkle or treat, with dust suppressants, the soil at the site, haul roads, and other areas disturbed by operations. Dry power brooming will not be permitted. Instead, use vacuuming, wet mopping, wet sweeping, or wet power brooming. Air blowing will be permitted only for cleaning nonparticulate debris such as steel reinforcing bars. Only wet cutting will be permitted for cutting concrete blocks, concrete, and bituminous concrete. Do not unnecessarily shake bags of cement, concrete mortar, or plaster.

3.5.7.1 Particulates

Dust particles, aerosols and gaseous by-products from construction activities, and processing and preparation of materials (such as from asphaltic batch plants) must be controlled at all times, including weekends, holidays, and hours when work is not in progress. Maintain excavations, stockpiles, haul roads, permanent and temporary access roads, plant sites, spoil areas, borrow areas, and other work areas within or outside the project boundaries free from particulates that would exceed 40 CFR 50, state, and local air pollution standards or that would cause a hazard or a nuisance. Sprinkling, chemical treatment of an approved type, baghouse, scrubbers, electrostatic precipitators, or other methods will be permitted to control particulates in the work area. Sprinkling, to be efficient, must be repeated to keep the disturbed area damp. Provide sufficient, competent equipment available to accomplish these tasks. Perform particulate control as the work proceeds and whenever a particulate nuisance or hazard occurs. Comply with state and local visibility regulations.

3.5.7.2 Abrasive Blasting

Blasting operations cannot be performed without prior approval of the Installation Air Program Manager. The use of silica sand is prohibited in

sandblasting.

Provide tarpaulin drop cloths and windscreens to enclose abrasive blasting operations to confine and collect dust, abrasive agent, paint chips, and other debris. Perform work involving removal of hazardous material in accordance with 29 CFR 1910.

3.5.8 Odors

Control odors from construction activities. The odors must be in compliance with state regulations and local ordinances and may not constitute a health hazard.

3.6 WASTE MINIMIZATION

Minimize the use of hazardous materials and the generation of waste. Include procedures for pollution prevention/hazardous waste minimization in the Hazardous Waste Management Section of the EPP. Obtain a copy of the installation's Pollution Prevention/Hazardous Waste Minimization Plan for reference material when preparing this part of the EPP. If no written plan exists, obtain information by contacting the Contracting Officer. Describe the anticipated types of the hazardous materials to be used in the construction when requesting information.

3.6.1 Salvage, Reuse and Recycle

Identify anticipated materials and waste for salvage, reuse, and recycling. Describe actions to promote material reuse, resale or recycling. To the extent practicable, all scrap metal must be sent for reuse or recycling and will not be disposed of in a landfill.

Include the name, physical address, and telephone number of the hauler, if transported by a franchised solid waste hauler. Include the destination and, unless exempted, provide a copy of the state or local permit (cover) or license for recycling.

3.6.2 Nonhazardous Solid Waste Diversion Report

Maintain an inventory of nonhazardous solid waste diversion and disposal of construction and demolition debris. Submit a report to the Contracting Officer on the first working day after each fiscal year quarter, starting the first quarter that nonhazardous solid waste has been generated. Include the following in the report:

Construction and Demolition (C&D) Debris Disposed	(_____) cubic yards or tons, as appropriate
C&D Debris Recycled	(_____) cubic yards or tons, as appropriate
Total C&D Debris Generated	(_____) cubic yards or tons, as appropriate

Construction and Demolition (C&D) Debris Disposed	(_____) cubic yards or tons, as appropriate
Waste Sent to Waste-To-Energy Incineration Plant (This amount should not be included in the recycled amount)	(_____) cubic yards or tons, as appropriate

3.7 WASTE MANAGEMENT AND DISPOSAL

3.7.1 Waste Determination Documentation

Complete a Waste Determination form (provided at the pre-construction conference) for Contractor-derived wastes to be generated. All potentially hazardous solid waste streams that are not subject to a specific exclusion or exemption from the hazardous waste regulations (e.g. scrap metal, domestic sewage) or subject to special rules (lead-acid batteries and precious metals) must be characterized in accordance with the requirements of 40 CFR 261 or corresponding applicable state or local regulations. Base waste determination on user knowledge of the processes and materials used, and analytical data when necessary. Consult with the Installation environmental staff for guidance on specific requirements. Attach support documentation to the Waste Determination form. As a minimum, provide a Waste Determination form for the following waste (this listing is not inclusive): oil- and latex -based painting and caulking products, solvents, adhesives, aerosols, petroleum products, and containers of the original materials.

3.7.2 Solid Waste Management

3.7.2.1 Solid Waste Management Report

Provide copies of the waste handling facilities' weight tickets, receipts, bills of sale, and other sales documentation. In lieu of sales documentation, a statement indicating the disposal location for the solid waste that is signed by an employee authorized to legally obligate or bind the firm may be submitted. The sales documentation Contractor certification must include the receiver's tax identification number and business, EPA or state registration number, along with the receiver's delivery and business addresses and telephone numbers. For each solid waste retained for the Contractor's own use, submit the information previously described in this paragraph on the solid waste disposal report. Prices paid or received do not have to be reported to the Contracting Officer unless required by other provisions or specifications of this Contract or public law.

3.7.2.2 Control and Management of Solid Wastes

Pick up solid wastes, and place in covered containers that are regularly emptied. Do not prepare or cook food on the project site. Prevent contamination of the site or other areas when handling and disposing of wastes. At project completion, leave the areas clean. Employ segregation measures so that no hazardous or toxic waste will become co-mingled with non-hazardous solid waste. Transport solid waste off Government property and dispose of it in compliance with 40 CFR 260, state, and local requirements for solid waste disposal. A Subtitle D RCRA permitted landfill is the minimum acceptable offsite solid waste disposal option.

Verify that the selected transporters and disposal facilities have the necessary permits and licenses to operate. Solid waste disposal offsite must comply with most stringent local, state, and federal requirements, including 40 CFR 241, 40 CFR 243, and 40 CFR 258.

Manage hazardous material used in construction, including but not limited to, aerosol cans, waste paint, cleaning solvents, contaminated brushes, and used rags, in accordance with 49 CFR 173.

3.7.3 Control and Management of Hazardous Waste

Do not dispose of hazardous waste on Government property. Do not discharge any waste to a sanitary sewer, storm drain, or to surface waters or conduct waste treatment or disposal on Government property without written approval of the Contracting Officer.

3.7.3.1 Hazardous Waste/Debris Management

Identify construction activities that will generate hazardous waste or debris. Provide a documented waste determination for resultant waste streams. Identify, label, handle, store, and dispose of hazardous waste or debris in accordance with federal, state, and local regulations, including 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, 40 CFR 265, 40 CFR 266, and 40 CFR 268.

Manage hazardous waste in accordance with the approved Hazardous Waste Management Section of the EPP. Store hazardous wastes in approved containers in accordance with 49 CFR 173 and 49 CFR 178. Hazardous waste generated within the confines of Government facilities is identified as being generated by the Government. Prior to removal of any hazardous waste from Government property, hazardous waste manifests must be signed by personnel from the Installation Environmental Office. Do not bring hazardous waste onto Government property. Provide the Contracting Officer with a copy of waste determination documentation for any solid waste streams that have any potential to be hazardous waste or contain any chemical constituents listed in 40 CFR 372-SUBPART D.

3.7.3.2 Waste Storage/Satellite Accumulation/90 Day Storage Areas

Accumulate hazardous waste at satellite accumulation points and in compliance with 40 CFR 262.34 and applicable state or local regulations. Individual waste streams will be limited to 55 gallons of accumulation (or 1 quart for acutely hazardous wastes). If the Contractor expects to generate hazardous waste at a rate and quantity that makes satellite accumulation impractical, the Contractor may request a temporary 90 day accumulation point be established. Submit a request in writing to the Contracting Officer and provide the following information (Attach Site Plan to the Request):

Contract Number	(_____)
Contractor	(_____)
Haz/Waste or Regulated Waste POC	(_____)
Phone Number	(_____)

Contract Number	(_____)
Type of Waste	(_____)
Source of Waste	(_____)
Emergency POC	(_____)
Phone Number	(_____)
Location of the Site	(_____)

Attach a Waste Determination form for the expected waste streams. Allow 10 working days for processing this request. Additional compliance requirements (e.g. training and contingency planning) that may be required are the responsibility of the Contractor. Barricade the designated area where waste is being stored and post a sign identifying as follows:

"DANGER - UNAUTHORIZED PERSONNEL KEEP OUT"

3.7.3.3 Hazardous Waste Disposal

3.7.3.3.1 Responsibilities for Contractor's Disposal

Provide hazardous waste manifest to the Installations Environmental Office for review, approval, and signature prior to shipping waste off Government property.

3.7.3.3.1.1 Services

Provide service necessary for the final treatment or disposal of the hazardous material or waste in accordance with 40 CFR 260, local, and state, laws and regulations, and the terms and conditions of the Contract within 60 days after the materials have been generated. These services include necessary personnel, labor, transportation, packaging, detailed analysis (if required for disposal or transportation, include manifesting or complete waste profile sheets, equipment, and compile documentation).

3.7.3.3.1.2 Samples

Obtain a representative sample of the material generated for each job done to provide waste stream determination.

3.7.3.3.1.3 Analysis

Analyze each sample taken and provide analytical results to the Contracting Officer. See paragraph WASTE DETERMINATION DOCUMENTATION.

3.7.3.3.1.4 Labeling

Determine the Department of Transportation's (DOT's) proper shipping names for waste (each container requiring disposal) and demonstrate to the Contracting Officer how this determination is developed and supported by the sampling and analysis requirements contained herein. Label all containers of hazardous waste with the words "Hazardous Waste" or other words to describe the contents of the container in accordance with 40 CFR 262.31 and applicable state or local regulations.

3.7.3.4 Universal Waste Management

Manage the following categories of universal waste in accordance with federal, state, and local requirements and installation instructions:

a. Batteries as described in 40 CFR 273.2
b. Lamps as described in 40 CFR 273.5
c. Mercury-containing equipment as described in 40 CFR 273.4
d. Section 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS

Mercury is prohibited in the construction of this facility, unless specified otherwise, and with the exception of mercury vapor lamps and fluorescent lamps. Dumping of mercury-containing materials and devices such as mercury vapor lamps, fluorescent lamps, and mercury switches, in rubbish containers is prohibited. Remove without breaking, pack to prevent breakage, and transport out of the activity in an unbroken condition for disposal as directed.

3.7.3.5 Electronics End-of-Life Management

Recycle or dispose of electronics waste, including, but not limited to, used electronic devices such computers, monitors, hard-copy devices, televisions, mobile devices, in accordance with 40 CFR 260-262, state, and local requirements, and installation instructions.

3.7.3.6 Disposal Documentation for Hazardous and Regulated Waste

Contact the Contracting Officer for the facility RCRA identification number that is to be used on each manifest.

Submit a copy of the applicable EPA and or state permit(s), manifest(s), or license(s) for transportation, treatment, storage, and disposal of hazardous and regulated waste by permitted facilities. Hazardous or toxic waste manifests must be reviewed, signed, and approved by the Contracting Officer before the Contractor may ship waste. To obtain specific disposal instructions, coordinate with the Installation Environmental Office. Refer to Section 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS for the Installation Point of Contact information.

3.7.4 Releases/Spills of Oil and Hazardous Substances

3.7.4.1 Response and Notifications

Exercise due diligence to prevent, contain, and respond to spills of hazardous material, hazardous substances, hazardous waste, sewage, regulated gas, petroleum, lubrication oil, and other substances regulated in accordance with 40 CFR 300. Maintain spill cleanup equipment and materials at the work site. In the event of a spill, take prompt, effective action to stop, contain, curtail, or otherwise limit the amount, duration, and severity of the spill/release. In the event of any releases of oil and hazardous substances, chemicals, or gases; immediately (within 15 minutes) notify the Installation Fire Department, the Installation Command Duty Officer, the Installation Environmental Office, the Contracting Officer and the state or local authority.

Submit verbal and written notifications as required by the federal (40 CFR 300.125 and 40 CFR 355), state, local regulations and instructions. Provide copies of the written notification and documentation that a verbal notification was made within 20 days. Spill

response must be in accordance with 40 CFR 300 and applicable state and local regulations. Contain and clean up these spills without cost to the Government.

3.7.4.2 Clean Up

Clean up hazardous and non-hazardous waste spills. Reimburse the Government for costs incurred including sample analysis materials, clothing, equipment, and labor if the Government will initiate its own spill cleanup procedures, for Contractor- responsible spills, when: Spill cleanup procedures have not begun within one hour of spill discovery/occurrence; or, in the Government's judgment, spill cleanup is inadequate and the spill remains a threat to human health or the environment.

3.7.5 Mercury Materials

Immediately report to the Environmental Office and the Contracting Officer instances of breakage or mercury spillage. Clean mercury spill area to the satisfaction of the Contracting Officer.

Do not recycle a mercury spill cleanup; manage it as a hazardous waste for disposal.

3.7.6 Wastewater

3.7.6.1 Disposal of wastewater must be as specified below.

3.7.6.1.1 Treatment

Do not allow wastewater from construction activities, such as onsite material processing, concrete curing, foundation and concrete clean-up, water used in concrete trucks, and forms to enter water ways or to be discharged prior to being treated to remove pollutants. Dispose of the construction- related waste water off-Government property in accordance with 40 CFR 403, state, regional, and local laws and regulations.

3.7.6.1.2 Surface Discharge

For discharge of ground water, Surface discharge in accordance with federal, state, and local laws and regulations. Surface discharge in accordance with the requirements of the NPDES or state STORMWATER DISCHARGES FROM CONSTRUCTION SITES permit.

3.7.6.1.3 Land Application

Water generated from the flushing of lines after disinfection or disinfection in conjunction with hydrostatic testing must be land- applied in accordance with federal, state, and local laws and regulations for land application.

3.8 HAZARDOUS MATERIAL MANAGEMENT

Include hazardous material control procedures in the Safety Plan, in accordance with Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS. Address procedures and proper handling of hazardous materials, including the appropriate transportation requirements. Do not bring hazardous material onto Government property that does not directly relate to requirements for the performance of this contract. Submit an SDS and

estimated quantities to be used for each hazardous material to the Contracting Officer prior to bringing the material on the installation. Typical materials requiring SDS and quantity reporting include, but are not limited to, oil and latex based painting and caulking products, solvents, adhesives, aerosol, and petroleum products. Use hazardous materials in a manner that minimizes the amount of hazardous waste generated. Containers of hazardous materials must have National Fire Protection Association labels or their equivalent. Certify that hazardous materials removed from the site are hazardous materials and do not meet the definition of hazardous waste, in accordance with 40 CFR 261.

3.8.1 Contractor Hazardous Material Inventory Log

Submit the "Contractor Hazardous Material Inventory Log"(found at: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic), which provides information required by (EPCRA Sections 312 and 313) along with corresponding SDS, to the Contracting Officer at the start and at the end of construction (30 days from final acceptance), and update no later than January 31 of each calendar year during the life of the contract. Keep copies of the SDSs for hazardous materials onsite. At the end of the project, provide the Contracting Officer with copies of the SDSs, and the maximum quantity of each material that was present at the site at any one time, the dates the material was present, the amount of each material that was used during the project, and how the material was used.

The Contracting Officer may request documentation for any spills or releases, environmental reports, or off-site transfers.

3.9 PREVIOUSLY USED EQUIPMENT

Clean previously used construction equipment prior to bringing it onto the project site. Equipment must be free from soil residuals, egg deposits from plant pests, noxious weeds, and plant seeds. Consult with the U.S. Department of Agriculture jurisdictional office for additional cleaning requirements.

3.10 CONTROL AND MANAGEMENT OF ASBESTOS-CONTAINING MATERIAL (ACM)

Manage and dispose of asbestos- containing waste in accordance with 40 CFR 61. Refer to Section 02 82 00 ASBESTOS REMEDIATION. Manifest asbestos-containing waste and provide the manifest to the Contracting Officer. Notifications to the state and Installation Asbestos Program Manager are required before starting any asbestos work.

3.11 CONTROL AND MANAGEMENT OF LEAD-BASED PAINT (LBP)

Manage and dispose of lead-contaminated waste in accordance with 40 CFR 745 and Section 02 83 00 LEAD REMEDIATION. Manifest any lead-contaminated waste and provide the manifest to the Contracting Officer.

3.12 CONTROL AND MANAGEMENT OF POLYCHLORINATED BIPHENYLS (PCBS)

Manage and dispose of PCB-contaminated waste in accordance with 40 CFR 761 and Section 02 84 33 REMOVAL AND DISPOSAL OF POLYCHLORINATED BIPHENYLS (PCBS).

3.13 CONTROL AND MANAGEMENT OF LIGHTING BALLAST AND LAMPS CONTAINING PCBS

Manage and dispose of contaminated waste in accordance with 40 CFR 761.

3.14 MILITARY MUNITIONS

In the event military munitions, as defined in 40 CFR 260, are discovered or uncovered, immediately stop work in that area and immediately inform the Contracting Officer.

3.14.1 Emergency Unexploded Ordinance (UXO) Response

In the event UXOs, as defined in 40 CFR 260, are encountered during construction activities, stop work immediately and have all personnel clear the immediate area. Immediately report the situation to the ROICC or Contracting Representative, who will then report the item to Range Control and Explosive Ordnance Disposal (EOD).

3.14.2 UXO Safety Awareness Training

Complete 3R (Recognize, Retreat, Report) UXO Safety Awareness Training prior to working in known contaminated areas at MCB Camp Lejeune. Refer to the website http://www.lejeune.marines.mil/OfficesStaff/EnvironmentalMgmt/TrainingVideo.aspx for the training and the latest edition of the Camp Lejeune Contractor Environmental Guide for guidance and information.

3.15 PETROLEUM, OIL, LUBRICANT (POL) STORAGE AND FUELING

POL products include flammable or combustible liquids, such as gasoline, diesel, lubricating oil, used engine oil, hydraulic oil, mineral oil, and cooking oil. Store POL products and fuel equipment and motor vehicles in a manner that affords the maximum protection against spills into the environment. Manage and store POL products in accordance with EPA 40 CFR 112, and other federal, state, regional, and local laws and regulations. Use secondary containments, dikes, curbs, and other barriers, to prevent POL products from spilling and entering the ground, storm or sewer drains, stormwater ditches or canals, or navigable waters of the United States. Describe in the EPP (see paragraph ENVIRONMENTAL PROTECTION PLAN) how POL tanks and containers must be stored, managed, and inspected and what protections must be provided. Storage of oil, including fuel, on the project site is not allowed. Fuel must be brought to the project site each day that work is performed.

3.15.1 Used Oil Management

Manage used oil generated on site in accordance with 40 CFR 279. Determine if any used oil generated while onsite exhibits a characteristic of hazardous waste. Used oil containing 1,000 parts per million of solvents is considered a hazardous waste and disposed of at the Contractor's expense. Used oil mixed with a hazardous waste is also considered a hazardous waste. Dispose in accordance with paragraph HAZARDOUS WASTE DISPOSAL.

3.16 INADVERTENT DISCOVERY OF PETROLEUM-CONTAMINATED SOIL OR HAZARDOUS WASTES

If petroleum-contaminated soil, or suspected hazardous waste is found during construction that was not identified in the Contract documents,

immediately notify the Contracting Officer and notify base FESD by calling 911 or (910) 451-3333.. Do not disturb this material until authorized by the Contracting Officer.

3.17 CHLORDANE

Evaluate excess soils and concrete foundation debris generated during the demolition of housing units or other wooden structures for the presence of chlordane or other pesticides prior to reuse or final disposal.

3.18 SOUND INTRUSION

Make the maximum use of low-noise emission products, as certified by the EPA. Blasting or use of explosives are not permitted without written permission from the Contracting Officer, and then only during the designated times. Confine pile-driving operations to the period between 8 a.m. and 6 p.m., Monday through Friday, exclusive of holidays, unless otherwise specified.

Keep construction activities under surveillance and control to minimize environment damage by noise. Comply with the provisions of the State of North Carolina rules.

3.19 POST CONSTRUCTION CLEANUP

Clean up areas used for construction in accordance with Contract Clause: "Cleaning Up". Unless otherwise instructed in writing by the Contracting Officer, remove traces of temporary construction facilities such as haul roads, work area, structures, foundations of temporary structures, stockpiles of excess or waste materials, and other vestiges of construction prior to final acceptance of the work. Grade parking area and similar temporarily used areas to conform with surrounding contours.

-- End of Section --

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 01 57 19.01 20

SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS
08/18

PART 1 GENERAL

1.1 MID-ATLANTIC

Comply with the following state, regional, and local requirements which supplement Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS.

1.1.1 North Carolina

1.1.1.1 MCB Camp Lejeune

1.1.1.1.1 Removal of Waste

Remove and dispose of rubbish and debris from Government property. Provide 24-hour advance written notice to the Contracting Office of Contractor's intention to dispose rubbish and debris off base. Disposal at sites or landfills not holding a valid state of North Carolina permit is specifically prohibited. The prohibition also applies to sites where a permit my have been applied for but not yet obtained. If construction debris has been disposed off-base outside the parameter of this paragraph at a site without state permits or not in accordance with regulatory requirements, remove, transport, and relocate the debris to a state-approved site at Contractor expense. Pay any required fines, penalties, or fees related to the illegal disposal of construction debris. Metal will not be accepted at the Base Sanitary Landfill.

1.1.1.1.2 Surplus Soils Disposal for Camp Lejeune and MCAS New River

Transport all surplus soil to one of the designated locations on government property. No surplus material will leave government property without approval of installation Environmental Program Manager and the Contracting Officer. Deliver and properly manage any surplus soil that cannot be reused on its originating site to one of the following locations:

a. Area managed by G-3/5 for reuse on training areas for various maintenance activities:

3.5-acre storage, within TLZ Condor off Verona Loop Road, approximate coordinates 34°38'07.3"N 77°26'41.7"W.

Coordinate with G-3/5, Mr. Dave Lynch or Mr. Bill Van Pelt, MCI EAST-MCB CAMLEJ at (910) 451-5772/8799, to determine capacity available at the storage location, prior to delivery.

This site operates Monday through Thursday between 0730 and 1500.

b. Area managed by PWD for use as daily cover:

Base landfill, located on Piney Green Road, approximate coordinates 34°41'26.9"N 77°19'27.4"W.

Contractor shall provide temporary silt fencing around designated stockpile areas as needed.

Coordinate with landfill POC: Joe Powers at (910) 451-4998.

This site operates Monday through Thursday between 0730 and 1500 and on Friday between 0700 and 1400.

Contact POCs listed above 7 to 10 days in advance to coordinate delivery of material at the storage locations.

Prior to transportation to one of the designated locations, screen all surplus soil to remove all objects greater than 3 inches and deleterious material. Deleterious material consists of organic debris such as roots, stumps, timber, and construction debris. Construction debris shall include, but is not limited to wood, plastic, glass, concrete, brick, and metal. Dispose of deleterious material and objects larger than 3 inches in accordance with Section 01 57 19 Temporary Environmental Controls.

Provide all plant, material, and labor for placement and management of the surplus material at the designated locations. Grade surplus material to a flat condition and slope to provide positive drainage daily. Submit the following verification documents to the Contracting Officer for review and approval:

1) Photographic documentation that surplus soil has been properly placed. Photograph will include time and date of image.
2) Certification statement indicating volume, in cubic yards (CY), of material delivered and confirming material is free of contaminants.

NOTE: Soil contaminated with debris or chemicals cannot be disposed at the stockpile locations. If contaminated soils are suspected or confirmed through presence of UXO, odors, or visual staining, affected soils must be properly tested, manifested, and disposed of in accordance with RCRA regulations. Contact Base EMD, ER Program Manager, for more information.

1.1.1.1.3 Hazardous Materials

1. Contractors may ONLY use the Camp Lejeune Sanitary Landfill for the disposal of asbestos containing materials, building products with tightly adhered lead containing paint, and non-contaminated clean dirt and clean gravel. The hours of operation are 0730-1530.

2. Delivery of acceptable materials (identified above) shall be by appointment only. Appointments made by phone at 910-451-5011 or 910-451-2946. ALL other contractor generated material shall be weighed through the Base Landfill scales before being removed from the Base. Contractors utilizing the base scales will require Contracting Officer assisted pre-registration with the Landfill Manager.

3. The Contracting Officer will register the contract via E-mail, with the Base Landfill. All haul vehicles will maintain a secure vehicle placard as a condition to utilize the scale. E-mail the contract information to the Landfill Clerk, including the name on the Prime Contractor, contract

number, job name/description, completion date and whether or not any of the above materials will be delivered to the Landfill.

4. As of May 01 2014 the above supersedes any other statements/specifications pertaining to the delivery of materials to the Base Landfill.

SECTION 01 60 00.00 22

REQUIREMENTS FOR PESTICIDE AND HERBICIDE COORDINATION
08/19

PART 1 GENERAL

1.1 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRCUTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-07 Certificates

Certificate of State Licensed Applicator; G

SD-11 Closeout Submittals

Completed Field Pesticide/Herbicide Management Record Form; G

1.2 QUALITY ASSURANCE

1.2.1 Certificate of State Licensed Applicator

A State licensed applicator is required and must be licensed in the state in which the project is located. Submit a copy of the certificate(s) to the Base Pest Management Coordinator (PMC) through the Contracting Officer..

PART 2 PRODUCTS

2.1 PESTICIDE/HERBICIDE LIST

Comply with Base Regulations and use only approved pesticides/herbicides listed on the current "Base Approved Pesticide/herbicide List". Use the approved list that is current at the time of application. Contact the Contracting Officer to obtain the current approved list.

PART 3 EXECUTION

3.1 COORDINATION WITH BASE PEST MANAGEMENT COORDINATOR (PMC)

Coordinate with the PMC before proceeding with any pesticide/herbicide application. The Point of Contact information for the Base Pest Management Coordinator can be obtained from the Contracting Officer.

3.2 Field Pesticide/Herbicide Management Record Form

Following the pesticide/herbicide application, complete the attached Field Pesticide/Herbicide Management Record Form and submit to the Base Pest Management Coordinator (PMC) through the Contracting Officer. Submit the completed form(s) within 15 days after application.

-- End of Section --

SECTION 01 74 19.05 20

CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT FOR DESIGN-BUILD
03/15

PART 1 GENERAL

1.1 GOVERNMENT POLICY

Military installations are required to direct at least 60 percent of their non-hazardous solid wastes (including waste from construction and demolition operations) from the waste stream. This guide specification requires the reduction of the amount of construction and demolition waste requiring landfill disposal or incineration, and to promote more efficient use of construction materials during construction.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29.05 20 SUSTAINABILITY REPORTING FOR DESIGN-BUILD. Submit the following in accordance with Section 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES and 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Waste Management Plan; G

SD-11 Closeout Submittals

Records; S

1.3 DISPOSAL

Control accumulation of waste materials and trash. Recycle or dispose of collected materials off-site at intervals approved by the Contracting Officer and in compliance with waste management procedures. Except as otherwise specified in other sections of the specifications, disposal must be in accordance with the following:

1.3.1 Recycle

Recycle waste materials not suitable for reuse, but are recyclable. Recycle all fluorescent lamps, HID lamps, and mercury-containing thermostats removed from the site. Arrange for timely pickups from the site or deliveries to recycling facilities in order to prevent contamination of recyclable materials.

1.3.2 Waste

Dispose of materials with no practical use or economic benefit to waste-to-energy plants where available. As the last choice, dispose of materials at a landfill or incinerator.

1.3.3 Return

Set aside and protect mis-delivered and substandard products and materials and return to supplier for credit.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 WASTE MANAGEMENT PLAN

Submit a waste management plan within 15 days after notice to proceed and not less than 10 days before the preconstruction meeting and prior to initiating any site preparation work. The plan must demonstrate how the project waste diversion goal is met and plan must include the following:

a. Name of individuals on the Contractor's staff responsible for waste prevention and management.

b. Actions that will be taken to reduce solid waste generation, including coordination with subcontractors to ensure awareness and participation.

c. Description of the regular meetings to be help to address waste management.

d. Description of the specific approaches to be used in recycling/reuse of the various materials generated, including the areas on site and equipment to be used for processing, sorting, and temporary storage of wastes.

e. Characterization, including estimate types and quantities, of the waste to be generated.

f. Name of landfill and/or incinerator to be used and the estimated costs for use, assuming that there would be no salvage or recycling on the project.

g. Identification of local and regional reuse programs, including non-profit organizations such as schools, local housing agencies, and organizations that accept used materials such as materials exchange networks and Habitat for Humanity. Include the name, location, and phone number for each reuse facility to be used, and provide a copy of the permit or license for each facility.

h. List of specific waste materials that will be salvaged for resale, salvaged and reused, or recycled. Identify recycling facilities that will be used. Provide percentage of non-hazardous construction and demolition waste materials that have been diverted from the waste stream.

i. Identification of materials that cannot be recycled/reused with an explanation or justification.

j. Description of the means by which any waste materials identified in item (h) above will be protected from contamination.

k. Description of the means of transportation of the recyclable materials

(whether materials will be site-separated and self-hauled to designated centers, or whether mixed materials will be collected by a waste hauler and removed from the site).

l. Anticipated net cost savings determined by subtracting Contractor program management costs and the cost of disposal from the revenue generated by sale of the materials and the incineration or landfill cost avoidance.

m. Actions that will be taken to divert at least the required amount of non-hazardous solid wastes (including waste from construction and demolition operations) from the waste stream. Report actual diversion rates during construction and demolition.

n. Identification of base, local and regional reuse programs, including non-profit organizations such as schools, local housing agencies, and organizations that accept used materials such as materials exchange networks and Habitat for Humanity.

3.2 RECORDS

Maintained records to document the quantity of waste generated; the quantity of waste diverted through sale, reuse, or recycling; and the quantity of waste disposed by landfill or incineration. Report with monthly invoicing the tons diverted, the tons sent to the landfill, cost for each, and the monthly diversion rate. Make the records available to the Contracting Officer during construction, and a copy of the records must be delivered to the Contracting Officer upon completion of the construction.

-- End of Section --

THIS PAGE LEFT INTENTIONALLY BLANK

SECTION 01 78 00

CLOSEOUT SUBMITTALS
08/11

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM E1971	(2005; R 2011) Standard Guide for Stewardship for the Cleaning of Commercial and Institutional Buildings

GREEN SEAL (GS)

GS-37	(2017) Cleaning Products for Industrial and Institutional Use

U.S. DEPARTMENT OF DEFENSE (DOD)

UFC 1-300-08	(2009, with Change 2) Criteria for Transfer and Acceptance of DoD Real Property

1.2 DEFINITIONS

1.2.1 As-Built Drawings

As-built drawings are developed and maintained by the Contractor and depict actual conditions, including deviations from the Contract Documents. These deviations and additions may result from coordination required by, but not limited to: contract modifications; official responses to Contractor submitted Requests for Information; direction from the Contracting Officer; designs which are the responsibility of the Contractor, and differing site conditions. Maintain the as-builts throughout construction as red-lined hard copies on site. These files serve as the basis for the creation of the record drawings.

1.2.2 Record Drawings

The record drawings are the final compilation of actual conditions reflected in the as-built drawings.

1.3 SOURCE DRAWING FILES

Request the full set of electronic drawings, in the source format, for Record Drawing preparation, after award and at least 30 days prior to required use.

1.3.1 Terms and Conditions

Data contained on these electronic files must not be used for any purpose other than as a convenience in the preparation of construction drawings and data for the referenced project. Any other use or reuse shall be at the sole risk of the Contractor and without liability or legal exposure to the Government. The Contractor must make no claim and waives to the fullest extent permitted by law, any claim or cause of action of any nature against the Government, its agents or sub consultants that may arise out of or in connection with the use of these electronic files. The Contractor must, to the fullest extent permitted by law, indemnify and hold the Government harmless against all damages, liabilities or costs, including reasonable attorney's fees and defense costs, arising out of or resulting from the use of these electronic files.

These electronic CAD drawing files are not construction documents. Differences may exist between the CAD files and the corresponding construction documents. The Government makes no representation regarding the accuracy or completeness of the electronic CAD files, nor does it make representation to the compatibility of these files with the Contractor hardware or software. In the event that a conflict arises between the signed and sealed construction documents prepared by the Government and the furnished Source drawing files, the signed and sealed construction documents govern. The Contractor is responsible for determining if any conflict exists. Use of these Source Drawing files does not relieve the Contractor of duty to fully comply with the contract documents, including and without limitation, the need to check, confirm and coordinate the work of all contractors for the project. If the Contractor uses, duplicates or modifies these electronic source drawing files for use in producing construction drawings and data related to this contract, remove all previous indicia of ownership (seals, logos, signatures, initials and dates).

1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Warranty Management Plan

Interim DD FORM 1354; G

Checklist for DD FORM 1354; G

High Performance and Sustainable Building (HPSB) Checklist; G

1.5 SPARE PARTS DATA

Submit two copies of the Spare Parts Data list.

a. Indicate manufacturer's name, part number, nomenclature, and stock level required for maintenance and repair. List those items that may be standard to the normal maintenance of the system.

1.6 WARRANTY MANAGEMENT

1.6.1 Warranty Management Plan

Develop a warranty management plan which contains information relevant to FAR 52.246-21 Warranty of Construction. At least 30 days before the planned pre-warranty conference, submit one set of the warranty management plan. Include within the warranty management plan all required actions and documents to assure that the Government receives all warranties to which it is entitled. The plan must be in narrative form and contain sufficient detail to render it suitable for use by future maintenance and repair personnel, whether tradesmen, or of engineering background, not necessarily familiar with this contract. The term "status" as indicated below must include due date and whether item has been submitted or was accomplished. Warranty information made available during the construction phase must be submitted to the Contracting Officer for approval prior to each monthly pay estimate. Assemble approved information in a binder and turn over to the Government upon acceptance of the work. The construction warranty period will begin on the date of project acceptance and continue for the full product warranty period. A joint 4 month and 9 month warranty inspection will be conducted, measured from time of acceptance, by the Contractor, Contracting Officer and the Customer Representative. Include within the warranty management plan , but not limited to, the following:

a. Roles and responsibilities of all personnel associated with the warranty process, including points of contact and telephone numbers within the organizations of the Contractors, subcontractors, manufacturers or suppliers involved.

b. Furnish with each warranty the name, address, and telephone number of each of the guarantor's representatives nearest to the project location.

c. Listing and status of delivery of all Certificates of Warranty for extended warranty items, to include roofs, HVAC balancing, pumps, motors, transformers, and for all commissioned systems such as fire protection and alarm systems, sprinkler systems, lightning protection systems, etc.

d. As-Built Record of Equipment and Materials list for each warranted equipment, item, feature of construction or system indicating:

(1) Name of item.
(2) Model and serial numbers.
(3) Location where installed.
(4) Name and phone numbers of manufacturers or suppliers.
(5) Names, addresses and telephone numbers of sources of spare parts.
(6) Warranties and terms of warranty. Include one-year overall warranty of construction, including the starting date of warranty of construction. Items which have extended warranties must be indicated with separate warranty expiration dates.
(7) Cross-reference to warranty certificates as applicable.
(8) Starting point and duration of warranty period.
(9) Summary of maintenance procedures required to continue the warranty in force.
(10) Cross-reference to specific pertinent Operation and Maintenance manuals.
(11) Organization, names and phone numbers of persons to call for warranty service.
(12) Typical response time and repair time expected for various warranted equipment.

e. The plans for attendance at the 4 and 9 month post-construction warranty inspections conducted by the Government.

f. Procedure and status of tagging of all equipment covered by extended warranties.

g. Copies of instructions to be posted near selected pieces of equipment where operation is critical for warranty and/or safety reasons.

1.6.2 Performance Bond

The Performance Bond must remain effective throughout the construction period .

a. In the event the Contractor fails to commence and diligently pursue any construction warranty work required, the Contracting Officer will have the work performed by others, and after completion of the work, will charge the remaining construction warranty funds of expenses incurred by the Government while performing the work, including, but not limited to administrative expenses.

b. In the event sufficient funds are not available to cover the construction warranty work performed by the Government at the Contractor's expense, the Contracting Officer will have the right to recoup expenses from the bonding company.

c. Following oral or written notification of required construction warranty repair work, respond in a timely manner. Written verification will follow oral instructions. Failure to respond will be cause for the Contracting Officer to proceed against the Contractor.

1.6.3 Pre-Warranty Conference

Prior to contract completion, and at a time designated by the Contracting Officer, meet with the Contracting Officer to develop a mutual understanding with respect to the requirements of this section. Communication procedures for Contractor notification of construction warranty defects, priorities with respect to the type of defect, reasonable time required for Contractor response, and other details deemed necessary by the Contracting Officer for the execution of the construction warranty will be established/reviewed at this meeting. In connection with these requirements and at the time of the Contractor's quality control completion inspection, furnish the name, telephone number and address of a licensed and bonded company which is authorized to initiate and pursue construction warranty work action on behalf of the Contractor. This point of contact will be located within the local service area of the warranted construction, be continuously available, and be responsive to Government inquiry on warranty work action and status. This requirement does not relieve the Contractor of any of its responsibilities in connection with other portions of this provision.

1.6.4 Warranty Tags

At the time of installation, tag each warranted item with a durable, oil and water resistant tag approved by the Contracting Officer. Attach each tag with a copper wire and spray with a silicone waterproof coating. Also, submit two record copies of the warranty tags showing the layout and design. The date of acceptance and the QC signature must remain blank until the project is accepted for beneficial occupancy. Show the following information on the tag.

Type of product/material	
Model number	
Serial number	
Contract number	
Warranty period from/to	
Inspector's signature	
Construction Contractor	
Address	

Telephone number	
Warranty contact	
Address	
Telephone number	
Warranty response time priority code	
WARNING - PROJECT PERSONNEL TO PERFORM ONLY OPERATIONAL MAINTENANCE DURING THE WARRANTY PERIOD.	

PART 2 PRODUCTS

2.1 CERTIFICATION OF EPA DESIGNATED ITEMS

Submit the Certification of EPA Designated Items as required by FAR 52.223-9 Estimate of Percentage of Recovered Material Content for EPA Designated Items and FAR 52-223-17 Affirmative Procurement of EPA designated items in Service and Construction Contracts.. Include on the certification form the following information: project name, project number, Contractor name, license number, Contractor address, and certification. The certification will read as follows and be signed and dated by the Contractor. "I hereby certify the information provided herein is accurate and that the requisition/procurement of all materials listed on this form comply with current EPA standards for recycled/recovered materials content. The following exemptions may apply to the non-procurement of recycled/recovered content materials:

1) The product does not meet appropriate performance standards;
2) The product is not available within a reasonable time frame;
3) The product is not available competitively (from two or more sources);
4) The product is only available at an unreasonable price (compared with a comparable non-recycled content product)."

Record each product used in the project that has a requirement or option of containing recycled content in accordance with SECTION 01 33 29 SUSTAINABILITY REPORTING, noting total price, total value of post-industrial recycled content, total value of post-consumer recycled content, exemptions (1, 2, 3, or 4, as indicated), and comments. Recycled content values may be determined by weight or volume percent, but must be consistent throughout.

2.2 CERTIFICATION OF USDA DESIGNATED ITEMS

Submit the Certification of USDA Designated Items as required by FAR 52-223-1 Bio-based Product Certifications and FAR 52.223-2 Affirmative Procurement of Biobased Products Under Service and Construction Contracts. Include on the certification form the following information: project name, project number, Contractor name, license number, Contractor address, and certification. The certification will read as follows and be signed and dated by the Contractor. "I hereby certify the information provided herein is accurate and that the requisition/procurement of all materials listed on this form comply with current USDA standards for

biobased materials content. The following exemptions may apply to the non-procurement of biobased content materials:

1) The product does not meet appropriate performance standards;
2) The product is not available within a reasonable time frame;
3) The product is not available competitively (from two or more sources);
4) The product is only available at an unreasonable price (compared with a comparable bio-based content product)."

Record each product used in the project that has a requirement or option of containing biobased content in accordance with SECTION 01 33 29 SUSTAINABILITY REPORTING, noting total price, total value of post-industrial recycled content, total value of post-consumer recycled content, total value of biobased content, exemptions (1, 2, 3, or 4, as indicated), and comments. Biobased content values may be determined by weight or volume percent, but must be consistent throughout.

PART 3 EXECUTION

3.1 AS-BUILT DRAWINGS

Provide and maintain two black line print copies of the PDF contract drawings for As-Built Drawings. At a minimum of 30 days prior to Beneficial Occupancy Date (BOD), certify both sets of as-built drawings as correct, sign, and submit the As-Built Drawings for Contracting Officer approval.

3.1.1 Markup Guidelines

Make comments and markup the drawings complete without reference to letters, memos, or materials that are not part of the As-Built drawing. Show what was changed, how it was changed, where item(s) were relocated and change related details. These working as-built markup prints must be neat, legible and accurate as follows:

a. Use base colors of red, green, and blue. Color code for changes as follows:

   (1) Special (Blue) - Items requiring special information, coordination, or special detailing or detailing notes.

   (2) Deletions (Red) - Over-strike deleted graphic items (lines), lettering in notes and leaders.

   (3) Additions (Green) - Added items, lettering in notes and leaders.

b. Provide a legend if colors other than the "base" colors of red, green, and blue are used.

c. Add and denote any additional equipment or material facilities, service lines, incorporated under As-Built Revisions if not already shown in legend.

d. Use frequent written explanations on markup drawings to describe changes. Do not totally rely on graphic means to convey the revision.

e. Use legible lettering and precise and clear digital values when marking prints. Clarify ambiguities concerning the nature and application of change involved.

f. Wherever a revision is made, also make changes to related section views, details, legend, profiles, plans and elevation views, schedules, notes and call out designations, and mark accordingly to avoid conflicting data on all other sheets.

g. For deletions, cross out all features, data and captions that relate to that revision.

h. For changes on small-scale drawings and in restricted areas, provide large-scale inserts, with leaders to the applicable location.

i. Indicate one of the following when attaching a print or sketch to a markup print:

1) Add an entire drawing to contract drawings

2) Change the contract drawing to show

3) Provided for reference only to further detail the initial design.

j. Incorporate all shop and fabrication drawings into the markup drawings.

3.1.2 As-Built Drawings Content

Show on the as-built drawings, but not limited to, the following information:

a. The actual location, kinds and sizes of all sub-surface utility lines. In order that the location of these lines and appurtenances may be determined in the event the surface openings or indicators become covered over or obscured, show by offset dimensions to two permanently fixed surface features the end of each run including each change in direction on the record drawings. Locate valves, splice boxes and similar appurtenances by dimensioning along the utility run from a reference point. Also record the average depth below the surface of each run.

b. The location and dimensions of any changes within the building structure.

c. Layout and schematic drawings of electrical circuits and piping.

d. Correct grade, elevations, cross section, or alignment of roads, earthwork, structures or utilities if any changes were made from contract plans.

e. Changes in details of design or additional information obtained from working drawings specified to be prepared or furnished by the Contractor; including but not limited to shop drawings, fabrication, erection, installation plans and placing details, pipe sizes, insulation material, dimensions of equipment, and foundations.

f. The topography, invert elevations and grades of drainage installed or affected as part of the project construction.

g. Changes or Revisions which result from the final inspection.

h. Where contract drawings or specifications present options, show only

the option selected for construction on the working as-built markup drawings.

i. If borrow material for this project is from sources on Government property, or if Government property is used as a spoil area, furnish a contour map of the final borrow pit/spoil area elevations.

j. Systems designed or enhanced by the Contractor, such as HVAC controls, fire alarm, fire sprinkler, and irrigation systems.

k. Changes in location of equipment and architectural features.

j. Modifications (include within change order price the cost to change working as-built markup drawings to reflect modifications) and compliance with FC 1-300-09N procedures.

l. Actual location of anchors, construction and control joints, etc., in concrete.

m. Unusual or uncharted obstructions that are encountered in the contract work area during construction.

n. Location, extent, thickness, and size of stone protection particularly where it will be normally submerged by water.

3.2 RECORD DRAWINGS

Prepare and provide Record Drawings in accordance with FC 1-300-09N. Provide 2 copies of Record Drawings on two separate CDs or DVDs 30 days after BOD.

3.3 OPERATION AND MAINTENANCE MANUALS

Provide project operation and maintenance manuals as specified in Section 01 78 23 OPERATION AND MAINTENANCE MANUALS DATA. Provide four electronic copies of the Operation and Maintenance Manual files. Submit to the Contracting Officer for approval within 60 calendar days of the Beneficial Occupancy Date (BOD). Update and resubmit files for final approval at BOD.

3.4 CLEANUP

Provide final cleaning in accordance with ASTM E1971 and submit two copies of the listing of completed final clean-up items. Leave premises "broom clean." Comply with GS-37 for general purpose cleaning and bathroom cleaning. Use only nonhazardous cleaning materials, including natural cleaning materials, in the final cleanup. Clean interior and exterior glass surfaces exposed to view; remove temporary labels, stains and foreign substances; polish transparent and glossy surfaces; vacuum carpeted and soft surfaces. Clean equipment and fixtures to a sanitary condition. Replace filters of operating equipment and comply with the Indoor Air Quality (IAQ) Management Plan. Clean debris from roofs, gutters, downspouts and drainage systems. Sweep paved areas and rake clean landscaped areas. Remove waste and surplus materials, rubbish and construction facilities from the site. Recycle, salvage, and return construction and demolition waste from project in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, and 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL.

3.5 REAL PROPERTY RECORD

Near the completion of Project, but a minimum of 60 days prior to final acceptance of the work, complete, update draft DD FORM 1354 attached to this section, and submit an accounting of all installed property with Interim DD FORM 1354. Include any additional assets, improvements, and alterations from the Draft DD FORM 1354. Contact the Contracting Officer for any project specific information necessary to complete the DD FORM 1354. Refer to UFC 1-300-08 for instruction on completing the DD FORM 1354. Attach the Real Property receiving Component's completed High Performance and Sustainable Building (HPSB) Checklist for each applicable building to the completed DD 1354, in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. For convenience, a blank fillable PDF DD FORM 1354 may be obtained at the following link: www.esd.whs.mil/Portals/54/Documents/DD/forms/dd/dd1354.pdf

Submit the completed Checklist for DD FORM 1354 of Installed Building Equipment items. Attach this list to the updated DD FORM 1354.

-- End of Section --

SECTION 01 78 23

OPERATION AND MAINTENANCE DATA
08/15

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM E1971	(2005; R 2011) Standard Guide for Stewardship for the Cleaning of Commercial and Institutional Buildings

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-10 Operation and Maintenance Data

O&M Database ; G

Training Plan ; G

Training Outline ; G

Training Content ; G

SD-11 Closeout Submittals

Training Video Recording ; G

Validation of Training Completion ; G

1.3 OPERATION AND MAINTENANCE DATA

Submit Operation and Maintenance (O&M) Data for the provided equipment, product, or system, defining the importance of system interactions, troubleshooting, and long-term preventive operation and maintenance. Compile, prepare, and aggregate O&M data to include clarifying and updating the original sequences of operation to as-built conditions. Organize and present information in sufficient detail to clearly explain O&M requirements at the system, equipment, component, and subassembly level. Include an index preceding each submittal. Submit in accordance with this section and Section 01 33 00 SUBMITTAL PROCEDURES.

1.3.1 Package Quality

Documents must be fully legible. Operation and Maintenance data must be consistent with the manufacturer's standard brochures, schematics, printed instructions, general operating procedures, and safety precautions.

1.3.2 Package Content

Provide data package content in accordance with paragraph SCHEDULE OF OPERATION AND MAINTENANCE DATA PACKAGES. Comply with the data package requirements specified in the individual technical sections, including the content of the packages and addressing each product, component, and system designated for data package submission, except as follows. Use Data Package 3 for commissioned items without a specified data package requirement in the individual technical sections. Provide a Data Package 3 instead of Data Package 1 or 2, as specified in the individual technical section, for items that are commissioned.

1.3.3 Changes to Submittals

Provide manufacturer-originated changes or revisions to submitted data if a component of an item is so affected subsequent to acceptance of the O&M Data. Submit changes, additions, or revisions required by the Contracting Officer for final acceptance of submitted data within 30 calendar days of the notification of this change requirement.

1.3.4 Commissioning Authority Review and Approval

Submit the commissioned systems and equipment submittals to the Government's Commissioning Authority (CxA) to review for completeness and applicability. Obtain validation from the CxA that the systems and equipment provided meet the requirements of the Contract documents and design intent, particularly as they relate to functionality, energy performance, water performance, maintainability, sustainability, system cost, indoor environmental quality, and local environmental impacts. The CxA communicates deficiencies to the Contracting Officer. Submit the O&M manuals to the Contracting Officer upon a successful review of the corrections, and with the CxA recommendation for approval and acceptance of these O&M manuals. This work is in addition to the normal review procedures for O&M data.

1.4 OPERATION AND MAINTENANCE MANUAL FILE FORMAT

Assemble data packages into electronic Operation and Maintenance Manuals. Assemble each manual into a composite electronically indexed file using the most current version of Adobe Acrobat or similar software capable of producing PDF file format. Provide compact disks (CD) or data digital versatile disk (DVD) as appropriate, so that each one contains operation, maintenance and record files, project record documents, and training videos. Include a complete electronically linked operation and maintenance directory.

1.4.1 Organization

Bookmark Product and Drawing Information documents using the current version of CSI Masterformat numbering system, and arrange submittals using the specification sections as a structure. Use CSI Masterformat and UFGS numbers along with descriptive bookmarked titles that explain the content of the information that is being bookmarked.

1.4.2 CD or DVD Label and Disk Holder or Case

Provide the following information on the disk label and disk holder or case:

a. Building Number

b. Project Title

c. Activity and Location

d. Construction Contract Number

e. Prepared For: (Contracting Agency)

f. Prepared By: (Name, title, phone number and email address)

g. Include the disk content on the disk label

h. Date

i. Virus scanning program used

1.5 TYPES OF INFORMATION REQUIRED IN O&M DATA PACKAGES

The following are a detailed description of the data package items listed in paragraph SCHEDULE OF OPERATION AND MAINTENANCE DATA PACKAGES.

1.5.1 Operating Instructions

Provide specific instructions, procedures, and illustrations for the following phases of operation for the installed model and features of each system:

1.5.1.1 Safety Precautions and Hazards

List personnel hazards and equipment or product safety precautions for operating conditions. List all residual hazards identified in the Activity Hazard Analysis provided under Section 01 35 26 GOVERNMENT SAFETY REQUIREMENTS. Provide recommended safeguards for each identified hazard.

1.5.1.2 Operator Prestart

Provide procedures required to install, set up, and prepare each system for use.

1.5.1.3 Startup, Shutdown, and Post-Shutdown Procedures

Provide narrative description for Startup, Shutdown and Post-shutdown operating procedures including the control sequence for each procedure.

1.5.1.4 Normal Operations

Provide Control Diagrams with data to explain operation and control of systems and specific equipment. Provide narrative description of Normal Operating Procedures.

1.5.1.5 Emergency Operations

Provide Emergency Procedures for equipment malfunctions to permit a short period of continued operation or to shut down the equipment to prevent further damage to systems and equipment. Provide Emergency Shutdown Instructions for fire, explosion, spills, or other foreseeable contingencies. Provide guidance and procedures for emergency operation of utility systems including required valve positions, valve locations and zones or portions of systems controlled.

1.5.1.6 Operator Service Requirements

Provide instructions for services to be performed by the operator such as lubrication, adjustment, inspection, and recording gauge readings.

1.5.1.7 Environmental Conditions

Provide a list of Environmental Conditions (temperature, humidity, and other relevant data) that are best suited for the operation of each product, component or system. Describe conditions under which the item equipment should not be allowed to run.

1.5.1.8 Operating Log

Provide forms, sample logs, and instructions for maintaining necessary operating records.

1.5.1.9 Additional Requirements for HVAC Control Systems

Provide Data Package 5 and the following for control systems:

a. Narrative description on how to perform and apply functions, features, modes, and other operations, including unoccupied operation, seasonal changeover, manual operation, and alarms. Include detailed technical manual for programming and customizing control loops and algorithms.

b. Full as-built sequence of operations.

c. Copies of checkout tests and calibrations performed by the Contractor (not Cx tests).

d. Full points list. Provide a listing of rooms with the following information for each room:

(1) Floor

(2) Room number

(3) Room name

(4) Air handler unit ID

(5) Reference drawing number

(6) Air terminal unit tag ID

(7) Heating or cooling valve tag ID

(8) Minimum cfm

(9) Maximum cfm

e. Full print out of all schedules and set points after testing and acceptance of the system.

f. Full as-built print out of software program.

g. Marking of system sensors and thermostats on the as-built floor plan and mechanical drawings with their control system designations.

1.5.2 Preventive Maintenance

Provide the following information for preventive and scheduled maintenance to minimize repairs for the installed model and features of each system. Include potential environmental and indoor air quality impacts of recommended maintenance procedures and materials.

1.5.2.1 Lubrication Data

Include the following preventive maintenance lubrication data, in addition to instructions for lubrication required under paragraph OPERATOR SERVICE REQUIREMENTS:

a. A table showing recommended lubricants for specific temperature ranges and applications.

b. Charts with a schematic diagram of the equipment showing lubrication points, recommended types and grades of lubricants, and capacities.

c. A Lubrication Schedule showing service interval frequency.

1.5.2.2 Preventive Maintenance Plan, Schedule, and Procedures

Provide manufacturer's schedule for routine preventive maintenance, inspections, condition monitoring (predictive tests) and adjustments required to ensure proper and economical operation and to minimize repairs. Provide instructions stating when the systems should be retested. Provide manufacturer's projection of preventive maintenance work-hours on a daily, weekly, monthly, and annual basis including craft requirements by type of craft. For periodic calibrations, provide manufacturer's specified frequency and procedures for each separate operation.

a. Define the anticipated time required to perform each of each test (work-hours), test apparatus, number of personnel identified by responsibility, and a testing validation procedure permitting the record operation capability requirements within the schedule. Provide a remarks column for the testing validation procedure referencing operating limits of time, pressure, temperature, volume, voltage, current, acceleration, velocity, alignment, calibration, adjustments, cleaning, or special system notes. Delineate procedures for preventive maintenance, inspection, adjustment, lubrication and cleaning necessary to minimize repairs.

b. Repair requirements must inform operators how to check out, troubleshoot, repair, and replace components of the system. Include electrical and mechanical schematics and diagrams and diagnostic techniques necessary to enable operation and troubleshooting of the

system after acceptance.

1.5.2.3 Cleaning Recommendations

Provide environmentally preferable cleaning recommendations in accordance with ASTM E1971.

1.5.3 Repair

Provide manufacturer's recommended procedures and instructions for correcting problems and making repairs for the installed model and features of each system. Include potential environmental and indoor air quality impacts of recommended maintenance procedures and materials.

1.5.3.1 Troubleshooting Guides and Diagnostic Techniques

Provide step-by-step procedures to promptly isolate the cause of typical malfunctions. Describe clearly why the checkout is performed and what conditions are to be sought. Identify tests or inspections and test equipment required to determine whether parts and equipment may be reused or require replacement.

1.5.3.2 Wiring Diagrams and Control Diagrams

Provide point-to-point drawings of wiring and control circuits including factory-field interfaces. Provide a complete and accurate depiction of the actual job specific wiring and control work. On diagrams, number electrical and electronic wiring and pneumatic control tubing and the terminals for each type, identically to actual installation configuration and numbering.

1.5.3.3 Repair Procedures

Provide instructions and a list of tools required to repair or restore the product or equipment to proper condition or operating standards.

1.5.3.4 Removal and Replacement Instructions

Provide step-by-step procedures and a list of required tools and supplies for removal, replacement, disassembly, and assembly of components, assemblies, subassemblies, accessories, and attachments. Provide tolerances, dimensions, settings and adjustments required. Use a combination of text and illustrations.

1.5.3.5 Spare Parts and Supply Lists

Provide lists of spare parts and supplies required for repair to ensure continued service or operation without unreasonable delays. Special consideration is required for facilities at remote locations. List spare parts and supplies that have a long lead-time to obtain.

1.5.3.6 Repair Work-Hours

Provide manufacturer's projection of repair work-hours including requirements by type of craft. Identify, and tabulate separately, repair that requires the equipment manufacturer to complete or to participate.

1.5.4 Appendices

Provide information required below and information not specified in the preceding paragraphs but pertinent to the maintenance or operation of the product or equipment. Include the following:

1.5.4.1 Product Submittal Data

Provide a copy of SD-03 Product Data submittals documented with the required approval.

1.5.4.2 Manufacturer's Instructions

Provide a copy of SD-08 Manufacturer's Instructions submittals documented with the required approval.

1.5.4.3 O&M Submittal Data

Provide a copy of SD-10 Operation and Maintenance Data submittals documented with the required approval.

1.5.4.4 Parts Identification

Provide identification and coverage for the parts of each component, assembly, subassembly, and accessory of the end items subject to replacement. Include special hardware requirements, such as requirement to use high-strength bolts and nuts. Identify parts by make, model, serial number, and source of supply to allow reordering without further identification. Provide clear and legible illustrations, drawings, and exploded views to enable easy identification of the items. When illustrations omit the part numbers and description, both the illustrations and separate listing must show the index, reference, or key number that will cross-reference the illustrated part to the listed part. Group the parts shown in the listings by components, assemblies, and subassemblies in accordance with the manufacturer's standard practice. Parts data may cover more than one model or series of equipment, components, assemblies, subassemblies, attachments, or accessories, such as typically shown in a master parts catalog.

1.5.4.5 Warranty Information

List and explain the various warranties and clearly identify the servicing and technical precautions prescribed by the manufacturers or contract documents in order to keep warranties in force. Include warranty information for primary components of the system. Provide copies of warranties required by Section 01 78 00 CLOSEOUT SUBMITTALS.

1.5.4.6 Extended Warranty Information

List all warranties for products, equipment, components, and sub-components whose duration exceeds one year. For each warranty listed, indicate the applicable specification section, duration, start date, end date, and the point of contact for warranty fulfillment. Also, list or reference the specific operation and maintenance procedures that must be performed to keep the warranty valid. Provide copies of warranties required by Section 01 78 00 CLOSEOUT SUBMITTALS.

1.5.4.7 Personnel Training Requirements

Provide information available from the manufacturers that is needed for use in training designated personnel to properly operate and maintain the equipment and systems.

1.5.4.8 Testing Equipment and Special Tool Information

Include information on test equipment required to perform specified tests and on special tools needed for the operation, maintenance, and repair of components. Provide final set points.

1.5.4.9 Testing and Performance Data

Include completed prefunctional checklists, functional performance test forms, and monitoring reports. Include recommended schedule for retesting and blank test forms. Provide final set points.

1.5.4.10 Field Test Reports

Provide a copy of Field Test Reports (SD-06) submittals documented with the required approval.

1.5.4.11 Contractor Information

Provide a list that includes the name, address, and telephone number of the General Contractor and each Subcontractor who installed the product or equipment, or system. For each item, also provide the name address and telephone number of the manufacturer's representative and service organization that can provide replacements most convenient to the project site. Provide the name, address, and telephone number of the product, equipment, and system manufacturers.

1.6 SCHEDULE OF OPERATION AND MAINTENANCE DATA PACKAGES

Provide the O&M data packages specified in individual technical sections. The information required in each type of data package follows:

1.6.1 Data Package 1

a. Safety precautions and hazards

b. Cleaning recommendations

c. Maintenance and repair procedures

d. Warranty information

e. Extended warranty information

f. Contractor information

g. Spare parts and supply list

1.6.2 Data Package 2

a. Safety precautions and hazards

b. Normal operations

c. Environmental conditions

d. Lubrication data

e. Preventive maintenance plan, schedule, and procedures

f. Cleaning recommendations

g. Maintenance and repair procedures

h. Removal and replacement instructions

i. Spare parts and supply list

j. Parts identification

k. Warranty information

l. Extended warranty information

m. Contractor information

1.6.3 Data Package 3

a. Safety precautions and hazards

b. Operator prestart

c. Startup, shutdown, and post-shutdown procedures

d. Normal operations

e. Emergency operations

f. Environmental conditions

g. Operating log

h. Lubrication data

i. Preventive maintenance plan, schedule, and procedures

j. Cleaning recommendations

k. Troubleshooting guides and diagnostic techniques

l. Wiring diagrams and control diagrams

m. Maintenance and repair procedures

n. Removal and replacement instructions

o. Spare parts and supply list

p. Product submittal data

q. O&M submittal data

r. Parts identification

s. Warranty information

t. Extended warranty information

u. Testing equipment and special tool information

v. Testing and performance data

w. Contractor information

x. Field test reports

1.6.4 Data Package 4

a. Safety precautions and hazards

b. Operator prestart

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.1 TRAINING

Prior to acceptance of the facility by the Contracting Officer for Beneficial Occupancy, provide comprehensive training for the systems and equipment specified in the technical specifications. The training must be targeted for the Facilities Management Specialist, building maintenance personnel, and applicable building occupants. Instructors must be well-versed in the particular systems that they are presenting. Address aspects of the eOMSI Manual, as submitted in Section 01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI). Training must include classroom or field lectures based on the system operating requirements. The location of classroom training requires approval by the Contracting Officer.

3.1.1 Training Plan

Submit a written training plan to the Contracting Officer for approval at least 60 calendar days prior to the scheduled training. Training plan must be approved by the Government's Commisioning Authority (CxA) prior to forwarding to the Contracting Officer. Also, coordinate the training schedule with the Contracting Officer and CxA. Include within the plan the following elements:

a. Equipment included in training

b. Intended audience

c. Location of training

d. Dates of training

e. Objectives

f. Outline of the information to be presented and subjects covered including description

g. Start and finish times and duration of training on each subject

h. Methods (e.g. classroom lecture, video, site walk-through, actual operational demonstrations, written handouts)

i. Instructor names and instructor qualifications for each subject

j. List of texts and other materials to be furnished by the Contractor that are required to support training

k. Description of proposed software to be used for video recording of training sessions.

3.1.2 Training Content

The core of this training must be based on manufacturer's recommendations and the operation and maintenance information. The CxA is responsible for

overseeing and approving the content and adequacy of the training. Provide a brief summary of the FACILITY INFORMATION manual, and a more detailed presentation of the PRODUCT AND DRAWING MANUAL, specified in Section 01 78 24.00 20 FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI). Spend 95 percent of the instruction time during the presentation on the OPERATION AND MAINTENANCE DATA. Include the following for each system training presentation:

a. Start-up, normal operation, shutdown, unoccupied operation, seasonal changeover, manual operation, controls set-up and programming, troubleshooting, and alarms.

b. Relevant health and safety issues.

c. Discussion of how the feature or system is environmentally responsive. Advise adjustments and optimizing methods for energy conservation.

d. Design intent.

e. Use of O&M Manual Files.

f. Review of control drawings and schematics.

g. Interactions with other systems.

h. Special maintenance and replacement sources.

i. Tenant interaction issues.

3.1.3 Training Outline

Provide the eOMSI Manual files as specified in Section 01 78 24.00 20, FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI), and a written course outline listing the major and minor topics to be discussed by the instructor on each day of the course to each trainee in the course. Provide the course outline 14 calendar days prior to the training.

3.1.4 Training Video Recording

Record classroom training session(s) on video. Provide to the Contracting Officer two copies of the training session(s) in DVD video recording format. Capture within the recording, in video and audio, the instructors' training presentations including question and answer periods with the attendees. The recording camera(s) must be attended by a person during the recording sessions to assure proper size of exhibits and projections during the recording are visible and readable when viewed as training.

3.1.5 Unresolved Questions from Attendees

If, at the end of the training course, there are questions from attendees that remain unresolved, the instructor must send the answers, in writing, to the Contracting Officer for transmittal to the attendees, and the training video must be modified to include the appropriate clarifications.

3.1.6 Validation of Training Completion

Ensure that each attendee at each training session signs a class roster daily to confirm Government participation in the training. At the completion of training, submit a signed validation letter that includes a sample record of training for reporting what systems were included in the training, who provided the training, when and where the training was performed, and copies of the signed class rosters. Provide two copies of the validation to the Contracting Officer, and one copy to the Operation and Maintenance Manual Preparer for inclusion into the Manual's documentation.

3.1.7 Quality Control Coordination

Coordinate this training with the CxA in accordance with Section 01 45 00.05 20 DESIGN AND CONSTRUCTION QUALITY CONTROL FOR DESIGN-BUILD.

-- End of Section --

SECTION 01 78 24.00 20

FACILITY ELECTRONIC OPERATION AND MAINTENANCE SUPPORT INFORMATION (eOMSI)
02/15

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. DEPARTMENT OF DEFENSE (DOD)

FC 1-300-09N	(2014; with Change 4) Navy and Marine Corps Design Procedures

1.2 DEFINITIONS AND ABBREVIATIONS

1.2.1 eOMSI Manual

Manual (PDF file) provided by the Contractor that includes, but is not limited to, product information, a facility description with photos, and a list of primary facility systems.

1.2.2 eOMSI Facility Data Workbook (FDW)

A Microsoft Excel file containing required facility information populated by the Contractor.

1.2.3 Systems

The words "system", "systems", and "equipment", when used in this document refer to as-built systems and equipment.

1.2.4 Computer Assisted Design and Drafting (CADD)

Electronic Computer Assisted Design and Drafting graphic software program that is used to create facility design contract documents and Record Drawings.

1.2.5 KTR

An abbreviation for "Contractor."

1.3 EOMSI MEETINGS

1.3.1 Post-Award Kickoff Meeting

Be prepared to discuss the following during this meeting:

a. eOMSI Manual and eOMSI Facility Data Workbook Development Meetings

b. Processes and methods of gathering eOMSI Manual and eOMSI Facility Data Workbook information during construction.

c. The eOMSI Submittals schedule. Include the eOMSI submittal schedule

on the Baseline Construction Schedule in accordance with Section 01 32 17.00 20 COST-LOADED NETWORK ANALYSIS SCHEDULE (NAS).

d. Electronic eOMSI Facility Data Workbook file for Contractor's use and completion.

1.3.2 eOMSI Manual and Facility Data Workbook Coordination Meeting

Facilitate a meeting after the Post-Award Kickoff Meeting prior to the submission of the eOMSI Progress Submittal. Meeting attendance must include the Contractor's eOMSI Manual and Facility Data Workbook Preparer, Designer of Record (DOR), and Quality Control Manager, the Commissioning Authority (CxA), and the Government's Design Manager (DM), Contracting Officer's Representative, and NAVFAC Public Works (PW) Facilities Management Division (FMD). Include any Mechanical, Electrical, and Fire Protection Sub-Contractors.

The purpose of this meeting is to reach a mutual understanding of the scope of work concerning the contract requirements for eOMSI and coordinate the efforts necessary by both the Government and Contractor to ensure an accurate collection, preparation and timely Government review of eOMSI.

1.3.3 Facility Turnover Meeting

Include eOMSI in NAVFAC Red Zone (NRZ) facility turnover meetings as specified in Section 01 30 00, ADMINISTRATIVE REQUIREMENTS.Section 01 31 19.05 20, POST AWARD MEETINGS.

1.4 SUBMITTAL SCHEDULING

1.4.1 eOMSI, Progress Submittal

Submit the Progress submittal when construction is approximately 50 percent complete, to the Contracting Officer for approval. Provide eOMSI Manual Files (Bookmarked PDF) and eOMSI Facility Data Workbook (Excel). Include the elements and portions of system construction completed up to this point.

The purpose of this submittal is to verify progress is in accordance with contract requirements as discussed during the eOMSI Coordination Meeting. Field verify a portion of the eOMSI information in accordance with paragraph FIELD VERIFICATION.

1.4.2 eOMSI, Prefinal Submittal

Submit the 100 percent submittal of the eOMSI Prefinal Submittal to the Contracting Officer for approval within 90 calendar days of the Beneficial Occupancy Date (BOD). This submittal must provide a complete, working document that can be used to operate and maintain the facility. Any portion of the submittal that is incomplete or inaccurate requires the entire submittal to be returned for correction. Any discrepancies discovered during the Government's review of eOMSI Progress submittal must be corrected prior to the Prefinal submission.

The eOMSI Prefinal Submittal must include eOMSI Manual Files (Bookmarked PDF) and eOMSI Facility Data Workbook (Excel).

1.4.3 eOMSI, Final Submittal

Submit completed eOMSI Manual Files (Bookmarked PDF) and eOMSI Facility Data Workbook (Excel). The Final submittal is due at BOD. Any discrepancies discovered during the Government's review of the Prefinal eOMSI submittal, including the Field Verification, must be corrected prior to the Final eOMSI submission.

1.5 UNITS OF MEASURE

Provide eOMSI utilizing the units of measurerequired by the RFP for the facility. Refer to Section 01 33 10.05 20 DESIGN SUBMITTAL PROCEDURES.

1.6 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-11 Closeout Submittals

eOMSI, Progress Submittal; G

eOMSI, Prefinal Submittal; G

eOMSI, Final Submittal; G

PART 2 PRODUCTS

2.1 eOMSI FILES FORMAT

Format eOMSI manuals and files in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Include a complete electronically linked operation and maintenance directory. Provide four electronic copies of the eOMSI Manuals to the Contracting Officer for approval.

Provide eOMSI Facility Data Workbook on compact disks (CD) or data digital versatile disk (DVD) disks in (EXCEL) format. Scan eOMSI Manual Files and eOMSI Facility Data Workbook for viruses, malware, and spyware using a commercially available scanning program that is routinely updated to identify and remove current virus threats.

2.1.1 eOMSI Manual Organization

Organize the eOMSI Manuals into two parts: 1) Product and Drawing Information, and 2) Facility Information. Bookmark the PDF files for easy access to the information.

a. Bookmark Product and Drawing Information documents in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

b. Bookmark Facility Information to at least one level lower than the major system.

2.1.2 eOMSI Manual CD or DVD Disk Label and Disk Holder or Case

Provide disks in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

2.2 eOMSI MANUAL

2.2.1 Product and Drawing Information

Provide an organized record of the facility products, materials, equipment, and minimum information necessary to operate the facility. Provide Product and Drawing Information for the systems in the final constructed facility.

2.2.1.1 O&M Data

As a minimum, provide the approved O&M Data, submitted in the technical specification sections, in accordance with paragraph TYPES OF INFORMATION REQUIRED IN O&M DATA PACKAGES in Section 01 78 23 OPERATION AND MAINTENANCE DATA.

2.2.1.2 Record Drawings

Provide an electronic, PDF copy of the Record Drawings, prepared in accordance with FC 1-300-09N and 01 78 00 CLOSEOUT SUBMITTALS. Bookmark drawings using the sheet title and sheet number.

Include Record Drawings as part of the Red-Zone specified in Section 01 30 00 ADMINISTRATIVE REQUIREMENTS.

2.2.1.3 Utility Record Drawings

Using Record Source Drawings, show and document details of the actual installation of the utility systems; annotate and highlight the eOMSI information. Provide Utility Record Drawings in PDF format. Provide the following drawings at a large enough scale to differentiate designated isolation units from surrounding valves and switches.

a. Utility Schematic Diagrams - Provide a one line schematic diagram for each utility system such as power, water, wastewater, and gas/fuel. Schematic diagram must show from the point where the utility line is connected to the mainline up to the five-foot connection point to the facility. Indicate location or area designation for route of transmission or distribution lines; locations of duct banks, manholes/ handholes or poles; isolation units such as valves and switches; and utility facilities such as pump stations, lift stations, and substations.

b. Enlarged Connection and Cutoff Plans - Provide enlarged floor plans that provide information between the five foot utility connection point and where utilities connect to facility distribution. Enlarge floor plans/ elevations of the rooms where the utility enters the building and indicate on these plans locations of the main interior and exterior connection and cutoff points for the utilities. Also enlarge floor plans / elevations of the rooms where equipment is located. Include enough information to enable someone unfamiliar with the facility to locate the connection and cutoff points. Indicate designations such as room number, panel number, circuit breaker, or valve number, of each utility and equipment connection and cutoff

point, and what that connection and cutoff point controls.

2.2.2 Facility Information

Provide the following in Facility Information:

2.2.2.1 General Facility and System Description

Describe the function of the facility. Detail the overall dimensions of the facility, number of floors, foundation type, expected number of occupants, and facility Category Code. List and generally describe all the facility systems and any special building features (for example, HVAC Controls, Sprinkler Systems, Cranes, Elevators, and Generators). Include photographs marked up and labeled to show key operating components and the overall facility appearance.

2.2.2.2 Basis of Design

Include the Basis of Design that shows the basic design scope of work, assumptions and the original intentions of the Designer of Record (DOR). Identify the site utility design goals, objectives, design load limits, assumptions, and system features that are critical to the operation and maintenance of the systems.

2.2.2.3 Floor Plans

Provide uncluttered, legible 11 by 17 inches floor plans. Include room numbers, type or function of spaces, and overall facility dimensions on the floor plans. Do not include items such as construction instructions, references, or frame numbers.

2.2.2.4 Floor Coverings, Wall Surfaces, and Ceiling Surfaces

Provide a table that lists by room number (including hallways and common spaces), the type, and area of finish, manufacturer's product name, identifying number, and color. Include a facility summary of the total area for each type of space and floor, wall, or ceiling finish in the table.

2.2.2.5 Windows

Provide a table that lists by room number (including hallways and common spaces), the type of window, window size, number of each size and type, special features, manufacturer's product name, identifying number, and color. The table must include a facility summary of the total number for each type and size of window.

2.2.2.6 Roofing

Provide the total area of each type of roof surface and system. Provide the name of the roofing product and system; manufacturer's, supplier's, and installer's names, addresses, and phone numbers; manufacturer's product name, identifying number, and color. For each type of roof, provide a recommended inspection, maintenance and repair schedule that details checkpoints, frequencies, and prohibited practices. List roof structural load limits.

2.2.2.7 HVAC Filters

Provide a table that lists the quantity, type, size, and location of each HVAC filter, manufacturer's product name, and identifying number.

2.2.2.8 Plumbing Fixtures

Provide a table that lists by room number, the number and type of plumbing and bathroom plumbing fixtures (for example, sinks, water closets, urinals, showers and drinking fountains).

2.2.2.9 Lighting Fixtures

Provide a table that lists by room number (including hallways and common spaces), the type of lighting fixture, ballast, number of lighting fixtures, type of lamps and number of lamps, and the manufacturer's product name and the identifying number. The table must include a facility summary of the total number of fixtures of each type and number of lamps of each type.

2.2.2.10 Equipment Listing

Provide a table that lists the major equipment shown on the design equipment schedules. Show the item descriptions, locations, model numbers; and the names, addresses, and telephone numbers of the manufacturers, suppliers, contractors, and subcontractors.

2.2.2.11 System Flow Diagrams

Provide a flow diagram indicating system liquid, air or gas flow during normal operations. Integrate the system components into the diagram. A compilation of non-integrated, flow diagrams for the individual system components are not acceptable.

2.2.2.12 Valve List

Provide a list of all valves associated with the system. Show valve type, identification number, function, location and normal operating position.

2.2.2.13 Riser Diagrams

Provide riser diagrams and settings of equipment.

2.3 eOMSI FACILITY DATA WORKBOOK

Download the eOMSI Facility Data Workbook at the following location: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic Complete the KTR Facility Data File tab based on the selection of Mastersystems, Systems, and Subsystems installed. The following tabs are included in the eOMSI Facility Data File Workbook and serve the purpose stated:

a. Instructions Tab: Instructions for completing Model & Facility Data Matrix Tab and KTR Facility Data File Tab. If a discrepancy exists between what is required in this section and the Workbook, the instructions within the workbook take precedence.

b. Model & Facility Data Matrix Tab: - The Matrix lists Required Facility Asset Fields for each SYSTEM and SUBSYSTEM. The Designer of Record

selects SYSTEMS and SUBSYSTEMS that are within the project scope, which the Contractor needs to include and populate in KTR Facility Data File tab. The "Required Facility Asset Field Position Numbers," one through seventeen, are pre-populated, and are not editable.

c. Required Facility Asset Fields Tab: Defines the 17 Required Facility Asset Field Position Numbers used in Model and Facility Data Matrix and KTR Facility Data File tabs.

d. KTR Sample Facility Data File Tab: Sample KTR eOMSI facility data file. This tab provides an example of the mandatory fields of equipment installed by the Contractor, and populated in the KTR eOMSI Facility Data File Tab, along with their descriptions.

e. KTR Facility Data File Tab: Required eOMSI facility data file deliverable provided to the Government. Provide a separate and unique new row for each facility component or piece of equipment installed.

PART 3 EXECUTION

3.1 FIELD VERIFICATION

Field verify eOMSI Facility Data Workbook information with Contractor and Government personnel. Include the following personnel in this meeting: Contractor's eOMSI Manual and Facility Data Workbook Preparer and Quality Control Manager, Commissioning Authority, and the Government's Contracting Officer's Representative and NAVFAC PW FMD. Request, and provide, an eOMSI Field Verification Meeting no sooner than 14 calendar days after submission of the Progress eOMSI submittal, and another, no sooner than 14 calendar days after submission of the Prefinal eOMSI submittal. During this meeting, the Government and Contractor will verify that the eOMSI Facility Data Workbook is complete and accurate.

Field verify that at least 5 Subsystems under each of the Mastersystems are accurate, for a total of 25 Subsystems. For each of these items, verify that the required facility asset field, as defined in the "Model & Facility Data Matrix" tab, contains the specified data and it is accurate (i.e. item description, manufacturer, model no., serial no.). 100 percent accuracy of eOMSI information is required for successful field verification. If data discrepancies are discovered amongst the 25 Subsystems verified, resubmit an updated eOMSI FDW, and request a make-up field verification meeting. At the make-up field verification meeting 25 new Subsystems and their associated required facility asset fields will be field verified; the 25 new Subsystems must be 100% accurate. Any discrepancies discovered must be corrected prior to next eOMSI Facility Data Workbook Submittal.

(1) D10 - CONVEYING
(2) D20 - PLUMBING
(3) D30 - HVAC
(4) D40 - FIRE PROTECTION
(5) D50 - ELECTRICAL

3.2 eOMSI TRAINING

Provide training on eOMSI Manuals and Facility Data Workbook in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA.

-- End of Section --

SECTION 01 78 30.00 22

GIS DATA DELIVERABLES

11/18

PART 1 GENERAL

1.1 OBJECTIVE

The primary objective of this section is to provide detailed specifications for collection and delivery of geospatial data commonly referred to as Geographic Information System (GIS) data. Additionally, this section shall provide guidance to ensure that all GIS data delivered is compatible and will add value to the Marine Corps Base (MCB) Camp Lejeune Installation Geospatial Information and Services (IGI&S) GEOdatabase.

Failure to comply with the specifications outlined in this document will result in non-acceptance of data deliverables.

1.1.1 Point of Contact for MCB Camp Lejeune

The Points of Contact (POC) for assistance in preparation of GIS deliverables are:

Resident Officer In Charge Of Construction
Construction Manager (CM)
1005 Michael Drive
Camp Lejeune, NC 28547-2521
(910) 451-2581

Public Works Division
GIS Data Manager
1005 Michael Road
Camp Lejeune, NC 28547-2521
(910) 451-5507 ext 3264

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES 01 33 00.05 20 CONSTRUCTION SUBMITTAL PROCEDURES:

SD-11 Closeout Submittals

GIS Data Deliverables; G

1.3 GOVERNMENT GEOSPATIAL DATA AND SCHEMA

1. The IGI&S repository model schema is based on the Spatial Data Standards for Facilities, Infrastructure and Environment (SDSFIE) GEOFidelis Data Model with recurring business driven modifications and or adaptations.

   a. Data will be created and delivered by developing an ARCGIS Personal GEODatabase using ArcGIS 10.1 or higher if a higher version is being utilized by the Government at the time the deliverable is being developed.

   b. Request the existing GIS Data, Schema and Domain Properties by means of a Data Request Package (DRP). Receipt of request will include Geospatial Database table structure, schema, Domain

configuration, Attribute text format, i.e., case size as well as Meta Data information.

c. The DRP should be submitted prior to the start of data collection efforts and again every 6 months for the duration of the contract. Ensure that all GIS data has been created and delivered utilizing the most up to date IGI&S GEODatabase schema.

d. Verify the ArcGIS and schema version, via the CM or PM, at the commencement of this contract. All GIS DATA DELIVERABLES will be created in accordance with the current version and these specifications.

2. Submit a request for a Geospatial DRP to the CM or the Project Manager.

a. Request to be completely filled out and include all the information as instructed on the data request form.

b. Request only GIS data and or schema for feature classes that are relevant to the contract and within the boundary of project area.

c. Attach Scope of Work, which is defined by this GIS DATA DELIVERABLES section for each project request.

d. Return the DRP to the CM or Project Manager for sponsorship and submittal to the Installation Geospatial Information & Services (IGI&S) Office.

e. Incomplete forms may delay receipt of the requested GIS data and Schema.

1.3.1 Global Positioning System (GPS) and Spatial Reference Properties

GPS data shall be completed in accordance with the GPS Data Collection and Documentation Standards, Version 4 (or higher version if available at the time of this project) as prepared by Geographic Information Coordinating Council (GICC) Statewide Mapping Advisory Committee (SMAC) and adopted by the North Carolina Geographic Information Coordinating Council.

1. Prior to GPS efforts, ALL underground utilities are to be located utilizing a utility locating service in order to verify and obtain accurate feature locations.

2. Only bench marks included in the North Carolina Geodetic Survey Base Station Network are to be used for GPS data collection.

3. Mission planning is essential. Utilize the best Position Dilution of Precision (PDOP) values for data accuracy.

4. Utility data, as identified in paragraph "ATTRIBUTE DATA COLLECTION AND GPS REQUIREMENTS FOR SPECIFIC FEATURES" will be collected utilizing Survey Grade GPS data collection methods.

5. Infrastructure data, as identified in paragraph "ATTRIBUTE DATA COLLECTION AND GPS REQUIREMENTS FOR SPECIFIC FEATURES" will be collected utilizing Sub-Foot or better GPS data collection methods.

a. Spatial accuracy requirements for Survey and Sub-Foot grade data collection are as follows:

i. Sub-Foot requirements:

1) All points shall be within + 12 inches

2) 95 percent accuracy rate for all points.

ii. Survey Grade requirements:

1) All points shall be within + 1 centimeter

2) 98 percent accuracy rate for all points

6. Make every effort to capture feature locations without using offsets. All Offsets will be noted in the Final Report for each feature.

7. Excessive offsets included in the Final Data, which will be referenced in the Final Report, will be reviewed for quality control.

a. Resubmittal of data will be required if PDOP planning was not observed per this specification.

The following GEODatabase Coordinate Systems and Spatial Reference Properties should be utilized for Camp Lejeune:

1. Transverse Mercator (UTM) Zone 18N

a. GRS 1980 spheroid

b. North American Datum 1983 (NAD83) horizontal datum

c. North American Vertical Datum 1988 (NAVD88) vertical datum.

2. Domain precision of 1000 which will result in a database accuracy of 1/1000 m

1.3.2 Demolished and Abandoned in Place (AIP) Features

Reference all Demolished and or AIP features in the data delivered. Should the current feature data class attributes and or domains not reference AIP or demolished features, the Contractor will be responsible for appropriately delivering these features by creating an associated "Demolished" or AIP feature class for all point and polyline data, i.e., CLJN.CL.WastewaterUtilitySegment and CLJN.CL.WateUtilNode_wHydrant, etc.

1. Utilize a blank schema for the associated feature class.

2. Rename associated feature class and add DEMO or AIP as a prefix, i.e., DEMO.CLJN.CL.WastewaterUtilitySegment, AIP.CLJN.CL.WastewaterUtilitySegment.

3. All demolished and or AIP features should provide existing spatial and non-spatial data which may be copied from existing data.

4. Update attributes appropriately to include the following:

a. Contract Number.

b. Drawing Number.

c. isDemolished.

d. dateDemolished or dateAIP.

e. Status.

1.3.3 Creating a New Feature Class

Should a new feature class be required that is not readily available in the current GIS schema provided by the Government. Contact the CM or Project Manager for guidence and schema format.

1.3.4 GIS Topology Rules

All data must be created using GIS topology rules for polygons, points and lines, such as, but not limited to the following examples:

1. Polygons, Polylines and points rules; please reference illustrating topology rules in ArcGIS at www.esri.com.

2. Polygons must not have slivers.

3. All utility or infrastructure system data, which is, but is not limited to, transportation system and electrical, water, steam distribution, and wastewater collection, etc., will be created using GIS spatial connectivity rules which specify that vertex, edge and endpoints be snapped to features within the system.

4. Features will be snapped to the appropriate item.

5. Data will be created to represent the real world, for example, water, sewer, and transportations systems, etc. will be drawn and or created in the direction of flow.

6. Utility and transportation systems will be created from source to sink, etc.

7. Abandoned In Place (AIP) utility lines will be located and updated in the current feature data set and identified as AIP in the attribute tableor provide in a feature data set as specified in paragraph "Demolished and Abandoned in Place (AIP) Features" with CM approval.

1.3.5 Creation of Geographic Data Documentation (METADATA)

For each digital file delivered containing geographic information, provide documentation consistent with the Federal Geographic Data Committee (FGDC) Content Standards for Digital Geospatial Metadata (CSDGM).

Metadata generation tools included in the ArcGIS suite of software (or equivalent technology) will be used in the production of the required metadata in XML format. Regardless of the tools used for metadata creation, must ensure that the metadata is delivered in XML format and can be easily imported into the IGI&S GEODatabase.

(NOTE: The metadata should be formatted from the Government perspective, not the Contractor project perspective. Therefore such items as Point of Contact (POC) should be the POC currently associated with the data and NOT the Contractor's Project Manager. Use language and format consistent with

existing metadata.)

1.3.6 GIS Submittals Guidelines

All GIS Submittals will be submitted to the CM or PM and then analyzed by Government GIS personnel prior to final approval. Failure to comply with the specifications outlined in this document will result in non-acceptance of data deliverables.

1. Prior to any database development, provide the Government with a technical approach document, in PDF format, for review and approval. The Technical Approach document will describe in detail the Contractor's technical approach to designing and developing the database.

2. All attributes will be populated in accordance with the "ATTRIBUTE DATA COLLECTION AND GPS REQUIREMENTS FOR SPECIFIC FEATURES" and will be obtained via contract specifications, plans and record drawings.

3. Reasearch may be required to be conducted to collect data and make copies of reports and studies as necessary to verify existing and/or record drawing data. Record drawing data and closed contracts can be located in the Technical Records Section in the Public Works Department which is located at 1005 Michael Street, MCB Camp Lejeune.

4. Raw GPS data and collection data files will be included with every phase of delivery.

5. Actual spatial and non-spatial conditions in the field always supersede drawings. Locate and field verify all features to ensure attribute data and location is correctly recorded.

6. Submit a preliminary review of data at 25 percent contract completion to ensure specifications compliance.

7. Deliver digital geographic maps, GPS collection files and related data. All working text and documents and personal geodatabase will be included for review in the draft and final delivery of data.

    a. All maps of GIS DATA DELIVERABLES will be ANSI C size and include a project title, contract number, scale, legend, standard symbology, attributes, i.e., building numbers, road names, segment diameters, etc. Also provide a PDF copy of all maps.

8. When required, provide a technical consultant to meet on site.

9. Do not deliver blank unused schema or feature class data with no attributes. Deliver only data pertinent to the contract that adds value to the GEODatabase per this section.

10. When projects are constructed in phases, deliver GIS Data at the end of each phase for all Phased Projects and Construction projects.

11. It is the Contractor's responsibility to perform quality assurance for all data and related materials required in the section prior to submitting product to the Government.

12. The data will be analyzed for discrepancies in subject content, correct format in accordance with this statement of work, and

compatibility with the existing GIS system as well as all other specifications in this section.

1.3.7 Formats, Versions and Guidelines

All data deliverables will be in the following formats and/or versions.

1. GIS data will be provided in an ArcGIS 10.1 or higher if a higher version is being used by the Government at the time of this project. Verify the ArcGIS version, via the CM or PM at the commencement of this contract.

2. Microsoft Windows 7 operating system, unless otherwise approved by the Government.

3. All reports and maps will be delivered as a hard copy and in a searchable Adobe Portable Document Format (PDF).

4. All text, spreadsheet, database files, reports, and maps will be delivered on Digital Versatile Disc read - only memory (DVD-ROM).

5. Verify required version(s) of software and schema, via the CM or PM.

6. Map submittals will accompany each geospatial deliverable.

    a. Include ANSI C map for each project/area.

    b. Data should be labeled and attributed per specification.

    c. All maps should include the date, a legend, scale, contract title, and number.

    d. Each map should be exported on a .pdf and delivered electronically with the project.

1.3.8 Final Report Requirements with additional Guidelines

Follow the following:

1. Specific procedures and list of equipment, software and versions that were utilized for the GPS data collection and creation of geospatial data.

2. Submit all GPS data files.

3. Provide the date(s) the IGI&S schema and geospatial data was received.

4. Provide details on any offsets to include justification as to why offsets were utilized and on which features and or points offsets were used.

5. Describe all modifications to the geodatabase to include the name of all new features classes, i.e., new, demolished or AIP.

6. Provide the source that was utilized for required attributes.

    a. Include an ANSI C size copy of all design drawings that were referenced in the attribute data. This information should be included in all phases of delivery to include draft and final

reviews.

b. Provide the overall utility site plan drawing(s)with each submittal.

c. Provide a separate map for communication which includes infrastructure in PDF format.

7. Specify Deliverable "Draft #" or "Final Submittal" when data is submitted to the CM or PM for review.

8. Provide the name and contact information for the GIS Technical Point of Contact who can answer questions regarding the data deliverable.

9. GIS DATA DELIVERABLES must be provided in a format that does not require translation or pre/post processing prior to being loaded into the IGI&S GEODatabase.

10. Provide any miscellaneous information that is deemed significant.

11. Provide the current version of the GIS DATA DELIVERABLES specification utilized for this contract submittal.

1.3.9 Ownership

All digital files, final hardcopy products, GPS raw data, source data acquired for this project, and related materials, including that furnished by the Government, will become the property of the Government and will not be issued, posted, distributed, or published by the Contractor. All documentation will be delivered in the final delivery.

Note: No endorsement of software or hardware is implied.

1.4 ATTRIBUTE DATA COLLECTION AND GPS REQUIREMENTS FOR SPECIFIC FEATURES

GPS and collect attribute data as specified for each feature listed with (GPS) accuracy as described in paragraph "Global Positioning System (GPS) and Spatial Reference Properties". Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

1.4.1 **CLJN.CL.Common**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System (GPS) and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table, or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.Sign
A structure that conveys directional, warning, or other information.

a) numberOfSigns
b) assemblyOffset
c) SignText

d) SignType - Directional, Standard Identifier, Safety Warnings, Regulatory, etc.
e) SymbolCode - Utilize manual for Uniform Traffic Control Devices Code as issued by the Federal Highway Administration
f) GisFeatureCollectionMethod - Survey Grade GPS, Digitized, etc.
g) Contract Number
h) SdsFeatureDescription
i) signAssemblyType - Pedestal Pole, Wood 4x4, etc.

1.4.2 **CLJN.CL.EMERGENCY_SERVICES**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System (GPS) and Spatial Reference Properties". Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table, or feature class. Domains must be utilized when populating the feature where required.

CLJN.CL.RoadCenterline
The center of the road area

a) roadClass - Major Roads/Local Roads/etc.
b) trackOrLaneCount
c) speedLimit
d) isPaved - YES / NO
e) oneWayDirection
f) fullStreetName
g) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
h) contractNumber
i) isTankTrail - YES / NO
j) isLighted - Yes / No
k) routeMinTravelledWayWidth
l) routeMinTravelledWayWidthUOM
m) routeTotalUsableWidth
n) routeTotalUsableWidthUOM
o) supportedByBridgeSpan - Yes / No

1.4.3 **CLJN.CL.REAL.PROPERTY**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System (GPS) and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.AccessControl
A structure manned or unmanned intended to control access to an area

a) controlType - gate, barricade, tire shedder, etc.
b) contractNumber
c) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.

d) isRangeAccess - YES / NO
e) gateType -
f) Facility Number
g) sdsFeatureDescription - Location

CLJN.CL.AlternativeEnergyPoint
Locations used for the production of alternative energy sources, such as wind turbines, photovoltaic, etc.

a) alternativeEnergyType - Photovoltaic, Natural Gas, etc.
b) contractNumber
c) designDrawingNumber
d) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
e) isPortable - YES / NO
f) wattage
g) operationalStatus - inservice, abandoned, etc.
h) panelType
i) sdsFeatureName
j) sdsFeatureDescription
k) wattage - Total per unit
l) hasInverter - YES / NO
m) isPartOfElectricalNetwork - YES / NO
n) photovoltaicPanelInstallation

CLJN.CL.AlternativeEnergyArea
Locations used for the production of alternative energy sources

a) operationalStatus - inservice, abandoned, etc.
b) isPortable - YES / NO
c) panelType
d) wattage - total for area
e) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
f) contractNumber
g) sdsFeatureName - Facility Number
h) hasInverter - YES / NO
i) isPartOfElectricalNetwork - YES / NO

CLJN.CL.BoatRamp
A partially submerged hard surfaced structure on a shoreline for launching or retrieving vessels or vehicles

a) boatRampIDPK - Facility Number
b) dateConstructed
c) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
d) contractNumber
e) sdsFeatureName
f) sdsFeatureDescription - Location
g) numberofLaunchLanes

CLJN.CL.Bridge
A structure used by vehicles that allows passage over or under an obstacle such as a river, chasm, mountain, road or railroad

a) isFixed - YES / NO
b) TransportationSystemType - Pedestrian, Road, Railway, etc.

c) FacilityNumber
d) verticalConstructionMaterial - Brick, Concrete, etc.
e) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
f) contractNumber
g) sdsFeatureDescription - Road Name if applicable
h) OperationalStatus - closed, operational, etc.

CLJN.CL.Building
A roofed, floored and walled structure that is completely enclosed

a) facilityNumber
b) builtDate
c) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
d) contractNumber
e) sdsFeatureDescription - General Description of Building's Purpose
f) floorCount
g) material - Exterior material such as Brick, Concrete, etc.
h) operationalStatus - inService, abandoned, etc.

CLJN.CL.BuildingFloorPlan
A linear representation of floor plans for buildings, provided in one feature per floor

a) buildingFloorLevel
b) buildingIDFK - Structure Number
c) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
d) contractNumber
e) sdsFeatureDescription Renovation Date

CLJN.CL.Disposal_RealProperty
Real property demolished structures

a) sdsFeatureDescription
b) sdsFeatureName
c) facilityNumber
d) contractNumber
e) disposalDate

CLJN.CL.DocksAndWharfs
A manmade water-land interface structure often for access to boats or ships

a) PurposeType - Fishing, Mooring, etc.
b) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
c) contractNumber
d) Facility Number - Structure Number
e) sdsFeatureDescription - Pier, boat ramp, dock, etc.
f) natureOfConstruction - concrete, earthen, steel

CLJN.CL.Fence
A freestanding structure designed to restrict or prevent movement across a boundary

a) facilityIDFK - Structure Number
b) fenceType - metal, wood, etc.
c) fenceUse - agriculture, boundary, etc.
d) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
e) contractNumber
f) sdsFeatureName - Fence or Gate
g) sdsFeatureDescription

CLJN.CL.Marina
Any facility or area for the exchange of people or materials from land to water such as a port, harbor, marina, launch area or small craft facility

a) marinaIDPK - Structure Number
b) marinaType
c) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
d) contractNumber
e) sdsFeatureName
f) createdDate - Construction Date
g) categoryOfCraftFacility - boat launch or landed, etc.

CLJN.CL.NavigationalAid
A visual or electronic device, on the ground or airborne, which provides point-to-point guidance information or position data to aircraft in flight

a) navigationalAidIDPK - Structure Number
b) navaidType - TACAN, Radar station, Beacon, etc.
c) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
d) contractNumber
e) sdsFeatureName - Type of navigational aid

CLJN.CL.PavementSectionAirfield
A pavement section is a portion of a pavement branch that differs in some aspect from other sections such that further segmentation is required to uniquely identify that section)

a) pavementSectionType - apron, roadway, etc.
b) isLighted - YES / NO
c) operationalStatus - inService, abandoned, etc.
d) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
e) builtDate
f) contractNumber
g) runwayClassification - class A, class B, rotatory, etc.
h) sdsFeatureName
i) sdsFeatureDescription - MCBCL, MCASNR, Geiger, Stone Bay, etc.

CLJN.CL.PavementSectionParkingArea
A vehicle parking area is an area used for parking vehicles not including residential streets and driveways.

a) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
b) operationalStatus - inService, abandoned, etc.

c) pavementSectionType - parking, slab, driveway, etc.
d) sdsFeatureDescription - Dumpster, Driveway, Transformer, Parking, etc.
e) sdsFeatureName - Pad, Slab, Parking, etc.
f) facilityNumber
g) builtDate
h) contractNumber
i) isLighted

CLJN.CL.PavementSectionRoadway
The surface area that comprise a road area, upon which vehicles drive and park.

a) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
b) operationalStatus - inService, abandoned, etc.
c) pavementSectionType - curb, roadway, etc.
d) facCode - Surfaced or Unsurfaced
e) divided - Yes / No
f) featureCode
g) oneWay - Yes / No
h) routeSurfaceComposition - concrete, asphalt, etc.
i) builtDate
j) contractNumber
k) isLighted - Yes / No
l) isTankTrail - Yes / No

CLJN.CL.PavementSectionSidewalk
The paved pedestrian walkway prepared to facilitate travel on foot. It may or may not be adjacent to a street/road.

a) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
b) operationalStatus - inService, abandoned, etc.
c) pavementSectionType - Sidewalks
d) sdsFeatureDescription - Named Area
e) routeSurfaceComposition - Concrete, Asphalt, etc.
f) builtDate
g) contractNumber
h) installationCode - M67001
i) isLighted - Yes / No

CLJN.CL.RailTrack
A track is the main designation for describing a physical linear portion of the network

a) contractNumber
b) facilityNumber
c) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
d) NetworkSubtype - railroadTrack, craneTrack
e) operationalStatus - inservice, abandoned, etc.
f) sdsFeatureName - Start & finish Points
g) sdsFeatureDescription - Provide Street Name Cross cover

CLJN.CL.RecreationArea

An area defined for recreational purposes

a) facilityNumber
b) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
c) contractNumber
d) sdsFeatureName - Type of recreation field
e) sdsFeatureDescription - Type of recreation feature
f) areaType - biking, boating, picnic, Hunting, etc.

CLJN.CL.RecreationTrail
A location providing physical activities which are mentally relaxing, such as running/walking, biking, or hiking

a) recreationTrailIDPK - Facility or Structure Number
b) trailType - Multi-use, horse riding, etc.
c) isPaved - YES / NO
d) dateConstructed
e) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
f) contractNumber
g) sdsFeatureName - Trail Name
h) sdsFeatureDescription - Area, Location or parallel street

CLJN.CL.StructureArea
A facility classified as other than a building or linear asset

a) facilityNumber - Structure Number
b) builtDate
c) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
d) contractNumber
e) sdsFeatureName - Name of structure according to contract
f) sdsFeatureDescription - Description of item
g) heightAboveSurfaceLevel
h) heightAboveSurfaceLevelUOM - foot, inch, meter, etc.

CLJN.CL.StructurePoint
Example: Flag poles; Point of Information Signs (POI) etc

a) facilityNumber - Structure Number
b) builtDate
c) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
d) contractNumber
e) sdsFeatureName - POI, Sign, Flagpole, bleacher, etc.
f) sdsFeatureDescription - Specific type of feature

CLJN.CL.Tower
A vertical projection, higher than its diameter, generally used for observation, storage, or electronic transmission

a) towerUseType - communication, observation, etc.
b) heightMax
c) heightUOM - foot, inch, meter, etc.
d) contractNumber
e) towerType - Observation Tower, Guard Tower, etc.

f) facilityNumber - Structure number
g) sdsFeatureDescription
h) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
i) towerMaterial - wood, concrete, steel, etc.

CLJN.CL.TrafficControlLight
A feature used to represent traffic lights

a) contractNumber
b) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
c) sdsFeatureName - Traffic Control Light, Traffic Signal control box, etc.
d) sdsFeatureDescription - Location such as streets that intersect

CLJN.CL.Wall
A linear feature used for separation of facilities, ornamental decoration, or structural reinforcement (retaining wall

a) wallType - brick, timber, stone, concrete, etc.
b) wallHeight
c) wallHeightUOM - foot, inch, meter, etc.
d) dateConstructed
e) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
f) contractNumber
g) sdsFeatureName
h) sdsFeatureDescription - Dumpster enclosure, Utility Enclosure, Blast Protection, etc.

1.4.4 **CLJN.CL.REAL_PROPERTY_RESTRICTED**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System (GPS) and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.Well
A shaft dug or drilled into the Earth for the purpose of extracting fluids from the subsurface, collecting environmental samples, injecting fluids into the subsurface or extracting contamination or other impurities from the subsurface

a) facilityNumber - Structure Number
b) wellPurpose - extraction, injection, etc.
c) wellResource - WATER
d) operationalStatus - inservice, abandoned, etc.
e) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
f) contractNumber
g) sdsFeatureName - potable or nonpotable
h) sdsFeatureDescription - operational status source

i) ProjectID - Name of Plant this well services
j) wellType - artesian, drilled, etc.
k) operationalStatus - inservice, abandoned, removed, etc

1.4.5 **CLJN.CL.COMMUNICATIONS_RESTRICTED**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System GPS and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.CommCartographicFeatureArea
Graphic features that aid in visually associating CommAnnotation features to the appropriate communication infrastructure feature.

a) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
b) sdsFeatureName
c) sdsFeatureDescription
d) commProjectName - Contract Number
e) operationalStatus - In service, Removed, Abandon in Place, etc.

CLJN.CL.CommCartographicFeatureLine
Graphic features that aid in visually associating CommAnnotation features to the appropriate communication infrastructure feature.

a) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
b) sdsFeatureName
c) sdsFeatureDescription
d) commProjectName - Contract Number
e) operationalStatus - In service, Removed, Abandon in Place, etc.

CLJN.CL.CommCartographicFeaturePoint
Graphic features that aid in visually associating CommAnnotation features to the appropriate communication infrastructure feature.

a) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
b) sdsFeatureName
c) sdsFeatureDescription
d) commProjectName - Contract Number
e) operationalStatus - In service, Removed, Abandon in Place, etc.

CLJN.CL.CommUtilityNode
A subdivision of a communications network, particularly an asset that participates in the transmission of a signal but that is not a cable.

a) commUtilityNodeIDPK - Structure Number
b) commNodeType - connection or two or more sheaths, Devise Used to detect & measure various environmental conditions,

Devise converts electrical signal in to sound, etc.
c) operatingSpectrum
d) transmissionPower
e) powerUOM
f) operationalStatus - In service, Removed, Abandon in Place, etc.
g) commProjectName - Contract Number
h) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
i) sdsFeatureName - MNS - Big Voice, MNS - Little Voice, MSN - Control Station, etc.
j) sdsFeatureDescription - MNS - Big Voice, Field Antenna, Antenna Communication, etc.

CLJN.CL.CommUtilitySegment
A subdivision of a communications network, particularly a cable for the transmission of a signal.

a) cableMaterial - Fiber Optical, PB, CU, Steel, ABS, etc.
b) cableSheathing - PE, XLPE, Cross Ply, etc.
c) availableFibers -
d) usedFibers
e) numberOfMultiModeFibers
f) numberOfPairs
g) numberOfSingleModeFibers
h) installationTypeCode - Underground, above ground, etc.
i) operationalStatus - In service, Removed, Abandon in Place, etc.
j) cableInstaller -
k) cableRoute -
l) cableCount -
m) numberOfStrands -
n) wireGauge -
o) commProjectName - Contract Number
p) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
q) sdsFeatureName - Non-direct Buried Lines, Direct Buried Lines, etc.
r) sdsFeatureDescription - communications line, etc.

CLJN.CL.UtilityFeature_cDuctBank
One or more ducts routed in parallel between two nodes.

a) networkType - A network used for the transmission of a signal.
b) networkSubType - The communication network subtype.
c) utilityFeatureType - One or more ducts routed in parallel between two nodes. (L), etc.
d) diameter
e) diameterUOM - Inches, Feet, meters, etc.
f) ductDepth
g) ductDepthUOM - Inches, Feet, meters, etc.
h) interDuctDiameter
i) interDuctDiameterUOM - Inches, Feet, meters, etc.
j) isEncased - Yes or No
k) numberOfDucts
l) numberOfInserts
m) operationalStatus - In service, Removed, Abandon in Place, etc.

n) commProjectName - Contract Number
o) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.

CLJN.CL.UtilityFeature_cManhole
An enclosed structure (manhole, or handhole)

a) utilityFeatureIDPK - MH Number - See project Manager
b) networkType - Network used for transmission of signal,
c) networkSubType - Communication network subtype
d) utilityFeatureType - Manhole, hand hole, etc.
e) cManholeType - T, R2A, L, j4, JC9C, etc.
f) cManholeMaterial - steel, plastic, aluminum, fiberglass, etc.
g) isHandhole - Yes or No
h) widthValue
i) widthUOM - Inches, Feet, meters, etc.
j) lengthValue
k) lengthUOM - Inches, Feet, meters, etc.
l) heightValue
m) heightUOM - Inches, Feet, meters, etc.
n) diameter
o) diameterUOM - Inches, Feet, meters, etc.
p) cManholeDepth
q) cManholeDepthUOM - Inches, Feet, meters, etc.
r) operationalStatus - In service, Removed, Abandon in Place, etc.
s) commProjectName - Contract Number
t) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.

CLJN.CL.UtilityFeature_cPedestal
An above-ground enclosed structure that provides access to buried plant and a place to house splices, terminals, etc.

a) networkType - A network used for the transmission of a signal.
b) networkSubType - The communication network subtype.
c) utilityFeatureType - above-ground enclosed structure that provides access to buried plant and a place to house splices, terminal, etc.
d) pedestalType - rectangular box type, etc.
e) operationalStatus - In service, Removed, Abandon in Place, etc.
f) commProjectName - Add Contract Number
g) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
h) sdsFeatureDescription

CLJN.CL.UtilityFeature_cVault
An enclosed structure in a facility used for cable entrance.

a) utilityFeatureType
b) networkType - A network used for the transmission of a signal.
c) networkSubType - The communication network subtype.
d) heightValue
e) heightUOM - Inches, Feet, meters, etc.
f) widthValue
g) widthUOM - Inches, Feet, meters, etc.

h) vaultDepth
i) vaultDepthUOM - Inches, Feet, meters, etc.
j) diameter
k) diameterUOM - Inches, Feet, meters, etc.
l) operationalStatus - In service, Removed, Abandon in Place, etc.
m) commProjectName - Contract Number
n) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
o) sdsFeatureDescription

1.4.6 **CLJN.CL.UTILITIES_ELECTRICAL**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System (GPS) and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.ElecUtilNode_eExteriorLight
Exterior lighting is supplied by local distribution systems and is generally the only service for which the electric utility installs, operates and maintains utilization equipment

a) electricalUtilityNodeIDPK
b) exteriorLightType - streetLight, parkingLotLight, etc.
c) electricalNodeType - eExteriorLight
d) operationalStatus - inservice, abandoned, etc.
e) bulbType LED, INCA, etc.
f) circuitID - This available from CM or PM
g) hasSensor - YES / NO
h) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
i) contractNumber
j) dateInService
k) sdsFeatureName
l) Voltage
m) Wattage

CLJN.CL.ElecUtilNode_eGenerator
Generator is a power source for providing electricity. Generators may be primary or standby power sources

a) FacilityNumber - structure number
b) electricalNodeType - eGenerator
c) operationalStatus - inservice, abandoned, etc.
d) voltage
e) kvaRate
f) circuitID - List is available from CM or PM
g) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
h) contractNumber
i) dateInService
j) sdsFeatureName - Manufacturer
k) generatorType - Primary, backup, emergency, etc.

CLJN.CL.ElecUtilNode_eMeterPoint
A electrical meter point represents the location of the metering device

a) electricalNodeType - Description
b) operationalStatus - inservice, abandoned, etc.
c) circuitID - List is available from CM or PM
d) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
e) contractNumber
f) dateInService
g) sdsFeatureName
h) sdsFeatureDescription -
i) mountingType
j) utilityOwner
k) voltage - 208Y-120V, 480Y-277V, etc.

CLJN.CL.ElecUtilNode_eSwitch
Electrical Switches are installed at strategic locations throughout distribution feeder circuits

a) electricalNodeType
b) switchPosition - closed, open, etc.
c) operationalStatus - inservice, abandoned, etc.
d) electricalSwitchType - switches
e) circuitID - List is available from CM or PM
f) numberOfPhases single, three, two
g) switchPosition - Open, closed, etc.
h) voltage - 208Y-120V, 480Y-277V, etc.
i) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
j) contractNumber

CLJN.CL.ElecUtilNode_eTransformer
The Transformer feature class captures information about distribution and power transformers

a) electricalNodeType - Transformer
b) transformerType - stepdown, step up, etc.
c) mountingType - pool or pad
d) numberOfPhases - 1, 2, 3, etc.
e) primaryVoltage - 208Y-120V, 480Y-277V, etc.
f) secondaryVoltage - 208Y-120V, 480Y-277V, etc.
g) totalKVA
h) circuitID - List is available from CM or PM
i) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
j) contractNumber
k) sdsFeatureName - Manufacturer
l) operationalStatus - inservice, abandoned, etc.

CLJN.CL.ElecUtilNode_eVoltageRegulator
Voltage regulators vary the ac supply or source voltage to the customer to maintain the voltage within desired limits

a) electricalNodeType - VoltageRegulator
b) operationalStatus - inservice, abandoned, etc.
c) primaryVoltage - 208Y-120V, 480Y-277V, etc.
d) secondaryVoltage - 208Y-120V, 480Y-277V, etc.

e) numberOfPhases - 1, 2, 3,
f) circuitID - This available from CM or PM
g) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
h) contractNumber

CLJN.CL.UtilFeat_eSupportStructure
A structure that supports electric devices

a) utilityFeatureType - Utility, Guy, Poles, etc.
b) networkType - electrical
c) heightValue -
d) heightUOM - foot, inch, meter, etc.
e) utilityOwner
f) operationalStatus - inservice, abandoned, etc.
g) cableCircuitName - List is available from CM or PM
h) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
i) contractNumber
j) sdsFeatureName - Utility Pole, etc
k) sdsFeatureDescription - Number of circuits attached to pole

CLJN.CL.UtilFeat_eUndergroundStructure
Underground Structure is a simple junction feature that includes vaults and manholes that house and protect electrical equipment

a) utilityFeatureIDPK - Structure Number
b) utilityFeatureType - Underground, surface structure, etc
c) networkType - electrical
d) operationalStatus - inservice, abandoned, etc.
e) electricalJunctionType - Manhole, Junction Box, Handhole, etc.
f) numberOfCables -
g) rimElevation -
h) rimElevationUOM - foot, inch, meter, etc.
i) cableCircuitName - List is available from CM or PM
j) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
k) contractNumber

CLJN.CL.ElecUtilSegment
A subdivision of an electrical distribution network, particularly a line for the transmission of electricity

a) electricalSegmentType - OH Primary, UG Primary, OH Secondary, UG Secondary, etc.
b) cableMaterial - AL, copper, etc.
c) location - aboveground, underground, etc.
e) voltage - 208Y-120V, 480Y-277V, etc.
f) utilityOwner -
g) operationalStatus - inservice, abandoned, etc.
h) insulationMaterial - polyCross, none, etc.
i) conductorSize -
j) neutralSize -
k) numberOfConduct -
l) numberOfNeutral -
m) numberOfPhases - 1, 2, 3, etc.
n) circuitID - List is available from CM or PM
o) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.

p) contractNumber -
q) dateInService -
r) sdsFeatureName - Electrical Distribution, exterior lighting, etc.
s) sdsFeatureDescription - Armless mount, cross arm, etc.

CLJN.CL.UtilFeat_eElecFacilitySite
Polygon feature class to define boundaries of electrical facility stations

a) utilityFeatureType - Electrical Facility station
b) operationalStatus - inservice, abandoned, etc.
c) numberOfCircuits
d) numberOfSpareBays
e) numberOfTransformers
f) voltageIn - 208Y-120V, 480Y-277V, etc.
g) utilityOwner
h) gisFeatureCollectionMethod - - CAD, Survey Grade GPS, etc.
i) contractNumber
j) equipmentInstallationDate
k) sdsFeatureDescription - Location of substation
l) facilityIDFK - structure number

1.4.7 **CLJN.CL.UTILITIES_POL**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System GPS and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.POLUtilNode_oDispenser
A fuel dispenser is a machine at a fueling station that is used to pump fuel into vehicles or AGE equipment

a) polNodeType - Fuel dispenser
b) networkSubType - automotive_diesel, jpts, etc.
c) operationalStatus - inservice, abandoned, etc.
d) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
e) contractNumber
f) dateInService
g) sdsFeatureName - Fuel Dispenser
h) sdsFeatureDescription - Type of fuel, unleaded, ethanol, diesel, etc.

CLJN.CL.UtilFeat_oPumpingFacility
A structure, typically a building, containing pumps, filters, and controls as part of a larger fuel handling system

a) utilityFeatureIDPK
b) utilityFeatureType - off-loading pumping facility
c) networkSubType automotive_diesel, jpts, etc.
d) operationalStatus - inservice, abandoned, etc.
e) gisFeatureCollectionMethod - - CAD, Survey Grade GPS, etc.

f) contractNumber
g) equipmentInstallationDate
h) sdsFeatureDescription -

1.4.8 **CLJN.CL.UTILITIES_STORMWATER**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System GPS and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.Impoundment_Stormwater
An accumulation of storm water that is impounded by a dam or weir

a) permitID - Permit Number
b) impoundmentType - minimumPool, topOfFloodControl, etc.
c) waterSurfaceElevation
d) waterSurfaceElevationUOM - foot, inch, meter, etc.
e) dateConstructed
f) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
g) contractNumber
h) operationalStatus - inservice, abandoned, etc.
i) stormwaterTreatmentType - Infiltration Basin, Constructed Wetlands, etc.
j) utilityOwner

CLJN.CL.StormwaterUtilityNode_swInlet
The location at which stormwater is collected/received into the stormwater network

a) stormwaterUtilityNodeIDPK - Structure ID
b) stormwaterNodeType - swInlet description
c) networkSubType - stormWater
d) stormwaterInletType - Inlet, Headwall, etc.
e) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
f) contractNumber
g) equipmentInstallationDate
h) sdsFeatureDescription -
i) operationalStatus inservice, abandoned, etc.

CLJN.CL.StormwaterUtilitySegment
A subdivision of a stormwater network, particularly a pipeline or drainage ditch for the transport of stormwater, between the source, holding facilities, and/or treatment facilities

a) diameter
b) diameterUOM - inch
c) pipeMaterial - cement, plastic, etc.
d) isLined - YES / NO
e) downstreamInvertElevation
f) upstreamInvertElevation
g) gisFeatureCollectionMethod - - CAD, Survey Grade GPS, etc.

h) contractNumber
i) equipmentInstallationDate
j) sdsFeatureName - Stormwater pipe, Open Ditch, etc.
k) sdsFeatureDescription
l) operationalStatus - inservice, abandoned, etc.
m) stormwaterPipeStyle
n) stormwaterSegmentType - open ditch, closed under other feature type, etc.

CLJN.CL.StorUtilNode_swManhole
A storm water manhole is an underground concrete structure with a top opening used for collecting and routing storm water runoff through underground pipes

a) stormwaterNodeType
b) stormwaterUtilityNodeIDPK - Structure Number
c) numberOfPipes
d) operationalStatus - inservice, abandoned, etc.
e) stormwaterBasinIDFK - Basin id
f) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
g) contractNumber
h) equipmentInstallationDate
i) sdsFeatureName
j) sdsFeatureDescription

1.4.9 **CLJN.CL.UTILITIES_THERMAL**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System GPS and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.GeothermalWell
A geothermal well is part of a central heating and/or cooling system that pumps heat to or from the ground

a) geothermalWellIDPK - Well ID
b) pipeMaterial - AL, stainless_steel, etc.
c) geothermalWellCasingMaterial
d) thermalInsulationMaterial - MINERAL_FIBER, ARMAFLEX, etc.
e) geothermalWellDepth
f) geothermalWellDepthUOM - foot, inch, meter, etc.
g) downholePipeDiameter
h) downholePipeDiameterUOM - foot, inch, meter, etc.
i) hasBentoniteSeal - YES / NO
j) hasPump - YES / NO
k) operationalStatus - inservice, abandoned, etc.
l) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
m) contractNumber
n) designDrawingNumber
o) equipmentInstallationDate
p) sdsFeatureDescription - Associated Building Number
q) geothermalPipeType

r) xLocation
s) xLocationUOM - foot, inch, meter, etc.
t) yLocation
u) yLocationUOM - foot, inch, meter, etc.

CLJN.CL.TherUtilNode
The Thermal Fitting Type bend, cap, tee, etc. subclass represents the joint between two lines

a) thermalUtilityNodeIDPK
b) thermalNodeType - tFittingType bend, cap, tee, etc.
c) diameter
d) diameterUOM - foot, inch, meter, etc.
e) operationalStatus - inservice, abandoned, etc.
f) fittingType - bend, cap, tee, etc.
g) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
h) contractNumber
i) dateInService
j) sdsFeatureName
k) sdsFeatureDescription
l) depth
m) depthUOM - foot, inch, meter, etc.
n) facilityNumber
o) fittingType - bend, cap, tee, etc.
p) projectID
q) utilityOwner

CLJN.CL.TherUtilSegment
A subdivision of a thermal distribution network, particularly a pipeline for the transmission of chilled water, refrigerant, hot water, or steam

a) thermalSegmentType - tMainLine, tServiceLine
b) networkSubType
c) operationalStatus - inservice, abandoned, etc.
d) material - AL, stainless_steel, etc.
e) pipeLocation - aboveground, underground, etc.
f) diameter
g) diameterUOM - foot, inch, meter, etc.
h) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
i) contractNumber
j) dateInService
k) sdsFeatureName
l) sdsFeatureDescription
m) cathodicProtection - YES / NO
n) depth
o) depthUOM - foot, inch, meter, etc.
p) facilityNumber
q) pipeType - circular, box, etc.
r) projectID
s) utilityOwner

CLJN.CL.TherUtilNode_tProdStruc
Thermal production structures are facilities which produce steam, high-temperature water, low-temperature water, dual-temperature water or chilled water

a) thermalNodeType - facility which produce steam, etc.
b) Capacity
c) CapacityUOM - foot, inch, meter, etc.
d) operationalStatus - inservice, abandoned, etc.
e) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
f) contractNumber
g) dateInService
h) sdsFeatureName
i) sdsFeatureDescription
j) facilityNumber
k) utilityOwner

CLJN.CL.TherUtilNode_tSystemValve
A thermal system valve is a device installed in a pipeline to isolate flow

a) thermalNodeType
b) systemValveType - gate, ball, etc.
c) diameter
d) diameterUOM - foot, inch, meter, etc.
e) operationalStatus - inservice, abandoned, etc.
f) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
g) contractNumber
h) dateInService
i) depth
j) depthUOM - foot, inch, meter, etc.
k) utilityOwner
l) valveMaterial - AL, stainless_steel, etc.

CLJN.CL.UtilFeat_tUGEnclosureAccess
A point feature class for locating the access point to a thermal manhole junction

a) utilityFeatureType - SCADA, UGEnclosureAccess point, etc.
b) networkSubType - steamSupply, steamReturn, etc.
c) networktype -
d) operationalStatus - inservice, abandoned, etc.
e) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
f) contractNumber
g) diameter
h) diameterUOM - inch, feet, meter, etc.
i) sdsFeatureName - steam pit, etc.

1.4.10 **CLJN.CL.UTILITIES_WASTEWATER**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System GPS and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.UtilFeat_sPretreatmentDevice

A wastewater pretreatment device is a piece of equipment that removes contaminants before they enter the waste system, etc.

a) utilityFeatureIDPK - Structure Number
b) utilityFeatureType - Pretreatment Device see existing data
c) operationalStatus - inservice, abandoned, etc.
d) pretreatmentDeviceType - OWS, Trap, etc.
e) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
f) contractNumber
g) equipmentInstallationDate
h) sdsFeatureDescription - detailed description

CLJN.CL.UtilityFeature_sPumpStation
This is a collection of waste water Pump Station is a facility, which indications total capacity for the station

a) utilityFeatureIDPK - Structure Number
b) utilityFeaturetype - Pump station, etc.
c) networkType - wastewater network subtype….
d) numberOfPumps -
e) totalDesignCapacity -
f) designCapacityUOM -
g) totalRatedFlow
h) ratedFlowUOM - GPM, CF_SEC, etc.
i) operationalStatus - inservice, abandoned, etc.
j) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
k) contractNumber
l) equipmentInstallationDate
m) sdsFeatureName
n) sdsFeatureDescription

CLJN.CL.UtilityFeature_sSCADASensor
The SCADA sensor is a feature that is used to remotely measure the status of network components

a) utilityFeatureIDPK - Structure Number
b) utilityFeatureType - SCADA
c) networkType - wastewater
d) operationalStatus - inservice, abandoned, etc.
e) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
f) contractNumber
g) equipmentInstallationDate
h) sdsFeatureName
i) sdsFeatureDescription - Antenna Radio to Location

CLJN.CL.UtilityFeature_sSepticTank
A wastewater septic tank is a small-scale anaerobic digester and leach field designed to treat wastewater from an individual facility, and is not connected to the wastewater collection system

a) utilityFeatureIDPK - Structure Number
b) utilityFeatureType - septic tank
c) storageTankProduct - domestic wastewater
d) volume
e) volumeUOM - usGallon, cubicMeter, etc.
f) isRegulated - YES / NO

g) operationalStatus - inservice, abandoned, etc.
h) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
i) contractNumber
j) equipmentInstallationDate
k) sdsFeatureName - Septic Tank
l) sdsFeatureDescription - Location area name

CLJN.CL.WastUtilNode_sCleanOut
A clean out is an access point in a lateral used for maintenance purposes

a) wastewaterNodeType - Cleanout
b) material - PVC, etc.
c) diameter
d) diameterUOM - inch, meter, etc.
e) operationalStatus - inservice, abandoned, etc.
f) mediaID - GIS Collection Method - - CAD, Survey Grade GPS, etc.
g) contractNumber
h) utilityOwner

CLJN.CL.WastUtilNode_sFitting
The wastewater fitting that represents the join between two lines

a) fittingType - Bend, Cap, Tee, etc.
b) sdsFeatureDescription - Ben, Cap, Tee, Wye, etc.
c) diameter
d) diameterUOM - foot, inch, meter, etc.
e) operationalStatus - inservice, abandoned, etc.
f) material - PVC, precast, stainless steel, etc.
g) mediaID - GIS Collection Method - - CAD, Survey Grade GPS, etc.
h) contractNumber
i) fittingType - bend, cap, tee, etc.
j) utilityOwner

CLJN.CL.WastUtilNode_sManhole
The wastewater manhole represents an access point between two or more lines

a) wastewaterNodeType - sManhole
b) operationalStatus - inservice, abandoned, etc.
c) numberOfPipes
d) pipeMaterial - precast brick, etc.
e) diameter
f) diameterUOM - inch, etc.
g) rimElevation
h) rimElevationUOM - foot, inch, meter, etc.
i) mediaID - GIS Collection Method - - CAD, Survey Grade GPS, etc.
j) contractNumber
k) dateInService
l) sdsFeatureName - Manhole, Valve box, etc.
m) manholeMaterial - precast brick, etc.
n) utilityOwner

CLJN.CL.WastUtilNode_sPump
A wastewater pump is a piece of equipment that adds energy to a fluid being conveyed through a pipe or other closed conduit

a) facilityNumber
b) numberOfPumps
c) operationalStatus - inservice, abandoned, etc.
d) wastewaterNodeType - sPump
e) ratedFlow
f) ratedFlowUOM - GPM, CF_SEC, etc.
g) pumpHorsepower
h) contractNumber
i) dateInService
j) mediaID - GIS Collection Method - - CAD, Survey Grade GPS, etc.
k) sdsFeatureName - Wastwater Pump, Lift Station, etc.
l) utilityOwner

CLJN.CL.WastUtilNode_sSystemValve
A system valve is a facility that is fitted to a pipeline or orifice in which the closure member is either rotated or moved transversely or longitudinally in the waterway so as to control or stop the flow

a) wastewaterNodeType - sSystemValve
b) valveMaterial - stainless_steel, etc.
c) diameter
d) diameterUOM - inch, meter, etc.
e) operationalStatus - inservice, abandoned, etc.
f) valveType - gate, butterfly, check, etc.
g) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
h) contractNumber
i) dateInService
j) utilityOwner

CLJN.CL.WastUtilNode_sTreatmentPlant
A facility designed to treat wastewater using physical, chemical and/or biological processes prior to discharge into receiving waters

a) wastewaterNodeType - facility designed to treat wastewater
b) Capacity
c) CapacityUOM - gallons, meter, etc.
d) ContractNumber
e) operationalStatus - inservice, abandoned, etc.
f) facilityNumber - Structure Number
g) mediaID - GIS Collection Method - - CAD, Survey Grade GPS, etc.
h) dateInService
i) sdsFeatureName

CLJN.CL.WastUtilSegment
Wastewater Line - A pipeline for the transport of sewage or industrial waste between the source, holding facilities, and/or treatment facilities

a) wastewaterSegmentType - Gravity, Force Main, Service etc.
b) utilityOwner - CLJN / ONWASA
c) operationalStatus - inservice, abandoned, etc.
d) pipeMaterial - PVC, VC, etc.
e) isLined - YES / NO
f) diameter
g) diameterUOM -foot, inch, meter, etc.
h) mediaID - GIS Collection Method - - CAD, Survey Grade GPS, etc.
i) contractNumber
j) dateInService
k) sdsFeatureName -
l) invertElevationDownstream
m) invertElevationUpstream
n) invertElevationUOM - foot, inch, meter, etc.
o) slope

1.4.11 **CLJN.CL.UTILITIES_WATER**

GPS and collect attribute data as specified for each feature listed with GPS accuracy as described in paragraph "Global Positioning System (GPS) and Spatial Reference Properties." Attribute fields may be associated with Domains, which are utilized to constrain the values allowed in a particular field, attribute table or feature class. Domains must be utilized when populating the feature where required.

GPS and collect the following attributes:

CLJN.CL.UtilFeat_wUGEnclosureAccess
A point feature class for locating the access point to a water manhole junction

a) utilityFeatureIDPK - Manhole Number
b) numberOfPipes
c) groundElevation
d) elevationUOM - inch, foot, meter, etc.
e) operationalStatus - inservice, abandoned, etc.
f) gisFeatureCollectionMethod - CAD, Survey Grade GPS, etc.
g) contractNumber
h) equipmentInstallationDate
i) sdsFeatureName - Manhole
j) utilityFeatureType - wUGEnclosureAccess
k) waterServiceAreaIDFK - Holcomb, Hadnot Pt, Onslow Beach, etc.

CLJN.CL.WaterUtilNode_wFittingType bend, cap, tee, etc.
The water fitting class represents the joint between two lines in the water network

a) waterNodeType - fitting class represents transition between two lines
b) diameter -
c) diameterUOM - inch, meter, etc.
d) operationalStatus -inservice, abandoned, etc.
e) fittingType - reducer, bend, cap, tee, etc.
f) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
g) contractNumber
h) dateInServicen

CLJN.CL.WaterUtiNode_wHydrant
A water distribution point that enables fire fighters to attach fire hoses

a) waterNodeType - wHydrant
b) networkSubType - fireProtectionwater
c) operationalStatus - inservice, abandoned, etc.
d) connectionType - fireconnect, firehydrant
e) facilityNumber - Structure number if connection is to structure
f) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
g) contractNumber
h) dateInService

CLJN.CL.WaterUtilNode_wMeterPoint
A water meter point represents the location of the metering device

a) waterNodeType - meterPoint
b) operationalStatus - inservice, abandoned, etc.
c) projectID - area name
d) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
e) contractNumber
f) diameter
g) diameterUOM - foot, inch, meter, etc.
h) dateInService

CLJN.CL.WateUtilNode_wReliefValve
A valve used to relieve pressure

a) operationalStatus
b) sdsFeatureDescription
c) sdsFeatureName - Air Release Valve
d) contractNumber
e) dateInService
f) diameter
g) diameterUOM
h) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
i) projectID
j) utilityOwner

CLJN.CL.WaterUtilNode_wSystemValve
A valve used to regulate pressure, isolate, throttle flow, prevent backflow

a) waterNodeType - wSystemValve
b) diameter
c) diameterUOM - foot, inch, meter, etc.
d) operationalStatus - inservice, abandoned, etc.
e) valveType - gate, ball, etc.
f) projectID - MCASNR, MCBCLJN, Geiger, etc
g) mediaID - GIS Collection Method -- CAD, Survey Grade GPS, etc.
h) contractNumber
i) dateInService

j) valveType - Gate Valve, Post Indicator Valve, etc.

CLJN.CL.WaterUtilSegment
A subdivision of a water distribution network, particularly a distribution pipeline

a) networkSubType - potable water, raw water, Service, Fire etc.
b) material - PVC, Ductile Iron, Cement, etc,
c) diameter
d) diameterUOM - inch
e) utilityOwner - MBCCLJN, Onwasa, etc.
f) operationalStatus -inservice, abandoned, etc.
g) projectID
h) mediaID - GIS Collection Method /- CAD, Survey Grade GPS, etc.
i) contractNumber
j) dateInService
k) sdsFeatureName - Main, Service, Fire, AIP, Raw, etc.
l) invertElevationDownstream
m) invertElevationUpstream

CLJN.CL.WateUtilNode_wProdStructure
Water production structures are facilities which produce raw or treated water

a) waterNodeType - produce treated water, etc.
b) facilityNumber - Structure Number
c) capacity
d) capacityUOM - gallons per day, etc
e) operationalStatus - inservice, abandoned, etc.
f) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.
g) contractNumber
h) dateInService
i) sdsFeatureName - Water Treatment Plant, Location
j) sdsFeatureDescription - Describe Plant purpose

CLJN.CL.WateUtilNode_wStorageStructure
Water storage structures are facilities that store large volumes of water - Water Tank)

a) facilityNumber - structure number
b) waterNodeType - water Storage Structure
c) storageTankProduct - treatedWater, rawWater, etc.
d) volume
e) volumeUOM - gallons, etc.
f) tankType - Elevated, Under Ground, Above Ground, etc.
g) operationalStatus - inservice, abandoned, etc.
h) width
i) widthUOM - foot, etc.
j) groundElevation
k) invertElevation
l) overflowElevation
m) surfaceElevation
n) elevationUOM - foot, etc.
o) projectID - Named Area of Location, Hadnot Point, etc.
p) mediaID - GIS Collection Method - CAD, Survey Grade GPS, etc.

q) contractNumber
r) dateInService
s) storageTypeProduct - Raw water or Potable Water

1.4.12 Non-Compliance

Failure to follow the specification outlined in this document will result in non-acceptance of data deliverable.

Note: Geospatial data delivery does not replace record drawing requirements.

PART 2 PRODUCTS

Not Used.

PART 3 EXECUTION

Not Used.

-- End of Section --

2019-99-99b-UFGS 01 91 00.15 22 - Total Building Commissioning SEC Rev00
SECTION 01 91 00.15 22

TOTAL BUILDING COMMISSIONING FOR PROJECT P-1512
11/19

PART 1 GENERAL

1.1 SUMMARY

The Government has employed an independent Commissioning Firm that has employed or has contracted Lead and Technical Commissioning Specialists. This Section specifies the commissioning scope of work for the entire Commissioning Team

Commissioning responsibilities assigned in this Section to Lead and Technical Commissioning Specialists are for informational purposes.

1.2 COMMISSIONING LIMITATIONS

Commissioning requirements specified in this Section are prohibited from fulfilling requirements specified in other Sections. Requirements specified in other Sections are prohibited from fulfilling requirements specified in this Section.

All commissioning submittals must be submitted and reviewed in accordance with paragraph SUBMITTALS. Commissioning utilities including, but not limited to, tracking utilities and software for commissioning activities are prohibited from taking the place of these requirements.

1.3 SYSTEMS TO BE COMMISSIONED

Systems specified in the following paragraphs must be commissioned whether or not specified systems are required to be commissioned by any reference for pursuing Sustainability TPC.

Specified equipment and system counts are totals that include all buildings in this project.

1.3.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category

a. Up to three chilled water plants each featuring up to two air-cooled chillers with packaged controls, up to two variable speed distribution pumps, and variable-primary distribution.

b. Up to three hot water plants each featuring up to two fuel-fired condensing boilers each with an integral circulating pump and packaged controls, one boiler master control panel, up to two variable speed distribution pumps, and variable-primary distribution.

c. Up to 24 air handling units each featuring a variable-air-volume supply air fan, a chilled water coil, a hot water coil, air-side energy recovery, and packaged controls.

d. Up to 360 variable-air-volume air terminal units each featuring a hydronic heating coil.

e. Up to 54 fan coil units each featuring a chilled water coil and a hot water coil.

f. Up to 16 computer room air-conditioning units each featuring packaged controls.

g. Up to 20 unit heaters.

h. Up to three supply air fans.

i. Up to 27 exhaust air fans.

j. Up to three Building Automation Systems.

1.3.2 Plumbing Systems Category

a. Up to 275 fixtures.

b. Up to three domestic heating hot water systems each featuring up to two fuel-fired condensing water heaters each with packaged controls, up to one recirculating pump, and up to one temperature mixing valve.

c. Up to 10 emergency eyewash stations.

1.3.3 Utility Systems Category

a. Up to three energy monitoring and control system.

b. Up to three water utility metering system.

1.3.4 Electrical Type I Systems Category

a. Power - all grounding systems.

b. Power - all industrial control systems.

c. Power - all main distribution panels.

d. Power - all main transformers.

e. Power - all panelboards.

f. Power - all step-down transformers.

g. Power - all transient voltage surge protective devices.

1.3.5 Electrical Type II Systems Category

a. Cable television - all systems.

b. Communications - all public address systems.

c. Communications - all telecommunications entrance backbone and distribution systems.

d. Communications - all audio-visual-type intercommunication systems.

e. Emergency power - up to one system featuring up to one single operation generator set and automatic transfer switches.

f. Emergency power off control - all systems.

g. Lighting - all emergency egress systems.

h. Lighting - all exit systems.

i. Lighting - all interior systems.

1.3.6 Building Envelope Systems, Components, and Assemblies Category

a. Air tightness / pressurization verification of building envelope, components, and assemblies.

b. Thermal integrity verification of building envelope, components, and assemblies.

c. Moisture integrity verification of building envelope, components, and assemblies.

d. All roofing including low sloped roofs and steep sloped roofs.

1.3.7 Integrated Systems Category

a. Testing of integrated systems is not required for this project.

1.4 COMPLEX SYSTEMS

Complex systems are defined as the following systems categories as listed under paragraph SYSTEMS TO BE COMMISSIONED with appropriate qualifiers and are subject to more stringent requirements as specified in this Section.

a. All equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category."

b. All equipment and systems listed under item entitled "Plumbing Systems Category" featuring on-board factory packaged controls. Refer to the following paragraph for definition of equipment featuring on-board factory packaged controls.

c. All equipment and systems listed under item entitled "Utility Systems Category."

Equipment featuring on-board factory packaged controls is defined as equipment that is a complex system as defined in paragraph COMPLEX SYSTEMS which features a controller issuing sophisticated logic-based commands to its internal components to accomplish the intent of Plans and Specifications. This equipment may function as either a stand-alone piece of commissioned equipment or may function as part of a commissioned system. This controller may be equipment mounted or may be remote mounted and may or may not interface with a building control system. Examples of equipment meeting and not meeting this definition are provided in the following paragraphs.

a. Equipment meeting this definition includes chillers, boilers provided with or without master controllers, packaged pumping systems, dedicated outside air systems, packaged rooftop units, computer room air conditioners, and air terminal units.

b. Equipment not meeting this definition includes unitary air-conditioners, packaged terminal air-conditioners, and heat pumps.

c. Equipment not meeting this definition, but requiring demonstration of minimum safe motor speed either prior to or during Functional Performance Testing includes variable frequency drives.

1.5 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF HEATING, REFRIGERATING AND AIR-CONDITIONING ENGINEERS (ASHRAE)

ASHRAE 189.1	(2014) Standard for the Design of High-Performance Green Buildings Except Low-Rise Residential Buildings

GREEN BUILDING INITIATIVE (GBI)

GBI GP Compliance	(2016) GBI Guiding Principles Compliance Program for New Construction (DOD Version)

1.6 SUBMITTALS

Commissioning submittals are not required to be submitted by the Installing Contractor.

1.7 COMMISSIONING TEAM

The Commissioning Team is defined as the entity that must perform all commissioning activities specified in this Section for systems listed under paragraph SYSTEMS TO BE COMMISSIONED. The Commissioning Team is composed of the Lead Commissioning Specialist, Technical Commissioning Specialists, Designers of Record, Installing Contractors, Equipment Suppliers, and the Contracting Officer's Technical Representative.

1.7.1 Lead Commissioning Specialist

The Lead Commissioning Specialist (CxC) is defined as the entity that must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, coordinating all aspects of the commissioning process; managing all Technical Commissioning Specialists; and submitting all Commissioning Plans, schedules, reports, and documentation directly to the Contracting Officer's Technical Representative as modified in this Section.

1.7.2 Technical Commissioning Specialists

Technical Commissioning Specialists are defined as entities that must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, performing reviews, witnessing that all system components have been installed, that each control device operates, that each equipment piece operates, that complete systems operate, and that interactive systems operate in accordance with Plans and Specifications.

Technical Commissioning Specialists must perform assigned responsibilities for equipment and systems listed under systems categories assigned to them

in this Section. Technical Commissioning Specialists are prohibited from performing responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

1.7.3 Designers of Record

Designers of Record are defined as the entities that must act as design professionals responsible for design of their respective system that is subject to commissioning. Designers of Record must perform all commissioning responsibilities assigned in this Section as directed by the General Contractor.

1.7.4 Installing Contractors

Installing Contractors are defined as the General Contractor's Superintendent or Project Manager; Quality Control Representative; and Mechanical, Controls, Plumbing, Electrical, Test and Balance, Fire Protection, and Building Envelope Sub-Contractors who provide, install, or construct systems in whole or in part for this contract. The General Contractor must provide a Lead Commissioning Representative to manage all Designers of Record, Sub-Contractor Commissioning Representatives, and Equipment Suppliers to accomplish all responsibilities assigned in this Section. Each Sub-Contractor must provide a Commissioning Representative to coordinate and perform all commissioning responsibilities for commissioned equipment and systems provided as part of their respective contract as directed by the General Contractor. Submission of commissioning related certifications or qualifications for the Lead Commissioning Representative and Installing Contractor Representatives is not required.

Installing Contractors must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, demonstrating performance of all commissioned equipment and systems provided as part of their respective contract and must provide all necessary materials, services, and labor required for successful demonstration as modified in this Section.

1.7.5 Equipment Suppliers

Equipment Suppliers (ES) are defined as factory authorized start-up technicians or factory representatives knowledgeable with start-up, demonstration, and testing of commissioned equipment featuring on-board factory packaged controls provided as part of their respective contract. Each Equipment Supplier must coordinate and perform all commissioning responsibilities assigned in this Section as directed by the General Contractor. Submission of commissioning related certifications or qualifications for Equipment Suppliers is not required. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

Equipment Suppliers must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, demonstrating performance of all commissioned equipment provided as part of their respective contract and must provide all necessary materials, services, and labor required for successful demonstration as modified in this Section.

1.7.6 Installing Contractors and Equipment Suppliers Coordination

Installing Contractors and Equipment Suppliers must coordinate and share demonstration and testing responsibilities specified in this Section for commissioned equipment featuring on-board factory packaged controls. Installing Contractors and Equipment Suppliers must simultaneously perform all aspects of demonstration and testing for these types of systems. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

1.7.7 Contracting Officer's Technical Representative

The Contracting Officer's Technical Representative (COTR) represents the Government for all elements of the commissioning process. The COTR will serve as the single point of contact with the Lead Commissioning Specialist, will receive all commissioning submittals, may attend meetings, and may, but is not required to, witness field inspections and testing specified in this Section.

1.8 COMMUNICATIONS

1.8.1 Communications with the Contracting Officer's Technical Representative

Communication with the Contracting Officer's Technical Representative must be through the Lead Commissioning Specialist who acts as the single direct point of contact for all aspects of the commissioning process.

1.8.2 Communications between the Commissioning Team

Communications between the Commissioning Team including, but not limited to, verbal communications, schedule information, and exchange of information specified in this Section, must occur directly between the Commissioning Team without requiring interaction of the Contracting Officer's Technical Representative.

1.9 PHASING

This project is not phased.

1.10 ASHRAE 189.1 COMMISSIONING COMPLIANCE

ASHRAE 189.1 commissioning compliance is required for this project.

1.10.1 General Requirements

All commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, commissioning activities listed in references contained in ASHRAE 189.1's paragraphs as modified in this Section, and commissioning activities specified in this Section must be performed. All commissioning activities that are referred to as "optional activities," "guidance," "should activities," "recommendations," "suggested practices," "informative information," or listed as similar designations are mandatory regardless of any qualifiers.

Commissioning activities listed in ASHRAE 189.1's paragraphs that also have requirements specified in this Section are listed only where requirements are specified in this Section and these commissioning activities are not repeated under ASHRAE 189.1's paragraphs.

1.10.2 Commissioning Team Responsibilities

The Commissioning Team must, at a minimum, perform all commissioning activities specified in the preceding item entitled "General Requirements" and must perform all commissioning activities specified in this Section. This Section takes precedence should there be a conflict between requirements listed in this Section and requirements listed in the Standard or listed in any of its references.

1.11 SUSTAINABILITY THIRD PARTY CERTIFICATION (TPC)

Sustainability Third Party Certification (TPC) is required for this project.

1.11.1 General Requirements

All commissioning activities listed in all references for pursuing Sustainability TPC as modified in this Section and commissioning activities specified in this Section must be performed. All commissioning activities that are referred to as "optional activities," "guidance," "should activities," "recommendations," "suggested practices," "informative information," or listed as similar designations are mandatory regardless of any qualifiers and whether or not activity is included as total points toward Sustainability TPC.

Commissioning activities listed in all references for pursuing Sustainability TPC that also have requirements specified in this Section are listed only where requirements are specified in this Section and these commissioning activities are not repeated under references for pursuing Sustainability TPC.

1.11.2 Commissioning Team Responsibilities

The Commissioning Team must, at a minimum, perform all commissioning activities specified in the preceding item entitled "General Requirements," perform commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, perform commissioning activities listed in all of its references as modified in this Section, and perform commissioning activities specified in this Section. This Section takes precedence should there be a conflict between requirements listed in this Section and requirements listed in the reference for pursuing Sustainability TPC or listed in any of its references.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 DESIGN PHASE

3.1.1 Design Phase ASHRAE 189.1 Commissioning Compliance

3.1.1.1 General Requirements

Activities must include, but not be limited to, design phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6

as modified in this Section, design phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and design phase commissioning activities specified in this Section.

3.1.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under item entitled "Design Phase ASHRAE 189.1 Commissioning Compliance."

3.1.2 Design Phase Sustainability Third Party Certification (TPC)

3.1.2.1 General Requirements

Activities must include, but not be limited to, design phase commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, design phase commissioning activities listed in all of its references as modified in this Section, and design phase commissioning activities specified in this Section.

3.1.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Design Phase Sustainability Third Party Certification (TPC)."

3.1.3 Design Phase Commissioning Coordination Meeting

3.1.3.1 General Requirements

A Design Phase Commissioning Coordination meeting must be conducted no later than 30 calendar days prior to the first Plans and Specifications submission or no later than 30 calendar days after approval of Commissioning Firm certifications and all Commissioning Specialist certifications, whichever occurs last. Meeting topics must include, but not be limited to, the commissioning process, contract requirements, lines of communication, roles and responsibilities, schedules, documentation requirements, and logistics as specified in this Section. Meeting must be conducted by conference call.

3.1.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, conduct meeting and prepare meeting minutes complete with Attendance Roster.

3.1.3.3 Designers of Record, Installing Contractors, and Others Responsibilities

Designers of Record and Installing Contractors must attend this meeting. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may also attend this meeting.

3.1.4 Design Phase Commissioning Plan

3.1.4.1 General Requirements

The Design Phase Commissioning Plan must be prepared and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Plan purpose.

b. Commissioning scope.

c. Commissioning process outline.

d. List of all commissioned equipment and systems.

e. Building information.

f. Contact information for the Lead Commissioning Specialist, Technical Commissioning Specialists, Designers of Record, and Contracting Officer's Technical Representative.

g. Criteria listing including Unified Facilities Criteria and Building Codes and Standards.

h. Description of Commissioning Team members.

i. Roles and responsibilities.

j. Lines of communication.

k. Documentation requirements.

l. Owner's Project Requirements.

m. Description of the Basis of Design.

n. Description of Plans and Specifications reviews performed by Technical Commissioning Specialists.

o. Description of Plans and Specifications reviews performed by the Contracting Officer's Technical Representative.

p. Examples and descriptions of Site Observation Reports and Issues Log.

q. Listing and description of Design Phase and Construction Phase Commissioning meetings.

r. Identification of commissioning activities for incorporation into the Project Construction Schedule.

s. Listing of submittals required by Technical Commissioning Specialists.

t. Examples and description of the development of Pre-Functional Checklists, Functional Performance Test Checklists, and Integrated Systems Test Checklists.

u. Description of Pre-Functional Checks, Functional Performance Testing,

and Integrated Systems Testing.

v. Description of Endurance Testing.

w. Description of Ductwork Air Leak Test (DALT) field acceptance testing specified in Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

x. Description of Performance Verification Test (PVT) field acceptance testing specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC.

y. Description of Test and Balance (TAB) field acceptance testing specified in Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

z. Listing of Operation and Maintenance Manual requirements.

aa. Description of Systems Manuals.

bb. Description of training requirements.

cc. Description of Final Commissioning Report.

3.1.4.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Design Phase Commissioning Plan no later than 45 calendar days after approval of Commissioning Specialists certifications.

File one copy of Approved Design Phase Commissioning Plan in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Design Phase Commissioning Plan.

3.1.5 Design Phase Issues Log

3.1.5.1 General Requirements

The Design Phase Issues Log must be prepared and maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Design Phase Issues Log must include the name of Commissioning Team member identifying the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Design Phase Issues Log must be prepared in an electronic format that can be used throughout the Design Phase such that it can be provided to the Government upon request.

3.1.5.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Design Phase Issues Log and must submit one electronic copy no later than seven calendar days after the addition of an issue or a change in status of an issue.

3.1.6 Commissioning Design Reviews

3.1.6.1 General Requirements

Commissioning Design Reviews must be performed and must include reviews

and back-checks of the Owner's Project Requirements (OPR), the Basis of Design and Design (BOD), and Plans and Specifications in accordance with Sustainability TPC rating system requirements and requirements specified in this Section. The number and schedule of design reviews must be in accordance with Sustainability TPC requirements and must include, but not be limited to, review of first Plans and Specifications submission and back-checks of all subsequent submissions. Plans and Specifications submissions are specified in the following paragraphs.

a. Design Development Plans and Specifications submission.

b. 100-Percent Pre-Final Plans and Specifications submission.

c. Final Plans and Specifications submission.

Commissioning Design Reviews must assess completeness and clarity of the OPR, verify requirements stated in the OPR are addressed in the BOD, and verify the Design Plans and Specifications are prepared in accordance with the BOD and applicable Unified Facilities Criteria (UFC). All issues, including those that would negatively impact building system operation and maintenance, must be identified and be provided with proposed corrective actions. The OPR and BOD are for review purposes only and are not contractually enforceable.

3.1.6.2 Commissioning Design Review Reports

A Commissioning Design Review Report must be prepared for each review and back-check of Plans and Specifications and must include each issue listed individually and its corresponding proposed corrective action. Issues must be separated into categories corresponding to systems categories listed under paragraph SYSTEMS TO BE COMMISSIONED.

Updated Commissioning Design Review Reports must be prepared to include resolution of outstanding issues reached during Commissioning Design Review meetings.

3.1.6.3 Commissioning Design Review Meetings

A Commissioning Design Review meeting must be conducted no later than 14 calendar days after preparation of each Commissioning Design Review Report to discuss proposed corrective actions and to resolve outstanding issues. The Contracting Officer's Technical Representative may attend these meetings. Meeting must be conducted by conference call.

3.1.6.4 Lead Commissioning Specialist Responsibilities

Lead Commissioning Specialist activities must include, but not be limited to, activities specified in the following paragraphs.

a. Prepare and provide Commissioning Design Review Reports to Designers of Record.

b. Conduct Commissioning Design Review meetings.

c. Update Commissioning Design Review Reports.

d. Prepare and submit Updated Commissioning Design Review Reports no later than 14 calendar days after each Commissioning Design Review meeting.

3.1.6.5 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists activities must include, but not be limited to, performing reviews and back-checks of Plans and Specifications and attending Commissioning Design Review meetings for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.1.6.6 Designers of Record Responsibilities

Designers of Record activities must include, but not be limited to, providing written responses to Commissioning Design Review Reports and attending Commissioning Design Review meetings.

3.2 CONSTRUCTION PHASE

3.2.1 Construction Phase ASHRAE 189.1 Commissioning Compliance

3.2.1.1 General Requirements

Activities must include, but not be limited to, construction phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, construction phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and construction phase commissioning activities specified in this Section.

3.2.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under the item entitled "Construction Phase ASHRAE 189.1 Commissioning Compliance."

3.2.2 Construction Phase Sustainability Third Party Certification (TPC)

3.2.2.1 General Requirements

Activities must include, but not be limited to, commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, commissioning activities listed in all of its references as modified in this Section, and commissioning activities specified in this Section.

3.2.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Construction Phase Sustainability Third Party Certification (TPC)."

3.2.3 Construction Phase Sequencing

3.2.3.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Heating, ventilation, and air-conditioning (HVAC) systems activities specified in the following paragraphs must be performed as applicable prior to performing Functional Performance Testing of systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED.

a. All equipment and systems have been completed, cleaned, flushed, disinfected, calibrated, tested, and operate in accordance with Plans and Specifications.

b. All Ductwork Air Leakage Testing (DALT) field work, Test and Balance (TAB) field work, Pre-Final TAB Reports, and related prerequisites have been completed, submitted, and approved in accordance with Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

c. All testing of building envelope, components, and assemblies for air tightness / pressurization verification, thermal integrity verification, and moisture integrity verification have been completed, submitted, and approved.

d. All Pre-Functional Checklists have been completed, submitted, and approved.

e. Certified Certificates of Readiness for respective system has been completed, submitted, and approved.

All completed Final Functional Performance Test Checklists for commissioned equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be submitted and approved prior to the Government performing any Performance Verification Testing specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC.

3.2.3.2 Electrical Systems

Electrical systems activities specified in the following paragraphs must be performed as applicable prior to performing Functional Performance Testing of systems listed under item entitled "Electrical Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED.

a. All electrical, power generation, and lighting equipment and systems have been completed, calibrated, tested, and operate in accordance with Plans and Specifications.

b. Building Envelope is enclosed according to contract documents with final construction completed.

c. All ceiling tiles, floor coverings, and window coverings are in place.

d. All lamps have completed a minimum 100-hour burn-in period.

e. All furniture is in place.

f. Certified Certificates of Readiness for respective system has been

completed, submitted, and approved.

3.2.4 Construction Phase Scheduling

3.2.4.1 General Requirements

Commissioning activities and other related activities for inclusion into the Project Construction Schedule must include, but not be limited to, activities specified in the following paragraphs.

a. Perform Construction Phase Commissioning Coordination meeting.

b. Submittal and approval of Construction Phase Interim Commissioning Plan.

c. Submittal and approval of Construction Phase Final Commissioning Plan.

d. Submittal and approval of completed Pre-Functional Checklists.

e. Perform testing of building envelope, components, and assemblies for air tightness / pressurization verification, thermal integrity verification, and moisture integrity verification.

f. Submittal and approval of proposed Functional Performance Test Checklists.

g. Submittal and approval of final Functional Performance Test Checklists.

j. Perform Construction Phase Site Observations.

k. Participate in Construction Phase Endurance Testing.

l. Witness Construction Phase Functional Performance Testing.

m. Corrections of deficiencies discovered during Construction Phase Functional Performance Testing.

n. Re-witness Construction Phase Functional Performance Testing.

r. Provide all Systems Manuals contents.

s. Submittal and approval of completed Systems Manuals.

t. Perform training.

u. Submittal and approval of Final Commissioning Report.

v. Perform Post-Construction Phase Site Observations.

w. Participate in Post-Construction Phase Endurance Testing.

x. Witness Post-Construction Phase Functional Performance Testing.

y. Corrections of deficiencies discovered during Post-Construction Phase Functional Performance Testing.

z. Re-witness Post-Construction Phase Functional Performance Testing.

3.2.4.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must request a current Project Construction Schedule from Installing Contractors no later than at the Construction Phase Commissioning Coordination Meeting and must prepare and provide to Installing Contractors a list of commissioning activities for inclusion into the Project Construction Schedule. The Lead Commissioning Specialist must associate each commissioning activity to a single construction activity such that if the date of the construction activity changes, the associated commissioning activity changes accordingly.

3.2.4.3 Installing Contractors Responsibilities

Installing Contractors must provide a current Project Construction Schedule to the Lead Commissioning Specialist upon receiving request. Installing Contractors must incorporate the list of commissioning activities into the Project Construction Schedule and must link each commissioning activity to the associated construction activity identified by the Lead Commissioning Specialist such that if the date of the construction activity changes, the associated commissioning activity changes accordingly.

Installing Contractors must provide updated Project Construction Schedules to the Lead Commissioning Specialist at least on a monthly basis.

3.2.5 Construction Phase Commissioning Coordination Meeting

3.2.5.1 General Requirements

A Construction Phase Commissioning Coordination meeting must be conducted no later than 14 calendar days after approval of Commissioning Firm and Commissioning Specialists certifications to discuss topics that include, but not be limited to, the commissioning process, contract requirements, lines of communication, roles and responsibilities, commissioning activities for inclusion into the Project Construction Schedule, documentation requirements, Inspections and Testing, and logistics specified in this Section. Meeting must be conducted by conference call.

3.2.5.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, conduct meeting and prepare meeting minutes complete with Attendance Roster.

3.2.5.3 Installing Contractors, Designers of Record, and Other Commissioning Team Member Responsibilities

Installing Contractors and Designers of Record must attend this meeting. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may attend this meeting.

3.2.6 Construction Phase Commissioning Progress Meetings

3.2.6.1 General Requirements

Construction Phase Commissioning Progress meetings must be conducted to discuss topics that include, but not be limited to, unresolved commissioning issues, status of items specified to be provided to the Lead Commissioning Specialist, and upcoming commissioning activities. Two Construction Phase Commissioning Progress meetings must be conducted for

each systems category unless modified in the following paragraphs. Meetings must be conducted by conference call.

a. Heating, Ventilation, and Air-Conditioning (HVAC) Systems: Six meetings.

b. Building Envelope Systems, Components, and Assemblies: Three meetings.

Construction Phase Commissioning Progress meetings are prohibited from being combined with conducting Construction Phase Commissioning Coordination meeting, conducting Site Observations, witnessing Functional Performance Testing, or witnessing Integrated Systems Testing.

3.2.6.2 Technical Commissioning Specialists Responsibilities

Each Technical Commissioning Specialist must, at a minimum, conduct meetings and prepare meeting minutes complete with Attendance Roster for systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for systems categories assigned to other Technical Commissioning Specialists.

3.2.6.3 Installing Contractors and Others Responsibilities

Installing Contractors must attend these meetings. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may attend these meetings.

3.2.7 Construction Phase Interim Commissioning Plan

3.2.7.1 General Requirements

The Construction Phase Interim Commissioning Plan must be prepared and must be an update to the Design Phase Commissioning Plan and contents must include, but not be limited to, contents specified in the following paragraphs.

a. All contents specified for the Design Phase Commissioning Plan.

b. Basis of Design.

c. Contact information for the entire Commissioning Team.

3.2.7.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Construction Phase Interim Commissioning Plan no later than 30 calendar days after the Construction Phase Commissioning Coordination meeting and no later than 14 calendar days prior to performing construction of the building envelope.

3.2.8 Construction Phase Final Commissioning Plan

3.2.8.1 General Requirements

The Construction Phase Final Commissioning Plan must be prepared and must be an update to the Construction Phase Interim Commissioning Plan and contents must include, but not be limited to, contents specified in the following paragraphs.

a. All contents specified for the Construction Phase Interim Commissioning Plan.

b. All Pre-Functional Checklists.

c. All approved final Functional Performance Test Checklists.

3.2.8.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit the Construction Phase Final Commissioning Plan no later than 30 calendar days prior to performing any Functional Performance Testing.

b. File one copy of Approved Construction Phase Final Commissioning Plan in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Construction Phase Final Commissioning Plan.

3.2.9 Construction Phase Issues Log

3.2.9.1 General Requirements

The Construction Phase Issues Log must be prepared and maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Construction Phase Issues Log must include the name of Commissioning Team member identifying the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Construction Phase Issues Log must be a continuation of the Design Phase Issues Log and must be prepared in an electronic format that can be used throughout the Construction Phase such that it can be provided to the Government upon request.

3.2.9.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Construction Phase Issues Log and must submit one electronic copy no later than seven calendar days after the addition of an issue or a change in status of an issue.

3.2.10 Pre-Functional Checklists

3.2.10.1 General Requirements

Pre-Functional Checklists must be prepared for all commissioned equipment and contents must include, but not be limited to, contents for physical inspections that demonstrate construction, installation and start-up of equipment and systems is complete. Refer to item entitled "Pre-Functional Checklists" in item entitled "Inspections and Testing" for more information.

Download example Pre-Functional Checklists for Section 01 91 00.15 TOTAL BUILDING COMMISSIONING at the following location: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic Checklists must contain the same level of detail shown in examples, but are not required to match the format of examples.

3.2.10.2 Lead Commissioning Specialist Responsibilities

Lead Commissioning Specialist must provide blank Pre-Functional Checklists to Installing Contractors. Blank Pre-Functional Checklists are not required to be submitted to the Government.

3.2.10.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must prepare Pre-Functional Checklists for all equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.11 Functional Performance Test (FPT) Checklists

Functional Performance Test (FPT) Checklists must be prepared for all commissioned equipment and systems demonstrating performance is in accordance with Plans and Specifications. A single final FPT Checklist must be prepared for each system except that a single final FPT Checklist may be prepared for use with multiple systems that have identical features, unless modified in this Section. FPT Checklist contents must include, but not be limited to, step-by-step actions and expected results, unless modified in this Section. Refer to item entitled "Functional Performance Testing and Integrated Systems Testing" for more information.

3.2.11.1 Complex Systems Requirements

FPT Checklists must be prepared for all complex systems as defined in paragraph COMPLEX SYSTEMS demonstrating performance is in accordance with Plans and Specifications. A single FPT Checklist must be prepared for each system except that a single FPT Checklist may be prepared for use with multiple systems that have identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps. Refer to item entitled "Functional Performance Testing and Integrated Systems Testing" and item entitled "Sample Strategy" for more information.

Contents must include, but not be limited to, contents specified in the following paragraphs and shown in example FPT Checklists for Section 01 91 00.15 TOTAL BUILDING COMMISSIONING available for download at the following location:
http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic
FPT Checklists must contain the same level of detail specified below and as shown in examples, but are not required to match the format of examples.

a. Notable system features including information about such attributes as system sizing and controls to facilitate understanding of system operation.

b. Conclusions and recommendations based on control system feature, point-to-point, actuator, and system operation observations. Conclusions must clearly indicate if system does or does not perform in accordance with requirements of Plans and Specifications. Recommendation must clearly indicate that the system should or should not be accepted by the Government.

c. Test conditions including date, beginning and ending time, and

beginning and ending outdoor air conditions.

d. Identification of the equipment involved in the test.

e. Attendees present throughout the entire system test.

f. Control system feature identification including control point description, embedded/visible type, adjustable/monitoring type, actual value, and setpoint value/alarm range.

g. Point-to-point observations including demonstrating system flow meters and sensors have been calibrated and are correctly displayed on the Operator workstation.

h. Actuator operation observations demonstrating actuator responses to commands from the control system.

i. Variable frequency drive observations demonstrating minimum safe motor speed.

j. System operation observations for system-based testing demonstrating each control sequence, operation mode, and alarm condition resulting from control setpoint manipulation. System operation observations must include, but not be limited to, observations specified in the following paragraphs.

(1) Introduction identifying testing methodology.

(2) As-found conditions prior to system manipulation.

(3) Clear list of test items (step numbers).

(4) Design control sequences or interlocks segmented by unique functions.

(5) Intended test procedures following each segmented sequence or interlock identifying the system manipulation required to initiate system response.

(6) Expected system responses.

(7) Space for comments for each test item.

(8) Pass or fail indication for each test.

Performance Verification Tests prepared by the Controls Contractor as specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC are prohibited from being used in whole or in part to meet requirements specified in this Section.

3.2.11.2 Building Envelope Systems, Components, and Assemblies Requirements

FPT Checklists must be prepared for thermal integrity verification and moisture integrity verification of building envelope, components, and assemblies listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED. FPT Checklists must demonstrate performance is in accordance with Plans and Specifications. A single final FPT Checklist must be prepared for each unique type of construction.

3.2.11.3 Proposed FPT Checklist Meeting and Draft FPT Checklist Meeting

For all complex systems as defined in paragraph COMPLEX SYSTEMS, a Proposed FPT Checklist Meeting and a Draft FPT Checklist Meeting must be conducted for detailed discussions of procedures intended to demonstrate performance is in accordance with Plans and Specifications. Meetings must be conducted by conference call.

3.2.11.4 Lead and Technical Commissioning Specialists Responsibilities

For all systems other than complex systems as defined in paragraph COMPLEX SYSTEMS, the Lead Commissioning Specialist must submit Final Functional Performance Test Checklists for all systems in each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal for each systems category no later than 30 calendar days prior to performing FPT testing of any system in the respective systems category.

For all complex systems as defined in paragraph COMPLEX SYSTEMS, the Lead and Technical Commissioning Specialists must prepare and submit Final Functional Performance Test Checklists in the sequence specified in the following paragraphs. Technical Commissioning Specialists must perform respective responsibilities for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing respective responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Technical Commissioning Specialists must prepare Proposed Functional Performance Test Checklists.

b. The Lead Commissioning Specialist must submit Proposed Functional Performance Test Checklists for all complex systems as a single submittal no later than 60 calendar days prior to testing of any complex system.

c. Technical Commissioning Specialists must conduct the Proposed Functional Performance Test Checklist Meeting attended by the Contracting Officer's Technical Representative.

d. Technical Commissioning Specialists must prepare Draft Functional Performance Test Checklists to incorporate input from the Contracting Officer's Technical Representative.

e. The Lead Commissioning Specialist must provide Draft Functional Performance Test Checklists to Installing Contractors and Equipment Suppliers no later than seven calendar days prior to the Draft Functional Performance Test Checklist Meeting.

f. Technical Commissioning Specialists must conduct the Draft Functional Performance Test Checklist Meeting attended by Installing Contractors and Equipment Suppliers. The Contracting Officer's Technical Representative may attend this meeting.

g. Technical Commissioning Specialists must prepare Final Functional Performance Test Checklists to incorporate input from Installing Contractors.

h. The Lead Commissioning Specialist must submit Final Functional

Performance Test Checklists for all complex systems as a single submittal no later than seven calendar days after meeting to discuss Draft Functional Performance Test Checklists and no later than 30 calendar days prior to testing of any complex system.

3.2.11.5 Installing Contractors and Equipment Suppliers Responsibilities

Installing Contractors and Equipment Suppliers must attend Draft Functional Performance Test Checklist Meeting.

3.2.12 Construction Submittal Reviews

3.2.12.1 General Requirements

Construction Submittal Reviews must be performed for all commissioned equipment and systems to the extent necessary to verify that equipment and systems are in compliance with commissioning aspects of UFC's referenced by the Design-Build contract, Owner's Project Requirements (OPR), Basis of Design (BOD), and Plans and Specifications as modified in this Section. Reviews must be performed coincident with Designers of Record and reviews must include, but not be limited to, review of shop drawings, equipment submittals, test plans, procedures, and reports.

The OPR and BOD are for review purposes only and are not contractually enforceable.

3.2.12.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of shop drawings, equipment submittals, test plans, procedures, and reports that must be reviewed to Installing Contractors.

b. Prepare and provide Construction Submittal review comments to Installing Contractors. Construction Submittal review comments are not required to be submitted to the Government.

3.2.12.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform reviews of Construction Submittals for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.12.4 Installing Contractors Responsibilities

Installing Contractors must provide all requested Construction Submittals, BOD, and requested supplemental information to the Lead Commissioning Specialist.

3.2.13 Construction Phase Site Observations

3.2.13.1 General Requirements

Construction Phase Site Observations must be performed as specified in the

following paragraphs to verify and document commissioning aspects of equipment and systems as modified in this Section. Two Construction Phase Site Observations must be conducted for each systems category unless modified in the following paragraphs.

Construction Phase Site Observations are prohibited from being combined with witnessing Functional Performance Testing or witnessing Integrated Systems Testing, but may be combined with Pre-Functional Checklist Verificaitons unless indicated otherwise. Purposes of Site Observations specified in the following paragraphs for each systems category may be combined into a single Site Observation.

3.2.13.2 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

b. At least one Site Observation to verify and document HVAC pipe pressure testing.

c. At least one Site Observation to verify and document HVAC pump installation.

3.2.13.3 Plumbing Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least one Site Observation to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

b. At least one Site Observation to verify and document Plumbing pipe pressure testing.

c. At least one Site Observation to verify and document Plumbing pump installation.

3.2.13.4 Electrical Type I Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least six Site Observations to verify and document commissioning aspects and to witness testing performed by independent testing organizations of commissioned equipment and systems listed under this systems category and listed by the Lead Commissioning Specialist to require on-site verification and documentation by Technical Commissioning Specialists. Independent testing organizations typically use tests readily available from testing associations such as the InterNational Electrical Testing Association (NETA).

3.2.13.5 Electrical Type II Systems

Site Observations must be performed for the purposes specified in the

following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

3.2.13.6 Building Envelope Systems, Components, and Assemblies

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document in-progress building envelope construction prior to covering critical building envelope components and prior to pressure testing of building envelope, components, and assemblies.

b. At least two Site Observation to verify, document, and witness pressure testing, infrared thermography testing, and fog testing performed by independent testing agencies and specified in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS.

c. At least two Site Observation to verify, document, and witness inspections, measurements, and testing performed by independent testing agencies and specified in Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM.

3.2.13.7 Summary Meetings

A Summary Meeting must be conducted at the conclusion of each Site Observation for the purpose of discussing issues discovered during each Site Observation. Meeting must be conducted on-site with all attendees present.

3.2.13.8 Site Observation Reports

A Site Observation Report must be prepared for each Site Observation for the purpose of documenting issues discovered during each Site Observation.

Site Observation Reports for all equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include results of testing performed by independent testing organizations that were witnessed by Technical Commissioning Specialists and test results that were not witnessed by Technical Commissioning Specialists.

3.2.13.9 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must provide list of equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED that require on-site verification and documentation by Technical Commissioning Specialists to Installing Contractors.

The Lead Commissioning Specialist must submit Construction Phase Site Observation Reports complete with Summary Meeting Attendance Roster no later than seven calendar days after Site Observation.

3.2.13.10 Technical Commissioning Specialists Responsibilities

Each Technical Commissioning Specialist must be responsible to perform Site Observations, conduct Summary Meetings, and prepare Construction Phase Site Observation Reports for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.13.11 Installing Contractors Responsibilities

Installing Contractors must provide Technical Commissioning Specialists access to construction and systems for Site Observations and must attend Summary Meetings.

Installing Contractors must schedule testing to occur in the presence of Technical Commissioning Specialists as specified in the following paragraphs.

a. All equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED and listed by the Lead Commissioning Specialist to require on-site verification and documentation by Technical Commissioning Specialists. Results of testing of equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be provided to the Lead Commissioning Specialist that were witnessed by Technical Commissioning Specialists and that were not witnessed by Technical Commissioning Specialists.

b. Pressure testing, infrared thermography testing, and fog testing specified in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS and inspections, measurements, and testing specified in Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM for equipment and systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED. Results of all tests, inspections, and measurements must be provided to the Lead Commissioning Specialist that were witnessed by Technical Commissioning Specialists and that were not witnessed by Technical Commissioning Specialists.

3.2.14 Inspections and Testing

3.2.14.1 Pre-Functional Checks

Pre-Functional Checks must be performed prior to performing Functional Performance Testing or Integrated Systems Testing of respective system and activities must include, but not be limited to, activities specified in the following paragraphs.

a. Complete Pre-Functional Checklists.

b. Perform Construction Phase Endurance Testing.

3.2.14.1.1 Pre-Functional Checklist Verifications

Pre-Functional Checklist Verifications must be performed using Pre-Functional Checklists from the approved Construction Phase Final

Commissioning Plan by conducting on-site spot-checks to verify accuracy after receipt of completed Pre-Functional Checklists from Installing Contractors. Verifications may be combined with Construction Phase Site Observations.

3.2.14.1.1.1 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must provide blank Pre-Functional Checklists to Installing Contractors.

The Lead Commissioning Specialist must submit all completed Pre-Functional Checklists and all associated equipment start-up reports for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than seven calendar days after receipt of all completed checklists for equipment and systems listed under the respective systems category from Installing Contractors.

3.2.14.1.1.2 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform Pre-Functional Checklist Verifications and then must indicate acceptance of all Pre-Functional Checklist items for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.1.1.3 Installing Contractors Responsibilities

Installing Contractors must complete one Pre-Functional Checklist for each piece of equipment and system. Initial each Pre-Functional Checklist item for their area of responsibility indicating the item's construction, installation, and start-up as applicable has been verified to be complete and is ready for testing.

Installing Contractors must submit completed and initialed Pre-Functional Checklists and all associated equipment start-up reports to the Lead Commissioning Specialist no later than seven calendar days after completion of inspection of all checklist items for each piece of equipment and system.

3.2.14.2 Construction Phase Endurance Testing

3.2.14.2.1 General Requirements

Construction Phase Endurance Testing (trending of control system control points) for complex systems as defined in paragraph COMPLEX SYSTEMS must be performed as specified in the following paragraphs. Systems must be operating as normally anticipated during occupancy throughout Endurance Testing.

3.2.14.2.2 Hardware

Hardware must have sufficient buffer capacity to trend all data throughout Endurance Testing. Trend data uploading during the course of Endurance Testing to ensure all trend data is retained is encouraged. Lost trend data will require retesting of all control points for affected systems.

3.2.14.2.3 Results Format

Results format of trend data must be provided in a graphical format complete with clear indication of value(s) for y-axis, value for x-axis, and legend identifying each trended control point. The number of control points contained on a single graph must be such that all control points can be clearly visible. Control points must be logically grouped such that related points appear on a single graph. In addition, a separate comma separated value (CSV) file of raw trend data for each trended system must be provided. Each trended control point in CSV file must be clearly identified.

For control points recorded based on change of value, change of value for recording data must be clearly identified for each control point.

3.2.14.2.4 Construction Phase Endurance Testing Reports

A Construction Phase Endurance Testing Report must be prepared and contents must include, but not be limited to, an executive summary, review comments, trend results in graphical format, and raw trend data for all trend results for each trended system.

3.2.14.2.5 Start, Duration, and Recording Frequency

Starting date and time must be identical for all control points specified to be trended for each system subject to Endurance Testing regardless of specified duration and regardless of specified frequency. Duration of all Endurance Testing must be no less than seven consecutive calendar days.

Recording frequency of data for all control points specified to be trended for each system subject to Endurance Testing must be 15-minutes as modified in this Section. The recording frequency of data for specific control point types must occur at the frequency specified in the following paragraphs.

3.2.14.2.5.1 Control Points Trended at One Minute Intervals

a. Temperature for supply air, return air, mixed air, supply water, and return water.

b. Temperature entering and leaving all heat transfer devices such as coils, energy recovery wheels, and heat pipes.

c. Temperature for outside air, supply air, return air and exhaust air entering and leaving energy recovery device.

d. Flow for supply air, return air, outside air, chilled water, and HVAC heating hot water.

e. Flow for exhaust air associated with energy recovery.

f. Relative humidity for outside air and return air.

g. Relative humidity for outside air, supply air, return air and exhaust air entering and leaving energy recovery device.

h. Command and status for control dampers and control valves.

i. Speed for fans and pumps.

j. Pressure for fans and pumps.

3.2.14.2.5.2 Control Points Trended at 15 Minute Intervals

a. Temperature and relative humidity for zones.

b. Temperature and relative humidity for outside air not associated with energy recovery.

c. Pressure relative to the outside for facility.

3.2.14.2.5.3 Control Points Trended at Change of Position or State

a. Command and status for equipment such as chillers, boilers, pumps, compressors, air handling units, dedicated outside air systems.

b. Operation state for occupied, unoccupied, warm-up, cool-down, timed override, cooling, heating, alarm, and lead-lag duty status change.

c. Command and position for two-position control air dampers.

3.2.14.2.6 Trended Control Points

Trended control points for each system must demonstrate performance is in accordance with Plans and Specifications. Trended control points must include, but not be limited to, control points listed in Plans and Specifications' points lists.

Trended control points for selected systems, at a minimum, must include control points specified in the following paragraphs. These control points must be trended as applicable to this contract in addition to control points necessary to demonstrate systems perform in accordance with requirements of Plans and Specifications and control points listed in Plans and Specifications' points lists.

3.2.14.2.6.1 Air-Cooled Chiller Chilled Water System

a. Chiller(s) command and status.

b. Chiller isolation valve(s) command and status.

c. Chilled water pump(s) actual speed.

d. Chilled water pump(s) setpoint and actual differential pressure.

e. Minimum flow bypass control valve command.

f. Minimum system flow setpoint and actual flow.

g. Chilled water supply setpoint and actual temperature.

h. Chilled water return actual temperature.

i. Chilled water actual flow.

j. Outside air actual dry-bulb temperature.

3.2.14.2.6.2 HVAC Heating Hot Water System with Boiler

a. Boiler(s) command and status.

b. Boiler(s) isolation valve command and status.

c. HVAC heating hot water pump(s) actual speed.

d. HVAC heating hot water pump(s) setpoint and actual differential pressure.

e. Minimum flow bypass control valve command.

f. Minimum system setpoint and actual flow.

g. HVAC heating hot water supply setpoint and actual temperature.

h. HVAC heating hot water return actual temperature.

i. HVAC heating hot water actual flow.

j. Outside air actual dry-bulb temperature.

3.2.14.2.6.3 Dedicated Outside Air System (DOAS)

a. Outside air actual dry-bulb temperature.

b. Outside air actual relative humidity.

c. Outside air isolation damper command and status.

d. Outside air setpoint and actual airflow.

e. Energy recovery wheel command, status, and actual speed.

f. Energy recovery wheel's OA bypass control damper command and status.

g. Energy recovery wheel's defrost cycle command and status.

h. Energy recovery wheel's OA discharge air actual dry-bulb temperature.

i. Energy recovery wheel's OA discharge air actual relative humidity.

j. Preheat coil leaving air setpoint and actual temperature.

k. Preheat coil control actuator command.

l. Cooling coil leaving air setpoint and actual temperature.

m. Cooling coil control valve command.

n. Supply air fan actual speed.

o. Reheat coil control valve command.

p. Discharge air setpoint and actual temperature.

q. Supply air fan setpoint and actual static pressure.

r. Facility setpoint and actual relative pressure.

s. Return air actual dry-bulb temperature.

t. Return air actual relative humidity.

u. Energy recovery wheel's EA bypass control damper command and status.

v. Energy recovery wheel's EA discharge air actual dry-bulb temperature.

w. Energy recovery wheel's EA discharge air actual relative humidity.

x. Exhaust air fan actual speed.

y. Exhaust air isolation damper command and status.

3.2.14.2.6.4 Supply Air Terminal Units

a. Zone setpoint and actual dry-bulb temperature.

b. Zone actual relative humidity.

c. Control damper command.

d. Heating coil valve command.

e. Airflow actual value.

f. Leaving air actual temperature.

3.2.14.2.7 Sample Strategy

Sample strategy must be as specified in the following paragraphs.

a. 100-Percent trending for central plant equipment such as chilled water and HVAC heating hot water systems, air handling unit systems including all associated fans except for remote exhaust air fans, dedicated outside air systems including all associated fans except for remote exhaust air fans, and renewable energy system.

b. 20-Percent sample trending for equipment with identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps.

3.2.14.2.8 Unsuccessful Trending and Re-Trending

3.2.14.2.8.1 100-Percent Samples

Trending results must be failed for equipment or systems for which 100-percent sample size are trended if one or more of the trended control points results in discovery of a deficiency.

Re-trending must be required to the extent necessary to confirm that deficiencies have been corrected.

3.2.14.2.8.2 Less than 100-Percent Samples

Trending results must be failed for equipment or systems for which less than 100-percent sample size are trended if one or more of the trended

control points results in discovery of a deficiency.

a. Re-trending must be required for only items which experienced initial failures if the failure rate is 5-percent or less, meaning that 5-percent or less of the equipment or systems had at least one deficiency.

b. Re-trending must be required for items which experienced initial failures to the extent necessary to confirm that the deficiencies have been corrected if the failure rate is higher than 5-percent, meaning that more than 5-percent of equipment or systems trended had at least one deficiency. In addition, re-trending of another random sample of the same size as the initial sample for the first time. If the second random sample set has any failures, those failed items must be re-trended and all remaining equipment and systems must be trended to complete 100-percent testing of that system type.

3.2.14.2.8.3 Re-Trending Costs

Re-trending costs must be reimbursed to the Government. These costs must include salary associated with additional reviews of trend results for the Lead Commissioning Specialist, Technical Commissioning Specialists, and Government personnel.

3.2.14.2.9 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of systems that must be trended, control points that must be trended, and reminder of trend results format specified in this Section to Installing Contractors.

b. Provide action plan for correcting failed trend results to Installing Contractors.

c. Provide list of systems that must be re-trended due to failure of trend results or having been provided in an incorrect trend results format to Installing Contractors.

d. Prepare and submit Construction Phase Endurance Testing Reports as a single submittal no later than 14 calendar days after preparation of all Endurance Testing Reports. In addition, submit one electronic copy of raw trend data.

3.2.14.2.10 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these activities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Select systems that must be trended for samples of less than 100-percent.

b. Prepare list of systems and control points that must be trended.

c. Perform review of all trend results and provide approval or failure disposition.

d. Prepare list of systems that must be re-trended due to failure of trend results or having been provided in an incorrect trend results format.

e. Prepare action plan for correcting failed trend results.

3.2.14.2.11 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform activities specified in the following paragraphs.

a. Provide hardware suitable to obtain trend data for systems and control points identified by Technical Commissioning Specialists.

b. Provide hardware suitable to interface with and obtain trend data from equipment identified by the Lead Commissioning Specialist to require trending that features on-board factory packaged controls. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

c. Provide list of equipment and control points that must be trended to Equipment Suppliers who provided equipment featuring on-board factory packaged controls as part of their contract.

d. Collect trend data in the format specified in this Section for specified systems and control points and provide to the Lead Commissioning Specialist.

e. Provide action plan for correcting failed trend results to Equipment Suppliers who provided equipment featuring on-board factory packaged controls as part of their contract.

f. Implement action plan for correcting failed trend results.

g. Re-collect and provide trend data in the format specified in this Section for trend results determined to have failed or determined to have been provided in an incorrect trend results format to the Lead Commissioning Specialist

3.2.14.2.12 Equipment Suppliers Responsibilities

Equipment Suppliers must, at a minimum, perform activities specified in the following paragraphs.

a. Provide Installing Contractor access, but not interface equipment, to equipment featuring on-board factory packaged controls provided as part of their contract. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

b. Provide descriptions to Installing Contractors in clearly understood language (not proprietary code) for all trended control points.

c. Implement action plan for correcting failed trend results for equipment featuring on-board factory packaged controls provided as part of their contract.

3.2.14.3 Certified Certificates of Readiness and Certificates of Readiness

3.2.14.3.1 General Requirements

A single Certified Certificate of Readiness must be prepared for each system subject to Functional Performance Testing or subject to Integrated Systems Testing by reviewing, signing, and dating Certificates of Readiness to indicate each system is complete and ready for testing. Testing of any equipment or system is prohibited until after its Certified Certificate of Readiness has been submitted and approved.

A single Certificate of Readiness must be prepared for each system subject to Functional Performance Testing or subject to Integrated Systems Testing. Certificate of Readiness contents must include, but not be limited to, contents specified in the following paragraphs to the extent applicable to the specific system being tested.

a. Cover sheet with spaces for signatures and dates by the Lead Commissioning Specialist and by Installing Contractors to indicate each system is complete and ready for testing.

c. Equipment and system start-up reports.

d. Control system start-up reports.

e. Diagnostic test reports.

g. Completed Pre-Functional Checklists.

3.2.14.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must sign, date, and submit Certified Certificates of Readiness no later than 14 calendar days prior to testing of respective system.

3.2.14.3.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform reviews of Certificates of Readiness for accuracy to ensure systems are complete and ready for testing for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.3.4 Installing Contractors Responsibilities

Installing Contractors must prepare, sign, and date Certificates of Readiness indicating systems are complete and ready for testing and provide to the Lead Commissioning Specialist.

3.2.14.4 Functional Performance Testing and Integrated Systems Testing

3.2.14.4.1 General Requirements

Functional Performance Testing and Integrated Systems Testing must be performed using approved checklists and all required Commissioning Team participants must be present prior to start of testing. Testing must be aborted and rescheduled to occur at a later date if any Commissioning Team

participant is not present or if deficiencies discovered during testing prevent successful completion. Testing of any equipment or system is prohibited until after its Certified Certificate of Readiness has been submitted and approved.

All necessary materials and system modifications to simulate actual conditions as close as is practically possible must be provided. Complete all testing by returning affected equipment and systems to pre-test conditions.

3.2.14.4.2 Complex Systems and Integrated Systems Category Requirements

Testing of complex systems as defined in paragraph COMPLEX SYSTEMS and testing of systems listed under item entitled "Integrated Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be performed as specified in the following paragraphs.

3.2.14.4.2.1 Equipment Featuring On-Board Factory Packaged Controls

Testing of equipment featuring on-board factory packaged controls must include, but not be limited to, testing specified in the following paragraphs.

a. Equipment enabling and disabling.

b. Equipment standard and optional control points necessary to accomplish functionality whether or not control points are specified in Plans and Specifications.

c. Equipment standard and optional alarms critical to safe operation whether or not optional alarms are specified in Plans and Specifications.

d. All control points added by Controls Contractor in addition to on-board factory packaged controls whether or not control points are specified in Plans and Specifications.

3.2.14.4.2.2 Test Setup and Condition Simulation

Test setup must include all necessary materials and system modifications to simulate flows, pressures, temperatures, and other conditions necessary to perform testing according to specified conditions must be provided.

Condition simulation must be accomplished by temporarily changing control system setpoints. Condition simulation by over-writing control system inputs (actual) values is prohibited unless approved in advance of test by the Contracting Officer's Technical Representative.

3.2.14.4.2.3 Condition Simulation Methods

Condition simulation methods for equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED that are acceptable are specified in the following paragraphs.

a. When varying static pressures inside ductwork cannot be simulated within the duct, and where a sensor signals the controls system to initiate sequences at various duct static pressures, it is acceptable to simulate the various pressures with a Pneumatic Squeeze-Bulb Type

Signaling Device with gauge temporarily attached to the sensing tube leading to the transmitter. It is not acceptable to reset the various setpoints, nor to simulate an electric analog signal unless approved as specified in the preceding paragraphs.

b. Dirty filter pressure drops can be simulated using sheets of cardboard at filter face.

c. Freeze-stat safeties can be simulated by packing portion of sensor with ice.

d. High outside air temperatures can be simulated with a hair blower.

e. High entering cooling coil temperatures can be used to simulate entering cooling coil conditions.

f. Do not use signal generators to simulate sensor signals unless approved by the Contracting Officer's Technical Representative, as noted above, for special cases.

g. Control setpoints can be altered. For example, to see the air conditioning compressor lockout work at an outside air temperature below lockout setpoint, when the outside air temperature is above lockout setpoint, temporarily change the lockout setpoint to be minus 0 degrees above the current outside air temperature. Caution: Setpoints are not to be raised or lowered to a point such that damage to the components, systems, or the building structure and/or contents will occur.

h. Test duct mounted smoke detectors in accordance with the manufacturer's recommendations. Perform testing with air system at minimum airflow condition in ductwork.

i. Test current sensing relays used for fan and pump status signals to control system to indicate unit failure and run status by resetting the setpoint on the relay to simulate a lost belt or unit failure while the unit is running. Confirm that the failure alarm was generated and received at the control system. After the test is performed, return the setpoint to its original setpoint or a setpoint as indicated by the Contracting Officer's Technical Representative.

3.2.14.4.3 Sample Strategy

3.2.14.4.3.1 General Requirements

100-Percent testing of all systems unless modified in the following paragraphs. Sample strategy for testing must be equally applied to each building in this project.

Sample strategy must be applied to total equipment and system counts specified for system categories under paragraph SYSTEMS TO BE COMMISSIONED.

3.2.14.4.3.2 Complex Systems

Sample strategy for all complex systems as defined in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for central plant equipment such as chilled water and HVAC heating hot water systems, air handling unit systems

including all associated fans except for remote exhaust air fans, dedicated outside air systems including all associated fans except for remote exhaust air fans, and renewable energy system.

b. 20-Percent sample testing for equipment with identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps. Sample must include at least one complete item such as one complete unitary air-conditioner.

3.2.14.4.3.3 Plumbing Systems

Sample strategy for all systems listed under item entitled "Plumbing Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED except plumbing systems defined as complex systems in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for central plant equipment such as natural gas systems, domestic cold water systems, domestic heating hot water systems, and process water systems.

b. 20-Percent sample testing for equipment with identical features such as fixtures, irrigation systems, emergency eyewash stations, and vacuum systems. Sample must include at least one complete item such as one complete fixture.

3.2.14.4.3.4 Electrical Type II Systems

Sample strategy for all systems listed under item entitled "Electrical Type II Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED except electrical systems defined as complex systems in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for equipment such as emergency power systems featuring single operation generator sets, automatic transfer switches, and uninterruptible power supplies (not local uninterruptible power supplies), emergency response systems, and frequency converters.

b. 20-Percent sample testing for equipment with identical features such as lighting systems, daylighting control systems, and fenestration control systems. Sample must include at least one complete item such as lighting in one space.

3.2.14.4.3.5 Building Envelope Systems, Components, and Assemblies

Sample strategy for all systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED must be as specified in the following paragraphs.

a. 20-Percent sample testing of surface area for each unique type of construction for thermal integrity verification of entire of the building envelope, components, and assemblies.

b. 20-Percent sample testing of surface area for each unique type of construction for moisture integrity verification of the building envelope, components, and assemblies.

3.2.14.4.4 Unsuccessful Testing and Re-Testing Costs

3.2.14.4.4.1 Unsuccessful Testing of 100-Percent Sample

Testing must be failed for equipment or systems for which 100-percent sample size are tested if one or more of the test procedures results in discovery of a deficiency that cannot be resolved within five minutes during testing.

Re-testing must be witnessed to the extent necessary to confirm that deficiencies have been corrected without negatively impacting the performance of the rest of the system.

3.2.14.4.4.2 Unsuccessful Testing of Less than 100-Percent Sample

Testing must be failed for equipment or systems for which less than 100-percent sample size are tested if one or more of the test procedures results in discovery of a deficiency, regardless of whether the deficiency is corrected during the sample test.

a. Re-testing must be witnessed of only items which experienced initial failures if the failure rate is 5-percent or less, meaning that 5-percent or less of the equipment or systems had at least one deficiency.

b. Re-testing must be witnessed of items which experienced initial failures to the extent necessary to confirm that the deficiencies have been corrected if the failure rate is higher than 5-percent, meaning that more than 5-percent of equipment or systems tested had at least one deficiency. In addition, testing of another random sample must be witnessed for the same size as the initial sample for the first time. If the second random sample set has any failures, those failed items must be retested and all remaining equipment and systems must be tested to complete 100-percent testing of that system type.

3.2.14.4.4.3 Re-Testing Costs

Re-testing costs must be reimbursed to the Government. These costs must include salary, travel costs, and per diem for Government personnel and all Commissioning Team participants. Reimbursement responsibilities are specified in the following paragraphs.

a. Commissioning Team participants who were not present must equally share reimbursement costs.

b. Installing Contractors and Equipment Suppliers who were responsible for discovered deficiencies resulting in test failures must equally share reimbursement costs.

3.2.14.4.5 Commissioning Team Participants

Participants of Functional Performance Testing and Integrated Systems Testing must include, but not be limited to, participants specified in the following paragraphs. The Contracting Officer's Technical Representative, Public Works Department Division (PWD) Representatives, and Using Agent's Representatives (Users) may, but are not required to, participate in any testing.

3.2.14.4.5.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Controls Commissioning Representative (CC).

d. Installing Contractors' TAB Commissioning Representative (TAB).

e. Installing Contractors' Mechanical Commissioning Representative (MC).

f. Equipment Supplier (ES).

3.2.14.4.5.2 Plumbing Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Plumbing Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Plumbing Commissioning Representative (PC).

d. Equipment Supplier (ES).

e. Installing Contractors' Controls Commissioning Representative (CC).

3.2.14.4.5.3 Utility Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Utility Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Controls Commissioning Representative (CC).

d. Installing Contractors' TAB Commissioning Representative (TAB).

e. Installing Contractors' Mechanical Commissioning Representative (MC).

f. Installing Contractors' Electrical Commissioning Representative (EC).

g. Equipment Supplier (ES).

3.2.14.4.5.4 Electrical Type II Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Electrical Type II Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Electrical Technical Commissioning Specialist (CxE).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Electrical Commissioning Representative (EC).

d. Equipment Supplier (ES).

3.2.14.4.5.5 Building Envelope Systems, Components, and Assemblies

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Building Envelope Technical Commissioning Specialist (CxB).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Building Envelope Commissioning Representative (BC).

d. Equipment Supplier (ES).

3.2.14.4.6 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Testing to select which systems must be tested for samples of less than 100-percent.

b. Coordinate logistics with Installing Contractors.

c. Submit completed Final Functional Performance Test Checklists for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than 14 calendar days after successful testing of all systems listed under the respective systems category.

3.2.14.4.7 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must witness, re-witness, and document all testing for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.4.8 Installing Contractors Responsibilities

Installing Contractors must provide all necessary materials and perform all aspects of testing including modifications to simulate actual conditions for all equipment and systems related to their contract.

3.2.14.4.9 Equipment Suppliers Responsibilities

Equipment Suppliers must perform all aspects of testing of equipment featuring on-board factory packaged controls provided as part of their contract. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

3.2.14.4.10 Installing Contractors and Equipment Supplier Coordination

Installing Contractors and Equipment Suppliers must simultaneously perform all aspects of testing of equipment featuring on-board factory packaged controls provided as part of their contract.

3.2.15 Systems Manuals

3.2.15.1 General Requirements

Systems Manuals must be prepared for all commissioned equipment and systems and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Final Owner's Project Requirements.

b. Final Basis of Design.

c. Recommended maintenance schedules when schedules are not provided in Operation and Maintenance manuals.

d. Recommended re-testing schedule.

e. Blank copy of all approved final Functional Performance Test Checklists.

g. Complete equipment warranty information.

h. Recommended schedule for sensor and actuator calibration.

Systems Manual contents for all complex systems as defined in paragraph COMPLEX SYSTEMS, in addition to contents specified in the preceding paragraphs, must include, but not be limited to, contents specified in the following paragraphs.

a. As-built system single line diagrams.

b. As-built sequences of operation and controls drawings.

c. As-built control system setpoints.

3.2.15.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of contents required for all Systems Manuals to Installing Contractors.

b. Prepare and submit all Systems Manuals as a single submittal no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

3.2.15.3 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, provide required contents for all Systems Manuals to the Lead Commissioning Specialist.

3.2.16 Training

3.2.16.1 Training Plans

Training Plans must be prepared for all commissioned equipment and systems and contents must include, but not be limited to, contents specified in the following paragraphs.

a. List of those who should receive training by position or name.

b. List of systems that require training organized by Specification Section.

c. Training content.

d. Level of instruction required.

e. Level of required instructor expertise.

f. Trainer name and trainer contact information.

g. Identification of whether training is conduced on-site or in a classroom setting.

h. Schedule and location of training.

i. Criteria for determining whether provided training is acceptable.

j. Blank Training Attendance Rosters.

3.2.16.2 Training

Training must be performed in accordance with Training Plans and in accordance with requirements specified in respective Technical Sections.

3.2.16.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit all Training Plans as a single submittal no later than 30 calendar days prior to the occurrence of any training session.

b. Provide approved Training Plans to Installing Contractors.

c. Submit all completed Training Attendance Rosters as a single submittal no later than 14 calendar days after completion of all training

sessions.

3.2.16.4 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform activities specified in the following paragraphs.

a. Perform training as specified in the preceding paragraphs.

b. Require all training attendees to sign Training Attendance Rosters.

c. Provide completed Training Attendance Rosters no later than seven calendar days after completion of all training sessions to the Lead Commissioning Specialist.

3.2.17 Final Commissioning Report

3.2.17.1 General Requirements

The Final Commissioning Report must be prepared and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Executive summary describing the overall commissioning process.

b. Results of the commissioning process.

c. Issues Log.

d. Commissioning Design Review Reports.

e. Approved Construction Phase Final Commissioning Plan.

f. Approved Pre-Final Test and Balance Reports.

g. Completed Pre-Functional Checklists.

h. Endurance Testing Reports.

i. Completed Functional Performance Test Checklists.

k. Approved Training Plans.

l. Completed Training Attendance Rosters.

m. Identification of all deficiencies complete with corrective actions taken.

n. Indication that systems meet requirements of the Owner's Project Requirements and Plans and Specifications.

o. List of any testing that must be performed during the Post-Construction (Warranty) Phase.

3.2.17.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit the Final Commissioning Report no later than 14

calendar days after successful completion of all Functional Performance Testing and all Integrated Systems Testing.

b. File one copy of Approved Final Commissioning Report in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Final Commissioning Report.

3.3 POST-CONSTRUCTION (WARRANTY) PHASE

3.3.1 Post-Construction Phase ASHRAE 189.1 Commissioning Compliance

3.3.1.1 General Requirements

Activities must include, but not be limited to, post-construction phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, post-construction phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and post-construction phase commissioning activities specified in this Section.

3.3.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under item entitled "Post-Construction Phase ASHRAE 189.1 Commissioning Compliance."

3.3.2 Post-Construction Phase Sustainability Third Party Certification (TPC)

3.3.2.1 General Requirements

Activities must include, but not be limited to, post-construction phase commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, post-construction phase commissioning activities listed in all of its references as modified in this Section, and post-construction phase commissioning activities specified in this Section.

3.3.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Post-Construction Phase Sustainability Third Party Certification (TPC)."

3.3.3 Post-Construction Phase Issues Log

3.3.3.1 General Requirements

The Post-Construction Phase Issues Log must be maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Post-Construction Phase Issues Log must include the name of Commissioning Team member identifying

the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Post-Construction Phase Issues Log must be a continuation of the Construction Phase Issues Log and must be prepared in an electronic format that can be used throughout the Post-Construction Phase such that it can be provided to the Government upon request.

3.3.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Post Construction Phase Issues Log and must submit one electronic copy no later than 14 calendar days after completion of any Post-Construction Phase commissioning activity.

3.3.4 Post-Construction Phase Site Observations

3.3.4.1 General Requirements

Post-Construction Phase Site Observations must be performed between eight and 10 months after Beneficial Occupancy to verify and document that all commissioned equipment and systems are operating in accordance with the Owner's Project Requirements.

Post-Construction Phase Site Observations are prohibited from being combined with witnessing Post-Construction Phase Functional Performance Testing or witnessing Post-Construction Phase Integrated Systems Testing.

3.3.4.2 Site Observation Reports

Site Observation Reports must be prepared for each Site Observation for the purpose of documenting issues discovered during Site Observation.

3.3.4.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Site Observation to schedule attendance of Operations and Maintenance staff and occupants and to make provisions for access to all commissioned equipment and systems.

b. Submit Post-Construction Phase Site Observation Reports no later than 14 calendar days after Site Observation.

3.3.4.4 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Interview Operations and Maintenance staff.

b. Interview occupants.

c. Determine status of unresolved commissioning issues.

d. Compare current operations to operations identified throughout the commissioning process.

e. Prepare Post-Construction Phase Site Observation Reports.

3.3.5 Inspections and Testing

3.3.5.1 Post-Construction Phase Endurance Testing

3.3.5.1.1 General Requirements

Post-Construction Phase Endurance Testing (trending of control system control points) requirements and activities for each complex system as defined in paragraph COMPLEX SYSTEMS must be performed if all requirements and activities for respective system could not be fully or successfully completed during Construction Phase Endurance Testing.

Post-Construction Phase Endurance Testing requirements and activities must include, but not be limited to, requirements and activities specified for Construction Phase Endurance Testing as modified in the following paragraphs. Systems must be operating as normally anticipated during occupancy throughout Endurance Testing.

3.3.5.1.2 Post-Construction Phase Endurance Testing Reports

A Post-Construction Phase Endurance Testing Report must be prepared and contents must include, but not be limited to, an executive summary, Technical Commissioning Specialists’ review comments, trend results in graphical format, and raw trend data for all trend results for each trended system.

3.3.5.1.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing and specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Endurance Testing to make provisions for access to all commissioned equipment and systems.

b. Coordinate logistics of trend data collection with Installing Contractors.

c. Prepare and submit Post-Construction Phase Endurance Testing Reports as a single submittal no later than 14 calendar days after preparation of all Endurance Testing Reports. In addition, submit one electronic copy of raw trend data.

3.3.5.1.4 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing and specified in the following paragraphs.

a. Setup trend hardware during one site visit and retrieve trend data and trend hardware as applicable during an additional site visit.

3.3.5.1.5 Equipment Suppliers Responsibilities

Equipment Suppliers must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing.

3.3.5.2 Certified Certificates of Readiness and Certificates of Readiness

Certified Certificates of Readiness and Certificates of Readiness are not required for any Post-Construction Phase activity.

3.3.5.3 Post-Construction Phase Functional Performance Testing and Integrated Systems Testing

3.3.5.3.1 General Requirements

Functional Performance Testing and Integrated Systems Testing must be performed for all commissioned equipment and systems that could not be fully or successfully tested during the Construction Phase. Testing must be performed using approved checklists and all required Commissioning Team participants must be present prior to start of testing. Testing must be aborted and rescheduled to occur at a later date if any Commissioning Team participant is not present or if deficiencies discovered during testing prevent successful completion.

Functional Performance Testing and Integrated Systems Testing requirements and activities must include, but not be limited to, requirements and activities specified for Construction Phase Functional Performance Testing and Integrated Systems Testing as modified in paragraphs under paragraph POST-CONSTRUCTION (WARRANTY) PHASE.

3.3.5.3.2 Commissioning Team Participants

Participants of Functional Performance Testing and Integrated Systems Testing must include, but not be limited to, participants specified in the following paragraphs. The Contracting Officer's Technical Representative, Public Works Department Division (PWD) Representatives, and Using Agent's Representatives (Users) may, but are not required to, participate in any testing.

a. Lead Commissioning Specialist.

b. Technical Commissioning Specialists.

c. Installing Contractors.

d. Equipment Suppliers.

3.3.5.3.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to witnessing Functional Performance Testing and Integrated Systems Testing to make provisions for access to all commissioned equipment and systems.

b. Coordinate logistics with Installing Contractors.

c. Submit completed Final Functional Performance Test Checklists for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than 14 calendar days after successful testing of all systems listed under the respective systems category.

3.3.6 Updated Systems Manuals

3.3.6.1 General Requirements

Updated Systems Manuals must be prepared and must be an update to Systems Manuals prepared during the Construction Phase and contents must include, but not be limited to, changes resulting from Post-Construction Phase commissioning activities.

3.3.6.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit all Updated Systems Manuals as a single submittal no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

3.3.7 Updated Final Commissioning Report

3.3.7.1 General Requirements

The Updated Final Commissioning Report must be prepared and must be an update to the Final Commissioning Report prepared during the Construction Phase and contents must include, but not be limited to, changes resulting from Post-Construction Phase commissioning activities.

3.3.7.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Updated Final Commissioning Report no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

File one copy of Approved Updated Final Commissioning Report in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Updated Final Commissioning Report.

-- End of Section --

2019-99-99b-UFGS 01 91 00.15 22 - Total Building Commissioning SEC Rev00
SECTION 01 91 00.15 22

TOTAL BUILDING COMMISSIONING FOR PROJECT P-1527
11/19

PART 1 GENERAL

1.1 SUMMARY

The Government has employed an independent Commissioning Firm that has employed or has contracted Lead and Technical Commissioning Specialists. This Section specifies the commissioning scope of work for the entire Commissioning Team

Commissioning responsibilities assigned in this Section to Lead and Technical Commissioning Specialists are for informational purposes.

1.2 COMMISSIONING LIMITATIONS

Commissioning requirements specified in this Section are prohibited from fulfilling requirements specified in other Sections. Requirements specified in other Sections are prohibited from fulfilling requirements specified in this Section.

All commissioning submittals must be submitted and reviewed in accordance with paragraph SUBMITTALS. Commissioning utilities including, but not limited to, tracking utilities and software for commissioning activities are prohibited from taking the place of these requirements.

1.3 SYSTEMS TO BE COMMISSIONED

Systems specified in the following paragraphs must be commissioned whether or not specified systems are required to be commissioned by any reference for pursuing Sustainability TPC.

Specified equipment and system counts are totals that include all buildings in this project.

1.3.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category

a. Up to one chilled water plant featuring up to two air-cooled chillers with packaged controls, up to two variable speed distribution pumps, and variable-primary distribution.

b. Up to one hot water plant featuring up to two fuel-fired condensing boilers each with an integral circulating pump and packaged controls, one boiler master control panel, up to two variable speed distribution pumps, and variable-primary distribution.

c. Up to two air handling units each featuring a variable-air-volume supply air fan, a chilled water coil, a hot water coil, air-side energy recovery, and packaged controls.

d. Up to 30 variable-air-volume air terminal units each featuring a hydronic heating coil.

e. Up to 10 fan coil units each featuring a chilled water coil and a hot water coil.

f. Up to eight computer room air-conditioning units each featuring packaged controls.

g. Up to eight unit heaters.

h. Up to one supply air fan.

i. Up to eight exhaust air fans.

j. Up to one Building Automation System.

1.3.2 Plumbing Systems Category

a. Up to 25 fixtures.

b. Up to one domestic heating hot water system featuring up to two fuel-fired condensing water heaters each with packaged controls, up to one recirculating pump, and up to one temperature mixing valve.

c. Up to three emergency eyewash stations.

d. Up to one compressed air system featuring packaged controls.

1.3.3 Utility Systems Category

a. Up to one energy monitoring and control system.

b. Up to one water utility metering system.

1.3.4 Electrical Type I Systems Category

a. Power - all grounding systems.

b. Power - all industrial control systems.

c. Power - all main distribution panels.

d. Power - all main transformers.

e. Power - all panelboards.

f. Power - all step-down transformers.

g. Power - all transient voltage surge protective devices.

1.3.5 Electrical Type II Systems Category

a. Cable television - all systems.

b. Communications - all public address systems.

c. Communications - all telecommunications entrance backbone and distribution systems.

d. Emergency power - up to one system featuring up to one single operation generator set and automatic transfer switches.

e. Emergency power off control - all systems.

f. Lighting - all emergency egress systems.

g. Lighting - all exit systems.

h. Lighting - all interior systems.

1.3.6 Building Envelope Systems, Components, and Assemblies Category

a. Air tightness / pressurization verification of building envelope, components, and assemblies.

b. Thermal integrity verification of building envelope, components, and assemblies.

c. Moisture integrity verification of building envelope, components, and assemblies.

d. All roofing including low sloped roofs and steep sloped roofs.

1.3.7 Integrated Systems Category

a. Testing of integrated systems is not required for this project.

1.4 COMPLEX SYSTEMS

Complex systems are defined as the following systems categories as listed under paragraph SYSTEMS TO BE COMMISSIONED with appropriate qualifiers and are subject to more stringent requirements as specified in this Section.

a. All equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category."

b. All equipment and systems listed under item entitled "Plumbing Systems Category" featuring on-board factory packaged controls. Refer to the following paragraph for definition of equipment featuring on-board factory packaged controls.

c. All equipment and systems listed under item entitled "Utility Systems Category."

Equipment featuring on-board factory packaged controls is defined as equipment that is a complex system as defined in paragraph COMPLEX SYSTEMS which features a controller issuing sophisticated logic-based commands to its internal components to accomplish the intent of Plans and Specifications. This equipment may function as either a stand-alone piece of commissioned equipment or may function as part of a commissioned system. This controller may be equipment mounted or may be remote mounted and may or may not interface with a building control system. Examples of equipment meeting and not meeting this definition are provided in the following paragraphs.

a. Equipment meeting this definition includes chillers, boilers provided with or without master controllers, packaged pumping systems, dedicated outside air systems, packaged rooftop units, computer room air conditioners, and air terminal units.

b. Equipment not meeting this definition includes unitary air-conditioners, packaged terminal air-conditioners, and heat pumps.

c. Equipment not meeting this definition, but requiring demonstration of minimum safe motor speed either prior to or during Functional Performance Testing includes variable frequency drives.

1.5 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF HEATING, REFRIGERATING AND AIR-CONDITIONING ENGINEERS (ASHRAE)

ASHRAE 189.1	(2014) Standard for the Design of High-Performance Green Buildings Except Low-Rise Residential Buildings

GREEN BUILDING INITIATIVE (GBI)

GBI GP Compliance	(2016) GBI Guiding Principles Compliance Program for New Construction (DOD Version)

1.6 SUBMITTALS

Commissioning submittals are not required to be submitted by the Installing Contractor.

1.7 COMMISSIONING TEAM

The Commissioning Team is defined as the entity that must perform all commissioning activities specified in this Section for systems listed under paragraph SYSTEMS TO BE COMMISSIONED. The Commissioning Team is composed of the Lead Commissioning Specialist, Technical Commissioning Specialists, Designers of Record, Installing Contractors, Equipment Suppliers, and the Contracting Officer's Technical Representative.

1.7.1 Lead Commissioning Specialist

The Lead Commissioning Specialist (CxC) is defined as the entity that must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, coordinating all aspects of the commissioning process; managing all Technical Commissioning Specialists; and submitting all Commissioning Plans, schedules, reports, and documentation directly to the Contracting Officer's Technical Representative as modified in this Section.

1.7.2 Technical Commissioning Specialists

Technical Commissioning Specialists are defined as entities that must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, performing reviews, witnessing that all system components have been installed, that each control device operates, that each equipment piece operates, that complete systems operate, and that interactive systems operate in accordance with Plans and Specifications.

Technical Commissioning Specialists must perform assigned responsibilities for equipment and systems listed under systems categories assigned to them

in this Section. Technical Commissioning Specialists are prohibited from performing responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

1.7.3 Designers of Record

Designers of Record are defined as the entities that must act as design professionals responsible for design of their respective system that is subject to commissioning. Designers of Record must perform all commissioning responsibilities assigned in this Section as directed by the General Contractor.

1.7.4 Installing Contractors

Installing Contractors are defined as the General Contractor's Superintendent or Project Manager; Quality Control Representative; and Mechanical, Controls, Plumbing, Electrical, Test and Balance, Fire Protection, and Building Envelope Sub-Contractors who provide, install, or construct systems in whole or in part for this contract. The General Contractor must provide a Lead Commissioning Representative to manage all Designers of Record, Sub-Contractor Commissioning Representatives, and Equipment Suppliers to accomplish all responsibilities assigned in this Section. Each Sub-Contractor must provide a Commissioning Representative to coordinate and perform all commissioning responsibilities for commissioned equipment and systems provided as part of their respective contract as directed by the General Contractor. Submission of commissioning related certifications or qualifications for the Lead Commissioning Representative and Installing Contractor Representatives is not required.

Installing Contractors must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, demonstrating performance of all commissioned equipment and systems provided as part of their respective contract and must provide all necessary materials, services, and labor required for successful demonstration as modified in this Section.

1.7.5 Equipment Suppliers

Equipment Suppliers (ES) are defined as factory authorized start-up technicians or factory representatives knowledgeable with start-up, demonstration, and testing of commissioned equipment featuring on-board factory packaged controls provided as part of their respective contract. Each Equipment Supplier must coordinate and perform all commissioning responsibilities assigned in this Section as directed by the General Contractor. Submission of commissioning related certifications or qualifications for Equipment Suppliers is not required. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

Equipment Suppliers must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, demonstrating performance of all commissioned equipment provided as part of their respective contract and must provide all necessary materials, services, and labor required for successful demonstration as modified in this Section.

1.7.6 Installing Contractors and Equipment Suppliers Coordination

Installing Contractors and Equipment Suppliers must coordinate and share demonstration and testing responsibilities specified in this Section for commissioned equipment featuring on-board factory packaged controls. Installing Contractors and Equipment Suppliers must simultaneously perform all aspects of demonstration and testing for these types of systems. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

1.7.7 Contracting Officer's Technical Representative

The Contracting Officer's Technical Representative (COTR) represents the Government for all elements of the commissioning process. The COTR will serve as the single point of contact with the Lead Commissioning Specialist, will receive all commissioning submittals, may attend meetings, and may, but is not required to, witness field inspections and testing specified in this Section.

1.8 COMMUNICATIONS

1.8.1 Communications with the Contracting Officer's Technical Representative

Communication with the Contracting Officer's Technical Representative must be through the Lead Commissioning Specialist who acts as the single direct point of contact for all aspects of the commissioning process.

1.8.2 Communications between the Commissioning Team

Communications between the Commissioning Team including, but not limited to, verbal communications, schedule information, and exchange of information specified in this Section, must occur directly between the Commissioning Team without requiring interaction of the Contracting Officer's Technical Representative.

1.9 PHASING

This project is not phased.

1.10 ASHRAE 189.1 COMMISSIONING COMPLIANCE

ASHRAE 189.1 commissioning compliance is required for this project.

1.10.1 General Requirements

All commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, commissioning activities listed in references contained in ASHRAE 189.1's paragraphs as modified in this Section, and commissioning activities specified in this Section must be performed. All commissioning activities that are referred to as "optional activities," "guidance," "should activities," "recommendations," "suggested practices," "informative information," or listed as similar designations are mandatory regardless of any qualifiers.

Commissioning activities listed in ASHRAE 189.1's paragraphs that also have requirements specified in this Section are listed only where requirements are specified in this Section and these commissioning activities are not repeated under ASHRAE 189.1's paragraphs.

1.10.2 Commissioning Team Responsibilities

The Commissioning Team must, at a minimum, perform all commissioning activities specified in the preceding item entitled "General Requirements" and must perform all commissioning activities specified in this Section. This Section takes precedence should there be a conflict between requirements listed in this Section and requirements listed in the Standard or listed in any of its references.

1.11 SUSTAINABILITY THIRD PARTY CERTIFICATION (TPC)

Sustainability Third Party Certification (TPC) is required for this project.

1.11.1 General Requirements

All commissioning activities listed in all references for pursuing Sustainability TPC as modified in this Section and commissioning activities specified in this Section must be performed. All commissioning activities that are referred to as "optional activities," "guidance," "should activities," "recommendations," "suggested practices," "informative information," or listed as similar designations are mandatory regardless of any qualifiers and whether or not activity is included as total points toward Sustainability TPC.

Commissioning activities listed in all references for pursuing Sustainability TPC that also have requirements specified in this Section are listed only where requirements are specified in this Section and these commissioning activities are not repeated under references for pursuing Sustainability TPC.

1.11.2 Commissioning Team Responsibilities

The Commissioning Team must, at a minimum, perform all commissioning activities specified in the preceding item entitled "General Requirements," perform commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, perform commissioning activities listed in all of its references as modified in this Section, and perform commissioning activities specified in this Section. This Section takes precedence should there be a conflict between requirements listed in this Section and requirements listed in the reference for pursuing Sustainability TPC or listed in any of its references.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 DESIGN PHASE

3.1.1 Design Phase ASHRAE 189.1 Commissioning Compliance

3.1.1.1 General Requirements

Activities must include, but not be limited to, design phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6

as modified in this Section, design phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and design phase commissioning activities specified in this Section.

3.1.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under item entitled "Design Phase ASHRAE 189.1 Commissioning Compliance."

3.1.2 Design Phase Sustainability Third Party Certification (TPC)

3.1.2.1 General Requirements

Activities must include, but not be limited to, design phase commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, design phase commissioning activities listed in all of its references as modified in this Section, and design phase commissioning activities specified in this Section.

3.1.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Design Phase Sustainability Third Party Certification (TPC)."

3.1.3 Design Phase Commissioning Coordination Meeting

3.1.3.1 General Requirements

A Design Phase Commissioning Coordination meeting must be conducted no later than 30 calendar days prior to the first Plans and Specifications submission or no later than 30 calendar days after approval of Commissioning Firm certifications and all Commissioning Specialist certifications, whichever occurs last. Meeting topics must include, but not be limited to, the commissioning process, contract requirements, lines of communication, roles and responsibilities, schedules, documentation requirements, and logistics as specified in this Section. Meeting must be conducted by conference call.

3.1.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, conduct meeting and prepare meeting minutes complete with Attendance Roster.

3.1.3.3 Designers of Record, Installing Contractors, and Others Responsibilities

Designers of Record and Installing Contractors must attend this meeting. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may also attend this meeting.

3.1.4 Design Phase Commissioning Plan

3.1.4.1 General Requirements

The Design Phase Commissioning Plan must be prepared and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Plan purpose.

b. Commissioning scope.

c. Commissioning process outline.

d. List of all commissioned equipment and systems.

e. Building information.

f. Contact information for the Lead Commissioning Specialist, Technical Commissioning Specialists, Designers of Record, and Contracting Officer's Technical Representative.

g. Criteria listing including Unified Facilities Criteria and Building Codes and Standards.

h. Description of Commissioning Team members.

i. Roles and responsibilities.

j. Lines of communication.

k. Documentation requirements.

l. Owner's Project Requirements.

m. Description of the Basis of Design.

n. Description of Plans and Specifications reviews performed by Technical Commissioning Specialists.

o. Description of Plans and Specifications reviews performed by the Contracting Officer's Technical Representative.

p. Examples and descriptions of Site Observation Reports and Issues Log.

q. Listing and description of Design Phase and Construction Phase Commissioning meetings.

r. Identification of commissioning activities for incorporation into the Project Construction Schedule.

s. Listing of submittals required by Technical Commissioning Specialists.

t. Examples and description of the development of Pre-Functional Checklists, Functional Performance Test Checklists, and Integrated Systems Test Checklists.

u. Description of Pre-Functional Checks, Functional Performance Testing,

and Integrated Systems Testing.

v. Description of Endurance Testing.

w. Description of Ductwork Air Leak Test (DALT) field acceptance testing specified in Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

x. Description of Performance Verification Test (PVT) field acceptance testing specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC.

y. Description of Test and Balance (TAB) field acceptance testing specified in Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

z. Listing of Operation and Maintenance Manual requirements.

aa. Description of Systems Manuals.

bb. Description of training requirements.

cc. Description of Final Commissioning Report.

3.1.4.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Design Phase Commissioning Plan no later than 45 calendar days after approval of Commissioning Specialists certifications.

File one copy of Approved Design Phase Commissioning Plan in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Design Phase Commissioning Plan.

3.1.5 Design Phase Issues Log

3.1.5.1 General Requirements

The Design Phase Issues Log must be prepared and maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Design Phase Issues Log must include the name of Commissioning Team member identifying the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Design Phase Issues Log must be prepared in an electronic format that can be used throughout the Design Phase such that it can be provided to the Government upon request.

3.1.5.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Design Phase Issues Log and must submit one electronic copy no later than seven calendar days after the addition of an issue or a change in status of an issue.

3.1.6 Commissioning Design Reviews

3.1.6.1 General Requirements

Commissioning Design Reviews must be performed and must include reviews

and back-checks of the Owner's Project Requirements (OPR), the Basis of Design and Design (BOD), and Plans and Specifications in accordance with Sustainability TPC rating system requirements and requirements specified in this Section. The number and schedule of design reviews must be in accordance with Sustainability TPC requirements and must include, but not be limited to, review of first Plans and Specifications submission and back-checks of all subsequent submissions. Plans and Specifications submissions are specified in the following paragraphs.

a. Design Development Plans and Specifications submission.

b. 100-Percent Pre-Final Plans and Specifications submission.

c. Final Plans and Specifications submission.

Commissioning Design Reviews must assess completeness and clarity of the OPR, verify requirements stated in the OPR are addressed in the BOD, and verify the Design Plans and Specifications are prepared in accordance with the BOD and applicable Unified Facilities Criteria (UFC). All issues, including those that would negatively impact building system operation and maintenance, must be identified and be provided with proposed corrective actions. The OPR and BOD are for review purposes only and are not contractually enforceable.

3.1.6.2 Commissioning Design Review Reports

A Commissioning Design Review Report must be prepared for each review and back-check of Plans and Specifications and must include each issue listed individually and its corresponding proposed corrective action. Issues must be separated into categories corresponding to systems categories listed under paragraph SYSTEMS TO BE COMMISSIONED.

Updated Commissioning Design Review Reports must be prepared to include resolution of outstanding issues reached during Commissioning Design Review meetings.

3.1.6.3 Commissioning Design Review Meetings

A Commissioning Design Review meeting must be conducted no later than 14 calendar days after preparation of each Commissioning Design Review Report to discuss proposed corrective actions and to resolve outstanding issues. The Contracting Officer's Technical Representative may attend these meetings. Meeting must be conducted by conference call.

3.1.6.4 Lead Commissioning Specialist Responsibilities

Lead Commissioning Specialist activities must include, but not be limited to, activities specified in the following paragraphs.

a. Prepare and provide Commissioning Design Review Reports to Designers of Record.

b. Conduct Commissioning Design Review meetings.

c. Update Commissioning Design Review Reports.

d. Prepare and submit Updated Commissioning Design Review Reports no later than 14 calendar days after each Commissioning Design Review meeting.

3.1.6.5 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists activities must include, but not be limited to, performing reviews and back-checks of Plans and Specifications and attending Commissioning Design Review meetings for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.1.6.6 Designers of Record Responsibilities

Designers of Record activities must include, but not be limited to, providing written responses to Commissioning Design Review Reports and attending Commissioning Design Review meetings.

3.2 CONSTRUCTION PHASE

3.2.1 Construction Phase ASHRAE 189.1 Commissioning Compliance

3.2.1.1 General Requirements

Activities must include, but not be limited to, construction phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, construction phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and construction phase commissioning activities specified in this Section.

3.2.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under the item entitled "Construction Phase ASHRAE 189.1 Commissioning Compliance."

3.2.2 Construction Phase Sustainability Third Party Certification (TPC)

3.2.2.1 General Requirements

Activities must include, but not be limited to, commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, commissioning activities listed in all of its references as modified in this Section, and commissioning activities specified in this Section.

3.2.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Construction Phase Sustainability Third Party Certification (TPC)."

3.2.3 Construction Phase Sequencing

3.2.3.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Heating, ventilation, and air-conditioning (HVAC) systems activities specified in the following paragraphs must be performed as applicable prior to performing Functional Performance Testing of systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED.

a. All equipment and systems have been completed, cleaned, flushed, disinfected, calibrated, tested, and operate in accordance with Plans and Specifications.

b. All Ductwork Air Leakage Testing (DALT) field work, Test and Balance (TAB) field work, Pre-Final TAB Reports, and related prerequisites have been completed, submitted, and approved in accordance with Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

c. All testing of building envelope, components, and assemblies for air tightness / pressurization verification, thermal integrity verification, and moisture integrity verification have been completed, submitted, and approved.

d. All Pre-Functional Checklists have been completed, submitted, and approved.

e. Certified Certificates of Readiness for respective system has been completed, submitted, and approved.

All completed Final Functional Performance Test Checklists for commissioned equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be submitted and approved prior to the Government performing any Performance Verification Testing specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC.

3.2.3.2 Electrical Systems

Electrical systems activities specified in the following paragraphs must be performed as applicable prior to performing Functional Performance Testing of systems listed under item entitled "Electrical Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED.

a. All electrical, power generation, and lighting equipment and systems have been completed, calibrated, tested, and operate in accordance with Plans and Specifications.

b. Building Envelope is enclosed according to contract documents with final construction completed.

c. All ceiling tiles, floor coverings, and window coverings are in place.

d. All lamps have completed a minimum 100-hour burn-in period.

e. All furniture is in place.

f. Certified Certificates of Readiness for respective system has been

completed, submitted, and approved.

3.2.4 Construction Phase Scheduling

3.2.4.1 General Requirements

Commissioning activities and other related activities for inclusion into the Project Construction Schedule must include, but not be limited to, activities specified in the following paragraphs.

a. Perform Construction Phase Commissioning Coordination meeting.

b. Submittal and approval of Construction Phase Interim Commissioning Plan.

c. Submittal and approval of Construction Phase Final Commissioning Plan.

d. Submittal and approval of completed Pre-Functional Checklists.

e. Perform testing of building envelope, components, and assemblies for air tightness / pressurization verification, thermal integrity verification, and moisture integrity verification.

f. Submittal and approval of proposed Functional Performance Test Checklists.

g. Submittal and approval of final Functional Performance Test Checklists.

j. Perform Construction Phase Site Observations.

k. Participate in Construction Phase Endurance Testing.

l. Witness Construction Phase Functional Performance Testing.

m. Corrections of deficiencies discovered during Construction Phase Functional Performance Testing.

n. Re-witness Construction Phase Functional Performance Testing.

r. Provide all Systems Manuals contents.

s. Submittal and approval of completed Systems Manuals.

t. Perform training.

u. Submittal and approval of Final Commissioning Report.

v. Perform Post-Construction Phase Site Observations.

w. Participate in Post-Construction Phase Endurance Testing.

x. Witness Post-Construction Phase Functional Performance Testing.

y. Corrections of deficiencies discovered during Post-Construction Phase Functional Performance Testing.

z. Re-witness Post-Construction Phase Functional Performance Testing.

3.2.4.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must request a current Project Construction Schedule from Installing Contractors no later than at the Construction Phase Commissioning Coordination Meeting and must prepare and provide to Installing Contractors a list of commissioning activities for inclusion into the Project Construction Schedule. The Lead Commissioning Specialist must associate each commissioning activity to a single construction activity such that if the date of the construction activity changes, the associated commissioning activity changes accordingly.

3.2.4.3 Installing Contractors Responsibilities

Installing Contractors must provide a current Project Construction Schedule to the Lead Commissioning Specialist upon receiving request. Installing Contractors must incorporate the list of commissioning activities into the Project Construction Schedule and must link each commissioning activity to the associated construction activity identified by the Lead Commissioning Specialist such that if the date of the construction activity changes, the associated commissioning activity changes accordingly.

Installing Contractors must provide updated Project Construction Schedules to the Lead Commissioning Specialist at least on a monthly basis.

3.2.5 Construction Phase Commissioning Coordination Meeting

3.2.5.1 General Requirements

A Construction Phase Commissioning Coordination meeting must be conducted no later than 14 calendar days after approval of Commissioning Firm and Commissioning Specialists certifications to discuss topics that include, but not be limited to, the commissioning process, contract requirements, lines of communication, roles and responsibilities, commissioning activities for inclusion into the Project Construction Schedule, documentation requirements, Inspections and Testing, and logistics specified in this Section. Meeting must be conducted by conference call.

3.2.5.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, conduct meeting and prepare meeting minutes complete with Attendance Roster.

3.2.5.3 Installing Contractors, Designers of Record, and Other Commissioning Team Member Responsibilities

Installing Contractors and Designers of Record must attend this meeting. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may attend this meeting.

3.2.6 Construction Phase Commissioning Progress Meetings

3.2.6.1 General Requirements

Construction Phase Commissioning Progress meetings must be conducted to discuss topics that include, but not be limited to, unresolved commissioning issues, status of items specified to be provided to the Lead Commissioning Specialist, and upcoming commissioning activities. Two Construction Phase Commissioning Progress meetings must be conducted for

each systems category unless modified in the following paragraphs. Meetings must be conducted by conference call.

a. Heating, Ventilation, and Air-Conditioning (HVAC) Systems: Six meetings.

b. Building Envelope Systems, Components, and Assemblies: Three meetings.

Construction Phase Commissioning Progress meetings are prohibited from being combined with conducting Construction Phase Commissioning Coordination meeting, conducting Site Observations, witnessing Functional Performance Testing, or witnessing Integrated Systems Testing.

3.2.6.2 Technical Commissioning Specialists Responsibilities

Each Technical Commissioning Specialist must, at a minimum, conduct meetings and prepare meeting minutes complete with Attendance Roster for systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for systems categories assigned to other Technical Commissioning Specialists.

3.2.6.3 Installing Contractors and Others Responsibilities

Installing Contractors must attend these meetings. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may attend these meetings.

3.2.7 Construction Phase Interim Commissioning Plan

3.2.7.1 General Requirements

The Construction Phase Interim Commissioning Plan must be prepared and must be an update to the Design Phase Commissioning Plan and contents must include, but not be limited to, contents specified in the following paragraphs.

a. All contents specified for the Design Phase Commissioning Plan.

b. Basis of Design.

c. Contact information for the entire Commissioning Team.

3.2.7.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Construction Phase Interim Commissioning Plan no later than 30 calendar days after the Construction Phase Commissioning Coordination meeting and no later than 14 calendar days prior to performing construction of the building envelope.

3.2.8 Construction Phase Final Commissioning Plan

3.2.8.1 General Requirements

The Construction Phase Final Commissioning Plan must be prepared and must be an update to the Construction Phase Interim Commissioning Plan and contents must include, but not be limited to, contents specified in the following paragraphs.

a. All contents specified for the Construction Phase Interim Commissioning Plan.

b. All Pre-Functional Checklists.

c. All approved final Functional Performance Test Checklists.

3.2.8.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit the Construction Phase Final Commissioning Plan no later than 30 calendar days prior to performing any Functional Performance Testing.

b. File one copy of Approved Construction Phase Final Commissioning Plan in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Construction Phase Final Commissioning Plan.

3.2.9 Construction Phase Issues Log

3.2.9.1 General Requirements

The Construction Phase Issues Log must be prepared and maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Construction Phase Issues Log must include the name of Commissioning Team member identifying the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Construction Phase Issues Log must be a continuation of the Design Phase Issues Log and must be prepared in an electronic format that can be used throughout the Construction Phase such that it can be provided to the Government upon request.

3.2.9.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Construction Phase Issues Log and must submit one electronic copy no later than seven calendar days after the addition of an issue or a change in status of an issue.

3.2.10 Pre-Functional Checklists

3.2.10.1 General Requirements

Pre-Functional Checklists must be prepared for all commissioned equipment and contents must include, but not be limited to, contents for physical inspections that demonstrate construction, installation and start-up of equipment and systems is complete. Refer to item entitled "Pre-Functional Checklists" in item entitled "Inspections and Testing" for more information.

Download example Pre-Functional Checklists for Section 01 91 00.15 TOTAL BUILDING COMMISSIONING at the following location: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic Checklists must contain the same level of detail shown in examples, but are not required to match the format of examples.

3.2.10.2 Lead Commissioning Specialist Responsibilities

Lead Commissioning Specialist must provide blank Pre-Functional Checklists to Installing Contractors. Blank Pre-Functional Checklists are not required to be submitted to the Government.

3.2.10.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must prepare Pre-Functional Checklists for all equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.11 Functional Performance Test (FPT) Checklists

Functional Performance Test (FPT) Checklists must be prepared for all commissioned equipment and systems demonstrating performance is in accordance with Plans and Specifications. A single final FPT Checklist must be prepared for each system except that a single final FPT Checklist may be prepared for use with multiple systems that have identical features, unless modified in this Section. FPT Checklist contents must include, but not be limited to, step-by-step actions and expected results, unless modified in this Section. Refer to item entitled "Functional Performance Testing and Integrated Systems Testing" for more information.

3.2.11.1 Complex Systems Requirements

FPT Checklists must be prepared for all complex systems as defined in paragraph COMPLEX SYSTEMS demonstrating performance is in accordance with Plans and Specifications. A single FPT Checklist must be prepared for each system except that a single FPT Checklist may be prepared for use with multiple systems that have identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps. Refer to item entitled "Functional Performance Testing and Integrated Systems Testing" and item entitled "Sample Strategy" for more information.

Contents must include, but not be limited to, contents specified in the following paragraphs and shown in example FPT Checklists for Section 01 91 00.15 TOTAL BUILDING COMMISSIONING available for download at the following location:
http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic
FPT Checklists must contain the same level of detail specified below and as shown in examples, but are not required to match the format of examples.

a. Notable system features including information about such attributes as system sizing and controls to facilitate understanding of system operation.

b. Conclusions and recommendations based on control system feature, point-to-point, actuator, and system operation observations. Conclusions must clearly indicate if system does or does not perform in accordance with requirements of Plans and Specifications. Recommendation must clearly indicate that the system should or should not be accepted by the Government.

c. Test conditions including date, beginning and ending time, and

beginning and ending outdoor air conditions.

d. Identification of the equipment involved in the test.

e. Attendees present throughout the entire system test.

f. Control system feature identification including control point description, embedded/visible type, adjustable/monitoring type, actual value, and setpoint value/alarm range.

g. Point-to-point observations including demonstrating system flow meters and sensors have been calibrated and are correctly displayed on the Operator workstation.

h. Actuator operation observations demonstrating actuator responses to commands from the control system.

i. Variable frequency drive observations demonstrating minimum safe motor speed.

j. System operation observations for system-based testing demonstrating each control sequence, operation mode, and alarm condition resulting from control setpoint manipulation. System operation observations must include, but not be limited to, observations specified in the following paragraphs.

(1) Introduction identifying testing methodology.

(2) As-found conditions prior to system manipulation.

(3) Clear list of test items (step numbers).

(4) Design control sequences or interlocks segmented by unique functions.

(5) Intended test procedures following each segmented sequence or interlock identifying the system manipulation required to initiate system response.

(6) Expected system responses.

(7) Space for comments for each test item.

(8) Pass or fail indication for each test.

Performance Verification Tests prepared by the Controls Contractor as specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC are prohibited from being used in whole or in part to meet requirements specified in this Section.

3.2.11.2 Building Envelope Systems, Components, and Assemblies Requirements

FPT Checklists must be prepared for thermal integrity verification and moisture integrity verification of building envelope, components, and assemblies listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED. FPT Checklists must demonstrate performance is in accordance with Plans and Specifications. A single final FPT Checklist must be prepared for each unique type of construction.

3.2.11.3 Proposed FPT Checklist Meeting and Draft FPT Checklist Meeting

For all complex systems as defined in paragraph COMPLEX SYSTEMS, a Proposed FPT Checklist Meeting and a Draft FPT Checklist Meeting must be conducted for detailed discussions of procedures intended to demonstrate performance is in accordance with Plans and Specifications. Meetings must be conducted by conference call.

3.2.11.4 Lead and Technical Commissioning Specialists Responsibilities

For all systems other than complex systems as defined in paragraph COMPLEX SYSTEMS, the Lead Commissioning Specialist must submit Final Functional Performance Test Checklists for all systems in each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal for each systems category no later than 30 calendar days prior to performing FPT testing of any system in the respective systems category.

For all complex systems as defined in paragraph COMPLEX SYSTEMS, the Lead and Technical Commissioning Specialists must prepare and submit Final Functional Performance Test Checklists in the sequence specified in the following paragraphs. Technical Commissioning Specialists must perform respective responsibilities for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing respective responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Technical Commissioning Specialists must prepare Proposed Functional Performance Test Checklists.

b. The Lead Commissioning Specialist must submit Proposed Functional Performance Test Checklists for all complex systems as a single submittal no later than 60 calendar days prior to testing of any complex system.

c. Technical Commissioning Specialists must conduct the Proposed Functional Performance Test Checklist Meeting attended by the Contracting Officer's Technical Representative.

d. Technical Commissioning Specialists must prepare Draft Functional Performance Test Checklists to incorporate input from the Contracting Officer's Technical Representative.

e. The Lead Commissioning Specialist must provide Draft Functional Performance Test Checklists to Installing Contractors and Equipment Suppliers no later than seven calendar days prior to the Draft Functional Performance Test Checklist Meeting.

f. Technical Commissioning Specialists must conduct the Draft Functional Performance Test Checklist Meeting attended by Installing Contractors and Equipment Suppliers. The Contracting Officer's Technical Representative may attend this meeting.

g. Technical Commissioning Specialists must prepare Final Functional Performance Test Checklists to incorporate input from Installing Contractors.

h. The Lead Commissioning Specialist must submit Final Functional

Performance Test Checklists for all complex systems as a single submittal no later than seven calendar days after meeting to discuss Draft Functional Performance Test Checklists and no later than 30 calendar days prior to testing of any complex system.

3.2.11.5 Installing Contractors and Equipment Suppliers Responsibilities

Installing Contractors and Equipment Suppliers must attend Draft Functional Performance Test Checklist Meeting.

3.2.12 Construction Submittal Reviews

3.2.12.1 General Requirements

Construction Submittal Reviews must be performed for all commissioned equipment and systems to the extent necessary to verify that equipment and systems are in compliance with commissioning aspects of UFC's referenced by the Design-Build contract, Owner's Project Requirements (OPR), Basis of Design (BOD), and Plans and Specifications as modified in this Section. Reviews must be performed coincident with Designers of Record and reviews must include, but not be limited to, review of shop drawings, equipment submittals, test plans, procedures, and reports.

The OPR and BOD are for review purposes only and are not contractually enforceable.

3.2.12.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of shop drawings, equipment submittals, test plans, procedures, and reports that must be reviewed to Installing Contractors.

b. Prepare and provide Construction Submittal review comments to Installing Contractors. Construction Submittal review comments are not required to be submitted to the Government.

3.2.12.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform reviews of Construction Submittals for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.12.4 Installing Contractors Responsibilities

Installing Contractors must provide all requested Construction Submittals, BOD, and requested supplemental information to the Lead Commissioning Specialist.

3.2.13 Construction Phase Site Observations

3.2.13.1 General Requirements

Construction Phase Site Observations must be performed as specified in the

following paragraphs to verify and document commissioning aspects of equipment and systems as modified in this Section. Two Construction Phase Site Observations must be conducted for each systems category unless modified in the following paragraphs.

Construction Phase Site Observations are prohibited from being combined with witnessing Functional Performance Testing or witnessing Integrated Systems Testing, but may be combined with Pre-Functional Checklist Verificaitons unless indicated otherwise. Purposes of Site Observations specified in the following paragraphs for each systems category may be combined into a single Site Observation.

3.2.13.2 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

b. At least one Site Observation to verify and document HVAC pipe pressure testing.

c. At least one Site Observation to verify and document HVAC pump installation.

3.2.13.3 Plumbing Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least one Site Observation to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

b. At least one Site Observation to verify and document Plumbing pipe pressure testing.

c. At least one Site Observation to verify and document Plumbing pump installation.

3.2.13.4 Electrical Type I Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects and to witness testing performed by independent testing organizations of commissioned equipment and systems listed under this systems category and listed by the Lead Commissioning Specialist to require on-site verification and documentation by Technical Commissioning Specialists. Independent testing organizations typically use tests readily available from testing associations such as the InterNational Electrical Testing Association (NETA).

3.2.13.5 Electrical Type II Systems

Site Observations must be performed for the purposes specified in the

following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

3.2.13.6 Building Envelope Systems, Components, and Assemblies

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document in-progress building envelope construction prior to covering critical building envelope components and prior to pressure testing of building envelope, components, and assemblies.

b. At least one Site Observation to verify, document, and witness pressure testing, infrared thermography testing, and fog testing performed by independent testing agencies and specified in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS.

c. At least one Site Observation to verify, document, and witness inspections, measurements, and testing performed by independent testing agencies and specified in Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM.

3.2.13.7 Summary Meetings

A Summary Meeting must be conducted at the conclusion of each Site Observation for the purpose of discussing issues discovered during each Site Observation. Meeting must be conducted on-site with all attendees present.

3.2.13.8 Site Observation Reports

A Site Observation Report must be prepared for each Site Observation for the purpose of documenting issues discovered during each Site Observation.

Site Observation Reports for all equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include results of testing performed by independent testing organizations that were witnessed by Technical Commissioning Specialists and test results that were not witnessed by Technical Commissioning Specialists.

3.2.13.9 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must provide list of equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED that require on-site verification and documentation by Technical Commissioning Specialists to Installing Contractors.

The Lead Commissioning Specialist must submit Construction Phase Site Observation Reports complete with Summary Meeting Attendance Roster no later than seven calendar days after Site Observation.

3.2.13.10 Technical Commissioning Specialists Responsibilities

Each Technical Commissioning Specialist must be responsible to perform Site Observations, conduct Summary Meetings, and prepare Construction Phase Site Observation Reports for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.13.11 Installing Contractors Responsibilities

Installing Contractors must provide Technical Commissioning Specialists access to construction and systems for Site Observations and must attend Summary Meetings.

Installing Contractors must schedule testing to occur in the presence of Technical Commissioning Specialists as specified in the following paragraphs.

a. All equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED and listed by the Lead Commissioning Specialist to require on-site verification and documentation by Technical Commissioning Specialists. Results of testing of equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be provided to the Lead Commissioning Specialist that were witnessed by Technical Commissioning Specialists and that were not witnessed by Technical Commissioning Specialists.

b. Pressure testing, infrared thermography testing, and fog testing specified in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS and inspections, measurements, and testing specified in Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM for equipment and systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED. Results of all tests, inspections, and measurements must be provided to the Lead Commissioning Specialist that were witnessed by Technical Commissioning Specialists and that were not witnessed by Technical Commissioning Specialists.

3.2.14 Inspections and Testing

3.2.14.1 Pre-Functional Checks

Pre-Functional Checks must be performed prior to performing Functional Performance Testing or Integrated Systems Testing of respective system and activities must include, but not be limited to, activities specified in the following paragraphs.

a. Complete Pre-Functional Checklists.

b. Perform Construction Phase Endurance Testing.

3.2.14.1.1 Pre-Functional Checklist Verifications

Pre-Functional Checklist Verifications must be performed using Pre-Functional Checklists from the approved Construction Phase Final

Commissioning Plan by conducting on-site spot-checks to verify accuracy after receipt of completed Pre-Functional Checklists from Installing Contractors. Verifications may be combined with Construction Phase Site Observations.

3.2.14.1.1.1 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must provide blank Pre-Functional Checklists to Installing Contractors.

The Lead Commissioning Specialist must submit all completed Pre-Functional Checklists and all associated equipment start-up reports for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than seven calendar days after receipt of all completed checklists for equipment and systems listed under the respective systems category from Installing Contractors.

3.2.14.1.1.2 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform Pre-Functional Checklist Verifications and then must indicate acceptance of all Pre-Functional Checklist items for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.1.1.3 Installing Contractors Responsibilities

Installing Contractors must complete one Pre-Functional Checklist for each piece of equipment and system. Initial each Pre-Functional Checklist item for their area of responsibility indicating the item's construction, installation, and start-up as applicable has been verified to be complete and is ready for testing.

Installing Contractors must submit completed and initialed Pre-Functional Checklists and all associated equipment start-up reports to the Lead Commissioning Specialist no later than seven calendar days after completion of inspection of all checklist items for each piece of equipment and system.

3.2.14.2 Construction Phase Endurance Testing

3.2.14.2.1 General Requirements

Construction Phase Endurance Testing (trending of control system control points) for complex systems as defined in paragraph COMPLEX SYSTEMS must be performed as specified in the following paragraphs. Systems must be operating as normally anticipated during occupancy throughout Endurance Testing.

3.2.14.2.2 Hardware

Hardware must have sufficient buffer capacity to trend all data throughout Endurance Testing. Trend data uploading during the course of Endurance Testing to ensure all trend data is retained is encouraged. Lost trend data will require retesting of all control points for affected systems.

3.2.14.2.3 Results Format

Results format of trend data must be provided in a graphical format complete with clear indication of value(s) for y-axis, value for x-axis, and legend identifying each trended control point. The number of control points contained on a single graph must be such that all control points can be clearly visible. Control points must be logically grouped such that related points appear on a single graph. In addition, a separate comma separated value (CSV) file of raw trend data for each trended system must be provided. Each trended control point in CSV file must be clearly identified.

For control points recorded based on change of value, change of value for recording data must be clearly identified for each control point.

3.2.14.2.4 Construction Phase Endurance Testing Reports

A Construction Phase Endurance Testing Report must be prepared and contents must include, but not be limited to, an executive summary, review comments, trend results in graphical format, and raw trend data for all trend results for each trended system.

3.2.14.2.5 Start, Duration, and Recording Frequency

Starting date and time must be identical for all control points specified to be trended for each system subject to Endurance Testing regardless of specified duration and regardless of specified frequency. Duration of all Endurance Testing must be no less than seven consecutive calendar days.

Recording frequency of data for all control points specified to be trended for each system subject to Endurance Testing must be 15-minutes as modified in this Section. The recording frequency of data for specific control point types must occur at the frequency specified in the following paragraphs.

3.2.14.2.5.1 Control Points Trended at One Minute Intervals

a. Temperature for supply air, return air, mixed air, supply water, and return water.

b. Temperature entering and leaving all heat transfer devices such as coils, energy recovery wheels, and heat pipes.

c. Temperature for outside air, supply air, return air and exhaust air entering and leaving energy recovery device.

d. Flow for supply air, return air, outside air, chilled water, and HVAC heating hot water.

e. Flow for exhaust air associated with energy recovery.

f. Relative humidity for outside air and return air.

g. Relative humidity for outside air, supply air, return air and exhaust air entering and leaving energy recovery device.

h. Command and status for control dampers and control valves.

i. Speed for fans and pumps.

j. Pressure for fans and pumps.

3.2.14.2.5.2 Control Points Trended at 15 Minute Intervals

a. Temperature and relative humidity for zones.

b. Temperature and relative humidity for outside air not associated with energy recovery.

c. Pressure relative to the outside for facility.

3.2.14.2.5.3 Control Points Trended at Change of Position or State

a. Command and status for equipment such as chillers, boilers, pumps, compressors, air handling units, dedicated outside air systems.

b. Operation state for occupied, unoccupied, warm-up, cool-down, timed override, cooling, heating, alarm, and lead-lag duty status change.

c. Command and position for two-position control air dampers.

3.2.14.2.6 Trended Control Points

Trended control points for each system must demonstrate performance is in accordance with Plans and Specifications. Trended control points must include, but not be limited to, control points listed in Plans and Specifications' points lists.

Trended control points for selected systems, at a minimum, must include control points specified in the following paragraphs. These control points must be trended as applicable to this contract in addition to control points necessary to demonstrate systems perform in accordance with requirements of Plans and Specifications and control points listed in Plans and Specifications' points lists.

3.2.14.2.6.1 Air-Cooled Chiller Chilled Water System

a. Chiller(s) command and status.

b. Chiller isolation valve(s) command and status.

c. Chilled water pump(s) actual speed.

d. Chilled water pump(s) setpoint and actual differential pressure.

e. Minimum flow bypass control valve command.

f. Minimum system flow setpoint and actual flow.

g. Chilled water supply setpoint and actual temperature.

h. Chilled water return actual temperature.

i. Chilled water actual flow.

j. Outside air actual dry-bulb temperature.

3.2.14.2.6.2 HVAC Heating Hot Water System with Boiler

a. Boiler(s) command and status.

b. Boiler(s) isolation valve command and status.

c. HVAC heating hot water pump(s) actual speed.

d. HVAC heating hot water pump(s) setpoint and actual differential pressure.

e. Minimum flow bypass control valve command.

f. Minimum system setpoint and actual flow.

g. HVAC heating hot water supply setpoint and actual temperature.

h. HVAC heating hot water return actual temperature.

i. HVAC heating hot water actual flow.

j. Outside air actual dry-bulb temperature.

3.2.14.2.6.3 Dedicated Outside Air System (DOAS)

a. Outside air actual dry-bulb temperature.

b. Outside air actual relative humidity.

c. Outside air isolation damper command and status.

d. Outside air setpoint and actual airflow.

e. Energy recovery wheel command, status, and actual speed.

f. Energy recovery wheel's OA bypass control damper command and status.

g. Energy recovery wheel's defrost cycle command and status.

h. Energy recovery wheel's OA discharge air actual dry-bulb temperature.

i. Energy recovery wheel's OA discharge air actual relative humidity.

j. Preheat coil leaving air setpoint and actual temperature.

k. Preheat coil control actuator command.

l. Cooling coil leaving air setpoint and actual temperature.

m. Cooling coil control valve command.

n. Supply air fan actual speed.

o. Reheat coil control valve command.

p. Discharge air setpoint and actual temperature.

q. Supply air fan setpoint and actual static pressure.

r. Facility setpoint and actual relative pressure.

s. Return air actual dry-bulb temperature.

t. Return air actual relative humidity.

u. Energy recovery wheel's EA bypass control damper command and status.

v. Energy recovery wheel's EA discharge air actual dry-bulb temperature.

w. Energy recovery wheel's EA discharge air actual relative humidity.

x. Exhaust air fan actual speed.

y. Exhaust air isolation damper command and status.

3.2.14.2.6.4 Supply Air Terminal Units

a. Zone setpoint and actual dry-bulb temperature.

b. Zone actual relative humidity.

c. Control damper command.

d. Heating coil valve command.

e. Airflow actual value.

f. Leaving air actual temperature.

3.2.14.2.7 Sample Strategy

Sample strategy must be as specified in the following paragraphs.

a. 100-Percent trending for central plant equipment such as chilled water and HVAC heating hot water systems, air handling unit systems including all associated fans except for remote exhaust air fans, dedicated outside air systems including all associated fans except for remote exhaust air fans, and renewable energy system.

b. 20-Percent sample trending for equipment with identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps.

3.2.14.2.8 Unsuccessful Trending and Re-Trending

3.2.14.2.8.1 100-Percent Samples

Trending results must be failed for equipment or systems for which 100-percent sample size are trended if one or more of the trended control points results in discovery of a deficiency.

Re-trending must be required to the extent necessary to confirm that deficiencies have been corrected.

3.2.14.2.8.2 Less than 100-Percent Samples

Trending results must be failed for equipment or systems for which less than 100-percent sample size are trended if one or more of the trended

control points results in discovery of a deficiency.

a. Re-trending must be required for only items which experienced initial failures if the failure rate is 5-percent or less, meaning that 5-percent or less of the equipment or systems had at least one deficiency.

b. Re-trending must be required for items which experienced initial failures to the extent necessary to confirm that the deficiencies have been corrected if the failure rate is higher than 5-percent, meaning that more than 5-percent of equipment or systems trended had at least one deficiency. In addition, re-trending of another random sample of the same size as the initial sample for the first time. If the second random sample set has any failures, those failed items must be re-trended and all remaining equipment and systems must be trended to complete 100-percent testing of that system type.

3.2.14.2.8.3 Re-Trending Costs

Re-trending costs must be reimbursed to the Government. These costs must include salary associated with additional reviews of trend results for the Lead Commissioning Specialist, Technical Commissioning Specialists, and Government personnel.

3.2.14.2.9 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of systems that must be trended, control points that must be trended, and reminder of trend results format specified in this Section to Installing Contractors.

b. Provide action plan for correcting failed trend results to Installing Contractors.

c. Provide list of systems that must be re-trended due to failure of trend results or having been provided in an incorrect trend results format to Installing Contractors.

d. Prepare and submit Construction Phase Endurance Testing Reports as a single submittal no later than 14 calendar days after preparation of all Endurance Testing Reports. In addition, submit one electronic copy of raw trend data.

3.2.14.2.10 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these activities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Select systems that must be trended for samples of less than 100-percent.

b. Prepare list of systems and control points that must be trended.

c. Perform review of all trend results and provide approval or failure disposition.

d. Prepare list of systems that must be re-trended due to failure of trend results or having been provided in an incorrect trend results format.

e. Prepare action plan for correcting failed trend results.

3.2.14.2.11 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform activities specified in the following paragraphs.

a. Provide hardware suitable to obtain trend data for systems and control points identified by Technical Commissioning Specialists.

b. Provide hardware suitable to interface with and obtain trend data from equipment identified by the Lead Commissioning Specialist to require trending that features on-board factory packaged controls. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

c. Provide list of equipment and control points that must be trended to Equipment Suppliers who provided equipment featuring on-board factory packaged controls as part of their contract.

d. Collect trend data in the format specified in this Section for specified systems and control points and provide to the Lead Commissioning Specialist.

e. Provide action plan for correcting failed trend results to Equipment Suppliers who provided equipment featuring on-board factory packaged controls as part of their contract.

f. Implement action plan for correcting failed trend results.

g. Re-collect and provide trend data in the format specified in this Section for trend results determined to have failed or determined to have been provided in an incorrect trend results format to the Lead Commissioning Specialist

3.2.14.2.12 Equipment Suppliers Responsibilities

Equipment Suppliers must, at a minimum, perform activities specified in the following paragraphs.

a. Provide Installing Contractor access, but not interface equipment, to equipment featuring on-board factory packaged controls provided as part of their contract. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

b. Provide descriptions to Installing Contractors in clearly understood language (not proprietary code) for all trended control points.

c. Implement action plan for correcting failed trend results for equipment featuring on-board factory packaged controls provided as part of their contract.

3.2.14.3 Certified Certificates of Readiness and Certificates of Readiness

3.2.14.3.1 General Requirements

A single Certified Certificate of Readiness must be prepared for each system subject to Functional Performance Testing or subject to Integrated Systems Testing by reviewing, signing, and dating Certificates of Readiness to indicate each system is complete and ready for testing. Testing of any equipment or system is prohibited until after its Certified Certificate of Readiness has been submitted and approved.

A single Certificate of Readiness must be prepared for each system subject to Functional Performance Testing or subject to Integrated Systems Testing. Certificate of Readiness contents must include, but not be limited to, contents specified in the following paragraphs to the extent applicable to the specific system being tested.

a. Cover sheet with spaces for signatures and dates by the Lead Commissioning Specialist and by Installing Contractors to indicate each system is complete and ready for testing.

c. Equipment and system start-up reports.

d. Control system start-up reports.

e. Diagnostic test reports.

g. Completed Pre-Functional Checklists.

3.2.14.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must sign, date, and submit Certified Certificates of Readiness no later than 14 calendar days prior to testing of respective system.

3.2.14.3.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform reviews of Certificates of Readiness for accuracy to ensure systems are complete and ready for testing for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.3.4 Installing Contractors Responsibilities

Installing Contractors must prepare, sign, and date Certificates of Readiness indicating systems are complete and ready for testing and provide to the Lead Commissioning Specialist.

3.2.14.4 Functional Performance Testing and Integrated Systems Testing

3.2.14.4.1 General Requirements

Functional Performance Testing and Integrated Systems Testing must be performed using approved checklists and all required Commissioning Team participants must be present prior to start of testing. Testing must be aborted and rescheduled to occur at a later date if any Commissioning Team

participant is not present or if deficiencies discovered during testing prevent successful completion. Testing of any equipment or system is prohibited until after its Certified Certificate of Readiness has been submitted and approved.

All necessary materials and system modifications to simulate actual conditions as close as is practically possible must be provided. Complete all testing by returning affected equipment and systems to pre-test conditions.

3.2.14.4.2 Complex Systems and Integrated Systems Category Requirements

Testing of complex systems as defined in paragraph COMPLEX SYSTEMS and testing of systems listed under item entitled "Integrated Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be performed as specified in the following paragraphs.

3.2.14.4.2.1 Equipment Featuring On-Board Factory Packaged Controls

Testing of equipment featuring on-board factory packaged controls must include, but not be limited to, testing specified in the following paragraphs.

a. Equipment enabling and disabling.

b. Equipment standard and optional control points necessary to accomplish functionality whether or not control points are specified in Plans and Specifications.

c. Equipment standard and optional alarms critical to safe operation whether or not optional alarms are specified in Plans and Specifications.

d. All control points added by Controls Contractor in addition to on-board factory packaged controls whether or not control points are specified in Plans and Specifications.

3.2.14.4.2.2 Test Setup and Condition Simulation

Test setup must include all necessary materials and system modifications to simulate flows, pressures, temperatures, and other conditions necessary to perform testing according to specified conditions must be provided.

Condition simulation must be accomplished by temporarily changing control system setpoints. Condition simulation by over-writing control system inputs (actual) values is prohibited unless approved in advance of test by the Contracting Officer's Technical Representative.

3.2.14.4.2.3 Condition Simulation Methods

Condition simulation methods for equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED that are acceptable are specified in the following paragraphs.

a. When varying static pressures inside ductwork cannot be simulated within the duct, and where a sensor signals the controls system to initiate sequences at various duct static pressures, it is acceptable to simulate the various pressures with a Pneumatic Squeeze-Bulb Type

Signaling Device with gauge temporarily attached to the sensing tube leading to the transmitter. It is not acceptable to reset the various setpoints, nor to simulate an electric analog signal unless approved as specified in the preceding paragraphs.

b. Dirty filter pressure drops can be simulated using sheets of cardboard at filter face.

c. Freeze-stat safeties can be simulated by packing portion of sensor with ice.

d. High outside air temperatures can be simulated with a hair blower.

e. High entering cooling coil temperatures can be used to simulate entering cooling coil conditions.

f. Do not use signal generators to simulate sensor signals unless approved by the Contracting Officer's Technical Representative, as noted above, for special cases.

g. Control setpoints can be altered. For example, to see the air conditioning compressor lockout work at an outside air temperature below lockout setpoint, when the outside air temperature is above lockout setpoint, temporarily change the lockout setpoint to be minus 0 degrees above the current outside air temperature. Caution: Setpoints are not to be raised or lowered to a point such that damage to the components, systems, or the building structure and/or contents will occur.

h. Test duct mounted smoke detectors in accordance with the manufacturer's recommendations. Perform testing with air system at minimum airflow condition in ductwork.

i. Test current sensing relays used for fan and pump status signals to control system to indicate unit failure and run status by resetting the setpoint on the relay to simulate a lost belt or unit failure while the unit is running. Confirm that the failure alarm was generated and received at the control system. After the test is performed, return the setpoint to its original setpoint or a setpoint as indicated by the Contracting Officer's Technical Representative.

3.2.14.4.3 Sample Strategy

3.2.14.4.3.1 General Requirements

100-Percent testing of all systems unless modified in the following paragraphs. Sample strategy for testing must be equally applied to each building in this project.

Sample strategy must be applied to total equipment and system counts specified for system categories under paragraph SYSTEMS TO BE COMMISSIONED.

3.2.14.4.3.2 Complex Systems

Sample strategy for all complex systems as defined in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for central plant equipment such as chilled water and HVAC heating hot water systems, air handling unit systems

including all associated fans except for remote exhaust air fans, dedicated outside air systems including all associated fans except for remote exhaust air fans, and renewable energy system.

b. 20-Percent sample testing for equipment with identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps. Sample must include at least one complete item such as one complete unitary air-conditioner.

3.2.14.4.3.3 Plumbing Systems

Sample strategy for all systems listed under item entitled "Plumbing Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED except plumbing systems defined as complex systems in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for central plant equipment such as natural gas systems, domestic cold water systems, domestic heating hot water systems, and process water systems.

b. 20-Percent sample testing for equipment with identical features such as fixtures, irrigation systems, emergency eyewash stations, and vacuum systems. Sample must include at least one complete item such as one complete fixture.

3.2.14.4.3.4 Electrical Type II Systems

Sample strategy for all systems listed under item entitled "Electrical Type II Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED except electrical systems defined as complex systems in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for equipment such as emergency power systems featuring single operation generator sets, automatic transfer switches, and uninterruptible power supplies (not local uninterruptible power supplies), emergency response systems, and frequency converters.

b. 20-Percent sample testing for equipment with identical features such as lighting systems, daylighting control systems, and fenestration control systems. Sample must include at least one complete item such as lighting in one space.

3.2.14.4.3.5 Building Envelope Systems, Components, and Assemblies

Sample strategy for all systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED must be as specified in the following paragraphs.

a. 20-Percent sample testing of surface area for each unique type of construction for thermal integrity verification of entire of the building envelope, components, and assemblies.

b. 20-Percent sample testing of surface area for each unique type of construction for moisture integrity verification of the building envelope, components, and assemblies.

3.2.14.4.4 Unsuccessful Testing and Re-Testing Costs

3.2.14.4.4.1 Unsuccessful Testing of 100-Percent Sample

Testing must be failed for equipment or systems for which 100-percent sample size are tested if one or more of the test procedures results in discovery of a deficiency that cannot be resolved within five minutes during testing.

Re-testing must be witnessed to the extent necessary to confirm that deficiencies have been corrected without negatively impacting the performance of the rest of the system.

3.2.14.4.4.2 Unsuccessful Testing of Less than 100-Percent Sample

Testing must be failed for equipment or systems for which less than 100-percent sample size are tested if one or more of the test procedures results in discovery of a deficiency, regardless of whether the deficiency is corrected during the sample test.

a. Re-testing must be witnessed of only items which experienced initial failures if the failure rate is 5-percent or less, meaning that 5-percent or less of the equipment or systems had at least one deficiency.

b. Re-testing must be witnessed of items which experienced initial failures to the extent necessary to confirm that the deficiencies have been corrected if the failure rate is higher than 5-percent, meaning that more than 5-percent of equipment or systems tested had at least one deficiency. In addition, testing of another random sample must be witnessed for the same size as the initial sample for the first time. If the second random sample set has any failures, those failed items must be retested and all remaining equipment and systems must be tested to complete 100-percent testing of that system type.

3.2.14.4.4.3 Re-Testing Costs

Re-testing costs must be reimbursed to the Government. These costs must include salary, travel costs, and per diem for Government personnel and all Commissioning Team participants. Reimbursement responsibilities are specified in the following paragraphs.

a. Commissioning Team participants who were not present must equally share reimbursement costs.

b. Installing Contractors and Equipment Suppliers who were responsible for discovered deficiencies resulting in test failures must equally share reimbursement costs.

3.2.14.4.5 Commissioning Team Participants

Participants of Functional Performance Testing and Integrated Systems Testing must include, but not be limited to, participants specified in the following paragraphs. The Contracting Officer's Technical Representative, Public Works Department Division (PWD) Representatives, and Using Agent's Representatives (Users) may, but are not required to, participate in any testing.

3.2.14.4.5.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Controls Commissioning Representative (CC).

d. Installing Contractors' TAB Commissioning Representative (TAB).

e. Installing Contractors' Mechanical Commissioning Representative (MC).

f. Equipment Supplier (ES).

3.2.14.4.5.2 Plumbing Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Plumbing Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Plumbing Commissioning Representative (PC).

d. Equipment Supplier (ES).

e. Installing Contractors' Controls Commissioning Representative (CC).

3.2.14.4.5.3 Utility Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Utility Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Controls Commissioning Representative (CC).

d. Installing Contractors' TAB Commissioning Representative (TAB).

e. Installing Contractors' Mechanical Commissioning Representative (MC).

f. Installing Contractors' Electrical Commissioning Representative (EC).

g. Equipment Supplier (ES).

3.2.14.4.5.4 Electrical Type II Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Electrical Type II Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Electrical Technical Commissioning Specialist (CxE).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Electrical Commissioning Representative (EC).

d. Equipment Supplier (ES).

3.2.14.4.5.5 Building Envelope Systems, Components, and Assemblies

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Building Envelope Technical Commissioning Specialist (CxB).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Building Envelope Commissioning Representative (BC).

d. Equipment Supplier (ES).

3.2.14.4.6 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Testing to select which systems must be tested for samples of less than 100-percent.

b. Coordinate logistics with Installing Contractors.

c. Submit completed Final Functional Performance Test Checklists for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than 14 calendar days after successful testing of all systems listed under the respective systems category.

3.2.14.4.7 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must witness, re-witness, and document all testing for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.4.8 Installing Contractors Responsibilities

Installing Contractors must provide all necessary materials and perform all aspects of testing including modifications to simulate actual conditions for all equipment and systems related to their contract.

3.2.14.4.9 Equipment Suppliers Responsibilities

Equipment Suppliers must perform all aspects of testing of equipment featuring on-board factory packaged controls provided as part of their contract. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

3.2.14.4.10 Installing Contractors and Equipment Supplier Coordination

Installing Contractors and Equipment Suppliers must simultaneously perform all aspects of testing of equipment featuring on-board factory packaged controls provided as part of their contract.

3.2.15 Systems Manuals

3.2.15.1 General Requirements

Systems Manuals must be prepared for all commissioned equipment and systems and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Final Owner's Project Requirements.

b. Final Basis of Design.

c. Recommended maintenance schedules when schedules are not provided in Operation and Maintenance manuals.

d. Recommended re-testing schedule.

e. Blank copy of all approved final Functional Performance Test Checklists.

g. Complete equipment warranty information.

h. Recommended schedule for sensor and actuator calibration.

Systems Manual contents for all complex systems as defined in paragraph COMPLEX SYSTEMS, in addition to contents specified in the preceding paragraphs, must include, but not be limited to, contents specified in the following paragraphs.

a. As-built system single line diagrams.

b. As-built sequences of operation and controls drawings.

c. As-built control system setpoints.

3.2.15.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of contents required for all Systems Manuals to Installing Contractors.

b. Prepare and submit all Systems Manuals as a single submittal no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

3.2.15.3 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, provide required contents for all Systems Manuals to the Lead Commissioning Specialist.

3.2.16 Training

3.2.16.1 Training Plans

Training Plans must be prepared for all commissioned equipment and systems and contents must include, but not be limited to, contents specified in the following paragraphs.

a. List of those who should receive training by position or name.

b. List of systems that require training organized by Specification Section.

c. Training content.

d. Level of instruction required.

e. Level of required instructor expertise.

f. Trainer name and trainer contact information.

g. Identification of whether training is conduced on-site or in a classroom setting.

h. Schedule and location of training.

i. Criteria for determining whether provided training is acceptable.

j. Blank Training Attendance Rosters.

3.2.16.2 Training

Training must be performed in accordance with Training Plans and in accordance with requirements specified in respective Technical Sections.

3.2.16.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit all Training Plans as a single submittal no later than 30 calendar days prior to the occurrence of any training session.

b. Provide approved Training Plans to Installing Contractors.

c. Submit all completed Training Attendance Rosters as a single submittal no later than 14 calendar days after completion of all training

sessions.

3.2.16.4 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform activities specified in the following paragraphs.

a. Perform training as specified in the preceding paragraphs.

b. Require all training attendees to sign Training Attendance Rosters.

c. Provide completed Training Attendance Rosters no later than seven calendar days after completion of all training sessions to the Lead Commissioning Specialist.

3.2.17 Final Commissioning Report

3.2.17.1 General Requirements

The Final Commissioning Report must be prepared and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Executive summary describing the overall commissioning process.

b. Results of the commissioning process.

c. Issues Log.

d. Commissioning Design Review Reports.

e. Approved Construction Phase Final Commissioning Plan.

f. Approved Pre-Final Test and Balance Reports.

g. Completed Pre-Functional Checklists.

h. Endurance Testing Reports.

i. Completed Functional Performance Test Checklists.

k. Approved Training Plans.

l. Completed Training Attendance Rosters.

m. Identification of all deficiencies complete with corrective actions taken.

n. Indication that systems meet requirements of the Owner's Project Requirements and Plans and Specifications.

o. List of any testing that must be performed during the Post-Construction (Warranty) Phase.

3.2.17.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit the Final Commissioning Report no later than 14

calendar days after successful completion of all Functional Performance Testing and all Integrated Systems Testing.

b. File one copy of Approved Final Commissioning Report in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Final Commissioning Report.

3.3 POST-CONSTRUCTION (WARRANTY) PHASE

3.3.1 Post-Construction Phase ASHRAE 189.1 Commissioning Compliance

3.3.1.1 General Requirements

Activities must include, but not be limited to, post-construction phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, post-construction phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and post-construction phase commissioning activities specified in this Section.

3.3.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under item entitled "Post-Construction Phase ASHRAE 189.1 Commissioning Compliance."

3.3.2 Post-Construction Phase Sustainability Third Party Certification (TPC)

3.3.2.1 General Requirements

Activities must include, but not be limited to, post-construction phase commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, post-construction phase commissioning activities listed in all of its references as modified in this Section, and post-construction phase commissioning activities specified in this Section.

3.3.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Post-Construction Phase Sustainability Third Party Certification (TPC)."

3.3.3 Post-Construction Phase Issues Log

3.3.3.1 General Requirements

The Post-Construction Phase Issues Log must be maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Post-Construction Phase Issues Log must include the name of Commissioning Team member identifying

the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Post-Construction Phase Issues Log must be a continuation of the Construction Phase Issues Log and must be prepared in an electronic format that can be used throughout the Post-Construction Phase such that it can be provided to the Government upon request.

3.3.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Post Construction Phase Issues Log and must submit one electronic copy no later than 14 calendar days after completion of any Post-Construction Phase commissioning activity.

3.3.4 Post-Construction Phase Site Observations

3.3.4.1 General Requirements

Post-Construction Phase Site Observations must be performed between eight and 10 months after Beneficial Occupancy to verify and document that all commissioned equipment and systems are operating in accordance with the Owner's Project Requirements.

Post-Construction Phase Site Observations are prohibited from being combined with witnessing Post-Construction Phase Functional Performance Testing or witnessing Post-Construction Phase Integrated Systems Testing.

3.3.4.2 Site Observation Reports

Site Observation Reports must be prepared for each Site Observation for the purpose of documenting issues discovered during Site Observation.

3.3.4.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Site Observation to schedule attendance of Operations and Maintenance staff and occupants and to make provisions for access to all commissioned equipment and systems.

b. Submit Post-Construction Phase Site Observation Reports no later than 14 calendar days after Site Observation.

3.3.4.4 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Interview Operations and Maintenance staff.

b. Interview occupants.

c. Determine status of unresolved commissioning issues.

d. Compare current operations to operations identified throughout the commissioning process.

e. Prepare Post-Construction Phase Site Observation Reports.

3.3.5 Inspections and Testing

3.3.5.1 Post-Construction Phase Endurance Testing

3.3.5.1.1 General Requirements

Post-Construction Phase Endurance Testing (trending of control system control points) requirements and activities for each complex system as defined in paragraph COMPLEX SYSTEMS must be performed if all requirements and activities for respective system could not be fully or successfully completed during Construction Phase Endurance Testing.

Post-Construction Phase Endurance Testing requirements and activities must include, but not be limited to, requirements and activities specified for Construction Phase Endurance Testing as modified in the following paragraphs. Systems must be operating as normally anticipated during occupancy throughout Endurance Testing.

3.3.5.1.2 Post-Construction Phase Endurance Testing Reports

A Post-Construction Phase Endurance Testing Report must be prepared and contents must include, but not be limited to, an executive summary, Technical Commissioning Specialists’ review comments, trend results in graphical format, and raw trend data for all trend results for each trended system.

3.3.5.1.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing and specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Endurance Testing to make provisions for access to all commissioned equipment and systems.

b. Coordinate logistics of trend data collection with Installing Contractors.

c. Prepare and submit Post-Construction Phase Endurance Testing Reports as a single submittal no later than 14 calendar days after preparation of all Endurance Testing Reports. In addition, submit one electronic copy of raw trend data.

3.3.5.1.4 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing and specified in the following paragraphs.

a. Setup trend hardware during one site visit and retrieve trend data and trend hardware as applicable during an additional site visit.

3.3.5.1.5 Equipment Suppliers Responsibilities

Equipment Suppliers must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing.

3.3.5.2 Certified Certificates of Readiness and Certificates of Readiness

Certified Certificates of Readiness and Certificates of Readiness are not required for any Post-Construction Phase activity.

3.3.5.3 Post-Construction Phase Functional Performance Testing and Integrated Systems Testing

3.3.5.3.1 General Requirements

Functional Performance Testing and Integrated Systems Testing must be performed for all commissioned equipment and systems that could not be fully or successfully tested during the Construction Phase. Testing must be performed using approved checklists and all required Commissioning Team participants must be present prior to start of testing. Testing must be aborted and rescheduled to occur at a later date if any Commissioning Team participant is not present or if deficiencies discovered during testing prevent successful completion.

Functional Performance Testing and Integrated Systems Testing requirements and activities must include, but not be limited to, requirements and activities specified for Construction Phase Functional Performance Testing and Integrated Systems Testing as modified in paragraphs under paragraph POST-CONSTRUCTION (WARRANTY) PHASE.

3.3.5.3.2 Commissioning Team Participants

Participants of Functional Performance Testing and Integrated Systems Testing must include, but not be limited to, participants specified in the following paragraphs. The Contracting Officer's Technical Representative, Public Works Department Division (PWD) Representatives, and Using Agent's Representatives (Users) may, but are not required to, participate in any testing.

a. Lead Commissioning Specialist.

b. Technical Commissioning Specialists.

c. Installing Contractors.

d. Equipment Suppliers.

3.3.5.3.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to witnessing Functional Performance Testing and Integrated Systems Testing to make provisions for access to all commissioned equipment and systems.

b. Coordinate logistics with Installing Contractors.

c. Submit completed Final Functional Performance Test Checklists for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than 14 calendar days after successful testing of all systems listed under the respective systems category.

3.3.6 Updated Systems Manuals

3.3.6.1 General Requirements

Updated Systems Manuals must be prepared and must be an update to Systems Manuals prepared during the Construction Phase and contents must include, but not be limited to, changes resulting from Post-Construction Phase commissioning activities.

3.3.6.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit all Updated Systems Manuals as a single submittal no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

3.3.7 Updated Final Commissioning Report

3.3.7.1 General Requirements

The Updated Final Commissioning Report must be prepared and must be an update to the Final Commissioning Report prepared during the Construction Phase and contents must include, but not be limited to, changes resulting from Post-Construction Phase commissioning activities.

3.3.7.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Updated Final Commissioning Report no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

File one copy of Approved Updated Final Commissioning Report in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Updated Final Commissioning Report.

-- End of Section --

2019-99-99b-UFGS 01 91 00.15 22 - Total Building Commissioning SEC Rev00
SECTION 01 91 00.15 22

TOTAL BUILDING COMMISSIONING FOR PROJECT P-1338
11/19

PART 1 GENERAL

1.1 SUMMARY

The Government has employed an independent Commissioning Firm that has employed or has contracted Lead and Technical Commissioning Specialists. This Section specifies the commissioning scope of work for the entire Commissioning Team

Commissioning responsibilities assigned in this Section to Lead and Technical Commissioning Specialists are for informational purposes.

1.2 COMMISSIONING LIMITATIONS

Commissioning requirements specified in this Section are prohibited from fulfilling requirements specified in other Sections. Requirements specified in other Sections are prohibited from fulfilling requirements specified in this Section.

All commissioning submittals must be submitted and reviewed in accordance with paragraph SUBMITTALS. Commissioning utilities including, but not limited to, tracking utilities and software for commissioning activities are prohibited from taking the place of these requirements.

1.3 SYSTEMS TO BE COMMISSIONED

Systems specified in the following paragraphs must be commissioned whether or not specified systems are required to be commissioned by any reference for pursuing Sustainability TPC.

Specified equipment and system counts are totals that include all buildings in this project.

1.3.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category

a. Up to one chilled water plant featuring up to two air-cooled chillers with packaged controls, up to two variable speed distribution pumps, and variable-primary distribution.

b. Up to one hot water plant featuring up to two fuel-fired condensing boilers each with an integral circulating pump and packaged controls, one boiler master control panel, up to two variable speed distribution pumps, and variable-primary distribution.

c. Up to nine air handling units each featuring a variable-air-volume supply air fan, a chilled water coil, a hot water coil, air-side energy recovery, and packaged controls.

d. Up to 135 variable-air-volume air terminal units each featuring a hydronic heating coil.

e. Up to eight computer room air-conditioning units each featuring packaged controls.

f. Up to six unit heaters.

g. Up to one supply air fan.

h. Up to eight exhaust air fans.

i. Up to one Building Automation System.

1.3.2 Plumbing Systems Category

a. Up to 100 fixtures.

b. Up to one domestic heating hot water system featuring up to two fuel-fired condensing water heaters each with packaged controls, up to one recirculating pump, and up to one temperature mixing valve.

c. Up to three emergency eyewash stations.

1.3.3 Utility Systems Category

a. Up to one energy monitoring and control system.

b. Up to one water utility metering system.

1.3.4 Electrical Type I Systems Category

a. Power - all grounding systems.

b. Power - all industrial control systems.

c. Power - all main distribution panels.

d. Power - all main transformers.

e. Power - all panelboards.

f. Power - all step-down transformers.

g. Power - all transient voltage surge protective devices.

1.3.5 Electrical Type II Systems Category

a. Cable television - all systems.

b. Communications - all public address systems.

c. Communications - all telecommunications entrance backbone and distribution systems.

d. Communications - all audio-visual-type intercommunication systems.

e. Emergency power - up to one system featuring up to one single operation generator set, automatic transfer switches, and up to one uninterruptible power supply.

f. Emergency power off control - all systems.

g. Lighting - all emergency egress systems.

h. Lighting - all exit systems.

i. Lighting - all interior systems.

j. Security - all access control systems.

k. Security - all electronic security systems.

1.3.6 Building Envelope Systems, Components, and Assemblies Category

a. Air tightness / pressurization verification of building envelope, components, and assemblies.

b. Thermal integrity verification of building envelope, components, and assemblies.

c. Moisture integrity verification of building envelope, components, and assemblies.

d. All roofing including low sloped roofs and steep sloped roofs.

1.3.7 Integrated Systems Category

a. Testing of integrated systems is not required for this project.

1.4 COMPLEX SYSTEMS

Complex systems are defined as the following systems categories as listed under paragraph SYSTEMS TO BE COMMISSIONED with appropriate qualifiers and are subject to more stringent requirements as specified in this Section.

a. All equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category."

b. All equipment and systems listed under item entitled "Plumbing Systems Category" featuring on-board factory packaged controls. Refer to the following paragraph for definition of equipment featuring on-board factory packaged controls.

c. All equipment and systems listed under item entitled "Utility Systems Category."

Equipment featuring on-board factory packaged controls is defined as equipment that is a complex system as defined in paragraph COMPLEX SYSTEMS which features a controller issuing sophisticated logic-based commands to its internal components to accomplish the intent of Plans and Specifications. This equipment may function as either a stand-alone piece of commissioned equipment or may function as part of a commissioned system. This controller may be equipment mounted or may be remote mounted and may or may not interface with a building control system. Examples of equipment meeting and not meeting this definition are provided in the following paragraphs.

a. Equipment meeting this definition includes chillers, boilers provided with or without master controllers, packaged pumping systems, dedicated outside air systems, packaged rooftop units, computer room air conditioners, and air terminal units.

b. Equipment not meeting this definition includes unitary air-conditioners, packaged terminal air-conditioners, and heat pumps.

c. Equipment not meeting this definition, but requiring demonstration of minimum safe motor speed either prior to or during Functional Performance Testing includes variable frequency drives.

1.5 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF HEATING, REFRIGERATING AND AIR-CONDITIONING ENGINEERS (ASHRAE)

ASHRAE 189.1	(2014) Standard for the Design of High-Performance Green Buildings Except Low-Rise Residential Buildings

GREEN BUILDING INITIATIVE (GBI)

GBI GP Compliance	(2016) GBI Guiding Principles Compliance Program for New Construction (DOD Version)

1.6 SUBMITTALS

Commissioning submittals are not required to be submitted by the Installing Contractor.

1.7 COMMISSIONING TEAM

The Commissioning Team is defined as the entity that must perform all commissioning activities specified in this Section for systems listed under paragraph SYSTEMS TO BE COMMISSIONED. The Commissioning Team is composed of the Lead Commissioning Specialist, Technical Commissioning Specialists, Designers of Record, Installing Contractors, Equipment Suppliers, and the Contracting Officer's Technical Representative.

1.7.1 Lead Commissioning Specialist

The Lead Commissioning Specialist (CxC) is defined as the entity that must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, coordinating all aspects of the commissioning process; managing all Technical Commissioning Specialists; and submitting all Commissioning Plans, schedules, reports, and documentation directly to the Contracting Officer's Technical Representative as modified in this Section.

1.7.2 Technical Commissioning Specialists

Technical Commissioning Specialists are defined as entities that must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, performing reviews, witnessing that all system components have been installed, that each control device operates, that each equipment piece operates, that complete systems operate, and that interactive systems operate in accordance with Plans and Specifications.

Technical Commissioning Specialists must perform assigned responsibilities for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

1.7.3 Designers of Record

Designers of Record are defined as the entities that must act as design professionals responsible for design of their respective system that is subject to commissioning. Designers of Record must perform all commissioning responsibilities assigned in this Section as directed by the General Contractor.

1.7.4 Installing Contractors

Installing Contractors are defined as the General Contractor's Superintendent or Project Manager; Quality Control Representative; and Mechanical, Controls, Plumbing, Electrical, Test and Balance, Fire Protection, and Building Envelope Sub-Contractors who provide, install, or construct systems in whole or in part for this contract. The General Contractor must provide a Lead Commissioning Representative to manage all Designers of Record, Sub-Contractor Commissioning Representatives, and Equipment Suppliers to accomplish all responsibilities assigned in this Section. Each Sub-Contractor must provide a Commissioning Representative to coordinate and perform all commissioning responsibilities for commissioned equipment and systems provided as part of their respective contract as directed by the General Contractor. Submission of commissioning related certifications or qualifications for the Lead Commissioning Representative and Installing Contractor Representatives is not required.

Installing Contractors must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, demonstrating performance of all commissioned equipment and systems provided as part of their respective contract and must provide all necessary materials, services, and labor required for successful demonstration as modified in this Section.

1.7.5 Equipment Suppliers

Equipment Suppliers (ES) are defined as factory authorized start-up technicians or factory representatives knowledgeable with start-up, demonstration, and testing of commissioned equipment featuring on-board factory packaged controls provided as part of their respective contract. Each Equipment Supplier must coordinate and perform all commissioning responsibilities assigned in this Section as directed by the General Contractor. Submission of commissioning related certifications or qualifications for Equipment Suppliers is not required. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

Equipment Suppliers must perform all commissioning responsibilities assigned in this Section that includes, but is not limited to, demonstrating performance of all commissioned equipment provided as part of their respective contract and must provide all necessary materials, services, and labor required for successful demonstration as modified in this Section.

1.7.6 Installing Contractors and Equipment Suppliers Coordination

Installing Contractors and Equipment Suppliers must coordinate and share demonstration and testing responsibilities specified in this Section for commissioned equipment featuring on-board factory packaged controls. Installing Contractors and Equipment Suppliers must simultaneously perform all aspects of demonstration and testing for these types of systems. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

1.7.7 Contracting Officer's Technical Representative

The Contracting Officer's Technical Representative (COTR) represents the Government for all elements of the commissioning process. The COTR will serve as the single point of contact with the Lead Commissioning Specialist, will receive all commissioning submittals, may attend meetings, and may, but is not required to, witness field inspections and testing specified in this Section.

1.8 COMMUNICATIONS

1.8.1 Communications with the Contracting Officer's Technical Representative

Communication with the Contracting Officer's Technical Representative must be through the Lead Commissioning Specialist who acts as the single direct point of contact for all aspects of the commissioning process.

1.8.2 Communications between the Commissioning Team

Communications between the Commissioning Team including, but not limited to, verbal communications, schedule information, and exchange of information specified in this Section, must occur directly between the Commissioning Team without requiring interaction of the Contracting Officer's Technical Representative.

1.9 PHASING

This project is not phased.

1.10 ASHRAE 189.1 COMMISSIONING COMPLIANCE

ASHRAE 189.1 commissioning compliance is required for this project.

1.10.1 General Requirements

All commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, commissioning activities listed in references contained in ASHRAE 189.1's paragraphs as modified in this Section, and commissioning activities specified in this Section must be performed. All commissioning activities that are referred to as "optional activities," "guidance," "should activities," "recommendations," "suggested practices," "informative information," or listed as similar designations are mandatory regardless of any qualifiers.

Commissioning activities listed in ASHRAE 189.1's paragraphs that also have requirements specified in this Section are listed only where requirements are specified in this Section and these commissioning activities are not repeated under ASHRAE 189.1's paragraphs.

1.10.2 Commissioning Team Responsibilities

The Commissioning Team must, at a minimum, perform all commissioning activities specified in the preceding item entitled "General Requirements" and must perform all commissioning activities specified in this Section. This Section takes precedence should there be a conflict between requirements listed in this Section and requirements listed in the Standard or listed in any of its references.

1.11 SUSTAINABILITY THIRD PARTY CERTIFICATION (TPC)

Sustainability Third Party Certification (TPC) is required for this project.

1.11.1 General Requirements

All commissioning activities listed in all references for pursuing Sustainability TPC as modified in this Section and commissioning activities specified in this Section must be performed. All commissioning activities that are referred to as "optional activities," "guidance," "should activities," "recommendations," "suggested practices," "informative information," or listed as similar designations are mandatory regardless of any qualifiers and whether or not activity is included as total points toward Sustainability TPC.

Commissioning activities listed in all references for pursuing Sustainability TPC that also have requirements specified in this Section are listed only where requirements are specified in this Section and these commissioning activities are not repeated under references for pursuing Sustainability TPC.

1.11.2 Commissioning Team Responsibilities

The Commissioning Team must, at a minimum, perform all commissioning activities specified in the preceding item entitled "General Requirements," perform commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, perform commissioning activities listed in all of its references as modified in this Section, and perform commissioning activities specified in this Section. This Section takes precedence should there be a conflict between requirements listed in this Section and requirements listed in the reference for pursuing Sustainability TPC or listed in any of its references.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 DESIGN PHASE

3.1.1 Design Phase ASHRAE 189.1 Commissioning Compliance

3.1.1.1 General Requirements

Activities must include, but not be limited to, design phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6

as modified in this Section, design phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and design phase commissioning activities specified in this Section.

3.1.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under item entitled "Design Phase ASHRAE 189.1 Commissioning Compliance."

3.1.2 Design Phase Sustainability Third Party Certification (TPC)

3.1.2.1 General Requirements

Activities must include, but not be limited to, design phase commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, design phase commissioning activities listed in all of its references as modified in this Section, and design phase commissioning activities specified in this Section.

3.1.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Design Phase Sustainability Third Party Certification (TPC)."

3.1.3 Design Phase Commissioning Coordination Meeting

3.1.3.1 General Requirements

A Design Phase Commissioning Coordination meeting must be conducted no later than 30 calendar days prior to the first Plans and Specifications submission or no later than 30 calendar days after approval of Commissioning Firm certifications and all Commissioning Specialist certifications, whichever occurs last. Meeting topics must include, but not be limited to, the commissioning process, contract requirements, lines of communication, roles and responsibilities, schedules, documentation requirements, and logistics as specified in this Section. Meeting must be conducted by conference call.

3.1.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, conduct meeting and prepare meeting minutes complete with Attendance Roster.

3.1.3.3 Designers of Record, Installing Contractors, and Others Responsibilities

Designers of Record and Installing Contractors must attend this meeting. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may also attend this meeting.

3.1.4 Design Phase Commissioning Plan

3.1.4.1 General Requirements

The Design Phase Commissioning Plan must be prepared and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Plan purpose.

b. Commissioning scope.

c. Commissioning process outline.

d. List of all commissioned equipment and systems.

e. Building information.

f. Contact information for the Lead Commissioning Specialist, Technical Commissioning Specialists, Designers of Record, and Contracting Officer's Technical Representative.

g. Criteria listing including Unified Facilities Criteria and Building Codes and Standards.

h. Description of Commissioning Team members.

i. Roles and responsibilities.

j. Lines of communication.

k. Documentation requirements.

l. Owner's Project Requirements.

m. Description of the Basis of Design.

n. Description of Plans and Specifications reviews performed by Technical Commissioning Specialists.

o. Description of Plans and Specifications reviews performed by the Contracting Officer's Technical Representative.

p. Examples and descriptions of Site Observation Reports and Issues Log.

q. Listing and description of Design Phase and Construction Phase Commissioning meetings.

r. Identification of commissioning activities for incorporation into the Project Construction Schedule.

s. Listing of submittals required by Technical Commissioning Specialists.

t. Examples and description of the development of Pre-Functional Checklists, Functional Performance Test Checklists, and Integrated Systems Test Checklists.

u. Description of Pre-Functional Checks, Functional Performance Testing,

and Integrated Systems Testing.

v. Description of Endurance Testing.

w. Description of Ductwork Air Leak Test (DALT) field acceptance testing specified in Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

x. Description of Performance Verification Test (PVT) field acceptance testing specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC.

y. Description of Test and Balance (TAB) field acceptance testing specified in Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

z. Listing of Operation and Maintenance Manual requirements.

aa. Description of Systems Manuals.

bb. Description of training requirements.

cc. Description of Final Commissioning Report.

3.1.4.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Design Phase Commissioning Plan no later than 45 calendar days after approval of Commissioning Specialists certifications.

File one copy of Approved Design Phase Commissioning Plan in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Design Phase Commissioning Plan.

3.1.5 Design Phase Issues Log

3.1.5.1 General Requirements

The Design Phase Issues Log must be prepared and maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Design Phase Issues Log must include the name of Commissioning Team member identifying the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Design Phase Issues Log must be prepared in an electronic format that can be used throughout the Design Phase such that it can be provided to the Government upon request.

3.1.5.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Design Phase Issues Log and must submit one electronic copy no later than seven calendar days after the addition of an issue or a change in status of an issue.

3.1.6 Commissioning Design Reviews

3.1.6.1 General Requirements

Commissioning Design Reviews must be performed and must include reviews

and back-checks of the Owner's Project Requirements (OPR), the Basis of Design and Design (BOD), and Plans and Specifications in accordance with Sustainability TPC rating system requirements and requirements specified in this Section. The number and schedule of design reviews must be in accordance with Sustainability TPC requirements and must include, but not be limited to, review of first Plans and Specifications submission and back-checks of all subsequent submissions. Plans and Specifications submissions are specified in the following paragraphs.

a. Design Development Plans and Specifications submission.

b. 100-Percent Pre-Final Plans and Specifications submission.

c. Final Plans and Specifications submission.

Commissioning Design Reviews must assess completeness and clarity of the OPR, verify requirements stated in the OPR are addressed in the BOD, and verify the Design Plans and Specifications are prepared in accordance with the BOD and applicable Unified Facilities Criteria (UFC). All issues, including those that would negatively impact building system operation and maintenance, must be identified and be provided with proposed corrective actions. The OPR and BOD are for review purposes only and are not contractually enforceable.

3.1.6.2 Commissioning Design Review Reports

A Commissioning Design Review Report must be prepared for each review and back-check of Plans and Specifications and must include each issue listed individually and its corresponding proposed corrective action. Issues must be separated into categories corresponding to systems categories listed under paragraph SYSTEMS TO BE COMMISSIONED.

Updated Commissioning Design Review Reports must be prepared to include resolution of outstanding issues reached during Commissioning Design Review meetings.

3.1.6.3 Commissioning Design Review Meetings

A Commissioning Design Review meeting must be conducted no later than 14 calendar days after preparation of each Commissioning Design Review Report to discuss proposed corrective actions and to resolve outstanding issues. The Contracting Officer's Technical Representative may attend these meetings. Meeting must be conducted by conference call.

3.1.6.4 Lead Commissioning Specialist Responsibilities

Lead Commissioning Specialist activities must include, but not be limited to, activities specified in the following paragraphs.

a. Prepare and provide Commissioning Design Review Reports to Designers of Record.

b. Conduct Commissioning Design Review meetings.

c. Update Commissioning Design Review Reports.

d. Prepare and submit Updated Commissioning Design Review Reports no later than 14 calendar days after each Commissioning Design Review meeting.

3.1.6.5 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists activities must include, but not be limited to, performing reviews and back-checks of Plans and Specifications and attending Commissioning Design Review meetings for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.1.6.6 Designers of Record Responsibilities

Designers of Record activities must include, but not be limited to, providing written responses to Commissioning Design Review Reports and attending Commissioning Design Review meetings.

3.2 CONSTRUCTION PHASE

3.2.1 Construction Phase ASHRAE 189.1 Commissioning Compliance

3.2.1.1 General Requirements

Activities must include, but not be limited to, construction phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, construction phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and construction phase commissioning activities specified in this Section.

3.2.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under the item entitled "Construction Phase ASHRAE 189.1 Commissioning Compliance."

3.2.2 Construction Phase Sustainability Third Party Certification (TPC)

3.2.2.1 General Requirements

Activities must include, but not be limited to, commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, commissioning activities listed in all of its references as modified in this Section, and commissioning activities specified in this Section.

3.2.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Construction Phase Sustainability Third Party Certification (TPC)."

3.2.3 Construction Phase Sequencing

3.2.3.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Heating, ventilation, and air-conditioning (HVAC) systems activities specified in the following paragraphs must be performed as applicable prior to performing Functional Performance Testing of systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED.

a. All equipment and systems have been completed, cleaned, flushed, disinfected, calibrated, tested, and operate in accordance with Plans and Specifications.

b. All Ductwork Air Leakage Testing (DALT) field work, Test and Balance (TAB) field work, Pre-Final TAB Reports, and related prerequisites have been completed, submitted, and approved in accordance with Section 23 05 93.00 22 TESTING, ADJUSTING, AND BALANCING FOR MECHANICAL SYSTEMS.

c. All testing of building envelope, components, and assemblies for air tightness / pressurization verification, thermal integrity verification, and moisture integrity verification have been completed, submitted, and approved.

d. All Pre-Functional Checklists have been completed, submitted, and approved.

e. Certified Certificates of Readiness for respective system has been completed, submitted, and approved.

All completed Final Functional Performance Test Checklists for commissioned equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be submitted and approved prior to the Government performing any Performance Verification Testing specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC.

3.2.3.2 Electrical Systems

Electrical systems activities specified in the following paragraphs must be performed as applicable prior to performing Functional Performance Testing of systems listed under item entitled "Electrical Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED.

a. All electrical, power generation, and lighting equipment and systems have been completed, calibrated, tested, and operate in accordance with Plans and Specifications.

b. Building Envelope is enclosed according to contract documents with final construction completed.

c. All ceiling tiles, floor coverings, and window coverings are in place.

d. All lamps have completed a minimum 100-hour burn-in period.

e. All furniture is in place.

f. Certified Certificates of Readiness for respective system has been

completed, submitted, and approved.

3.2.4 Construction Phase Scheduling

3.2.4.1 General Requirements

Commissioning activities and other related activities for inclusion into the Project Construction Schedule must include, but not be limited to, activities specified in the following paragraphs.

a. Perform Construction Phase Commissioning Coordination meeting.

b. Submittal and approval of Construction Phase Interim Commissioning Plan.

c. Submittal and approval of Construction Phase Final Commissioning Plan.

d. Submittal and approval of completed Pre-Functional Checklists.

e. Perform testing of building envelope, components, and assemblies for air tightness / pressurization verification, thermal integrity verification, and moisture integrity verification.

f. Submittal and approval of proposed Functional Performance Test Checklists.

g. Submittal and approval of final Functional Performance Test Checklists.

j. Perform Construction Phase Site Observations.

k. Participate in Construction Phase Endurance Testing.

l. Witness Construction Phase Functional Performance Testing.

m. Corrections of deficiencies discovered during Construction Phase Functional Performance Testing.

n. Re-witness Construction Phase Functional Performance Testing.

r. Provide all Systems Manuals contents.

s. Submittal and approval of completed Systems Manuals.

t. Perform training.

u. Submittal and approval of Final Commissioning Report.

v. Perform Post-Construction Phase Site Observations.

w. Participate in Post-Construction Phase Endurance Testing.

x. Witness Post-Construction Phase Functional Performance Testing.

y. Corrections of deficiencies discovered during Post-Construction Phase Functional Performance Testing.

z. Re-witness Post-Construction Phase Functional Performance Testing.

3.2.4.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must request a current Project Construction Schedule from Installing Contractors no later than at the Construction Phase Commissioning Coordination Meeting and must prepare and provide to Installing Contractors a list of commissioning activities for inclusion into the Project Construction Schedule. The Lead Commissioning Specialist must associate each commissioning activity to a single construction activity such that if the date of the construction activity changes, the associated commissioning activity changes accordingly.

3.2.4.3 Installing Contractors Responsibilities

Installing Contractors must provide a current Project Construction Schedule to the Lead Commissioning Specialist upon receiving request. Installing Contractors must incorporate the list of commissioning activities into the Project Construction Schedule and must link each commissioning activity to the associated construction activity identified by the Lead Commissioning Specialist such that if the date of the construction activity changes, the associated commissioning activity changes accordingly.

Installing Contractors must provide updated Project Construction Schedules to the Lead Commissioning Specialist at least on a monthly basis.

3.2.5 Construction Phase Commissioning Coordination Meeting

3.2.5.1 General Requirements

A Construction Phase Commissioning Coordination meeting must be conducted no later than 14 calendar days after approval of Commissioning Firm and Commissioning Specialists certifications to discuss topics that include, but not be limited to, the commissioning process, contract requirements, lines of communication, roles and responsibilities, commissioning activities for inclusion into the Project Construction Schedule, documentation requirements, Inspections and Testing, and logistics specified in this Section. Meeting must be conducted by conference call.

3.2.5.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, conduct meeting and prepare meeting minutes complete with Attendance Roster.

3.2.5.3 Installing Contractors, Designers of Record, and Other Commissioning Team Member Responsibilities

Installing Contractors and Designers of Record must attend this meeting. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may attend this meeting.

3.2.6 Construction Phase Commissioning Progress Meetings

3.2.6.1 General Requirements

Construction Phase Commissioning Progress meetings must be conducted to discuss topics that include, but not be limited to, unresolved commissioning issues, status of items specified to be provided to the Lead Commissioning Specialist, and upcoming commissioning activities. Two Construction Phase Commissioning Progress meetings must be conducted for

each systems category unless modified in the following paragraphs. Meetings must be conducted by conference call.

a. Heating, Ventilation, and Air-Conditioning (HVAC) Systems: Six meetings.

b. Building Envelope Systems, Components, and Assemblies: Three meetings.

Construction Phase Commissioning Progress meetings are prohibited from being combined with conducting Construction Phase Commissioning Coordination meeting, conducting Site Observations, witnessing Functional Performance Testing, or witnessing Integrated Systems Testing.

3.2.6.2 Technical Commissioning Specialists Responsibilities

Each Technical Commissioning Specialist must, at a minimum, conduct meetings and prepare meeting minutes complete with Attendance Roster for systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for systems categories assigned to other Technical Commissioning Specialists.

3.2.6.3 Installing Contractors and Others Responsibilities

Installing Contractors must attend these meetings. The Contracting Officer's Technical Representative, a User Representative, and a Public Works Department Representative may attend these meetings.

3.2.7 Construction Phase Interim Commissioning Plan

3.2.7.1 General Requirements

The Construction Phase Interim Commissioning Plan must be prepared and must be an update to the Design Phase Commissioning Plan and contents must include, but not be limited to, contents specified in the following paragraphs.

a. All contents specified for the Design Phase Commissioning Plan.

b. Basis of Design.

c. Contact information for the entire Commissioning Team.

3.2.7.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Construction Phase Interim Commissioning Plan no later than 30 calendar days after the Construction Phase Commissioning Coordination meeting and no later than 14 calendar days prior to performing construction of the building envelope.

3.2.8 Construction Phase Final Commissioning Plan

3.2.8.1 General Requirements

The Construction Phase Final Commissioning Plan must be prepared and must be an update to the Construction Phase Interim Commissioning Plan and contents must include, but not be limited to, contents specified in the following paragraphs.

a. All contents specified for the Construction Phase Interim Commissioning Plan.

b. All Pre-Functional Checklists.

c. All approved final Functional Performance Test Checklists.

3.2.8.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit the Construction Phase Final Commissioning Plan no later than 30 calendar days prior to performing any Functional Performance Testing.

b. File one copy of Approved Construction Phase Final Commissioning Plan in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Construction Phase Final Commissioning Plan.

3.2.9 Construction Phase Issues Log

3.2.9.1 General Requirements

The Construction Phase Issues Log must be prepared and maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Construction Phase Issues Log must include the name of Commissioning Team member identifying the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Construction Phase Issues Log must be a continuation of the Design Phase Issues Log and must be prepared in an electronic format that can be used throughout the Construction Phase such that it can be provided to the Government upon request.

3.2.9.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Construction Phase Issues Log and must submit one electronic copy no later than seven calendar days after the addition of an issue or a change in status of an issue.

3.2.10 Pre-Functional Checklists

3.2.10.1 General Requirements

Pre-Functional Checklists must be prepared for all commissioned equipment and contents must include, but not be limited to, contents for physical inspections that demonstrate construction, installation and start-up of equipment and systems is complete. Refer to item entitled "Pre-Functional Checklists" in item entitled "Inspections and Testing" for more information.

Download example Pre-Functional Checklists for Section 01 91 00.15 TOTAL BUILDING COMMISSIONING at the following location: http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic Checklists must contain the same level of detail shown in examples, but are not required to match the format of examples.

3.2.10.2 Lead Commissioning Specialist Responsibilities

Lead Commissioning Specialist must provide blank Pre-Functional Checklists to Installing Contractors. Blank Pre-Functional Checklists are not required to be submitted to the Government.

3.2.10.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must prepare Pre-Functional Checklists for all equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.11 Functional Performance Test (FPT) Checklists

Functional Performance Test (FPT) Checklists must be prepared for all commissioned equipment and systems demonstrating performance is in accordance with Plans and Specifications. A single final FPT Checklist must be prepared for each system except that a single final FPT Checklist may be prepared for use with multiple systems that have identical features, unless modified in this Section. FPT Checklist contents must include, but not be limited to, step-by-step actions and expected results, unless modified in this Section. Refer to item entitled "Functional Performance Testing and Integrated Systems Testing" for more information.

3.2.11.1 Complex Systems Requirements

FPT Checklists must be prepared for all complex systems as defined in paragraph COMPLEX SYSTEMS demonstrating performance is in accordance with Plans and Specifications. A single FPT Checklist must be prepared for each system except that a single FPT Checklist may be prepared for use with multiple systems that have identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps. Refer to item entitled "Functional Performance Testing and Integrated Systems Testing" and item entitled "Sample Strategy" for more information.

Contents must include, but not be limited to, contents specified in the following paragraphs and shown in example FPT Checklists for Section 01 91 00.15 TOTAL BUILDING COMMISSIONING available for download at the following location:
http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms-graphic
FPT Checklists must contain the same level of detail specified below and as shown in examples, but are not required to match the format of examples.

a. Notable system features including information about such attributes as system sizing and controls to facilitate understanding of system operation.

b. Conclusions and recommendations based on control system feature, point-to-point, actuator, and system operation observations. Conclusions must clearly indicate if system does or does not perform in accordance with requirements of Plans and Specifications. Recommendation must clearly indicate that the system should or should not be accepted by the Government.

c. Test conditions including date, beginning and ending time, and

beginning and ending outdoor air conditions.

d. Identification of the equipment involved in the test.

e. Attendees present throughout the entire system test.

f. Control system feature identification including control point description, embedded/visible type, adjustable/monitoring type, actual value, and setpoint value/alarm range.

g. Point-to-point observations including demonstrating system flow meters and sensors have been calibrated and are correctly displayed on the Operator workstation.

h. Actuator operation observations demonstrating actuator responses to commands from the control system.

i. Variable frequency drive observations demonstrating minimum safe motor speed.

j. System operation observations for system-based testing demonstrating each control sequence, operation mode, and alarm condition resulting from control setpoint manipulation. System operation observations must include, but not be limited to, observations specified in the following paragraphs.

(1) Introduction identifying testing methodology.

(2) As-found conditions prior to system manipulation.

(3) Clear list of test items (step numbers).

(4) Design control sequences or interlocks segmented by unique functions.

(5) Intended test procedures following each segmented sequence or interlock identifying the system manipulation required to initiate system response.

(6) Expected system responses.

(7) Space for comments for each test item.

(8) Pass or fail indication for each test.

Performance Verification Tests prepared by the Controls Contractor as specified in Section 23 09 00.00 22 INSTRUMENTATION AND CONTROL FOR HVAC are prohibited from being used in whole or in part to meet requirements specified in this Section.

3.2.11.2 Building Envelope Systems, Components, and Assemblies Requirements

FPT Checklists must be prepared for thermal integrity verification and moisture integrity verification of building envelope, components, and assemblies listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED. FPT Checklists must demonstrate performance is in accordance with Plans and Specifications. A single final FPT Checklist must be prepared for each unique type of construction.

3.2.11.3 Proposed FPT Checklist Meeting and Draft FPT Checklist Meeting

For all complex systems as defined in paragraph COMPLEX SYSTEMS, a Proposed FPT Checklist Meeting and a Draft FPT Checklist Meeting must be conducted for detailed discussions of procedures intended to demonstrate performance is in accordance with Plans and Specifications. Meetings must be conducted by conference call.

3.2.11.4 Lead and Technical Commissioning Specialists Responsibilities

For all systems other than complex systems as defined in paragraph COMPLEX SYSTEMS, the Lead Commissioning Specialist must submit Final Functional Performance Test Checklists for all systems in each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal for each systems category no later than 30 calendar days prior to performing FPT testing of any system in the respective systems category.

For all complex systems as defined in paragraph COMPLEX SYSTEMS, the Lead and Technical Commissioning Specialists must prepare and submit Final Functional Performance Test Checklists in the sequence specified in the following paragraphs. Technical Commissioning Specialists must perform respective responsibilities for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing respective responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Technical Commissioning Specialists must prepare Proposed Functional Performance Test Checklists.

b. The Lead Commissioning Specialist must submit Proposed Functional Performance Test Checklists for all complex systems as a single submittal no later than 60 calendar days prior to testing of any complex system.

c. Technical Commissioning Specialists must conduct the Proposed Functional Performance Test Checklist Meeting attended by the Contracting Officer's Technical Representative.

d. Technical Commissioning Specialists must prepare Draft Functional Performance Test Checklists to incorporate input from the Contracting Officer's Technical Representative.

e. The Lead Commissioning Specialist must provide Draft Functional Performance Test Checklists to Installing Contractors and Equipment Suppliers no later than seven calendar days prior to the Draft Functional Performance Test Checklist Meeting.

f. Technical Commissioning Specialists must conduct the Draft Functional Performance Test Checklist Meeting attended by Installing Contractors and Equipment Suppliers. The Contracting Officer's Technical Representative may attend this meeting.

g. Technical Commissioning Specialists must prepare Final Functional Performance Test Checklists to incorporate input from Installing Contractors.

h. The Lead Commissioning Specialist must submit Final Functional

Performance Test Checklists for all complex systems as a single submittal no later than seven calendar days after meeting to discuss Draft Functional Performance Test Checklists and no later than 30 calendar days prior to testing of any complex system.

3.2.11.5 Installing Contractors and Equipment Suppliers Responsibilities

Installing Contractors and Equipment Suppliers must attend Draft Functional Performance Test Checklist Meeting.

3.2.12 Construction Submittal Reviews

3.2.12.1 General Requirements

Construction Submittal Reviews must be performed for all commissioned equipment and systems to the extent necessary to verify that equipment and systems are in compliance with commissioning aspects of UFC's referenced by the Design-Build contract, Owner's Project Requirements (OPR), Basis of Design (BOD), and Plans and Specifications as modified in this Section. Reviews must be performed coincident with Designers of Record and reviews must include, but not be limited to, review of shop drawings, equipment submittals, test plans, procedures, and reports.

The OPR and BOD are for review purposes only and are not contractually enforceable.

3.2.12.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of shop drawings, equipment submittals, test plans, procedures, and reports that must be reviewed to Installing Contractors.

b. Prepare and provide Construction Submittal review comments to Installing Contractors. Construction Submittal review comments are not required to be submitted to the Government.

3.2.12.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform reviews of Construction Submittals for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.12.4 Installing Contractors Responsibilities

Installing Contractors must provide all requested Construction Submittals, BOD, and requested supplemental information to the Lead Commissioning Specialist.

3.2.13 Construction Phase Site Observations

3.2.13.1 General Requirements

Construction Phase Site Observations must be performed as specified in the

following paragraphs to verify and document commissioning aspects of equipment and systems as modified in this Section. Two Construction Phase Site Observations must be conducted for each systems category unless modified in the following paragraphs.

Construction Phase Site Observations are prohibited from being combined with witnessing Functional Performance Testing or witnessing Integrated Systems Testing, but may be combined with Pre-Functional Checklist Verificaitons unless indicated otherwise. Purposes of Site Observations specified in the following paragraphs for each systems category may be combined into a single Site Observation.

3.2.13.2 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

b. At least one Site Observation to verify and document HVAC pipe pressure testing.

c. At least one Site Observation to verify and document HVAC pump installation.

3.2.13.3 Plumbing Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least one Site Observation to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

b. At least one Site Observation to verify and document Plumbing pipe pressure testing.

c. At least one Site Observation to verify and document Plumbing pump installation.

3.2.13.4 Electrical Type I Systems

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects and to witness testing performed by independent testing organizations of commissioned equipment and systems listed under this systems category and listed by the Lead Commissioning Specialist to require on-site verification and documentation by Technical Commissioning Specialists. Independent testing organizations typically use tests readily available from testing associations such as the InterNational Electrical Testing Association (NETA).

3.2.13.5 Electrical Type II Systems

Site Observations must be performed for the purposes specified in the

following paragraphs.

a. At least two Site Observations to verify and document commissioning aspects of commissioned equipment and systems listed under this systems category.

3.2.13.6 Building Envelope Systems, Components, and Assemblies

Site Observations must be performed for the purposes specified in the following paragraphs.

a. At least two Site Observations to verify and document in-progress building envelope construction prior to covering critical building envelope components and prior to pressure testing of building envelope, components, and assemblies.

b. At least one Site Observation to verify, document, and witness pressure testing, infrared thermography testing, and fog testing performed by independent testing agencies and specified in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS.

c. At least one Site Observation to verify, document, and witness inspections, measurements, and testing performed by independent testing agencies and specified in Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM.

3.2.13.7 Summary Meetings

A Summary Meeting must be conducted at the conclusion of each Site Observation for the purpose of discussing issues discovered during each Site Observation. Meeting must be conducted on-site with all attendees present.

3.2.13.8 Site Observation Reports

A Site Observation Report must be prepared for each Site Observation for the purpose of documenting issues discovered during each Site Observation.

Site Observation Reports for all equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include results of testing performed by independent testing organizations that were witnessed by Technical Commissioning Specialists and test results that were not witnessed by Technical Commissioning Specialists.

3.2.13.9 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must provide list of equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED that require on-site verification and documentation by Technical Commissioning Specialists to Installing Contractors.

The Lead Commissioning Specialist must submit Construction Phase Site Observation Reports complete with Summary Meeting Attendance Roster no later than seven calendar days after Site Observation.

3.2.13.10 Technical Commissioning Specialists Responsibilities

Each Technical Commissioning Specialist must be responsible to perform Site Observations, conduct Summary Meetings, and prepare Construction Phase Site Observation Reports for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.13.11 Installing Contractors Responsibilities

Installing Contractors must provide Technical Commissioning Specialists access to construction and systems for Site Observations and must attend Summary Meetings.

Installing Contractors must schedule testing to occur in the presence of Technical Commissioning Specialists as specified in the following paragraphs.

a. All equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED and listed by the Lead Commissioning Specialist to require on-site verification and documentation by Technical Commissioning Specialists. Results of testing of equipment and systems listed under item entitled "Electrical Type I Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be provided to the Lead Commissioning Specialist that were witnessed by Technical Commissioning Specialists and that were not witnessed by Technical Commissioning Specialists.

b. Pressure testing, infrared thermography testing, and fog testing specified in Section 07 05 23 PRESSURE TESTING AN AIR BARRIER SYSTEM FOR AIR TIGHTNESS and inspections, measurements, and testing specified in Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM for equipment and systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED. Results of all tests, inspections, and measurements must be provided to the Lead Commissioning Specialist that were witnessed by Technical Commissioning Specialists and that were not witnessed by Technical Commissioning Specialists.

3.2.14 Inspections and Testing

3.2.14.1 Pre-Functional Checks

Pre-Functional Checks must be performed prior to performing Functional Performance Testing or Integrated Systems Testing of respective system and activities must include, but not be limited to, activities specified in the following paragraphs.

a. Complete Pre-Functional Checklists.

b. Perform Construction Phase Endurance Testing.

3.2.14.1.1 Pre-Functional Checklist Verifications

Pre-Functional Checklist Verifications must be performed using Pre-Functional Checklists from the approved Construction Phase Final

Commissioning Plan by conducting on-site spot-checks to verify accuracy after receipt of completed Pre-Functional Checklists from Installing Contractors. Verifications may be combined with Construction Phase Site Observations.

3.2.14.1.1.1 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must provide blank Pre-Functional Checklists to Installing Contractors.

The Lead Commissioning Specialist must submit all completed Pre-Functional Checklists and all associated equipment start-up reports for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than seven calendar days after receipt of all completed checklists for equipment and systems listed under the respective systems category from Installing Contractors.

3.2.14.1.1.2 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform Pre-Functional Checklist Verifications and then must indicate acceptance of all Pre-Functional Checklist items for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.1.1.3 Installing Contractors Responsibilities

Installing Contractors must complete one Pre-Functional Checklist for each piece of equipment and system. Initial each Pre-Functional Checklist item for their area of responsibility indicating the item's construction, installation, and start-up as applicable has been verified to be complete and is ready for testing.

Installing Contractors must submit completed and initialed Pre-Functional Checklists and all associated equipment start-up reports to the Lead Commissioning Specialist no later than seven calendar days after completion of inspection of all checklist items for each piece of equipment and system.

3.2.14.2 Construction Phase Endurance Testing

3.2.14.2.1 General Requirements

Construction Phase Endurance Testing (trending of control system control points) for complex systems as defined in paragraph COMPLEX SYSTEMS must be performed as specified in the following paragraphs. Systems must be operating as normally anticipated during occupancy throughout Endurance Testing.

3.2.14.2.2 Hardware

Hardware must have sufficient buffer capacity to trend all data throughout Endurance Testing. Trend data uploading during the course of Endurance Testing to ensure all trend data is retained is encouraged. Lost trend data will require retesting of all control points for affected systems.

3.2.14.2.3 Results Format

Results format of trend data must be provided in a graphical format complete with clear indication of value(s) for y-axis, value for x-axis, and legend identifying each trended control point. The number of control points contained on a single graph must be such that all control points can be clearly visible. Control points must be logically grouped such that related points appear on a single graph. In addition, a separate comma separated value (CSV) file of raw trend data for each trended system must be provided. Each trended control point in CSV file must be clearly identified.

For control points recorded based on change of value, change of value for recording data must be clearly identified for each control point.

3.2.14.2.4 Construction Phase Endurance Testing Reports

A Construction Phase Endurance Testing Report must be prepared and contents must include, but not be limited to, an executive summary, review comments, trend results in graphical format, and raw trend data for all trend results for each trended system.

3.2.14.2.5 Start, Duration, and Recording Frequency

Starting date and time must be identical for all control points specified to be trended for each system subject to Endurance Testing regardless of specified duration and regardless of specified frequency. Duration of all Endurance Testing must be no less than seven consecutive calendar days.

Recording frequency of data for all control points specified to be trended for each system subject to Endurance Testing must be 15-minutes as modified in this Section. The recording frequency of data for specific control point types must occur at the frequency specified in the following paragraphs.

3.2.14.2.5.1 Control Points Trended at One Minute Intervals

a. Temperature for supply air, return air, mixed air, supply water, and return water.

b. Temperature entering and leaving all heat transfer devices such as coils, energy recovery wheels, and heat pipes.

c. Temperature for outside air, supply air, return air and exhaust air entering and leaving energy recovery device.

d. Flow for supply air, return air, outside air, chilled water, and HVAC heating hot water.

e. Flow for exhaust air associated with energy recovery.

f. Relative humidity for outside air and return air.

g. Relative humidity for outside air, supply air, return air and exhaust air entering and leaving energy recovery device.

h. Command and status for control dampers and control valves.

i. Speed for fans and pumps.

j. Pressure for fans and pumps.

3.2.14.2.5.2 Control Points Trended at 15 Minute Intervals

a. Temperature and relative humidity for zones.

b. Temperature and relative humidity for outside air not associated with energy recovery.

c. Pressure relative to the outside for facility.

3.2.14.2.5.3 Control Points Trended at Change of Position or State

a. Command and status for equipment such as chillers, boilers, pumps, compressors, air handling units, dedicated outside air systems.

b. Operation state for occupied, unoccupied, warm-up, cool-down, timed override, cooling, heating, alarm, and lead-lag duty status change.

c. Command and position for two-position control air dampers.

3.2.14.2.6 Trended Control Points

Trended control points for each system must demonstrate performance is in accordance with Plans and Specifications. Trended control points must include, but not be limited to, control points listed in Plans and Specifications' points lists.

Trended control points for selected systems, at a minimum, must include control points specified in the following paragraphs. These control points must be trended as applicable to this contract in addition to control points necessary to demonstrate systems perform in accordance with requirements of Plans and Specifications and control points listed in Plans and Specifications' points lists.

3.2.14.2.6.1 Air-Cooled Chiller Chilled Water System

a. Chiller(s) command and status.

b. Chiller isolation valve(s) command and status.

c. Chilled water pump(s) actual speed.

d. Chilled water pump(s) setpoint and actual differential pressure.

e. Minimum flow bypass control valve command.

f. Minimum system flow setpoint and actual flow.

g. Chilled water supply setpoint and actual temperature.

h. Chilled water return actual temperature.

i. Chilled water actual flow.

j. Outside air actual dry-bulb temperature.

3.2.14.2.6.2 HVAC Heating Hot Water System with Boiler

a. Boiler(s) command and status.

b. Boiler(s) isolation valve command and status.

c. HVAC heating hot water pump(s) actual speed.

d. HVAC heating hot water pump(s) setpoint and actual differential pressure.

e. Minimum flow bypass control valve command.

f. Minimum system setpoint and actual flow.

g. HVAC heating hot water supply setpoint and actual temperature.

h. HVAC heating hot water return actual temperature.

i. HVAC heating hot water actual flow.

j. Outside air actual dry-bulb temperature.

3.2.14.2.6.3 Dedicated Outside Air System (DOAS)

a. Outside air actual dry-bulb temperature.

b. Outside air actual relative humidity.

c. Outside air isolation damper command and status.

d. Outside air setpoint and actual airflow.

e. Energy recovery wheel command, status, and actual speed.

f. Energy recovery wheel's OA bypass control damper command and status.

g. Energy recovery wheel's defrost cycle command and status.

h. Energy recovery wheel's OA discharge air actual dry-bulb temperature.

i. Energy recovery wheel's OA discharge air actual relative humidity.

j. Preheat coil leaving air setpoint and actual temperature.

k. Preheat coil control actuator command.

l. Cooling coil leaving air setpoint and actual temperature.

m. Cooling coil control valve command.

n. Supply air fan actual speed.

o. Reheat coil control valve command.

p. Discharge air setpoint and actual temperature.

q. Supply air fan setpoint and actual static pressure.

r. Facility setpoint and actual relative pressure.

s. Return air actual dry-bulb temperature.

t. Return air actual relative humidity.

u. Energy recovery wheel's EA bypass control damper command and status.

v. Energy recovery wheel's EA discharge air actual dry-bulb temperature.

w. Energy recovery wheel's EA discharge air actual relative humidity.

x. Exhaust air fan actual speed.

y. Exhaust air isolation damper command and status.

3.2.14.2.6.4 Supply Air Terminal Units

a. Zone setpoint and actual dry-bulb temperature.

b. Zone actual relative humidity.

c. Control damper command.

d. Heating coil valve command.

e. Airflow actual value.

f. Leaving air actual temperature.

3.2.14.2.7 Sample Strategy

Sample strategy must be as specified in the following paragraphs.

a. 100-Percent trending for central plant equipment such as chilled water and HVAC heating hot water systems, air handling unit systems including all associated fans except for remote exhaust air fans, dedicated outside air systems including all associated fans except for remote exhaust air fans, and renewable energy system.

b. 20-Percent sample trending for equipment with identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps.

3.2.14.2.8 Unsuccessful Trending and Re-Trending

3.2.14.2.8.1 100-Percent Samples

Trending results must be failed for equipment or systems for which 100-percent sample size are trended if one or more of the trended control points results in discovery of a deficiency.

Re-trending must be required to the extent necessary to confirm that deficiencies have been corrected.

3.2.14.2.8.2 Less than 100-Percent Samples

Trending results must be failed for equipment or systems for which less than 100-percent sample size are trended if one or more of the trended

control points results in discovery of a deficiency.

a. Re-trending must be required for only items which experienced initial failures if the failure rate is 5-percent or less, meaning that 5-percent or less of the equipment or systems had at least one deficiency.

b. Re-trending must be required for items which experienced initial failures to the extent necessary to confirm that the deficiencies have been corrected if the failure rate is higher than 5-percent, meaning that more than 5-percent of equipment or systems trended had at least one deficiency. In addition, re-trending of another random sample of the same size as the initial sample for the first time. If the second random sample set has any failures, those failed items must be re-trended and all remaining equipment and systems must be trended to complete 100-percent testing of that system type.

3.2.14.2.8.3 Re-Trending Costs

Re-trending costs must be reimbursed to the Government. These costs must include salary associated with additional reviews of trend results for the Lead Commissioning Specialist, Technical Commissioning Specialists, and Government personnel.

3.2.14.2.9 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of systems that must be trended, control points that must be trended, and reminder of trend results format specified in this Section to Installing Contractors.

b. Provide action plan for correcting failed trend results to Installing Contractors.

c. Provide list of systems that must be re-trended due to failure of trend results or having been provided in an incorrect trend results format to Installing Contractors.

d. Prepare and submit Construction Phase Endurance Testing Reports as a single submittal no later than 14 calendar days after preparation of all Endurance Testing Reports. In addition, submit one electronic copy of raw trend data.

3.2.14.2.10 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these activities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Select systems that must be trended for samples of less than 100-percent.

b. Prepare list of systems and control points that must be trended.

c. Perform review of all trend results and provide approval or failure disposition.

d. Prepare list of systems that must be re-trended due to failure of trend results or having been provided in an incorrect trend results format.

e. Prepare action plan for correcting failed trend results.

3.2.14.2.11 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform activities specified in the following paragraphs.

a. Provide hardware suitable to obtain trend data for systems and control points identified by Technical Commissioning Specialists.

b. Provide hardware suitable to interface with and obtain trend data from equipment identified by the Lead Commissioning Specialist to require trending that features on-board factory packaged controls. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

c. Provide list of equipment and control points that must be trended to Equipment Suppliers who provided equipment featuring on-board factory packaged controls as part of their contract.

d. Collect trend data in the format specified in this Section for specified systems and control points and provide to the Lead Commissioning Specialist.

e. Provide action plan for correcting failed trend results to Equipment Suppliers who provided equipment featuring on-board factory packaged controls as part of their contract.

f. Implement action plan for correcting failed trend results.

g. Re-collect and provide trend data in the format specified in this Section for trend results determined to have failed or determined to have been provided in an incorrect trend results format to the Lead Commissioning Specialist

3.2.14.2.12 Equipment Suppliers Responsibilities

Equipment Suppliers must, at a minimum, perform activities specified in the following paragraphs.

a. Provide Installing Contractor access, but not interface equipment, to equipment featuring on-board factory packaged controls provided as part of their contract. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

b. Provide descriptions to Installing Contractors in clearly understood language (not proprietary code) for all trended control points.

c. Implement action plan for correcting failed trend results for equipment featuring on-board factory packaged controls provided as part of their contract.

3.2.14.3 Certified Certificates of Readiness and Certificates of Readiness

3.2.14.3.1 General Requirements

A single Certified Certificate of Readiness must be prepared for each system subject to Functional Performance Testing or subject to Integrated Systems Testing by reviewing, signing, and dating Certificates of Readiness to indicate each system is complete and ready for testing. Testing of any equipment or system is prohibited until after its Certified Certificate of Readiness has been submitted and approved.

A single Certificate of Readiness must be prepared for each system subject to Functional Performance Testing or subject to Integrated Systems Testing. Certificate of Readiness contents must include, but not be limited to, contents specified in the following paragraphs to the extent applicable to the specific system being tested.

a. Cover sheet with spaces for signatures and dates by the Lead Commissioning Specialist and by Installing Contractors to indicate each system is complete and ready for testing.

c. Equipment and system start-up reports.

d. Control system start-up reports.

e. Diagnostic test reports.

g. Completed Pre-Functional Checklists.

3.2.14.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must sign, date, and submit Certified Certificates of Readiness no later than 14 calendar days prior to testing of respective system.

3.2.14.3.3 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must perform reviews of Certificates of Readiness for accuracy to ensure systems are complete and ready for testing for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.3.4 Installing Contractors Responsibilities

Installing Contractors must prepare, sign, and date Certificates of Readiness indicating systems are complete and ready for testing and provide to the Lead Commissioning Specialist.

3.2.14.4 Functional Performance Testing and Integrated Systems Testing

3.2.14.4.1 General Requirements

Functional Performance Testing and Integrated Systems Testing must be performed using approved checklists and all required Commissioning Team participants must be present prior to start of testing. Testing must be aborted and rescheduled to occur at a later date if any Commissioning Team

participant is not present or if deficiencies discovered during testing prevent successful completion. Testing of any equipment or system is prohibited until after its Certified Certificate of Readiness has been submitted and approved.

All necessary materials and system modifications to simulate actual conditions as close as is practically possible must be provided. Complete all testing by returning affected equipment and systems to pre-test conditions.

3.2.14.4.2 Complex Systems and Integrated Systems Category Requirements

Testing of complex systems as defined in paragraph COMPLEX SYSTEMS and testing of systems listed under item entitled "Integrated Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must be performed as specified in the following paragraphs.

3.2.14.4.2.1 Equipment Featuring On-Board Factory Packaged Controls

Testing of equipment featuring on-board factory packaged controls must include, but not be limited to, testing specified in the following paragraphs.

a. Equipment enabling and disabling.

b. Equipment standard and optional control points necessary to accomplish functionality whether or not control points are specified in Plans and Specifications.

c. Equipment standard and optional alarms critical to safe operation whether or not optional alarms are specified in Plans and Specifications.

d. All control points added by Controls Contractor in addition to on-board factory packaged controls whether or not control points are specified in Plans and Specifications.

3.2.14.4.2.2 Test Setup and Condition Simulation

Test setup must include all necessary materials and system modifications to simulate flows, pressures, temperatures, and other conditions necessary to perform testing according to specified conditions must be provided.

Condition simulation must be accomplished by temporarily changing control system setpoints. Condition simulation by over-writing control system inputs (actual) values is prohibited unless approved in advance of test by the Contracting Officer's Technical Representative.

3.2.14.4.2.3 Condition Simulation Methods

Condition simulation methods for equipment and systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED that are acceptable are specified in the following paragraphs.

a. When varying static pressures inside ductwork cannot be simulated within the duct, and where a sensor signals the controls system to initiate sequences at various duct static pressures, it is acceptable to simulate the various pressures with a Pneumatic Squeeze-Bulb Type

Signaling Device with gauge temporarily attached to the sensing tube leading to the transmitter. It is not acceptable to reset the various setpoints, nor to simulate an electric analog signal unless approved as specified in the preceding paragraphs.

b. Dirty filter pressure drops can be simulated using sheets of cardboard at filter face.

c. Freeze-stat safeties can be simulated by packing portion of sensor with ice.

d. High outside air temperatures can be simulated with a hair blower.

e. High entering cooling coil temperatures can be used to simulate entering cooling coil conditions.

f. Do not use signal generators to simulate sensor signals unless approved by the Contracting Officer's Technical Representative, as noted above, for special cases.

g. Control setpoints can be altered. For example, to see the air conditioning compressor lockout work at an outside air temperature below lockout setpoint, when the outside air temperature is above lockout setpoint, temporarily change the lockout setpoint to be minus 0 degrees above the current outside air temperature. Caution: Setpoints are not to be raised or lowered to a point such that damage to the components, systems, or the building structure and/or contents will occur.

h. Test duct mounted smoke detectors in accordance with the manufacturer's recommendations. Perform testing with air system at minimum airflow condition in ductwork.

i. Test current sensing relays used for fan and pump status signals to control system to indicate unit failure and run status by resetting the setpoint on the relay to simulate a lost belt or unit failure while the unit is running. Confirm that the failure alarm was generated and received at the control system. After the test is performed, return the setpoint to its original setpoint or a setpoint as indicated by the Contracting Officer's Technical Representative.

3.2.14.4.3 Sample Strategy

3.2.14.4.3.1 General Requirements

100-Percent testing of all systems unless modified in the following paragraphs. Sample strategy for testing must be equally applied to each building in this project.

Sample strategy must be applied to total equipment and system counts specified for system categories under paragraph SYSTEMS TO BE COMMISSIONED.

3.2.14.4.3.2 Complex Systems

Sample strategy for all complex systems as defined in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for central plant equipment such as chilled water and HVAC heating hot water systems, air handling unit systems

including all associated fans except for remote exhaust air fans, dedicated outside air systems including all associated fans except for remote exhaust air fans, and renewable energy system.

b. 20-Percent sample testing for equipment with identical control sequences such as unitary air-conditioners, packaged terminal air-conditioners, and heat pumps. Sample must include at least one complete item such as one complete unitary air-conditioner.

3.2.14.4.3.3 Plumbing Systems

Sample strategy for all systems listed under item entitled "Plumbing Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED except plumbing systems defined as complex systems in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for central plant equipment such as natural gas systems, domestic cold water systems, domestic heating hot water systems, and process water systems.

b. 20-Percent sample testing for equipment with identical features such as fixtures, irrigation systems, emergency eyewash stations, and vacuum systems. Sample must include at least one complete item such as one complete fixture.

3.2.14.4.3.4 Electrical Type II Systems

Sample strategy for all systems listed under item entitled "Electrical Type II Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED except electrical systems defined as complex systems in paragraph COMPLEX SYSTEMS must be as specified in the following paragraphs.

a. 100-Percent testing for equipment such as emergency power systems featuring single operation generator sets, automatic transfer switches, and uninterruptible power supplies (not local uninterruptible power supplies), emergency response systems, and frequency converters.

b. 20-Percent sample testing for equipment with identical features such as lighting systems, daylighting control systems, and fenestration control systems. Sample must include at least one complete item such as lighting in one space.

3.2.14.4.3.5 Building Envelope Systems, Components, and Assemblies

Sample strategy for all systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED must be as specified in the following paragraphs.

a. 20-Percent sample testing of surface area for each unique type of construction for thermal integrity verification of entire of the building envelope, components, and assemblies.

b. 20-Percent sample testing of surface area for each unique type of construction for moisture integrity verification of the building envelope, components, and assemblies.

3.2.14.4.4 Unsuccessful Testing and Re-Testing Costs

3.2.14.4.4.1 Unsuccessful Testing of 100-Percent Sample

Testing must be failed for equipment or systems for which 100-percent sample size are tested if one or more of the test procedures results in discovery of a deficiency that cannot be resolved within five minutes during testing.

Re-testing must be witnessed to the extent necessary to confirm that deficiencies have been corrected without negatively impacting the performance of the rest of the system.

3.2.14.4.4.2 Unsuccessful Testing of Less than 100-Percent Sample

Testing must be failed for equipment or systems for which less than 100-percent sample size are tested if one or more of the test procedures results in discovery of a deficiency, regardless of whether the deficiency is corrected during the sample test.

a. Re-testing must be witnessed of only items which experienced initial failures if the failure rate is 5-percent or less, meaning that 5-percent or less of the equipment or systems had at least one deficiency.

b. Re-testing must be witnessed of items which experienced initial failures to the extent necessary to confirm that the deficiencies have been corrected if the failure rate is higher than 5-percent, meaning that more than 5-percent of equipment or systems tested had at least one deficiency. In addition, testing of another random sample must be witnessed for the same size as the initial sample for the first time. If the second random sample set has any failures, those failed items must be retested and all remaining equipment and systems must be tested to complete 100-percent testing of that system type.

3.2.14.4.4.3 Re-Testing Costs

Re-testing costs must be reimbursed to the Government. These costs must include salary, travel costs, and per diem for Government personnel and all Commissioning Team participants. Reimbursement responsibilities are specified in the following paragraphs.

a. Commissioning Team participants who were not present must equally share reimbursement costs.

b. Installing Contractors and Equipment Suppliers who were responsible for discovered deficiencies resulting in test failures must equally share reimbursement costs.

3.2.14.4.5 Commissioning Team Participants

Participants of Functional Performance Testing and Integrated Systems Testing must include, but not be limited to, participants specified in the following paragraphs. The Contracting Officer's Technical Representative, Public Works Department Division (PWD) Representatives, and Using Agent's Representatives (Users) may, but are not required to, participate in any testing.

3.2.14.4.5.1 Heating, Ventilation, and Air-Conditioning (HVAC) Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Heating, Ventilation, and Air-Conditioning (HVAC) Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Controls Commissioning Representative (CC).

d. Installing Contractors' TAB Commissioning Representative (TAB).

e. Installing Contractors' Mechanical Commissioning Representative (MC).

f. Equipment Supplier (ES).

3.2.14.4.5.2 Plumbing Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Plumbing Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Plumbing Commissioning Representative (PC).

d. Equipment Supplier (ES).

e. Installing Contractors' Controls Commissioning Representative (CC).

3.2.14.4.5.3 Utility Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Utility Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Mechanical Technical Commissioning Specialist (CxM).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Controls Commissioning Representative (CC).

d. Installing Contractors' TAB Commissioning Representative (TAB).

e. Installing Contractors' Mechanical Commissioning Representative (MC).

f. Installing Contractors' Electrical Commissioning Representative (EC).

g. Equipment Supplier (ES).

3.2.14.4.5.4 Electrical Type II Systems

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Electrical Type II Systems Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Electrical Technical Commissioning Specialist (CxE).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Electrical Commissioning Representative (EC).

d. Equipment Supplier (ES).

3.2.14.4.5.5 Building Envelope Systems, Components, and Assemblies

Commissioning Team members participating in Functional Performance Testing of systems listed under item entitled "Building Envelope Systems, Components, and Assemblies Category" in paragraph SYSTEMS TO BE COMMISSIONED must include, but not be limited to, participants specified in the following paragraphs.

a. Building Envelope Technical Commissioning Specialist (CxB).

b. Installing Contractors' Quality Control Personnel (CQC).

c. Installing Contractors' Building Envelope Commissioning Representative (BC).

d. Equipment Supplier (ES).

3.2.14.4.6 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Testing to select which systems must be tested for samples of less than 100-percent.

b. Coordinate logistics with Installing Contractors.

c. Submit completed Final Functional Performance Test Checklists for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than 14 calendar days after successful testing of all systems listed under the respective systems category.

3.2.14.4.7 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must witness, re-witness, and document all testing for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

3.2.14.4.8 Installing Contractors Responsibilities

Installing Contractors must provide all necessary materials and perform all aspects of testing including modifications to simulate actual conditions for all equipment and systems related to their contract.

3.2.14.4.9 Equipment Suppliers Responsibilities

Equipment Suppliers must perform all aspects of testing of equipment featuring on-board factory packaged controls provided as part of their contract. Refer to paragraph COMPLEX SYSTEMS for definition of equipment featuring on-board factory packaged controls.

3.2.14.4.10 Installing Contractors and Equipment Supplier Coordination

Installing Contractors and Equipment Suppliers must simultaneously perform all aspects of testing of equipment featuring on-board factory packaged controls provided as part of their contract.

3.2.15 Systems Manuals

3.2.15.1 General Requirements

Systems Manuals must be prepared for all commissioned equipment and systems and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Final Owner's Project Requirements.

b. Final Basis of Design.

c. Recommended maintenance schedules when schedules are not provided in Operation and Maintenance manuals.

d. Recommended re-testing schedule.

e. Blank copy of all approved final Functional Performance Test Checklists.

g. Complete equipment warranty information.

h. Recommended schedule for sensor and actuator calibration.

Systems Manual contents for all complex systems as defined in paragraph COMPLEX SYSTEMS, in addition to contents specified in the preceding paragraphs, must include, but not be limited to, contents specified in the following paragraphs.

a. As-built system single line diagrams.

b. As-built sequences of operation and controls drawings.

c. As-built control system setpoints.

3.2.15.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Provide list of contents required for all Systems Manuals to Installing Contractors.

b. Prepare and submit all Systems Manuals as a single submittal no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

3.2.15.3 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, provide required contents for all Systems Manuals to the Lead Commissioning Specialist.

3.2.16 Training

3.2.16.1 Training Plans

Training Plans must be prepared for all commissioned equipment and systems and contents must include, but not be limited to, contents specified in the following paragraphs.

a. List of those who should receive training by position or name.

b. List of systems that require training organized by Specification Section.

c. Training content.

d. Level of instruction required.

e. Level of required instructor expertise.

f. Trainer name and trainer contact information.

g. Identification of whether training is conduced on-site or in a classroom setting.

h. Schedule and location of training.

i. Criteria for determining whether provided training is acceptable.

j. Blank Training Attendance Rosters.

3.2.16.2 Training

Training must be performed in accordance with Training Plans and in accordance with requirements specified in respective Technical Sections.

3.2.16.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit all Training Plans as a single submittal no later than 30 calendar days prior to the occurrence of any training session.

b. Provide approved Training Plans to Installing Contractors.

c. Submit all completed Training Attendance Rosters as a single submittal no later than 14 calendar days after completion of all training

sessions.

3.2.16.4 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform activities specified in the following paragraphs.

a. Perform training as specified in the preceding paragraphs.

b. Require all training attendees to sign Training Attendance Rosters.

c. Provide completed Training Attendance Rosters no later than seven calendar days after completion of all training sessions to the Lead Commissioning Specialist.

3.2.17 Final Commissioning Report

3.2.17.1 General Requirements

The Final Commissioning Report must be prepared and contents must include, but not be limited to, contents specified in the following paragraphs.

a. Executive summary describing the overall commissioning process.

b. Results of the commissioning process.

c. Issues Log.

d. Commissioning Design Review Reports.

e. Approved Construction Phase Final Commissioning Plan.

f. Approved Pre-Final Test and Balance Reports.

g. Completed Pre-Functional Checklists.

h. Endurance Testing Reports.

i. Completed Functional Performance Test Checklists.

k. Approved Training Plans.

l. Completed Training Attendance Rosters.

m. Identification of all deficiencies complete with corrective actions taken.

n. Indication that systems meet requirements of the Owner's Project Requirements and Plans and Specifications.

o. List of any testing that must be performed during the Post-Construction (Warranty) Phase.

3.2.17.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Prepare and submit the Final Commissioning Report no later than 14

calendar days after successful completion of all Functional Performance Testing and all Integrated Systems Testing.

b. File one copy of Approved Final Commissioning Report in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Final Commissioning Report.

3.3 POST-CONSTRUCTION (WARRANTY) PHASE

3.3.1 Post-Construction Phase ASHRAE 189.1 Commissioning Compliance

3.3.1.1 General Requirements

Activities must include, but not be limited to, post-construction phase commissioning activities listed in ASHRAE 189.1 paragraphs 10.3.1.2.1 through 10.3.1.2.6 as modified in this Section, post-construction phase commissioning activities listed in references contained in ASHRAE 189.1's listed paragraphs as modified in this Section, and post-construction phase commissioning activities specified in this Section.

3.3.1.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform all activities specified under item entitled "Post-Construction Phase ASHRAE 189.1 Commissioning Compliance."

3.3.2 Post-Construction Phase Sustainability Third Party Certification (TPC)

3.3.2.1 General Requirements

Activities must include, but not be limited to, post-construction phase commissioning activities listed in the reference for pursuing Sustainability TPC, GBI GP Compliance, as modified in this Section, post-construction phase commissioning activities listed in all of its references as modified in this Section, and post-construction phase commissioning activities specified in this Section.

3.3.2.2 Lead and Technical Commissioning Specialists Responsibilities

The Lead and Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs.

a. The Lead Commissioning Specialist must submit all documentation of commissioning activities directly to the Suitability TPC organization as modified in this Section.

b. The Lead and Technical Commissioning Specialists must perform all activities specified under item entitled "Post-Construction Phase Sustainability Third Party Certification (TPC)."

3.3.3 Post-Construction Phase Issues Log

3.3.3.1 General Requirements

The Post-Construction Phase Issues Log must be maintained to track all commissioning issues identified by any member of the Commissioning Team. At a minimum for each commissioning issue, the Post-Construction Phase Issues Log must include the name of Commissioning Team member identifying

the issue, identification date, description, proposed resolution, final resolution, and final resolution date. The Post-Construction Phase Issues Log must be a continuation of the Construction Phase Issues Log and must be prepared in an electronic format that can be used throughout the Post-Construction Phase such that it can be provided to the Government upon request.

3.3.3.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must prepare and maintain the Post Construction Phase Issues Log and must submit one electronic copy no later than 14 calendar days after completion of any Post-Construction Phase commissioning activity.

3.3.4 Post-Construction Phase Site Observations

3.3.4.1 General Requirements

Post-Construction Phase Site Observations must be performed between eight and 10 months after Beneficial Occupancy to verify and document that all commissioned equipment and systems are operating in accordance with the Owner's Project Requirements.

Post-Construction Phase Site Observations are prohibited from being combined with witnessing Post-Construction Phase Functional Performance Testing or witnessing Post-Construction Phase Integrated Systems Testing.

3.3.4.2 Site Observation Reports

Site Observation Reports must be prepared for each Site Observation for the purpose of documenting issues discovered during Site Observation.

3.3.4.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Site Observation to schedule attendance of Operations and Maintenance staff and occupants and to make provisions for access to all commissioned equipment and systems.

b. Submit Post-Construction Phase Site Observation Reports no later than 14 calendar days after Site Observation.

3.3.4.4 Technical Commissioning Specialists Responsibilities

Technical Commissioning Specialists must, at a minimum, perform activities specified in the following paragraphs for equipment and systems listed under systems categories assigned to them in this Section. Technical Commissioning Specialists are prohibited from performing these responsibilities for equipment and systems listed under systems categories assigned to other Technical Commissioning Specialists.

a. Interview Operations and Maintenance staff.

b. Interview occupants.

c. Determine status of unresolved commissioning issues.

d. Compare current operations to operations identified throughout the commissioning process.

e. Prepare Post-Construction Phase Site Observation Reports.

3.3.5 Inspections and Testing

3.3.5.1 Post-Construction Phase Endurance Testing

3.3.5.1.1 General Requirements

Post-Construction Phase Endurance Testing (trending of control system control points) requirements and activities for each complex system as defined in paragraph COMPLEX SYSTEMS must be performed if all requirements and activities for respective system could not be fully or successfully completed during Construction Phase Endurance Testing.

Post-Construction Phase Endurance Testing requirements and activities must include, but not be limited to, requirements and activities specified for Construction Phase Endurance Testing as modified in the following paragraphs. Systems must be operating as normally anticipated during occupancy throughout Endurance Testing.

3.3.5.1.2 Post-Construction Phase Endurance Testing Reports

A Post-Construction Phase Endurance Testing Report must be prepared and contents must include, but not be limited to, an executive summary, Technical Commissioning Specialists’ review comments, trend results in graphical format, and raw trend data for all trend results for each trended system.

3.3.5.1.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing and specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to performing Endurance Testing to make provisions for access to all commissioned equipment and systems.

b. Coordinate logistics of trend data collection with Installing Contractors.

c. Prepare and submit Post-Construction Phase Endurance Testing Reports as a single submittal no later than 14 calendar days after preparation of all Endurance Testing Reports. In addition, submit one electronic copy of raw trend data.

3.3.5.1.4 Installing Contractors Responsibilities

Installing Contractors must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing and specified in the following paragraphs.

a. Setup trend hardware during one site visit and retrieve trend data and trend hardware as applicable during an additional site visit.

3.3.5.1.5 Equipment Suppliers Responsibilities

Equipment Suppliers must, at a minimum, perform all activities assigned for Construction Phase Endurance Testing.

3.3.5.2 Certified Certificates of Readiness and Certificates of Readiness

Certified Certificates of Readiness and Certificates of Readiness are not required for any Post-Construction Phase activity.

3.3.5.3 Post-Construction Phase Functional Performance Testing and Integrated Systems Testing

3.3.5.3.1 General Requirements

Functional Performance Testing and Integrated Systems Testing must be performed for all commissioned equipment and systems that could not be fully or successfully tested during the Construction Phase. Testing must be performed using approved checklists and all required Commissioning Team participants must be present prior to start of testing. Testing must be aborted and rescheduled to occur at a later date if any Commissioning Team participant is not present or if deficiencies discovered during testing prevent successful completion.

Functional Performance Testing and Integrated Systems Testing requirements and activities must include, but not be limited to, requirements and activities specified for Construction Phase Functional Performance Testing and Integrated Systems Testing as modified in paragraphs under paragraph POST-CONSTRUCTION (WARRANTY) PHASE.

3.3.5.3.2 Commissioning Team Participants

Participants of Functional Performance Testing and Integrated Systems Testing must include, but not be limited to, participants specified in the following paragraphs. The Contracting Officer's Technical Representative, Public Works Department Division (PWD) Representatives, and Using Agent's Representatives (Users) may, but are not required to, participate in any testing.

a. Lead Commissioning Specialist.

b. Technical Commissioning Specialists.

c. Installing Contractors.

d. Equipment Suppliers.

3.3.5.3.3 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, perform activities specified in the following paragraphs.

a. Contact Contracting Officer's Technical Representative no later than 30 calendar days prior to witnessing Functional Performance Testing and Integrated Systems Testing to make provisions for access to all commissioned equipment and systems.

b. Coordinate logistics with Installing Contractors.

c. Submit completed Final Functional Performance Test Checklists for each systems category listed under paragraph SYSTEMS TO BE COMMISSIONED as a single submittal no later than 14 calendar days after successful testing of all systems listed under the respective systems category.

3.3.6 Updated Systems Manuals

3.3.6.1 General Requirements

Updated Systems Manuals must be prepared and must be an update to Systems Manuals prepared during the Construction Phase and contents must include, but not be limited to, changes resulting from Post-Construction Phase commissioning activities.

3.3.6.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit all Updated Systems Manuals as a single submittal no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

3.3.7 Updated Final Commissioning Report

3.3.7.1 General Requirements

The Updated Final Commissioning Report must be prepared and must be an update to the Final Commissioning Report prepared during the Construction Phase and contents must include, but not be limited to, changes resulting from Post-Construction Phase commissioning activities.

3.3.7.2 Lead Commissioning Specialist Responsibilities

The Lead Commissioning Specialist must, at a minimum, prepare and submit the Updated Final Commissioning Report no later than 30 calendar days after completion of all Functional Performance Testing and all Integrated Systems Testing.

File one copy of Approved Updated Final Commissioning Report in the Sustainability eNotebook no later than 14 calendar days after receiving approval of the Updated Final Commissioning Report.

1.0 PROJECT DESCRIPTION – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

1.1. Overview

Hurricane Florence impacted Marine Corps Base (MCB) Camp Lejeune and Marine Corps Air Station (MCAS) New River with periods of strong winds, heavy rains, flooding of urban and low-lying areas, flash floods, and coastal storm surges. As a result, MCB Camp Lejeune, MCAS New River and MCAS Cherry Point experienced damage to approximately 781 buildings and structures. Numerous facilities were either partially damaged or rendered uninhabitable.

This project will replace facilities that sustained severe structural and water intrusion damage, rendering them uninhabitable. The existing facilities were already in poor condition due to age and deterioration and structural integrity issues. The effects of Hurricane Florence exacerbated chronic material conditions with the facilities, impacting mission capability.

The project consists of a one-story training facility to contain the II Marine Expeditionary Force (MEF) Battle Simulation Center and II MEF Combined Arms and Staff Trainer (CAST). The facility will be constructed on a greenfield site that will include parking, outdoor training areas, and a new building with open secret storage space, containing multiple configurable simulation training classrooms, configurable First Integrated Rehearsal Environment (FIRE) classrooms, audio/visual, computer and server room equipment spaces, and spaces for personnel and administrative support. These functions will be relocated from several separate existing buildings and consolidated into the new training facility.

II MEF Simulation Center is currently housed in Buildings 125 and 127, and the II MEF CAST in Building H-13. The existing buildings will be demolished after they are vacated.

1.2. Project Components

The components found within the Scope of Work for this project include, but are not limited to:

- Development of a greenfield site on the northeast corner of McHugh Boulevard and Cross Street
- Stormwater management features to comply with Government LID requirements and state stormwater management permit requirements.
- Site utility connections.
- Parking areas
- Gazebo
- Impervious and pervious outdoor training areas
- One-story building of approximately 53,400 square feet to house a new, consolidated simulation training center
- Classified and unclassified areas
- Ready Room/Auditorium
- Open secret storage space
- Multiple configurable training classrooms

- FIRE training classrooms and equipment support room
- Computer and server room equipment spaces
- Personnel and administrative offices
- Storage/shipping/receiving area
- Demolition of existing Buildings 125, 125A, 127 and H13
- Removal of existing mobile Buildings 125B and 125C.

1.3. Project Purpose

The purpose of this project is to construct a state-of-the-art facility that provides a modern training/education environment that facilitates training from the individual marine through Marine Air Ground Task Force (MAGTF) and Joint Coalition level staffs. This project will provide effective and efficient training opportunities for Commanders in one facility for the first time and is necessary because II MEF has outgrown its existing facilities that are old, dated, and were affected by Hurricane Florence.

The primary driver behind the project is to consolidate the II MEF Simulation Center Buildings 125 and 127, and the CAST facility Building H13 to improve student and staff efficiency and allow for necessary computer and networking connectivity. Its main function will be to provide Marines and Sailors using a wide spectrum of training venues using computer-based simulations that span from first-person simulations, designed for individual and small units; to combined arms integration using current generation Combined Arms Command and Control Training Upgrade System simulations; to staffs ranging from company through MAGTF to include Allied Forces, using current constructive simulation MAGTF Tactical Warfare Simulations (MTWS).

The secondary driver behind the project is that, with an expanding global Department of Defense (DoD) mission in simulation and aided training, II MEF provides instruction to over 100,000 DoD students annually and has outgrown its existing facilities. II MEF simulation enabled exercises are currently supported by multiple, separate training facilities, including the MEF Simulation Center housed in Buildings 125 and 127, and the II MEF CAST in Building H13. These buildings were designed as standalone facilities and were adequate for the expected training needs at the time of their design. Since 2001, the II MEF has rapidly expanded its simulation-based training, and Training and Education Command (TECOM) has fielded several simulation training systems targeted at battalions and below, as well as individuals. Because of this, combined with the increased requirement for computer network infrastructures and ancillary systems to support distributed training and inclusion of sister services and allied partners, the current facilities have become inadequate. The facilities are undersized and include deteriorated temporary facilities that lack weatherproofing, leading to equipment damage. Office space within the facilities has been forfeited to accommodate current activity levels, separating users and resulting in inefficiencies.

1.4. Most Relevant Codes and Standards

The following codes and standards, and those incorporated by reference within the following, are applicable to the project.

This is not a comprehensive list, and the Contractor is responsible for ensuring that the completed project complies with all applicable federal, state, and local codes, standards, and regulations.

MCB Camp Lejeune

- International Plumbing Code (IPC), 2018, as modified by UFC criteria

2.0 PROJECT OBJECTIVES – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

2.1. Mission Statement

After Hurricane Florence, numerous Camp Lejeune facilities were rendered uninhabitable, including the existing training center, comprised of Buildings 125, 125A, 125B, 125C, 127, and H13. Severe structural, roof truss and water intrusion damage made Building 125 unable to be occupied, especially during high winds or heavy snow load conditions. These facilities, built in the 1940s and 1980s, were already in very poor condition due to their age and deterioration as well as inadequately sized for current operational needs. The hurricane exacerbated chronic material conditions with the facilities, impacting mission capability. Therefore, the existing operations will be replaced with and consolidated into new state-of-the-art facilities that will be constructed on a greenfield site. These facilities will include a new building with more area that will incorporate all training functions under one roof and satisfy the tenant's needs and requirements to adequately conduct their day-to-day operations.

2.2. Facility Function

2.2.1. Overview

The new II MEF combined training facility will house the II MEF Simulation Center and II MEF CAST. The new facility will provide a modern training and education environment that facilitates training from the individual Marine through MAGTF and Joint Coalition level staffs. The new building will improve student and staff efficiency and allow for necessary computer and networking connectivity. Its main function is to train Marines and Sailors using a wide spectrum of training venues using computer-based simulations that span first-person simulations designed for individual and small units; to combined arms integration using current generation Combined Arms Command and Control Training Upgrade System simulations; to staffs ranging from company through MAGTF to include Allied Forces, using the current constructive simulation MTWS. The new facilities will provide reconfigurable spaces that will adapt to numerous training scenarios, whether small unit, Company, Battalion or MAGTF. The new facility will also include administrative functions directly related to the new combined training facility.

2.3. Project Specific Priorities

The specific priorities of this project include:

- Protecting the health, safety, and welfare of those who currently occupy the existing training facilities located in dated, hurricane-damaged, substandard buildings.
- Consolidation of a multitude of training missions under one roof. This includes personnel, equipment, and virtual simulation requirements from various existing facilities.
- Increase efficiencies in scheduling and deployment of these respective training exercises, offering considerable reductions in the cost of servers, various networking requirement, military support staff, and contractor support.
- The main functional aspects of the Simulation Training Center at Building 125, the Deployable Virtual Training Environment (DVTE) at Building 127, and the CAST at

Building H13 will be incorporated and consolidated into a new state-of-the-art training facility.

2.3.1. Sustainable Design and Construction

All NAVFAC projects are subject to sustainable design criteria and are required to meet the requirements of the Guiding Principles for Sustainable Federal Buildings (HPSB). The Guiding Principles are outlined in a cross disciplinary publication addressing requirements for new building construction and modernization of all federally owned facilities. Sustainable principles will be integrated into the design, development and construction of the project in accordance with Executive Order 13834 and other applicable laws and Executive Orders.

Design and construct the project to comply with sustainability requirements identified in Part 2 Section 01 33 29.05 20, *Sustainability Reporting for Design-Build*. Additional specific sustainability requirements are found in RFP Part 2, Part 3, and Part 4 sections.

Design and construct the project in accordance with UFC 1-200-02, *High Performance and Sustainable Building Requirements.* The UFC provides design, construction and modernization criteria for projects of all sizes. It outlines performance thresholds in energy and water, addresses criteria of indoor air quality, identifies resiliency concerns, addresses planning and design, and establishes a baseline across all of DOD for documenting sustainability. A major component of the policy established in this UFC is the Sustainable Third-Party Certification requirement for projects that reach specific size and cost thresholds.

Additional, agency-specific requirements can be found in NAVFAC Engineering & Construction Bulletins (ECBs) such as Issue No. 2014-02. ECB 2014-02 describes overall NAVFAC policy and guidance on sustainability and energy requirements.

2.3.2. Stormwater Management – Low Impact Development (LID)

Comply with UFC 3-210-10, *Low Impact Development* and FC 1-300-09N, *Navy and Marine Corps Design Procedures*. Additional specific LID and stormwater management requirements are found in RFP Parts 3 and 4, Section G30. In addition to LID, comply with state and local stormwater regulations.

2.3.3. Energy Efficiency

The level of energy performance the Government seeks may only be achieved through coordinated design of architectural, electrical, and mechanical elements. All energy systems must be designed in compliance with the following unless more stringent requirements are noted otherwise:

- UFC 1-200-02, HPSB Requirements.
- Energy Policy Act (EPAct), 2005
- Energy Independence and Security Act (EISA), 2007
- American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Standard 189.1 - 2014
- ASHRAE/Illuminating Engineering Society of North America (IESNA) Standard 90.1 - 2013.

Energy consuming equipment and products must meet or exceed Energy Star or Federal Energy Management Program (FEMP) efficiency levels. This includes built-in equipment (e.g., lights; heating, ventilation, and air conditioning (HVAC); water heating; and industrial equipment) and collateral equipment (e.g., office equipment, information technology (IT), and task lighting). For equipment types not rated by Energy Star or FEMP, equipment efficiencies must be in the top 25 percent of similar products. All purchased electronics must be Electronic Product Environmental Assessment Tool (EPEAT)-registered. In addition, provide an energy compliance analysis (ECA), which will demonstrate compliance with all energy-related requirements in UFC 1-200-02. Measure and record existing building utility consumption, and provide design-calculated, estimated energy savings and post-construction documentation and reporting of actual realized energy savings.

2.3.4. Building Commissioning

Provide commissioning to meet requirements identified in Section 01 91 00.15 22 Total Building Commissioning, and UFC 1-200-02 High Performance and Sustainable Building Requirements.

2.3.5. Accessibility Requirements

Provide barrier-free design in accordance with UFC 1-200-01, *General Building Requirements*.

2.3.6. Antiterrorism Force Protection

The primary objective for the Marine Corps Base (MCB) security engineering is to ensure compliance with the Antiterrorism Force Protection (AT/FP) program requirements and applicable Marine Corps physical security measures in MCO 5530.14A, as supplemented by the UFC. The AT/FP program requirements and Marine Corps physical security measures are to safeguard personnel, equipment, and property. A risk analysis and vulnerability assessment (RAVA) has not been performed and a specific Design Basis Threat has not been identified.

The facility is considered inhabited and will be routinely occupied by 11 or more personnel. The facility must be designed in accordance with UFC 4-010-01 Chapter 3, except that parking is not permitted in the minimum 33-foot, unobstructed space around the building. This includes low-occupancy portions of the building, as applicable, due to physical security and operational requirements. The facility must also be designed in accordance with the following requirements:

a) **Antiterrorism Architectural Special Requirements:** Installation Mission Assurance has requested security-conscious layouts and configurations for interior building spaces and building entrances. The goal is to improve antiterrorism safety without adding cost, without hardening the building, and without adversely affecting the usability of the building.

b) **Building Entrance Orientation:** Orient the main building entrance such that vehicles are not able to drive through the main building entrance. Where this is impractical, ensure that the entry storefront does not directly face a main hallway or a mass-gathering space. Lay out entrances to be welcoming and accessible, but also visibly protected and inaccessible to vehicles attempting a forced entry. The main entrance layout must be in compliance with UFC 4-010-01 Chapter 3-12, Standard 11, *Building Entrance Layout*. Where this section conflicts with Standard 11, Standard 11 must take precedence.

c) **Proximity of Densely Populated Areas to Parking:** To mitigate risks to densely populated areas, locate uninhabited, low-occupancy, and mechanical yard areas

adjacent to parking lots. Locate densely populated areas away from parking lots to the maximum extent possible given available site space and building square footage. Keep densely populated areas a minimum of 82 feet away from parking spaces, if sufficient site space is available. Uninhabited and low-occupancy spaces include spaces such as utility rooms, hallways and corridors without seating, and storage areas. Densely populated areas include classrooms, large break rooms, locker rooms, conference rooms, auditoriums, and other areas with a high-personnel density. During the concept development workshop (CDW), include the installation Antiterrorism Officer (Mission Assurance) in discussions for the preferred layout of mass-gathering and densely-populated administrative areas relative to the proposed site plan.

d) **Antiterrorism Landscape Architecture Special Requirements:** Installation Mission Assurance has requested security-conscious landscape features that afford improved protection to the building occupants. The goal is to improve antiterrorism safety without adding cost by using UFC-mandated landscape architecture features to protect vulnerable areas and using excess fill from the project site to provide landscaped berms. A specific design-basis threat for an active shooter or vehicle attack does not apply; therefore, the intent is to complement architectural layouts and civil site features to improve occupant protection within the project scope of work (SOW).

e) **Vehicle Deterrent Landscaping:** As part of a vehicle-deterrent perimeter, landscape features can provide significant physical and psychological deterrents to the risk of a vehicle ramming attack. Landscape features do not need to be rated passive vehicle barriers to afford greater security to the building occupants.

f) **Unobstructed Space:** Trees, plantings, and site furniture may be located within the minimum 33-foot unobstructed space around each building, provided they are compliant with the UFC 4-010-01 and UFC 3-201-02 requirements for landscaping in the minimum 33-foot unobstructed space. To eliminate concealment opportunities, berms in the minimum 33-foot unobstructed space must not exceed a height of 4 feet, 6 inches.

g) **Large-Diameter Trees:** Tree species that will grow to a large (6 inches or greater) diameter at breast height (DBH) provide an aesthetically pleasing and natural barrier to vehicle traffic. It is desirable to position large-diameter trees in the space between the building and parking lots or roads where permissible by code and feasible based on available site space. Provide tree plantings with at least a 4-inch DBH where the trees are integrated into the vehicle-deterrent perimeter. Multiple staggered rows of trees serve as highly-effective vehicle barriers once the trees have grown. Where providing multiple rows of trees, stagger and space the trees to eliminate any corridors exceeding a 5-foot width perpendicular to the adjacent roads or drive aisles. Final tree layout, spacing, and species selection must be approved by the Government Landscape Architect and installation Antiterrorism Officer or their designated representatives.

h) **Concrete Site Features:** Concrete benches and picnic tables are excellent deterrents to vehicles. Concrete planters are not desirable due to landscape maintenance issues and concealment concerns in the minimum 33-foot unobstructed space.

i) **Berms and Ditches:** Berms and ditches provide protection and can be integrated with the landscaping plan (e.g. trees along tops of berms and creeping juniper on the sides).

j) **Elevated Plazas:** For buildings that require elevated entryway access with stairs and accessible ramps, arrange the stairs, ramps, and low retaining walls or sloped soil so that they are positioned near the edge of the vehicle parking lot or adjacent roadways. A

steeper, landscaped, stabilized slope near the edge of the parking lot with a sidewalk in front of it serves as a visible deterrent to illegal parking and approaching vehicles.

k) **Bollards at Building Entrances:** Bollards are an option where other features such as stairs, pedestrian ramps, trees, or berms do not deter direct vehicle access to the main building entrance. Bollards are desirable for sidewalks and plazas leading to the main building entrance provided there is no adverse impact to pedestrian accessibility. A bollard spacing of 4 feet on center will meet Architectural Barriers Act (ABA) and Americans with Disabilities Act (ADA) requirements. Architectural bollards near the building entry are a desirable way to improve protection while improving site lighting (for lighted bollards) and aesthetic appeal. Removable bollards are acceptable and beneficial for future building maintenance. Coordinate with vehicle access control requirements as part of civil site design. Provide the option of either permanent or removable bollards, determined based on customer needs at the CDW and subsequent design review meetings.

l) **Visual Screening Landscaping at Queuing and Entry Areas:** Visual screening affords protection for building occupants and visitors against the potential for vehicular or active shooter threats. Landscaping that provides visual obscuration of building entrances and outdoor queuing or congregation areas is highly desirable to improve protection of personnel in exposed areas.

m) **Antiterrorism Civil Site Design Special Requirements:** Installation Mission Assurance has requested security-conscious site plans that afford improved protection to building occupants. The goal is to improve antiterrorism safety without adding cost by laying out necessary vehicle parking and stormwater features to protect vulnerable areas of the building. A specific design basis threat for an attack vehicle does not apply; therefore, the intent is to complement architectural layouts and landscaping features to improve occupant protection within the project SOW. The minimum 33-foot unobstructed space and vehicle access control requirements defined below are added scope items to manage nuisance parking and maintain the minimum 33-foot unobstructed space for base operational considerations.

n) **Vehicle Access Control:** All projects must include consideration for vehicle access control in the form of lockable swing gates and/or lockable removable bollards along driveways and access roads that lead to service areas around the building within the minimum 33-foot unobstructed space. Other open-plaza areas must be secured with permanent bollards in combination with removable bollards. Portions of buildings that must be secured within a restricted area fence (e.g., motor pools) are excluded from this requirement.

o) **Service Area Access:** Access for service areas around the building includes roads and driveways that lead to utility rooms, loading docks, mechanical yards, other areas in the minimum 33-foot unobstructed space that are used for building maintenance, and for roads that are only used for fire access.

p) **Pedestrian Areas:** Open plazas, hardscaping, and other outdoor pedestrian-congregation areas that are adjacent to a roadway must also feature vehicle access control integrated with permanent landscaping and civil site features as part of a vehicle-deterrent perimeter. Removable and fixed architectural bollards (lighted, where beneficial) are preferred for vehicle access control to open plazas, hardscaping, and other outdoor pedestrian-congregation areas with at least four removable bollards in a row for service access to these pedestrian areas. Provide the option of either permanent

or removable bollards, determined based on customer needs at the CDWand subsequent design review meetings.

q) **Access Control Requirements:** Where bollards are provided, space bollards 4 feet on center starting at each edge of the road or driveway. Where gates are provided, provide single- or double-leaf swing gates with posts that start at the edge of the roadway or behind the curb. Provide receiving posts to secure the gate in the open position. Gates must not encroach on the roadway or driveway while in the open position. Gates and bollards must be high-visibility and meet UFC requirements for signage, high-visibility, reflectivity, and striping to meet traffic safety requirements. Gates and bollards for vehicle access control to service areas and pedestrian-congregation areas need not be crash rated. Refer to UFC 4-022-03, *Security Fences and Gates,* for additional requirements for gates.

r) **Vehicle-Deterrent Perimeter:** Gates and bollards must be integrated with landscaping and civil site features to deter vehicles from bypassing the access control by driving around the barriers and to maintain a vehicle-deterrent perimeter.

s) **Consolidating Access Control:** Access roads to service areas around the building can be secured where the access road begins at the adjacent roadway or parking lot, provided this is integrated with the vehicle-deterrent perimeter, to reduce the total cost of providing vehicle access control to the minimum 33-foot unobstructed space.

t) **Control Vehicle Speed:** Arrange parking lot access roads and drive aisles so that any direct approaches to the building walls or building entrance cannot exceed 25 miles per hour. Speed limit signage alone is not sufficient to constrain vehicle speed. Speed limit control in parking lots and access roads is also desirable to improve pedestrian safety and reduce the risk of vehicle accidents.

u) **Limit Vehicle Approaches to Building:** Arrange access roads and drive aisles so that no vehicles have long, straight approaches directly at the exterior walls of the building, particularly at the building entrance. Keep the long axis of drive aisles parallel with the walls of the building to control the approach direction of a vehicle. Arrange access roads so that personnel do not drive directly facing the building walls or any entrance. For short drive aisles that run perpendicular to the long axis of the parking lot, coordinate with landscape architecture to provide civil site and landscaping features that visually or physically deter vehicle access. Alternatively, locate these perpendicular drive aisles beyond the ends of the building so traffic does not directly face the building walls or any entrance. Loading docks and heavy truck areas need not consider these requirements due to the impracticability of implementing this where building access is a requirement. Provide curb stops in parking spots that are adjacent to the building to discourage vehicle parking in the minimum 33-foot unobstructed space.

v) **Unobstructed Space and Vehicle-Deterrence:** Provide a minimum 33-foot unobstructed space around the building without new parking, existing parking, new roadways, or new drive aisles. Keep existing roadways out of the minimum 33-foot unobstructed space to the maximum extent practicable. Provide berms, drainage swales and ditches, and other civil site features between the building and any adjacent parking lots or roadways as part of a vehicle-deterrent perimeter. Berms can also reduce offsite fill disposal costs, provided that fill is verified to be non-hazardous, non-contaminated. The CDW must address how to integrate unobstructed space and vehicle-deterrence needs within the available site footprint in consultation with the installation Antiterrorism Officer.

w) **Unobstructed Space Preferences:** The installation mission-assurance personnel prefer larger unobstructed spaces where feasible, based on available site space. Unobstructed space need not exceed 82 feet for larger, open sites. This unobstructed space preference is to the mass-gathering portions of each facility that excludes open hangar areas, apparatus bays, and other areas that are specifically designed to be low-occupancy spaces as defined in UFC 4-010-01. Refer to paragraph 2.3.6.c, Proximity of Densely Populated Areas to Parking, for more information.

2.3.7. Facility-Related Control System Cybersecurity

Design, acquire, and execute all facility-related control systems in accordance with UFC 4-010-06, *Cybersecurity of Facility-Related Control Systems*. Design the project using UFGS 25 05 11, *Cybersecurity for Facility-Related Control Systems*. Government Point of Contact to be utilized in SECTION 25 05 11 for Camp LeJeune is James Mahoney, ICS ISSM, email James.D.Mahoney@usmc.mil. Submit Control Correlation Identifiers (CCI) as attachments to SECTION 25 05 11.

The table below identifies the Facility-Related Control Systems which must be included for this facility. Final C-I-A impact levels must be coordinated and approved by the Camp LeJeune ICS ISSM, James Mahoney, James.D.Mahoney@usmc.mil.

Authorizing Official (AO)	System Owner	System Group	System	Existing Authority to Operate (ATO)?	C-I-A Impact Level
USMC AO Dr. Ken Bible	DPW	UMCS	HVAC	Existing ATO in MCCAST (USMC) to be validated by Information System Security Manager (ISSM)	LOW-LOW-LOW – ISSM must validate
USMC AO Dr. Ken Bible	DPW	UMCS	Lighting	Existing ATO in MCCAST (USMC) to be validated by ISSM	LOW-LOW-LOW – ISSM must validate

Incorporate these facility-related control system cybersecurity requirements into project facility control systems identified in:

- ESR D20, Plumbing
- ESR D30, HVAC
- ESR D40, Fire Protection, including Cooper Notification, Inc. WAVES Emergency Notification System
- ESR D50, Electrical

2.3.8. Secured Areas

Comply with the Marine Corps physical security measures in MCO 5530.14A as supplemented by the UFC.

2.3.9. Air Quality Management

Ensure that subject buildings are evaluated for asbestos and asbestos-containing materials by a certified professional prior to demolition or renovation.

Ensure that any fugitive dust emissions generated by construction, renovation, or demolition are appropriately controlled.

If the project includes installation of new activities or equipment which generate air emissions, and the sources have not been evaluated for air permitting by MCB Camp Lejeune, contact Air Quality (AQ) program at (910)451-9017. Please note that air emission sources are required to be permitted prior to their installation and operation. Examples of such sources include, but are not limited to: boilers, water heaters, generators, fuel storage tanks, painting and coating operations, woodworking, welding, abrasive blasting, engine testing, refrigerant recovery devices, and parts ovens.

If the project involves any refrigerant handling or manipulation, ensure that appropriate ozone depleting substance (ODS) servicing procedures are followed.

If the project includes removal of currently permitted air emission sources (see Item 3 for examples), contact AQ program at (910)451-9017.

2.4. Appropriate Design

Design the new building and systems in accordance with all Codes, Standards, UFCs, and criteria explicitly and implicitly stated in this Design-Build RFP. Employ integrated design principles.

2.4.1. Building Design – Architecture

The II MEF Simulation Training Building exterior envelope design must follow the architectural design features prescribed in the Camp Lejeune Base Exterior Architectural Plan (BEAP), 2010 for Hadnot Point (Section 4.2). This document establishes key exterior materials, material finishes and colors, and building façade and roofing design elements to be incorporated into the building's exterior design.

Options for the exterior wall design are listed in Part 3, Chapter 6, B20 Exterior Closure ESR. Any of the listed options is allowed for the design of the exterior wall, as long as the design elements for the exterior wall defined in the BEAP are provided. An applicable 4:12 to 6:12 roof slope is defined in the BEAP for Hadnot Point.

The building design floor plan must generally follow the arrangement of spaces indicated in the Blocking Diagram in Part 3, Chapter 4 of this RFP. Locations of break rooms and restrooms may vary from what is shown in the diagrams if the function of the primary training and administrative spaces are maintained due to the nature of the building's classified and non-classified functions.

The massing of the building and roofing placement will be influenced by its final layout and configuration. The building design and design documentation must comply with applicable UFCs listed in Chapter 3, Part 1 and applicable building codes.

2.4.2. Civil/Site

2.4.2.1. General

The II MEF Simulation Training Building site as proposed will be located on what is currently a heavily wooded site on the northeast corner of McHugh Boulevard and Birch Street. A right-turn lane and a left-turn lane must be provided on McHugh Boulevard to provide direct access to the site. The first driveway accessed via the right turn lane on McHugh must line up with the existing driveway across McHugh Boulevard. This current existing driveway has a single entry off of McHugh Boulevard and a right and left turn lane pulling onto McHugh Boulevard. The new building will front McHugh Boulevard, with the loading area and mechanical yard at the rear of the building. A minimum 33-foot AT/FP unobstructed space requirement is applicable for this project. An 8-foot tall ornamental (not chain-link) Restricted Security Fence required for classification of exercises must envelope the building, concrete and grassed training areas, and the staff parking area adjacent to the building to the northwest (min 100 spaces). A dumpster pad and AT/FP compliant enclosure must be provided on the site outside the fenced area.

2.4.2.2. Parking and Access

Parking for the proposed facility is anticipated to be northwest of the site in the heavily wooded area along McHugh Boulevard. Additional student parking will be provided further to the northwest and requires 10 percent greenspace. For truck turning movements, use a WB-50 tractor trailer as the largest vehicle accessing the site. A segregated Military Owned Vehicle (MOV)-only drive aisle must be provided for access to the outdoor training areas. Provide emergency vehicle access, designed with required turning radii for emergency vehicles, immediately adjacent to the building, and provide associated gates. A minimum 12-foot-wide concrete pedestrian access must be provided from the parking areas to the building and from the building to the convenience store on the south side of Birch Street. Where indicated on the conceptual site plan in Part 6, outdoor space must be HS-20 load rated turf pavement to support emergency and tactical training vehicles and a separate turf area for communications tents. Vehicle area must not be hardstand; grounding rods are driven for communications equipment. Benches and picnic areas must be provided around the building to accommodate up to 50 people.

2.4.2.3. Utilities

Civil utilities available to the site include water, sewer, stormwater, and natural gas. Water borders the site on the west side, roughly in line with McHugh Boulevard. Provide fire hydrants inside of the secured fence to meet UFC requirements. Gravity sanitary sewer runs along the southeast side of the site. It is assumed at this time that the depth of the gravity sewer will be sufficient to serve the new facility. A closed storm drainage system must connect several storm drain inlets associated with the site, including parking lot drainage, to an NCDEQ approved stormwater control measure (SCM)and outfall to the northeast. Potential LID Stormwater Management Areas must be provided for the site to meet both NAVFAC LID and North Carolina Department of Environmental Quality (NCDEQ) permit requirements. Please note that pervious pavers and grass pave are not considered pervious area for NCDEQ stormwater permits. Pads for chillers and condensers must be provided on the ground level at an elevation above flood per UFC requirements

Geographic information system (GIS) information indicates electric and communications utilities run along the southwest side of the site along McHugh Boulevard. There is also overhead

power along McHugh Boulevard and Birch Street. Natural gas is adjacent to the site and serves the surrounding facilities.

2.4.3. Environmental/Conservation/Cultural Resources

There are no environmental, conservation or cultural resources identified for this project.

2.4.4. Structural

The structural design objective is to construct an efficient, safe, and durable building constructed from materials and load-bearing systems permitted in the Part 3 ESR narratives and meeting the reference codes and standards. As part of this objective, the structural design must be coordinated with all disciplines and must meet functional requirements.

To help meet the objective, NAVFAC has provided a significant amount of historic geotechnical information and ECS has performed a preliminary geotechnical investigation of this site. Refer to Part 6 for the ECS preliminary information that includes previous investigations provided by NAVFAC. The NAVFAC and ECS geotechnical information is reliable for preliminary information but must be verified by the Contractor. The Contractor is solely responsible for interpreting available geotechnical information. The Contractor is responsible for conducting an independent geotechnical investigation for foundation design.

2.4.5. Fire Protection

2.4.5.1. Building Code and Life Safety Analysis

Provide a complete building code and life safety code analyses in accordance with UFC 3-600-01 and FC 1-300-09N.

2.4.5.2. Fire Alarm and Mass Notification

Design and provide an integrated fire alarm, mass notification system capable of notifying building occupants inside the facility of an emergency event. Design and install all equipment per the criteria of ESR and PTS Sections D40 and the manufacturer’s recommendations. Where the words "should" or “shall” are used in the manufacturer’s recommendations and in referenced Codes and Standards, substitute the word "must".

2.4.5.3. Fire Protection Sprinkler System

Design and provide a wet pipe fire sprinkler system for complete fire protection coverage throughout the building. Design and install equipment per the criteria of ESR and PTS Sections D40 and the manufacturer’s recommendations. Where the words "should" or “shall” are used in the manufacturer’s recommendations and in referenced Codes and Standards, substitute the word "must". Base the hydraulic design on the water supply data provided in ESR Section D40 and Part 6.

2.4.5.4. Special Detailed Requirements Based on Use

Protect Electronic Equipment Areas in accordance with Chapter 4-11 of UFC 3-600-01. Refer to the ESR Section D40.

2.4.6. Telecommunications

Provide a complete telecommunications backbone and horizontal distribution system as specified throughout this RFP. Install all equipment, pathways, and cabling per the criteria in PTS Sections D50 and G40 and the manufacturer's recommendations. Where the words "should" or "shall" are used in the manufacturer's recommendations, substitute with the word "must".

Provide a main distribution frame (MDF) to house telecommunications equipment and cabling as well as service provider equipment and cabling. Additionally, provide floor or area serving intermediate distribution frames (IDF) to house telecommunications equipment and cabling.

Provide fiber and copper exterior and interior backbone cabling to each MDF and IDF. Provide copper horizontal cabling from each IDF with cable tray and conduit pathways to each Work Area Outlet (WAO).

Provide exterior underground communications duct bank manhole system from existing duct bank(s) and manhole to the MDF inside each building.

The design and installation must be in accordance with the latest TIA standards, all applicable Unified Facilities Criteria documents, and the latest Local provider and applicable Military Department standards and criteria.

2.5. Workflow Process

The new simulation training center consolidates multiple training missions, supporting a global DoD mission and providing instruction to over 100,000 DoD students annually. A variety of simulation-aided training functions will be incorporated. Therefore, multiple reconfigurable simulation rooms will be provided for maximum flexibility, as well as an auditorium for 100 persons. A single ISMT-E will be provided due to its specific requirements. In addition, administrative, briefing, server, and support spaces will also be housed in this facility.

The facility's main entrance will be the student entrance to the south. A secondary main entrance on the west will be for administrative personnel.

There will be two separate sets of restrooms and breakrooms in the non-classified areas of the facility, one set dedicated to administrative personnel and the other dedicated to students, whether they are participating in classified or non-classified training. Students will also have access to two outside areas, pervious and impervious, for outdoor simulations. These will be accessible to the student restrooms that will include shower facilities.

2.5.1. Hours of Operation

Hours of operation for student instruction are from 0700 to 1700, Monday through Friday. Instructors and other administrative staff will have access to the facility 24 hours per day, 7 days a week.

2.5.2. Staffing/Occupancy

The simulation training center is occupied primarily during daytime hours by students in training spaces and administrative staff in administrative departments.

The occupancy loads specified in the RFP and indicated in the Building Program in Part 3, Chapter 4 are identified for programming purposes. Determine occupancy loads to be used to design building features, such as structural, egress, and plumbing fixtures. The loads used must

be as required in applicable building or life safety codes, based on the spaces provided in the building design.

2.6. Special Design Challenges

The large number of military construction (MILCON) facilities that are to be built at or around the same time as the II MEF Simulation Training Center at Camp Lejeune may create challenges with both material and labor availability. The design of the building and systems selected for exterior envelope materials must take these challenges into account.

2.7. Adaptability and Flexibility

The II MEF Simulation Training Center provides flexibility in allowing the simulation classrooms to be adjoined by utilizing folding panel partitions. The combined enlarged classrooms provide for instructional flexibility.

3.0 SITE ANALYSIS – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

3.1. Existing Site Conditions

3.1.1. Site Conditions – Natural Constraints

3.1.1.1. Topography

The proposed site for the II MEF Simulation Training Center building is located in the heavily wooded area northeast of the intersection of McHugh Boulevard and Birch Street. Site elevations range from approximately 24 feet down to 6 feet. There is an existing ditch running along the northeast side of McHugh Boulevard with a high point that sends drainage northwest and southeast. A second ditch on the northeast side of Birch Street combines with the first ditch. This combined ditch then runs to the northeast to combine in a larger drainage draw that ultimately drains to Wallace Creek. Base GIS indicates no portion of this ditch as potential wetlands. Wetlands are located to the north, east and south of the proposed site but not within the project site itself.

3.1.1.2. Vegetation and Landscaping

The majority of the site is heavily wooded. The wooded areas are mostly pine with various understory shrubs such as Wax Myrtle. The cleared portion of the project site is turf and generally fronts McHugh Boulevard.

3.1.1.3. Natural Resources

An existing ditch borders the northeast side of McHugh Boulevard with a high point that sends drainage northwest and southeast. A second ditch on the northeast side of Birch Street combines with the first ditch. This combined ditch then runs to the northeast to combine in a larger drainage draw that ultimately drains to Wallace Creek.

3.1.1.4. Subsurface Investigation

See Part 4 ESR G10 for information regarding requirements to locate all utilities on the site.

3.1.1.5. Earthwork and Site Preparation

See Section 3.3.8 below for information regarding geotechnical earthwork and site preparation and sitework requirements for the site.

3.1.1.6. Unexploded Ordnance (UXO)

There is no known unexploded ordinance within the project limits.

3.1.1.7. Wetlands

Wetlands are expected adjacent to the limits of the proposed project area, though there is not a current delineation. Areas of possible wetlands impacts are noted in the Base GIS system within the southeast and east sides of the project site. The approximate GIS wetlands limits are indicated in the project site plan in Part 6.

3.1.1.8. 100-Year Floodplain

Per the FEMA Flood Insurance Rate Maps (FIRM) the project site is in “Area of Minimal Flood Hazard - Zone X”

Figure 1: 100-Year Floodplain Map

3.1.2. Site Conditions – Man-made Constraints

3.1.2.1. Existing Vehicular Access and Circulation

The proposed site of the P1338 building is currently undeveloped. The site is at the northeast corner of the intersection of McHugh Boulevard and Birch Street.

3.1.2.2. Site Drainage & Stormwater Runoff (hydrology)

The proposed site generally drains west to east. There is an existing ditch running along the northeast side of McHugh Boulevard with a high point that sends drainage northwest and southeast. A second ditch on the northeast side of Birch Street combines with the first ditch. This ditch then runs to the northeast to flow into a larger drainage draw that ultimately drains to Wallace Creek.

3.1.2.3. Site Features

Several power poles are on the southwest side of the site adjacent to McHugh Boulevard. The Camp LeJeune Trail runs parallel to McHugh Boulevard and continues along Birch Street. Electrical and telephone service lines for the site run above ground along Birch Street and McHugh Boulevard. Water and sanitary sewer service also front the site along Birch Street and McHugh Boulevard. Several utility pedestals are located on the western side of the Camp LeJeune Trail.

3.1.2.4. Existing Site and Building Conditions Photographs

Photographs of the existing site and building can be found in Part 6.

3.1.2.5. Hazardous Materials and Substances

See Section 3.3.8 for information regarding geotechnical earthwork and site preparation and sitework requirements for any hazardous materials found on the site.

3.1.2.6. Fencing

The proposed site does not contain any existing fencing.

3.1.2.7. Adjacent Land Use

McHugh Boulevard borders the southwestern portion of the site, while Birch Street borders the southern portion. Northwest, north, east and southeast are undeveloped areas.

3.2. Existing Infrastructure Network

3.2.1. Facility Footprint

3.2.1.1. Building Footprint and Building Characteristics

Not used. No building exists on the existing project site.

3.2.2. Vehicular Access and Circulation

3.2.2.1. General

The Contractor must develop a Traffic Investigation Report for the P1338 site, including the adjacent P1533 (PMO Facility) Building, as shown in Figure 3 below. Traffic Counts [Turning Movement Counts (TMC) and 24-Hour Tube Counts] must be collected at key intersections and driveways of the street network surrounding the site (see KMZ map of count locations in Figure 2). UFC 3-201-01, *Civil Engineering*, Sections 2-9 and 2-10 must be used, along with American Association of State Highway and Transportation Officials (AASHTO) Geometric Design of Highways and Streets (GDHS) and Institute of Traffic Engineers (ITE) guides, including ITE LP-674B (Highway Capacity Manual) and Transportation Impact Analyses for Site Development. The Manual on Uniform Traffic Control Devices (MUTCD) and North Carolina Department of Transportation (NCDOT) Roadway Design Manual must also be used. The Contractor must apply the most stringent requirements from the various manuals.

Construction of the P1338 and P1533 building are anticipated to generate traffic volumes for which the Traffic Investigation Report will require mitigation to address the impacts.

Current conditions for traffic flow and circulation need to be confirmed through the traffic count data. Projection of future traffic volumes and conditions must be determined for the build year plus 5 years (e.g., 2020 and 2025). The peak period (1 hour) for the AM and PM must be established. Synchro must be used to determine levels of service (LOS) at intersections and queuing at the driveways into the P1338 and P1533 building sites.

The Contractor must conduct an Origins and Destinations Study to determine traffic circulation to and from the site.

A Traffic Signal Warrant Study must be conducted for each of the driveways into the P1338 and P1533 sites to determine if an additional signal is warranted at any of the driveway locations.

A Speed Study must be conducted on Birch Street, particularly for westbound traffic to the intersection of McHugh Boulevard and Birch Street to address sight distance issues caused by

curvature in the road on the approach to the intersection. To address the sight distance issues, the Contractor must consider traffic calming actions or reduced speed limits based on the results of the study.

Based on the findings of the Traffic Investigation Report, the Contractor must recommend improvements to mitigate challenges in Traffic Operations, Circulation, Safety, and Access during daily operations. An estimate of magnitude of cost must be provided for such improvements after the Contractor completes the Traffic Investigation Report with the required data collection including traffic counts, an Origins and Destinations Study, a Traffic Warrant Study, and a Speed Study. Improvements and cost must be discussed with NAVFAC.

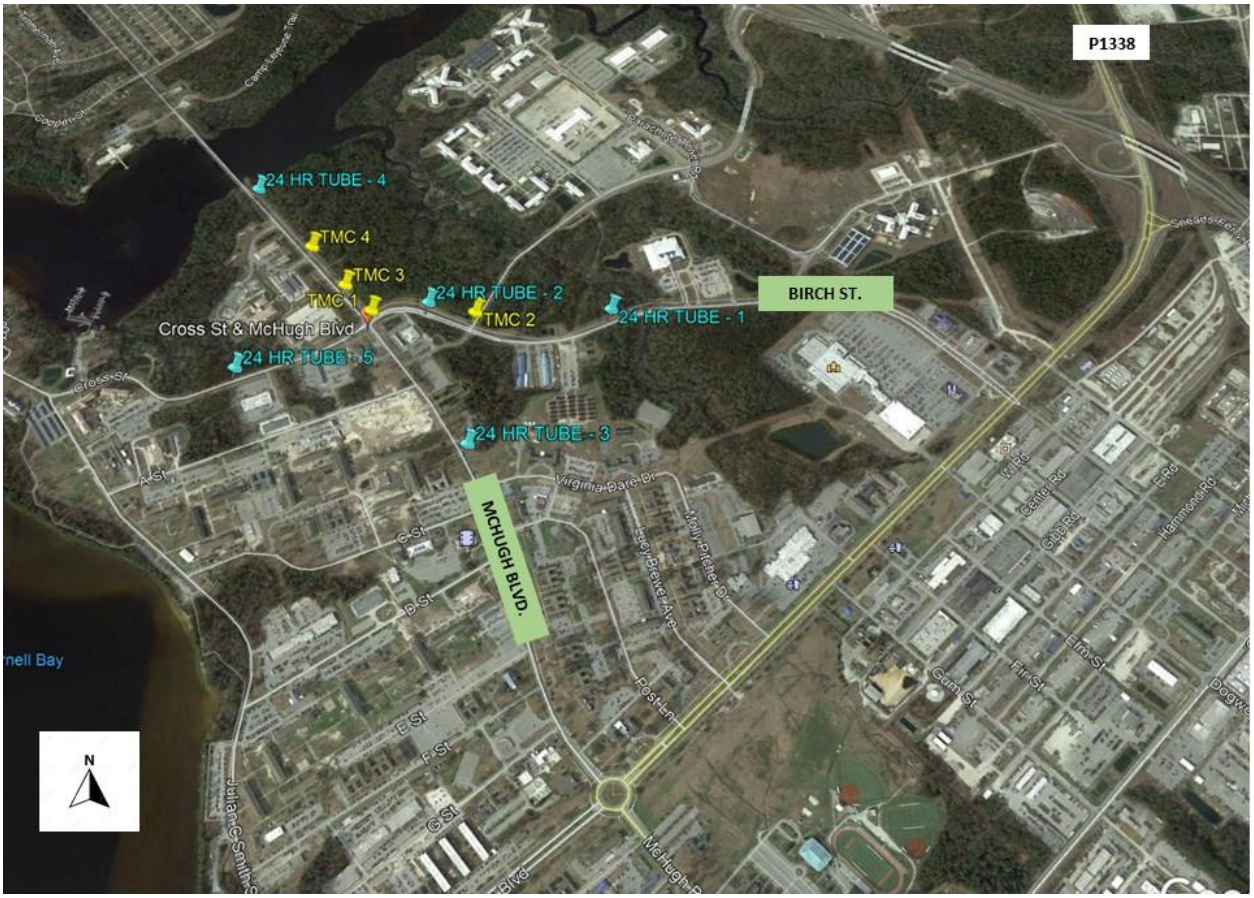

Figure 2: Traffic Count Calculations

3.2.3. Background

3.2.3.1. GENERAL LOCATION OF SITE

The site of the P1338 and P1533 buildings are located at the northeast quadrant of the intersection of Birch Street and McHugh Boulevard, as shown in Figure 3 below.

Figure 3: General Site Location

3.2.3.2. SITE AND SURROUNDING STREET NETWORK

The site view in Figure 4 below shows the location of new P1338 and P1533 buildings relative to the surrounding area and street network. Primary access to the new buildings is anticipated to be from McHugh Boulevard. Currently there are two driveways from McHugh Boulevard planned for both the P1338 and P1533 building sites.

This aerial shows the location of a pedestrian destination in the southeast quadrant of the intersection of Birch Street and McHugh Boulevard. It also shows curvature in the road on the eastern portion of Birch Street as it approaches the intersection. For vehicles heading west on Birch Street toward the intersection, this creates a sight view challenge for drivers not anticipating an upcoming intersection with vehicles and pedestrians around the curve. This sight view challenge creates a potential safety hazard at the intersection.

Figure 4: Site and Surrounding Street Network

3.2.3.3. PEDESTRIAN DESTINATIONS IN VICINITY

The detailed view in Figure 5 below shows the site layout of the pedestrian destination site. As shown in the photo, no sidewalks currently exist on the site. It also indicates the presence of stormwater features between the road and the building.

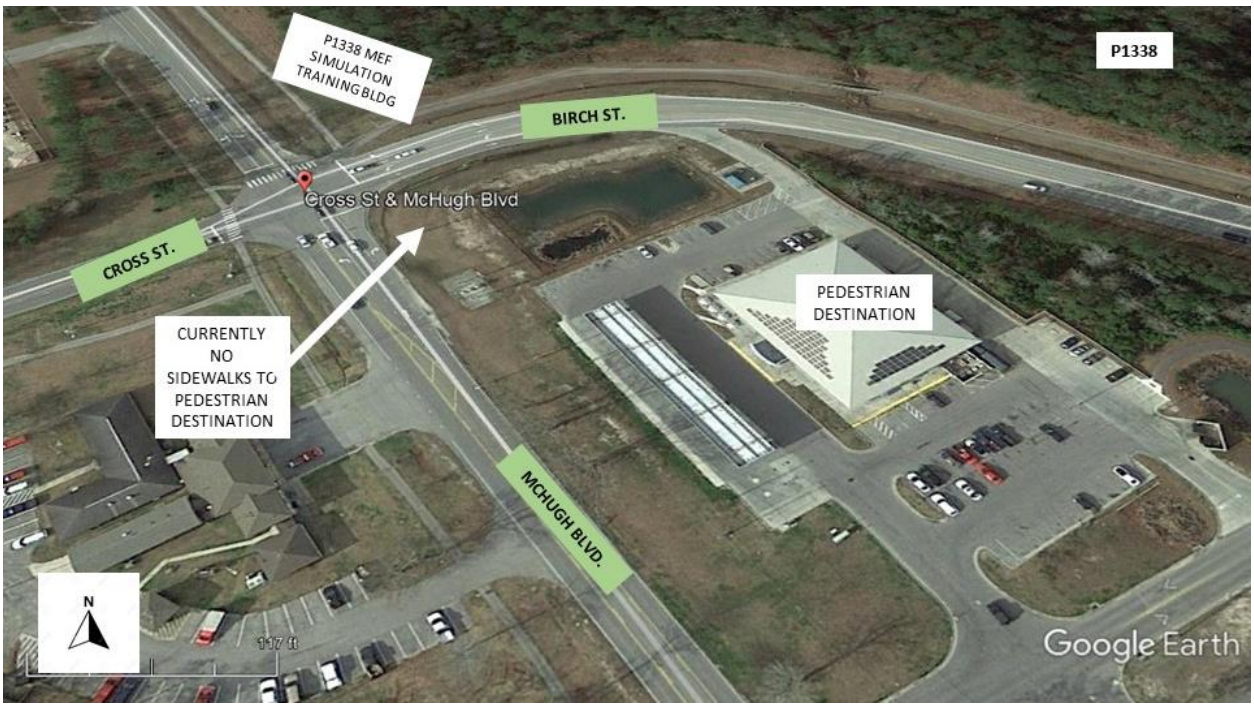

Figure 5: Pedestrian Destinations and Vicinity

3.2.3.4. Parking

A Traffic Signal Warrant Study must be conducted at the intersection of McHugh Boulevard and the ingress/egress driveways to the new P1338 and P1533 building sites. It is anticipated that most of the traffic will be traveling north on McHugh Boulevard when entering the site and turning left onto McHugh Boulevard when exiting the site.

3.2.3.5. Service Access

See parking above. Service access will be addressed by the same ingress/egress driveways as for parking.

3.2.3.6. Pedestrian Access and Circulation (flow, paths, and sidewalks)

To address the sight distance issue on Birch Street approaching the intersection, it is recommended that speeds be reduced, and Advanced Warning Signs posted to make drivers aware of the upcoming intersection signal and potential presence of pedestrians. A Speed Study must be performed to determine actual versus current posted speed and inform the decision to reduce speeds through posted speed limit signs and other potential traffic calming actions (such as redesigning the lane markings).

A primary concern to the building and site planners for this site is the lack of safe pedestrian facilities on all sides of the intersection and to the pedestrian destination in the southeast quadrant of the intersection.

All four legs of the intersection must have Pedestrian Signals installed. All four legs should also have marked crosswalks.

The pedestrian destination currently has no sidewalks leading to it. Although there are pedestrian facilities on the other three legs of the intersection, Human Factors of Traffic Safety suggest that people will not want to take the long way around. Visitors to the new P1338 and P1533 buildings are likely to be tempted to cross at this dangerous intersection to get to the pedestrian destination across the street. A system of pedestrian trails and sidewalks must be provided to improve pedestrian movement between the Catholic Church/Mini-mart to the project site and must comply with ABA.

3.2.4. Landscaping

As described above, the site is almost entirely wooded with long-needled pines. Understory species consist of wax myrtles and ground cover such as Virginia creeper. Trees will be preserved in areas where no development or grading occurs.

3.2.5. Site Utilities

An 8-inch water main runs approximately along Birch Street and along McHugh Boulevard.

An existing sanitary sewer line runs southeast along McHugh Boulevard and continues southeast along Birch Street.

An existing overhead 12.47kV, three phase, three wire, 60 Hertz electrical power line runs along McHugh Boulevard and Birch Street.

There are existing telecommunications and fiber optics utilities running roughly parallel to McHugh Boulevard.

3.2.6. Signage

As described above, the site is almost entirely wooded with no existing building identification signage or building number signage present.

3.3. Site Development Requirements

3.3.1. General Site

Site development must be designed in conformance with UFC 3-201-01. *Civil Engineering*. The bubble diagram site plan, with project limits of 15.0 acres, has been created to convey a potential general site layout and is included in Part 6. The bubble diagrams are the user's preferred general layout; however, the Contractor is responsible for the creation of a complete construction plan set meeting the requirements of this RFP for the construction of the project. The Contractor will be using the documents provided in this RFP to determine their bid.

Wetlands, as noted in the existing GIS information, are present just outside the limits of the project. It is not anticipated, based on the conceptual plan, that any of the existing wetlands will be disturbed as part of this project. In the event that the design results in disturbance of wetlands, the Designer of Record (DOR) must prepare all required permits for work required in tidal and non-tidal wetlands and wetland buffers or in streams designated as ephemeral or perennial. Coordinate with the Contracting Officer and MCB Camp Lejeune environmental staff.

The building must face McHugh Boulevard.

The building will require 100 parking spaces for instructor staff and advanced students. The concept site plan shows a total of 400 spaces.

All parking bay access pavement, drive aisles, dumpster and loading routes, and all pavement anticipated for emergency vehicle access must be rated for HL-93 loading and the section must be based upon the Contractor's geotechnical engineer's calculations and recommendations. See minimum pavement section requirements for bidding in Section 3.3.9.1.

The minimum width of driveway entrances are to be 50'.

A segregated MOV-only drive aisle must be provided for access to the outdoor training areas.

All parking stalls may be light-duty pavement based on the Contractor's geotechnical engineering calculations and recommendations.

All disturbed area not built upon with impervious surfaces must be graded to drain and covered in centipede sod.

Provide an all-weather access road (pavement or gravel) to the chiller.

The existing asphalt path (trail) running parallel to McHugh Boulevard must be relocated and reconnected. The trail must be asphalt and match the existing width.

All-weather access must be maintained along the north side of the parking lot and surrounding the proposed building.

The facility does not require a fenced perimeter. However, an 8-foot tall ornamental (not chain-link) Restricted Security Fence required for classification of exercises must envelope the building, concrete and grassed training areas, and parking area directly adjacent to the building to the northwest.

Provide each covered break area with four picnic tables and AT/FP compliant trash receptacles.

Provide a concrete dumpster pad for two trash and one recycling dumpsters in the 100-stall employee parking lot. The dumpster pad must extend to encompass the front wheels of the pick-up vehicle. The dumpster pad must have a masonry screen wall of building materials similar in nature and color to the proposed facility.

All paved areas must have perimeter concrete curb or curb and gutter. Gutter is required at any point where water will flow parallel to the bottom of curb.

Concrete sidewalk must be provided for pedestrian circulation and must be a minimum of 5 feet in width. Sidewalk must be a minimum of 4-inch thick concrete.

3.3.2. Site Demolition

Demolition of the existing site features will require both above-ground and sub-surface demolition. This site will require select demolition, as certain features will be required to remain as-is or be relocated as part of this project. Contractor must ensure access to the adjacent facilities at all times during demolition and construction.

Several facilities must be demolished after final construction of the proposed project included in this RFP Package. Demolition must not occur until all units within the facilities have relocated to the facilities constructed with this RFP package. The facilities to be demolished are Buildings 125, 125A, 127 and H13. Two prefabricated trailers, Buildings 125B and 125C, must be removed from their current locations.

The demolition of these buildings includes the complete removal of the building, including all shallow foundations, foundation walls, slabs, pits, pile caps, etc. Deep foundations, such as

piles, must be removed to a minimum depth of 48 inches below existing grade. Demolish all utilities serving each building as described further in this section and ESR G10. Site demolition must include the demolition and removal of all pavements and sidewalks specific to serving the building. Main circulation sidewalks or pavements serving facilities to remain must not be disturbed. Following demolition, all graded slopes must conform with UFC 3-201-01, and direct runoff toward existing drainage structures or ditches, with flow patterns matching existing to the extent feasible. Any pavement demolition that terminates at existing pavement must be terminated by saw cutting at the limits of demolition in neat straight lines.

Utility service lines to each building must be removed back to the main and capped. Do not demolish existing pavement to remain to facilitate the removal of a utility service line to be demolished. Where underground utilities to be demolished pass under pavement not to be demolished, cut the utility at each edge of pavement and fill the utility remaining under the pavement with flowable fill and abandon in place. Continue removal of the utility to the main on the far side of the pavement if applicable. If the utility main is within the pavement, cut and cap the service line at the edge of pavement and abandon the utility in place in accordance with applicable State or Federal regulations.

Prior to the demolition of any utility, coordinate with the utility owner to ensure the removal of the service line will not disrupt service to facilities to remain. Some telecom services may pass through buildings scheduled for demolition to buildings scheduled to remain.

For natural gas demolition, notify Piedmont Natural Gas (PNG) when a facility is ready for demolition. Once the facility has been confirmed for demolition PNG will remove and retire the meter. PNG will valve off the lateral at the main and will disconnect both ends of the gas lateral, the meter side and the main side. To depict retirement, PNG will remove the lines 4 to 5 feet from each end. Remove the remaining line left by PNG. Once a meter is retired the lateral cannot be reused for a new facility.

Any structure or pavement not to be demolished that is damaged during construction or demolition must be repaired or replaced at the expense of the Contractor.

Demolition of buildings associated with telecommunications must coordinate with telecommunications services. Demolition of telecommunications pathways must be coordinated with base telephone office.

3.3.3. Utilities

There is an existing 8-inch water main that runs approximately along Birch Street and along McHugh Boulevard. This main will serve as the source for both potable and fire protection water service.

There is an existing 8-inch gravity sanitary sewer line that runs southeast along McHugh Boulevard and then continues southeast along Birch Street. This main will serve as the connection point for the building’s sanitary sewer service.

Connect to a pole located on either McHugh Boulevard and Birch Street for the primary electrical service for the building. Extend primary service underground from the selected pole to the pad-mounted transformer.

Existing telecommunications and fiber optics utilities running roughly parallel to McHugh Boulevard must be relocated to a minimum of 10 feet outside of the proposed building footprint.

PNG will be providing natural gas service to the new facilities. During the design phase, invite PNG representatives to design review meetings, including Michael Lilly – PNG Commercial and

Residential Sales Specialist – Michael.lilly@duke-energy.com 252-808-7292 and Bobby Gurganus – PNG Construction – Bobby.gurganus@duke-energy.com 252-670-9613. Coordinate with PNG to depict the gas line routes on the civil utility site plans. The natural gas lines must be included in the project GIS deliverables. Provide projected loads of natural gas equipment to PNG for gas meter sizing. Notify PNG at least 6 months prior to in-service date to install new laterals and meters.

3.3.4. Signage

Provide building identification signage, building number signage, and wayfinding signage in accordance with the activity's BEAP.

3.3.5. Stormwater Management

Provide a complete stormwater management design that meets or exceeds UFC 3-210-10 *Low Impact Development*, UFC 3-201-01 *Civil Engineering*, and North Carolina Stormwater Management requirements. Provide calculations that demonstrate compliance with all three criteria.

A storm drainage system must be designed and constructed to collect and convey the ten-year peak flow from the building and other new impervious areas into a proposed Stormwater Control Measure (SCM). Subsurface precast concrete structures, such as catch basins and drop inlets, will collect stormwater. Reinforced concrete pipe (RCP) with watertight joints, where appropriate, will convey the stormwater toward the stormwater SCM, which will retain and treat the stormwater before it is discharged toward the nearby waterway. Roof downspouts must tie directly to drainage structures underground. The use of grassed swales, pre-treatment areas, and other low-impact stormwater strategies throughout the site are encouraged, where appropriate.

Provide a stormwater SCM onsite that is designed to meet NCDEQ regulations for stormwater detention and water quality.

While specific SCM devices are not required at Camp Lejeune, preferences based upon historic performance of devices are noted. The DOR should be aware of the challenges of providing functioning devices at the sites. The goal is to provide functioning and compliant devices that are not maintenance intensive nor require specialized or proprietary materials. The DOR should be cautioned in the use of sand filters; Camp Lejeune has had experience with the majority of sand filters being compromised by the development of algae crust on the surface of the filters. A third-party inspector is recommended to be specified for the installation of SCMs. Pre- and post-construction infiltration tests must be conducted for any SCMs that rely upon infiltration. A 3-day drawdown with a factor of safety of 2 must specified for SCMs to ensure continued stormwater compliance. Do not allow the conversion of sediment traps into infiltration SCMs. The sediment trap must be separate from the SCM to protect against premature failure. The use of heavy equipment in the bottom of infiltration devices will not be allowed due to the risk of compaction.

Overland relief for large storm events must be analyzed. Calculations must demonstrate that the 100-year storm routed through proposed stormwater management features will not reach higher than 1 foot below the Finish Floor Elevation of adjacent buildings. Demonstrate that the 100-year storm routed through proposed stormwater management features will not flood critical vehicle or pedestrian pathways.

Additional criteria that must be considered by the Contractor:

- Project involves the disturbance of over 5,000 square feet. Therefore, requirements under Section 438 of the EISA will be enforced. The policy directs all DoD construction projects and redevelopment projects with footprints greater than 5,000 square feet to implement LID techniques to maintain predevelopment hydrology to the extent feasible. Coordinate with Water Quality Manager, EQB at 451-9518 or Public Works Division, Operations Branch at 451-0869.
- Project involves the disturbance of 1 or more acres of land and will require a state-approved sedimentation and erosion control plan and stormwater permit. For questions regarding stormwater requirements coordinate with Water Quality Manager, EQB at 451-9518. To coordinate the permit application, contact Public Works Division, Design Branch at 451-2213.
- Project involves construction of an additional 10,000 square feet of impervious surface area. Permitting is required through the NCDEQ – Energy, Mineral and Land Resources Division (NCDEMLR) and the design and construction of approved SCMs (Coastal County Rules). Coordinate with Water Quality Manager, EQB at 451-9518 and the Stormwater Manager, ECB at 451-9657.
- If the project affects any existing built upon area (BUA) (impervious area) that is currently covered under an existing state-issued stormwater permit, that permit will need to be modified. Coordinate with Public Works Design Branch at 451-2213.
- If additional new BUA above and beyond the existing amount is proposed, then at a minimum, a high-density SCM is required to treat runoff from the new BUA. If the existing BUA within that drainage area and its runoff cannot be regraded or rerouted, then the proposed SCM must be designed to accommodate all runoff within its drainage area. A full stormwater permit application will be required. Coordinate with Water Quality Manager, EQB at 451-9518 or Public Works Division, Operations Branch at 451-0896. Coordinate with Public Works Division, Design Branch at 451-2213.
- Per direction from Public Works Division, each project site is considered to be a separate project. Building demolition, regardless of which project the building is demolished under, can be used to offset impervious area increases from new construction if the demolished building and the new building are adjacent to each other. There is no time limit between the demolition completion and new construction starting.

3.3.6. Sediment and Erosion Control

Erosion and sediment control must be designed and installed per the NCDEQ.

To prevent potential erosion and sedimentation from entering the surrounding wetlands, numerous erosion control methods and practices must be used. Place a stone construction entrance at a strategic location within the project limits to serve the site. A sediment basin with skimmer outlets and riser, if required, must be provided in the initial construction phase. This sediment basin must be separate from any proposed stormwater SCMs. The conversion of a sediment trap or basin to a stormwater SCM is not allowed. Basins may be constructed before the site is cleared and temporary swales graded to direct sediment laden stormwater toward the basin. Install a temporary construction fence around the entire limits of disturbance. Silt fence and silt fence outlets must be used around the perimeter of the of the construction sites to prevent sediment from exiting the disturbed areas. Install a double row of silt fence along any wetland buffers. Erosion control measures must be in place and approved by the local erosion control inspector representing NCDEQ before clearing and grading operations begin.

Once stormwater structures are installed and brought to grade, inlet protection must be provided at all inlets to prevent sediment from entering the stormwater system. The site will be paved, and disturbed areas will be stabilized with vegetation near the completion of the project.

Additional criteria that must be considered by the Contractor:

- Ensure sediment does not leave a construction site of any size as a result of land-disturbing activities. Coordinate with Water Quality Manager, EQB at 451-9518 and the Stormwater Manager, ECB at 451-9522.
- Project involves the disturbance of 1 or more acres of land and will require a state-approved sedimentation and erosion control plan and stormwater permit. For questions regarding stormwater requirements, coordinate with Water Quality Manager, EQB at 451-9518. To coordinate the permit application, contact Public Works Division, Design Branch at 451-2213.

3.3.7. Landscaping

Landscaping must comply with BEAP guidelines with regard to street trees, parking lot landscaping, outdoor amenities, and stormwater management. Landscaping proposed near the building must comply with all AT/FP requirements. See also Part 3 – Chapter 6 Section G20 for specific landscape requirements and plant establishment and maintenance requirements.

McHugh Boulevard frontage will provide a minimum 6-foot planting strip with deciduous trees planted at approximately 40 feet on-center, depending upon proposed utility locations. The Camp Lejeune Trail is included on this frontage and will be upgraded to an appropriate width.

Intersection of McHugh Boulevard and Birch Street offers an opportunity to create a neighborhood focal point; this location would be appropriate for a small seating area as the Camp Lejeune Trail turns from McHugh Boulevard to Birch Lane at this location.

Parking areas must be screened using a variety of tree and shrub planting to reduce visual impact from adjacent roadways. A minimum of 15 percent of the surface area of the parking lot must be shaded by deciduous trees within 10 years of installation. A minimum of 5 percent of the parking lot must be pervious planting bed.

Site furnishings must be provided within outdoor seating areas and will be constructed of durable materials with colors in compliance with the BEAP and surrounding examples.

Site grading must be designed to preserve pockets of existing trees to the extent feasible. Preserved trees must be monitored for 1 year after construction activity has ceased; dead or dying trees must be removed and replaced as directed by the Contracting Officer.

Turf areas must be limited to the extent feasible in favor of naturalized planting and groundcover. Turf species in formal lawn areas must be centipede grass; all lawn areas must be sodded.

Trees to remain within the limits of disturbance will be monitored for 1 year after construction and replaced as directed by the Contracting Officer. Turf areas must be graded and sodded for permanent stabilization. Other areas identified as turf must utilize centipede sod.

3.3.8. Permits

- Erosion and sediment control permit – NCDEQ.
- Stormwater management permit – NCDEQ.

- Water extension permit – NCDEQ.
- Sewer extension permit – NCDEQ.
- Wetlands Disturbance – U.S. Army Corps of Engineers (USACE)

3.3.9. Geotechnical Earthwork, Site Preparation, and Sitework Requirements

3.3.9.1. Criteria for Bidding

Base bids on the following criteria:

- Stripping depth of surficial soil material in existing grass surfaced areas: 6 inches.
- Stripping depth of surficial soil materials and root mat in existing wooded areas: 12 inches.
- Grubbing depth in existing wooded areas: 24 inches.
- The stabilized groundwater was observed approximately 5 feet below the surface. The underlying clay layer could create a perched water table 4 feet below current site grades.
- Seasonal high-water table depth: 2 feet.
- Excavated onsite soils will not be suitable for re-use as structural fill.
-
- Provide preloading or surcharging to mitigate excessive consolidation settlement associated with site grading impacts in all areas where finished site grade increases are 2 or more feet above existing site grades.
- Need and depth of predrilling or spudding to facilitate pile installation: 10 feet.
- Provide a preconstruction survey and vibration monitoring during pile installation: Not applicable. Provide specialized site earthwork construction methods and/or equipment: Not applicable.
- Minimum heavy-duty asphalt pavement section: 2-inch NCDOT surface course asphalt, 3-inch NCDOTbase course asphalt, 8-inch NCDOT aggregate base course.
- Minimum light-duty asphalt pavement section: 2-inch NCDOT surface course asphalt, 8-inch NCDOT aggregate base course.
- Minimum sidewalk section: 4-inch – 3,000 psi compressive strength Portland Cement Concrete,
- Minimum dumpster pad/equipment pad section: 8-inch – 5,000 psi compressive strength Portland Cement Concrete, #4 bars at 12 inches on-center each way.

3.3.9.2. Earthwork and Site Preparation Criteria

The Contractor’s geotechnical engineer must monitor site stripping operations on a full-time basis. Stripped surficial soil materials will be properly disposed of per Specification 01.57.19. No soils are to leave MCB Camp LeJeune. Imported topsoil will be provided for the project where needed.

The underlying soils that will be exposed after completion of site stripping and undercutting will have a tendency to become softened and unstable when saturated and worked or subjected to construction equipment. Provide the necessary measures to address these marginal subgrade support conditions throughout design and construction to obtain required soil support while maintaining progress for completion on schedule. Do not allow construction traffic to travel directly on exposed subgrades. Provide geosynthetic reinforced haul roads and staging pads to facilitate construction traffic access across the site and to protect the underlying subgrade from deterioration. The Contractor is responsible for all costs associated with any necessary measures to repair subgrades deteriorated by construction traffic and exposure to water. Determination of unsuitable subgrade conditions and need to implement remedial measures will be made by a NAVFAC geotechnical engineer and subject to the approval of the Contracting Officer.

Provide control of groundwater and surface water encountered during construction. Provide temporary dewatering and positive site drainage to prevent conditions that will cause deterioration of exposed subgrades and open excavations. Do not allow deterioration of exposed subgrades to create interruptions to the progress of construction. Establish storm drainage features at the earliest stages of site development. Install and maintain all necessary temporary water containment facilities, channels, ditches, and diversions for groundwater and surface water control to include all necessary temporary environmental controls. Provide a multiple well point dewatering system for any utility or foundation excavations that extend down to and below the groundwater level.

The site currently contains or may have formerly contained developments such as structures, surface pavements, haul roads, above- and below-ground utilities that will require demolition and removal prior to earthwork operations under this contract. The required removal depth of the existing site features is expected to be highly variable. It is reasonable to anticipate that excavations made in areas of known prior development will encounter additional materials beyond what is specifically indicated on the test boring records that will need to be removed.

Imported select material and backfill and fill material will be required for filling all undercut excavations; grubbing excavations; excavations resulting from the demolition of existing utilities or foundations, including new utility or foundation excavations within the planned building and pavement areas; and for grading fill in pavement and building areas. Provide imported select material for the top 2 feet of fill required beneath all pavements, foundations and slabs. Provide imported backfill and fill material in all other structure and pavement locations. Select material must meet ASTM D2487 classification symbols GW, GP, SW, SP, and SP-SM with not more than 12 percent passing the U.S. No. 200 sieve by ASTM D1140 and plasticity index not greater than zero by ASTM D4318. Backfill and fill material must meet ASTM D2487 classification symbols GW, GP, SW, SP, SP-SM, and SM and have a maximum of 20 percent passing the U.S. No. 200 sieve by ASTM D1140 and maximum liquid limit of 30 and maximum plasticity index of 9 by ASTM D4318.

Excavated existing onsite soils will only be reused as general fill beyond the limits of surface bearing structures (e.g., pavements, buildings, and pipe trenches) and beyond the limits of any undercut excavations, provided the material meets the project requirements. All soil material must exhibit the characteristics required to compact the soil to the density and performance specified for the intended locations. Excavated onsite soils will be amended (e.g., mixed with lime, cement, or blended with imported structural materials) as necessary to facilitate reuse as general fill and backfill and fill material. All fill materials will have a maximum particle diameter of 3 inches and will require moisture conditioning prior to placement and compaction to within

approximately 2 percent of the optimum moisture content as defined by ASTM D698 or ASTM D1557. Choose compaction standard as recommended by Geotechnical Engineer of Record.

The Contractor will be responsible for maintaining erosion control measures, preventing segregation, and moisture conditioning for any excavated onsite soil and aggregate materials and any imported soil and aggregate materials stockpiled onsite.

All excavated materials that cannot be reused on the project as common fill (surplus soils) must be transported to one of the designated locations on Government property. Refer to RFP Part 2, Specification 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS for locations and contact information. No surplus material Is permitted to leave Government property without written approval of the installation Environmental Program Manager and the Contracting Officer. The Contractor is responsible for all costs associated with the management and disposal of surplus excavation spoils.

Telecom	528 SF	

Corridors must be a minimum of 6 feet wide. However, AE2 will be responsible for determining if greater corridor widths are required by code.

Contractor must provide actual area in both square feet and square meters in proposals.

AE2 must verify with Camp LeJeune if 2 brief/debrief rooms adjacent to Exercise Control will be required. If not, their area must be added to Exercise Control. See Architectural Block Diagram.

4.2. Space Relationships

Refer to the space arrangement shown in the architectural block diagram. The diagram incorporates the spaces defined in the space tabulation. The new training facility will consolidate training programs that are currently held in three separate buildings. The design of the facility must provide spaces with the flexibility for a diverse number of trainings and trainees operating within classified and unclassified training areas. The building's administrative personnel entrance will be separate from the trainees' entrance. Trainees will enter the facility through a lobby with mobile-phone lockers then move to a Brief/Debrief Room. Trainees participating in classified trainings will then move into the Ready Room/Auditorium, an auditorium with sloped floors and a capacity for 100 persons. An Exercise Control Room will be in the middle of the facility, to control all training exercises from a central location.

There will be only two unclassified Simulation Rooms. The other nine Simulation Rooms will be classified. Simulation Rooms will be designed to be column free with acoustical movable partitions between them for maximum flexibility and to provide common training areas for small or large groups. The FIRE area will be in the unclassified part of the building and consists of 3 classrooms of equal size plus a dedicated storage room. In addition to the administrative areas and FIRE, the Library/File Storage/Plotter Room will also be in the unclassified area. Other rooms located in the classified area are Simulation Control (Server Room), Secure Workstation, Simulation Control Secure Communications (Servers), Server Administration, Secure Video Teleconferencing (VTC), Storage Room. Both the Secure Workstation and Simulation Control Secure Communications areas are confined rooms that act as "vaults."

The facility will require pervious and impervious exterior training areas that will require direct access to toilet/locker/shower facilities, which will also be accessible from interior areas. Intended for students, these will be two separate toilet facilities, one for men, the other for women, and each will include two shower stalls. The building's administrative areas will have separate toilet facilities for men and women. Each will include two shower stalls with an adjacent area for lockers. (There will be a total of eight shower stalls in the building, two per toilet facility). There will also be separate Break Rooms, one for students, the other for administrative personnel.

4.3. Exterior Character

The new single-story training center shall comply with the Hadnot Point section of the BEAP. All exterior elevations during design and exterior materials during construction must be approved by the MCB Camp Lejeune Architectural Review Board. All building exterior architectural design will be reviewed and approved by the MCB Camp Lejeune Architectural Review Board.

5.0 ROOM REQUIREMENTS – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

5.1. FINISH AND FF&E SCHEDULE

The following chart is provided for defining general room finishes and furniture, fixtures, and equipment (FF&E) items for the II MEF Simulation Training Center. Special interior finishes and FF&E items beyond those outlined below are provided in the Additional Room Requirements. The intent of each room requirement sheet is to highlight special, unique, additional, or exceptional room-specific requirements. These tables are not all-inclusive and the requirements listed should be considered as an addition to the typical requirements outlined in the UFCs, ESRs, & PTSs.

FF&E and AV Equipment will be funded separately as a modification to the construction contract, with the exception of fixed furnishings (SID). Infrastructure to support all FF&E and AV is included in the construction contract. Contractor's Interior Designer to determine FF&E requirements based on in-depth interviews with Activity at concept Design workshop (CDW).

Refer to ESR D50 for specific electrical and audio visual (AV) requirements. Coordinate with the Base to determine preferred locations of fixed artwork.

FFE to include Automated External Defibrillators as required by National Fire Protection Association's (NFPA) 101 Life Safety Code and Marine Corps Order (MCO) 11000.11A. Access to an AED shall be provided for all Assembly occupancies, fitness centers and high-risk training centers and as required by NFPA 101.

Room Typical guidelines:

1. Private office required to be a minimum 9'-0" wide (10'-0" wide is preferred).
2. Brief/Debrief rooms for 10+ people with no side chairs are required to be a minimum 12'-0" wide.
3. Workstations in open office areas will be a benching / desking system. Powered Cubicle walls will be used minimally.
4. Ceiling heights will be 10'-0" unless notes otherwise. See additional Room Requirements
5. All base to be 6" high

5.2. ADDITIONAL ROOM REQUIREMENTS

The Room data sheets are provided for special rooms in each facility to provide additional information for these rooms; and better define room requirements beyond those provided in the ESR, the Finish and FF&E Schedule located in section 5.1, and other parts of the RFP. If no room data sheet is provided for a space identified in this facility then the general requirements of this RFP, the Finish and FF&E schedule in section 5.1, and the referenced UFCs, Codes, and Standards apply.

P1338 MEF Simulation Training Building

Brief and Debrief Room

Space Characteristics

Function/Adjacencies: Shared area for the Briefing before training and Debriefing of Marines after training including an instructor.

Special Dimensions:
Ideal Plan Dimensions: See Space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC)-45 STC

Access: From entry area of the facility used by trainees. Close to the Ready Room/Auditorium.

Number of Occupants: 6 plus instructor

Other/Special Requirements: Podium
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Conference room furniture

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
C101001	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C101001	Fixed Partitions	SF		If used, CMU or concrete. Include sound insulation. All STC rated partitions must terminate at underside of floor/roof deck.
C1020	Interior Wood Doors	1	3' x 7'	Solid core, flush door with stain finish, along with hollow metal steel frame, factory primed, field painted.
C102007	Interior Door Hardware			Hinges, stop, acoustical gaskets, kick-plate, hold-open devices.
C103004	Identifying Devices			Signage on exterior of room entry door(s): Indicate the room name for the space being entered with an "Occupied" slider bar. Flashing light?
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard over top of CMU.
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C301090	Other Wall Finishes	AR		Epoxy Paint on CMU if used.

Brief and Debrief Room

Space Characteristics

Function/Adjacencies: Shared area for the Briefing before training and Debriefing of Marines after training including an instructor.

Special Dimensions:
Ideal Plan Dimensions: See Space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC)-45 STC

Access: From entry area of the facility used by trainees. Close to the Ready Room/Auditorium.

Number of Occupants: 6 plus instructor

Other/Special Requirements: Podium
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Conference room furniture

Uniformat Section	Description	Qty	Size	Specific Requirements
C302007	Wall Base Finishes	LF	6" high	Rubber cove base in 120' coils
C303001	Acoustical Ceiling Tiles & Panels	AR	24 x 24	Acoustical Ceiling Tile
C303005	Suspension Systems	AR	AR	9/16" or 15/16" suspended ceiling system
C303090	Other Ceiling and Ceiling Finishes	AR	AR	Paint all exposed surfaces in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
C304001	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones, controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide two multi-service recessed floor boxes at conference table.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.

Brief and Debrief Room

Space Characteristics

Function/Adjacencies: Shared area for the Briefing before training and Debriefing of Marines after training including an instructor.

Special Dimensions:
Ideal Plan Dimensions: See Space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC)-45 STC

Access: From entry area of the facility used by trainees. Close to the Ready Room/Auditorium.

Number of Occupants: 6 plus instructor

Other/Special Requirements: Podium
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Conference room furniture

Uniformat Section	Description	Qty	Size	Specific Requirements
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.

P1338 MEF Simulation Training Building

Classified Simulation Room-9 Required

Space Characteristics

Function/Adjacencies: Room to support CLASSIFIED Software based Marine Corps operational trainer simulations workstations on raised floors. Simulation software is controlled from these workstations to locations outside the new facility. Reconfigurable.
Column free, with moveable walls for flexibility for small or large groups.

Bid option: to provide folding partition between rooms.

Special Dimensions:
Ideal Plan Dimensions: See Space Tabulation
Minimum Ceiling Height: 12'-0" Minimum

Acoustics:
Sound Transmission Class (STC) 45 Minimum
Impact Insulation Class (HC)

Access: From Classified Corridor System

Number of Occupants: 20-40 PN seated at tables

Other/Special Requirements: Reconfigurable

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Training Tables with dual monitor arms and task chairs. Provide movable room dividers.

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	Seal concrete
C101001		SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C101001	Fixed Partitions	SF		CMU or concrete. Include sound insulation. All STC rated partitions must terminate at underside of floor/roof deck.
C1010	Folding Partitions			BID OPTION: Folding partition between Simulation Rooms as indicated on Block Diagram
C1020	Interior Wood Doors	1	3' x 7'	Solid core, flush door with stain finish, along with hollow metal steel frame, factory primed, field painted.
C102007	Interior Door Hardware			Hinges, stop, provide passage hardware. X10 or CR required.

Classified Simulation Room-9 Required

Space Characteristics

Function/Adjacencies: Room to support CLASSIFIED Software based Marine Corps operational trainer simulations workstations on raised floors. Simulation software is controlled from these workstations to locations outside the new facility. Reconfigurable.
Column free, with moveable walls for flexibility for small or large groups.

Bid option: to provide folding partition between rooms.

Special Dimensions:
Ideal Plan Dimensions: See Space Tabulation
Minimum Ceiling Height: 12'-0" Minimum

Acoustics:
Sound Transmission Class (STC) 45 Minimum
Impact Insulation Class (HC)

Access: From Classified Corridor System

Number of Occupants: 20-40 PN seated at tables

Other/Special Requirements: Reconfigurable

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Training Tables with dual monitor arms and task chairs. Provide movable room dividers.

Uniformat Section	Description	Qty	Size	Specific Requirements
C103003	Marker Boards and Tack Boards		36" H Minimum	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board, on two entire sides of room and on either side of Smartboard/touch screen on main wall of room. Tool trays and accessory kits shall be provided for each board. Top of boards to be mounted at approx. 8'-0" AFF.
C103004	Identifying Devices			Signage on exterior of room entry door(s): Indicate the room name for the space being entered with an "Occupied" slider bar.
C301003	Gypsum Wallboard Finishes	AR	AR	Cementitious backing units for wall tile installation where metal wall stud, CMU or concrete occurs.
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted impact resistant gypsum wallboard
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C301006	Acoustic Wall Panels	AR	30" h x 48" each	Wall-mounted acoustical panels
C3020	Raised Access Flooring	AR	24" x 24"	Base Bid-laminate surface. 12"

Classified Simulation Room-9 Required

Space will accommodate, at a minimum, the following FF&E and A/V: Training Tables with dual monitor arms and task chairs. Provide movable room dividers.

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide two multi-service recessed floor boxes every 25 square feet, or portion thereof. Coordinate requirements and locations with user.
D5020	Lighting and Branch Wiring	60		Provide ceiling mounted duplex receptacles for synchronized simulation clock system. Coordinate receptacle locations with COR.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.
E102009 D503004	AV Equipment/ Television System			Provide CATV outlets at appropriate height for all wall-mounted monitors. Provide laptop interface from monitor location to work console table floor box. HDMI/VGA, Cable, Blue Ray and VCR's located in the Exercise Control Room or Auditorium.

Classified Simulation Room-9 Required

Space Characteristics

Function/Adjacencies: Room to support CLASSIFIED Software based Marine Corps operational trainer simulations workstations on raised floors. Simulation software is controlled from these workstations to locations outside the new facility. Reconfigurable.
Column free, with moveable walls for flexibility for small or large groups.

Bid option: to provide folding partition between rooms.

Special Dimensions:
Ideal Plan Dimensions: See Space Tabulation
Minimum Ceiling Height: 12'-0" Minimum

Acoustics:
Sound Transmission Class (STC) 45 Minimum
Impact Insulation Class (HC)

Access: From Classified Corridor System

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Training Tables with dual monitor arms and task chairs. Provide movable room dividers.

Uniformat Section	Description	Qty	Size	Specific Requirements
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).

P1338 MEF Simulation Training Building

Exercise Control Room

Space Characteristics

Function/Adjacencies: A centralized control room for all facilities training and simulation functions. Video wall for Systems control. Heavy electronic equipment and loads.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: Off major corridor system adjacent to the Ready Room/Auditorium.
Number of Occupants: 5

Other/Special Requirements: Systems control TV type of monitoring stations and equipment to be determined. Capability to play video, HDMI,VGA, Cable TV, Blue Ray, and VCRs.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Sit to stand computer workstations, mobile pedestal and task chair. Workstations are shared.

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
C101001	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C101005	Interior Windows / Vision Panels			Windows/vision panels as required to achieve requisite view.
C1020	Wood Doors	1	3' x 7'	Provide solid core, flush door with stain finish, along with steel frame, factory primed, field painted. Coordinate door size and venting with room equipment.
C102007	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.
C103003	Marker Boards and Tack Boards		36" H Minimum	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board, on two entire sides of room and on either side of Smartboard/touch screen on main wall of room. Tool trays and accessory kits shall be provided for each board. Top of boards to be mounted at approx. 8'-0" AFF.
C103004	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.

Exercise Control Room

Space Characteristics

Function/Adjacencies: A centralized control room for all facilities training and simulation functions. Video wall for Systems control. Heavy electronic equipment and loads.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: Off major corridor system adjacent to the Ready Room/Auditorium.
Number of Occupants: 5

Other/Special Requirements: Systems control TV type of monitoring stations and equipment to be determined. Capability to play video, HDMI,VGA, Cable TV, Blue Ray, and VCRs.

FF&E and A/V Information for Coordination:

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide two multi-service recessed floor boxes every 25 square feet, or portion thereof. Coordinate requirements and locations with user.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
D503004	Television System			Provide CATV outlets.
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.
E102009 D503004	AV Equipment/ Television System			Provide video wall. Minimum of two projectors, smart podium with classified and unclassified connections. Provide CATV outlets at appropriate height for all wall-mounted monitors.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (podium and monitor to be funded separately in AV Package).

P1338 MEF Simulation Training Building

FIRE Rooms

Space Characteristics

Function/Adjacencies: A space for 3 FIRE training rooms and a FIRE equipment support room. Noisy fire fight training area with electronic wall displays.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations sheet
Minimum Ceiling Height: 12'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: off the unclassified area corridor system

Number of Occupants: up to 6 persons per each one of the four FIRE rooms

Other/Special Requirements: Noise from one room adds to the realism of combat training.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
C101001	Fixed Partitions	SF		Impact resistant Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C1020	Wood Doors	1	3' x 7'	Provide solid core, flush door with stain finish, along with steel frame, factory primed, field painted. Coordinate door size and venting with room equipment. Door seals
C102007	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.
C103004	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard
C3020	Raised Access Floor	AR	24 x 24	Base bid – laminate surface 12"
C302007	Wall Base Finishes	LF	6" high	Rubber cove base in 120' coils

FIRE Rooms

Space Characteristics

Function/Adjacencies: A space for 3 FIRE training rooms and a FIRE equipment support room. Noisy fire fight training area with electronic wall displays.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations sheet
Minimum Ceiling Height: 12'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: off the unclassified area corridor system

Number of Occupants: up to 6 persons per each one of the four FIRE rooms

Other/Special Requirements: Noise from one room adds to the realism of combat training.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C303001	Acoustical Ceiling Tiles & Panels	AR	24 x 24	Acoustical Ceiling Tile
C303005	Suspension Systems	AR	AR	9/16" or 15/16" suspended ceiling system
C304001	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones, controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide two multi-service recessed floor boxes every 25 square feet, or portion thereof. Coordinate requirements and locations with user.
D5020	Lighting and Branch Wiring			Provide one L5-30R locking receptacle and one 5-20R receptacle 6" from the locking receptacle at a location selected by the user.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.

FIRE Rooms

Space Characteristics

Function/Adjacencies: A space for 3 FIRE training rooms and a FIRE equipment support room. Noisy fire fight training area with electronic wall displays.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations sheet
Minimum Ceiling Height: 12'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: off the unclassified area corridor system

Number of Occupants: up to 6 persons per each one of the four FIRE rooms

Other/Special Requirements: Noise from one room adds to the realism of combat training.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.
E102009 D503004	AV Equipment/ Television System			Provide CATV outlets at appropriate height for all wall-mounted monitors. Provide laptop interface from monitor location to work console table floor box. HDMI/VGA, Cable, Blue Ray and VCR's located in the Exercise Control Room or Auditorium.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (podium and monitor to be funded separately in AV Package).

P1338 MEF Simulation Training Building

Ready Room/Auditorium

Space Characteristics

Function/Adjacencies: Sloped floor Auditorium to hold student trainees prior to moving to Classified or Unclassified training. Features a video wall and acoustic panels to control noise.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 12'-0" from top level of floor

Acoustics:
Sound Transmission Class (STC) 45
Acoustic panels on walls

Access: near main trainee entry

Number of Occupants: 100 persons in fixed seating

Other/Special Requirements: Electronic podium

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Fixed seating with tablet arms

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	Slope floor
B202001	Exterior Windows			Provide ½" thick solid surface window stool
B202004	Exterior Glazing			Low 'E' Glazing or Spectral glazing, to meet ATFP requirements as required.
C101001	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C101005	Interior Windows / Vision Panels			Windows/vision panels as required to achieve requisite view.
C1020	Wood Doors	1	3' x 7'	Provide solid core, flush door with stain finish, along with steel frame, factory primed, field painted. Coordinate door size and venting with room equipment.
C102007	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.

Ready Room/Auditorium

Space Characteristics

Function/Adjacencies: Sloped floor Auditorium to hold student trainees prior to moving to Classified or Unclassified training. Features a video wall and acoustic panels to control noise.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 12'-0" from top level of floor

Acoustics:
Sound Transmission Class (STC) 45
Acoustic panels on walls

Access: near main trainee entry

Number of Occupants: 100 persons in fixed seating

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Fixed seating with tablet arms

Uniformat Section	Description	Qty	Size	Specific Requirements
C103003	Marker Boards and Tack Boards		36" H Minimum	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board, on two entire sides of room and on either side of Smartboard/touch screen on main wall of room. Tool trays and accessory kits shall be provided for each board. Top of boards to be mounted at approx. 8'-0" AFF.
C103004	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C302005	Carpeting	SF	24 x 24 or Plank	Carpet Tile
C302007	Wall Base Finishes	LF	6" high	Rubber cove base in 120' coils
C303001	Acoustical Ceiling Tiles & Panels	AR	24 x 24	Acoustical Ceiling Tile
C303005	Suspension Systems	AR	AR	9/16" or 15/16" suspended ceiling system

Ready Room/Auditorium

Space Characteristics

Function/Adjacencies: Sloped floor Auditorium to hold student trainees prior to moving to Classified or Unclassified training. Features a video wall and acoustic panels to control noise.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 12'-0" from top level of floor

Acoustics:
Sound Transmission Class (STC) 45
Acoustic panels on walls

Access: near main trainee entry

Number of Occupants: 100 persons in fixed seating

Other/Special Requirements: Electronic podium

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Fixed seating with tablet arms

Uniformat Section	Description	Qty	Size	Specific Requirements
C304001	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones, controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide two multi-service recessed floor boxes at conference table.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.
D503004	Television System			Provide CATV outlets.
E102009 D503004	AV Equipment/ Television System			Provide Video wall. Min of 2 projectors, smart podium with classified and unclassified connections. Provide CATV outlets at appropriate height for all wall-mounted monitors.

Ready Room/Auditorium

Space Characteristics

Function/Adjacencies: Sloped floor Auditorium to hold student trainees prior to moving to Classified or Unclassified training. Features a video wall and acoustic panels to control noise.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 12'-0" from top level of floor

Acoustics:
Sound Transmission Class (STC) 45
Acoustic panels on walls

Access: near main trainee entry

Number of Occupants: 100 persons in fixed seating

Other/Special Requirements: Electronic podium

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Fixed seating with tablet arms

Uniformat Section	Description	Qty	Size	Specific Requirements
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).
E201002	Window Treatments	AR	AR	Manually operated, double solar shade system with 3% light filtering solar shade, room darkening lining and room darkening side channels, on all exterior windows. (USE FOR EXTERIOR WINDOWS)

P1338 MEF Simulation Training Building

Secure VTC Room

Space Characteristics

Function/Adjacencies: A secure room for data servers; heavy electronic cooling loads

Special Dimensions:
Ideal Plan Dimensions: see room tabulations sheets
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: from Simulation control room.

Number of Occupants: N/A electronic equipment room

Other/Special Requirements:

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
C101001	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C1020	Wood Doors	1	3' x 7'	Provide solid core, flush door with stain finish, along with steel frame, factory primed, field painted. Coordinate door size and venting with room equipment.
C102007	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.
C103004	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s)
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C302005	Carpeting	SF	24 x 24 or Plank	Carpet Tile
C302007	Wall Base Finishes	LF	6" high	Rubber cove base in 120' coils

Secure VTC Room

Space Characteristics

Function/Adjacencies: A secure room for data servers; heavy electronic cooling loads

Special Dimensions:
Ideal Plan Dimensions: see room tabulations sheets
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: from Simulation control room.

Number of Occupants: N/A electronic equipment room

Other/Special Requirements:

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
C303001	Acoustical Ceiling Tiles & Panels	AR	24 x 24	Acoustical Ceiling Tile
C303005	Suspension Systems	AR	AR	9/16" or 15/16" suspended ceiling system
C304001	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones.
D5020	Lighting and Branch Wiring			Provide two multi-service recessed floor boxes under the conference table. Coordinate requirements and locations with user.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.

P1338 MEF Simulation Training Building

Secure Workstation Room - Vault

Space Characteristics

Function/Adjacencies: Secure work area for secure network access and storage. Vault for Secure Equipment. CMU wall construction is preferred.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 12'-0"

Acoustics:
Sound Transmission Class (STC)-50 STC
Impact Insulation Class (HC)

Access: Secure Vault

Number of Occupants: 4

Other/Special Requirements: Secure Vault
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
C101001	Fixed Partitions	SF		If CMU not used: Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C101001	Fixed Partitions	SF		Prefer CMU or concrete wall construction. All STC rated partitions must terminate at underside of floor/roof deck.
C1020	Interior Wood Doors	1	3' x 7'	Solid core, flush door with stain finish, along with hollow metal steel frame, factory primed, field painted.
C102007	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, X10 hardware, kick-plate, hold-open devices.
C103004	Identifying Devices			Signage on exterior of room entry door(s): Indicate the room name for the space being entered with an "Occupied" slider bar. Flashing light
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard over top of CMU.
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.

Secure Workstation Room - Vault

Space Characteristics

Function/Adjacencies: Secure work area for secure network access and storage. Vault for Secure Equipment. CMU wall construction is preferred.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 12'-0"

Acoustics:
Sound Transmission Class (STC)-50 STC
Impact Insulation Class (HC)

Access: Secure Vault

Number of Occupants: 4

Other/Special Requirements: Secure Vault
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
C301090	Other Wall Finishes	AR		Epoxy Paint on CMU walls.
C302007	Wall Base Finishes	LF	6" high	Rubber cove base in 120' coils
C303001	Acoustical Ceiling Tiles & Panels	AR	24 x 24	Acoustical Ceiling Tile
C303005	Suspension Systems	AR	AR	9/16" or 15/16" suspended ceiling system
C303090	Other Ceiling and Ceiling Finishes	AR	AR	Paint all exposed surfaces in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
C304001	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide one multi-service recessed floor box every 25 square feet, or portion thereof. Coordinate requirements and locations with user.

Secure Workstation Room - Vault

Space Characteristics

Function/Adjacencies: Secure work area for secure network access and storage. Vault for Secure Equipment. CMU wall construction is preferred.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 12'-0"

Acoustics:
Sound Transmission Class (STC)-50 STC
Impact Insulation Class (HC)

Access: Secure Vault

Number of Occupants: 4

Other/Special Requirements: Secure Vault
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.

P1338 MEF Simulation Training Building

Simulation Control Room

Space Characteristics

Function/Adjacencies: A classified access room to provide workspace to control Simulation servers.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: From the classified and secure corridor system.

Number of Occupants: 20 operators

Other/Special Requirements:

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Sit to stand workstations, mobile pedestal and task chair. Workstations are shared.

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
C101001	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C1020	Wood Doors	1	3' x 7'	Provide solid core, flush door with stain finish, along with steel frame, factory primed, field painted. Coordinate door size and venting with room equipment.
C102007	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.
C103004	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C302005	Carpeting	SF	24 x 24 or Plank	Carpet Tile
C302007	Wall Base Finishes	LF	6" high	Rubber cove base in 120' coils

Simulation Control Room

Space Characteristics

Function/Adjacencies: A classified access room to provide workspace to control Simulation servers.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: From the classified and secure corridor system.

Number of Occupants: 20 operators

Other/Special Requirements:

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Sit to stand workstations, mobile pedestal and task chair. Workstations are shared.

Uniformat Section	Description	Qty	Size	Specific Requirements
C303001	Acoustical Ceiling Tiles & Panels	AR	24 x 24	Acoustical Ceiling Tile
C303005	Suspension Systems	AR	AR	9/16" or 15/16" suspended ceiling system
C304001	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D303002	Direct Expansion Systems			Provide a dedicated air-cooled direct expansion (DX) ductless split system heat pump unit for the space to back up the base building VAV system.
D501004	Panelboards			Provide a panelboard to serve the telecommunications and server equipment loads.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide two 120V, 20A receptacles, each on a dedicated circuit, at each equipment rack. Circuit to dedicated telecommunications panelboard.
D5020	Lighting and Branch Wiring	4		Provide 208V, 1-phase, 70A connection for government furnished, government installed APC model SRT10KXLT UPSs. Coordinate locations with COR.

Simulation Control Room

Space Characteristics

Function/Adjacencies: A classified access room to provide workspace to control Simulation servers.

Special Dimensions:
Ideal Plan Dimensions: see space tabulations
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: From the classified and secure corridor system.

Number of Occupants: 20 operators

Other/Special Requirements:

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Sit to stand workstations, mobile pedestal and task chair. Workstations are shared.

Uniformat Section	Description	Qty	Size	Specific Requirements
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.
D509090	Other Special Systems and Devices			Provide an EPO system to perform EPO functions in accordance with NEC Article 645.
E102009 D503004	AV Equipment/ Television System			

P1338 MEF Simulation Training Building

Simulation Control Secure Comm Room - Vault

Space Characteristics

Function/Adjacencies: A secure room for data servers. heavy electronic cooling loads

Special Dimensions:
Ideal Plan Dimensions: see room tabulations sheets
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45

Access: from Simulation control room.

Number of Occupants: N/A electronic equipment room

Other/Special Requirements:

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
C101001	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C1020	Wood Doors	1	3' x 7'	Provide solid core, flush door with stain finish, along with steel frame, factory primed, field painted. Coordinate door size and venting with room equipment.
C102007	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.
C103004	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s)
C103004	Fire Extinguisher Cabinet	1		Size cabinet for a clean-agent-type fire extinguisher having a minimum rating of 2-A:10-B:C. Locate the fire extinguisher cabinet within the server room adjacent to the primary door.
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C3020	Raised Access Floor	AR	24 x 24	Carpet tile finish surface

Simulation Control Secure Comm Room - Vault

Space Characteristics

Function/Adjacencies: A secure room for data servers. heavy electronic cooling loads

Special Dimensions:
Ideal Plan Dimensions: see room tabulations sheets

D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
D509090	Other Special Systems and Devices			Provide an EPO system to perform EPO functions in accordance with NEC Article 645.

P1338 MEF Simulation Training Building

Simulation Operator

Space Characteristics

Function/Adjacencies: Administrative office area for Simulation trainers and operators.
Adjacent to Simulation Analyst space of 15-20 analysts.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 10'-0"

Acoustics:
Sound Transmission Class (STC) 45 Minimum

Access: From Entry from POV parking for staff members.

Number of Occupants: 19 PN in Open Office at sit stand workstations.

Other/Special Requirements:

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	
B202001	Exterior Windows			If used.
B202001	Exterior Windows			Provide ½" thick solid surface window stool
B202004	Exterior Glazing			Low 'E' Glazing or Spectral glazing, to meet ATFP requirements as required.
C101001	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C101005	Interior Windows / Vision Panels			Windows/vision panels as required to achieve requisite view.
C1020	Wood Doors	1	3' x 7'	Provide solid core, flush door with stain finish, along with steel frame, factory primed, field painted. Coordinate door size and venting with room equipment.
C102007	Interior Door Hardware			Hinges, stop, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.

Simulation Operator

Space Characteristics

Function/Adjacencies: Administrative office area for Simulation trainers and operators.
Adjacent to Simulation Analyst space of 15-20 analysts.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 10'-0"

FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones, controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.
D5020	Lighting and Branch Wiring			Provide one multi-service recessed floor box every 25 square feet, or portion thereof. Coordinate requirements and locations with user.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
E201002	Window Treatments	AR	AR	If windows are used: Manually operated, double solar shade system with 3% light filtering solar shade, room darkening lining and room darkening side channels, on all exterior windows. (USE FOR EXTERIOR WINDOWS)

P1338 MEF Simulation Training Building

Unclassified Simulation Room - 2 Required

Space Characteristics

Function/Adjacencies: Unclassified Software based simulations control room. Reconfigurable.

Build to the same construction standards for Classified rooms.

Bid option: add retractable partition between rooms.

Special Dimensions:
Ideal Plan Dimensions: See Space Tabulation
Minimum Ceiling Height: 12'-0" Minimum

Acoustics:
Sound Transmission Class (STC) 45 Minimum
Impact Insulation Class (HC)

Access: From Non-Classified Corridor System

Number of Occupants: 20-40 PN at tables

Other/Special Requirements: Reconfigurable

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
A103001	Slab on Grade	SF	SF	Sealed concrete
C101001		SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Include sound insulation.
C101001	Fixed Partitions	SF		CMU or concrete. Include sound insulation. All STC rated partitions must terminate at underside of floor/roof deck.
C101003	Folding Partitions			BID OPTION: Folding partition between Simulation Rooms as indicated on Block Diagram
C101005	Interior Windows / Vision Panels			Windows/vision panels as required to achieve requisite view.
C1020	Interior Wood Doors	1	3' x 7'	Solid core, flush door with stain finish, along with hollow metal steel frame, factory primed, field painted.
C102007	Interior Door Hardware			Hinges, stop, provide passage hardware. X10 or CR required.

Unclassified Simulation Room - 2 Required

Space Characteristics

Function/Adjacencies: Unclassified Software based simulations control room. Reconfigurable.

Build to the same construction standards for Classified rooms.

Bid option: add retractable partition between rooms.

Special Dimensions:
Ideal Plan Dimensions: See Space Tabulation
Minimum Ceiling Height: 12'-0" Minimum

Acoustics:
Sound Transmission Class (STC) 45 Minimum
Impact Insulation Class (HC)

Access: From Non-Classified Corridor System

Number of Occupants: 20-40 PN at tables

Other/Special Requirements: Reconfigurable

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
C103003	Marker Boards and Tack Boards		36" H Minimum	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board, on two entire sides of room and on either side of Smartboard/touch screen on main wall of room. Tool trays and accessory kits shall be provided for each board. Top of boards to be mounted at approx. 8'-0" AFF.
C103004	Identifying Devices			Signage on exterior of room entry door(s): Indicate the room name for the space being entered with an "Occupied" slider bar.
C301003	Gypsum Wallboard Finishes	AR	AR	Cementitious backing units for wall tile installation where metal wall stud, CMU or concrete occurs.
C301003	Gypsum Wallboard Finishes	AR	AR	Primed and painted impact resistant gypsum wallboard
C301005	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C301006	Acoustic Wall Panels	AR	30" h x 48" each	Wall-mounted acoustical panels
C302011	Raised Access Flooring	AR	24" x 24"	Manufacturers standard line of finishes.

Unclassified Simulation Room - 2 Required

Space Characteristics

Function/Adjacencies: Unclassified Software based simulations control room. Reconfigurable.

Build to the same construction standards for Classified rooms.

Bid option: add retractable partition between rooms.

Special Dimensions:
Ideal Plan Dimensions: See Space Tabulation
Minimum Ceiling Height: 12'-0" Minimum

Acoustics:
Sound Transmission Class (STC) 45 Minimum
Impact Insulation Class (HC)

Access: From Non-Classified Corridor System

Number of Occupants: 20-40 PN at tables

Other/Special Requirements: Reconfigurable

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
C302007	Wall Base Finishes	LF	6" high	Rubber cove base in 120' coils
C302007	Wall Base Finishes	AR	AR	Sealed joint at base of wall between CMU and sealed concrete floor surface
C302011	Raised Access Flooring	AR	24" x 24" x 12"H	BASE BID-laminate
C303001	Acoustical Ceiling Tiles & Panels	AR	24" x 24"	Acoustical Ceiling Tile
C303005	Suspension Systems	AR	AR	9/16" or 15/16" suspended ceiling system
C303090	Other Ceiling and Ceiling Finishes	AR	AR	Paint all exposed surfaces in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
C304001	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones, controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide one quad receptacle adjacent to each network access drop set.

Unclassified Simulation Room - 2 Required

Space Characteristics

Function/Adjacencies: Unclassified Software based simulations control room. Reconfigurable.

Build to the same construction standards for Classified rooms.

Bid option: add retractable partition between rooms.

Special Dimensions:
Ideal Plan Dimensions: See Space Tabulation
Minimum Ceiling Height: 12'-0" Minimum

Acoustics:
Sound Transmission Class (STC) 45 Minimum
Impact Insulation Class (HC)

Access: From Non-Classified Corridor System

Number of Occupants: 20-40 PN at tables

Other/Special Requirements: Reconfigurable

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to 5.0 Room Finish and FF&E Requirements

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Provide two multi-service recessed floor boxes every 25 square feet, or portion thereof. Coordinate requirements and locations with user.
D5020	Lighting and Branch Wiring	60		Provide ceiling mounted duplex receptacles for synchronized simulation clock system. Coordinate receptacle locations with COR.
D503001	Telecommunications Systems			Provide network access drop sets as described in ESR D503001.
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.
E102009 D503004	AV Equipment/ Television System			Provide CATV outlets at appropriate height for all wall-mounted monitors. Provide laptop interface from monitor location to work console table floor box. HDMI/VGA, Cable, Blue Ray and VCR's located in the Exercise Control Room or Auditorium.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).

A10 FOUNDATIONS – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Provide foundation systems in accordance with UFC 3-301-01. Foundations must be designed to suit subsurface conditions and can transmit all building loads to the ground.

This section addresses both non-structural slabs-on-grade and structured slabs at ground level. For both systems, provide recessed areas as required to accommodate utilities at raised access floors such that the walking surface is one continuous plane throughout each space.

See Section B10, *Superstructure*, for additional loading criteria.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEMS REQUIREMENTS

A10 GENERAL

GOVERNMENT PROVIDED GEOTECHNICAL INFORMATION

Subsurface soil information, including a geotechnical data report prepared specifically for this project and historical subsurface data from other projects in close proximity to the project site, are included in Part 6 – Attachments of this RFP.

The soils information provided in this RFP is for reference only and reflects the soil conditions encountered only at the locations indicated. The Government shall not be responsible for any interpretation or conclusion by the Contractor drawn from the soils information beyond the industry standard of care. Geotechnical engineering reports accompanying the subsurface information are provided only to better convey the encountered data and observed site conditions. Assumptions, analyses and recommendations included in any accompanying report may or may not be applicable to the Offeror's design concept. The Contractor must retain a Geotechnical Engineer to interpret the Government provided information as it relates to the Contractor's design concept prior to submission of the proposal and develop geotechnical requirements to support the design and construction of the project meeting the requirements of this RFP for bidding purposes.

GEOTECHNICAL ENGINEERING CONSULTATION AND STUDY

The Geotechnical Engineer must have a minimum of 5 years of recent relevant experience in the geographic region of the project and must be currently licensed as a professional engineer in the State of North Carolina. In accordance with FAR Subpart 9.5, Organizational and Consultant Conflicts of Interest, the Contractor is prohibited from hiring the Geotechnical Engineer who provided data, reports and any other services on behalf of the Government for this project.

After award, the Contractor's Geotechnical Engineer (Geotechnical Engineer of Record) must provide a site-specific geotechnical study to include in-situ testing, soil borings and supporting laboratory analysis of representative soil samples. The Geotechnical Engineer must prepare a Geotechnical Report providing recommendations for design and construction of foundations, earthwork and site development in accordance with UFC 1-200-01 *DoD Building Code (General Building Requirements)*, UFC 3-220-01 *Geotechnical Engineering*, and FC 1-300-09N *Navy and*

Marine Corps Design Procedures and associated references. Calculations must be provided in the report to support all conclusions and recommendations.

SEISMIC DESIGN

Refer to ESR B10 for seismic design information.

A1010 STANDARD FOUNDATIONS

As determined by the Designer of Record to be applicable, provide a Standard Foundation to support the structure(s) associated with this project. "Standard Foundations" are shallow foundations or deep foundations as addressed in IBC Chapter 18. Do not use masonry unit footings, steel grillage footings, timber footings or wood foundations. Treated timber piles are permitted if deemed appropriate by the Designer of Record.

The structure(s) must be entirely supported by either a shallow foundation system or a deep foundation system as determined by the Designer of Record. Provide foundation materials that are compatible with the environmental exposure. When foundation elements are exposed to corrosive or otherwise aggressive soils, provide protection in accordance with ACI 318 requirements.

Calculate foundation ultimate resistance using multiple established methods. Determine allowable foundation capacity using the factors of safety provided in UFC 3-220-01 Tables 2-2 and 2-3. Develop geotechnical engineering design parameters using in-situ tests, laboratory tests and established empirical correlations. Evaluate upper and lower bound soil capacities based on variations in subsurface conditions at the site. Determine the minimum foundation bearing depth for frost protection in accordance with UFC 3-301-01. Provide minimum foundation widths to avoid failure and with consideration given to placement tolerances, ease of construction, etc.

Determine estimated foundation settlement based on comparison of predicted values from multiple established methods based on reaction loads provided by the Structural Designer of Record. Settlement calculations must include dead and live load components, live load reductions used in the analyses, actual or estimated foundation sizes, planned site grading changes, and expected fluctuations in groundwater levels. Estimated differential settlement must include upper and lower bound foundation settlements based on soil properties, different foundation loading, and variations in subsurface conditions across the building footprint.

The presence of weak and compressible soils may result in excessive settlement that could impact the performance of surface bearing structures and supporting facilities such as foundations, slabs, pavements, sidewalks, and utilities. The magnitude and duration of settlement depends on the composition, depth, and thickness of the weak/compressible soils as well as the Contractor’s selected design concept. The Contractor's Geotechnical Engineer is responsible for evaluating potential global settlement due to designed grade increases and final structural loads, and must develop any settlement mitigation procedures (such as preloading, surcharging, fill monitoring programs, and ground improvement systems) needed to maintain global settlements within tolerable limits. Surcharge material, if required, must remain in place for 90 days minimum.

Design must incorporate measures that limit total and differential settlement to levels that prevent structural or aesthetic damage or impairment of the serviceability and function of the facility or structures, including drainage and utilities. The safety factor for liquefaction potential must meet or exceed Table 2-1 in UFC 3-220-01.

Use the following geotechnical tolerances to design shallow foundation systems:

a) Limit slab-on-grade post construction total settlement due to permanent loads to ½ inch maximum;

b) Limit total settlement of column and wall footing foundations to one inch maximum; and

c) Limit differential settlement of adjacent footings to ½ inch maximum and an angular distortion of 1/500 maximum. Angular distortion is defined as the difference in settlement between two points divided by the distance between the points.

Use the following tolerances for designing deep foundation systems:

a) Limit total settlement of individual piles and pile caps to ½ inch maximum under service load conditions as determined by static or dynamic pile load testing.

b) Limit differential settlement of adjacent foundations to ½ inch maximum and to an angular distortion of 1/500 maximum. The angular distortion is defined as the difference in settlement between two points divided by the distance between the points.

c) Limit lateral deflection of deep foundations to ½ inch, with an applied axial load equal to the expected dead load.

Ensure allowable pile stresses not to exceed limitations specified in IBC Section 1810, Deep Foundations. Evaluate and address time dependent pile capacity conditions (i.e. pile setup), group effects, negative skin friction, lateral squeeze, preboring/jetting, installation sequencing, refusal driving conditions, etc. as applicable. Include requirements for completing pre-construction condition surveys, ground vibration monitoring, structural instrumentation, etc. to mitigate risks of ground vibration damage to nearby structures as applicable for the specific project. The Structural Engineer of Record must design and detail the pile foundations in accordance with IBC Section 1810.3. Submit structural calculations and details for the piles to the Government for review and approval during project design development.

Conduct a test pile program overseen by the Geotechnical Engineer of Record and submit a final signed and stamped report to the Government for review and approval. Monitor and record driving during installation and subject to hammer restrikes in accordance with ASTM D4945, “Standard Test Method for High-Strain Dynamic Testing of Piles.” Evaluate the ultimate load capacity of selected test pile restrike(s) using CAPWAP analyses. Additional load test requirements are stated in Part 4 of this RFP. The Contractor is responsible for all foundation testing and monitoring costs.

A1020 SPECIAL FOUNDATIONS

As determined by the Designer of Record to be applicable, provide a Special Foundation system to support the structure(s) associated with this project. "Special Foundations" are any foundations that are not specifically "Standard Foundations", or which are a combination of Standard Foundations and a site improvement/ground modification system. Incorporate design of these systems in the project plans and specifications following FC 1-300-09N Chapters 7 and 8 and not as a construction submittal. Examples of site improvement/ground modification systems include surcharge preloading, prefabricated vertical drains, over-excavation and replacement, stone columns, rammed aggregate piers, rigid column inclusions, deep dynamic compaction, low and high mobility grouting, vibroflotation, etc. As most "Special Foundation" techniques or systems typically require the use of specialty contractors, a registered Professional Engineer must establish installation and acceptance criteria and supervise the installation. The Designer of Record must submit justification for use, including acceptable

evidence of previous successful installation in similar conditions, methods and equipment used in their installation, proposed testing and inspection to be used, supporting test data, calculations, and any other information related to the structural properties and load capacity of such system. The allowable stresses and testing requirements for pile-like elements used for ground improvement must comply with IBC Section 1810.

A1030 SLAB ON GRADE

As determined by the Designer of Record to be applicable, provide soil supported concrete slab(s) on ground. Provide a vapor retarder and porous fill layer beneath all slabs. Where slab on ground is below the existing adjacent exterior grade, provide waterproofing on foundation walls or grade beams and a perimeter drainage system to remove ground water from the area immediately adjacent to the building. Provide perimeter and under slab insulation in accordance with UFC 3-101-01, *Architecture*.

A1030 GROUND FLOOR SLABS – BID ALTERNATE TERRAZZO FLOOR FINISHES

A reinforced vapor barrier equal to or greater than ASTM E 1745 15 mil must be used directly under all ground floor slabs. The vapor barrier must be properly flashed with all joints overlapped and taped. The vapor barrier must NOT be punctured during construction. If punctured, then the vapor barrier must be repaired per manufacturer's specifications. Concrete used for the ground floor slabs will have a minimum 28-day compressive strength of 3,500 psi and maximum water to cement ratio of 0.45 with a 4-inch maximum slump without water reducers. The ground floor slabs will have an overall specified floor flatness (Ff) of 35 and an overall specified floor levelness (Fl) of 25 as determined by ASTM E 1155 with minimum local values of not less than 65% of the specified overall values. The slabs will be allowed to cure for at least 7 days under a wet cure and for at least 60 days under dry cure conditions. The contractor will retain the services of an independent testing laboratory to verify that the concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to the epoxy resin manufacturer's written instructions. Perform relative humidity tests using in-situ probes in accordance with ASTM F 2170 at a frequency recommended by the manufacturer. Proceed with resinous flooring installation only after substrates have a maximum 75% relative humidity level measurement. Perform anhydrous calcium chloride tests in accordance with ASTM F 1869 and pH at a frequency recommended by the manufacturer. Proceed with application of resinous flooring only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. of slab area in 24 hours.

A1040 STRUCTURALLY SUPPORTED SLAB

As determined by the Designer of Record to be applicable, provide a structurally supported slab. Provide for structural support of all utilities that may be adversely affected by soil consolidation or expansive soils. Provide stainless steel hangers sized adequately to support the in-service utility. Provide a vapor retarder and porous fill layer beneath all slabs. Where the structurally supported slab is below the existing adjacent exterior grade, provide waterproofing on foundation walls or grade beams and a perimeter drainage system to remove ground water from the area immediately adjacent to the buildings. Provide perimeter and under slab insulation in accordance with UFC 3-101-01, *Architecture*.

B10 SUPERSTRUCTURE – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

The superstructure consists of structural elements above the foundation that provide support for vertical loads and resistance to lateral loads.

This section includes the requirements for the superstructure of the building, including floor and roof framing, columns, interior load-bearing walls and the main lateral-force resisting system. Exterior load bearing walls are addressed in Section B20.

Provide the building framing system in accordance with UFC 3-301-01, *Structural Engineering*.

The building must be constructed with concrete, steel, or masonry. Wood construction is prohibited.

All steel deck used on roofs and structural wall panels must be 20 gauge minimum thickness.

A Special Inspector of Record (SIOR) is required for this project. All structural steel deck must be 20-gauge minimum thickness, and applies to roof and wall structural panels.

Pre-engineered building systems are prohibited.

Load bearing light gage framing systems are prohibited.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Risk Category: II

Design for Live Loads in accordance with IBC 2018 as modified by UFC 3-301-01.

Wind load parameters

Wind speed: Comply with UFC 3-301-01

Determine wind exposure category, topographic factor, and other wind design parameters based on ASCE 7.

Wind Load design for this project must use exposure C or D. See ASCE 7-16 for further description of exposures. For this project, exposure B is prohibited

Snow load parameters

Ground snow load: Comply with UFC 3-301-01

Snow load importance factor: 1.00

Snow load design parameters must be based on ASCE 7-16. Except design wind loads must be based on Exposure C or D, whichever is applicable. Use of Exposure B is prohibited.

Seismic load parameters

A site-specific seismic ground motion study is not required. Use Risk Category II and soil classification D. Determine seismic loading adjusted for site class effects using the ground

motion parameters specified by UFC 3-301-01, *Structural Engineering*. Seismic Design Category (SDC) is B.

B1010 FLOOR CONSTRUCTION

Provide elevated floors and mezzanines consisting of any of the following construction types.

- Non-composite concrete slabs on form deck on steel joists.
- Non-composite or composite concrete slabs on metal decking on steel beams.
- Cast-in-place concrete slabs on removable forms.
- Precast concrete planks or shallow double-tee beams.
- Provide depressed slab or pit for areas requiring access flooring.

Support elevated floors and mezzanines on cast-in place concrete walls, plant or site pre-cast concrete walls (including tilt-up walls), reinforced concrete masonry walls/pilasters, structural steel columns and girders or joist girders. Do not support elevated floors on light gage stud wall construction. Wood framed systems are prohibited.

Provide access platforms constructed of steel grating and supported by structural steel framing.

B1020 ROOF CONSTRUCTION

Provide roof construction consisting of metal decking supported by structural steel framing or open web steel joists and joist girders bearing on load bearing columns or walls. Cast-in-place and precast concrete roof systems are also permitted. Support roof construction on cast-in-place concrete walls, precast concrete walls, reinforced concrete masonry unit walls/pilasters, or structural steel columns. Training rooms and conference rooms must be free of columns and other obstructions. Refer to Architectural sections for roof slopes.

--End of Section--

B20 EXTERIOR ENCLOSURE – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

This system consists of the exterior shell of the facility, which includes all vertical and horizontal exterior closure such as exterior walls, exterior windows, and exterior doors. This system excludes roofing (See Section B30, Roofing). Load bearing exterior walls will be included here, and not in Section B10, Superstructure. Structural frame elements at exterior such as columns, beams, and spandrels are included in Superstructure, with all exterior wall elements supported by columns, beams and spandrels included in this section.. Finishes to the inside face of walls which are not an integral part of the wall construction will be included in Section C30, Interior finishes.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEMS REQUIREMENTS

B2010 EXTERIOR WALLS

It is permissible for exterior walls to be load bearing or non-load bearing. Exterior load bearing walls must consist of any of the following construction types and comply with the architectural and functional requirements that follow this list (also refer to B201001 Exterior Closure section for inclusion of load bearing walls in the overall exterior closure design).

1) Reinforced concrete masonry (CMU)
2) Cast-in-place reinforced concrete
3) Site precast concrete (tilt-up)
4) Plant precast concrete

Exterior walls must incorporate the materials directed in the Camp Lejeune, Base Exterior Architectural Plan (BEAP), 2010 – Section 4.2 Hadnot Point.

The primary exterior cladding material of the building must be modular brick per color and finish conforming to the BEAP, along with a water table as prescribed in the BEAP. If thin brick cladding is used, the color and finish of the brick must match as closely as possible to that indicated in the BEAP.

Brick detailing and design of the exterior wall must provide accent banding and design features at windows as prescribed in the BEAP

Provide a cast-in-place, split-face masonry (used with veneer exterior wall closure) or precast concrete water table per the proportions shown in diagrams in the BEAP. If the cast in place option is chosen, the finish of the concrete is required to be a high quality, rubbed finish with a pattern mimicking CMU masonry joints.

Multiple options for providing the exterior wall system composed of the Exterior Closure and the Exterior Wall Backup Construction sections shown below.

B201001 EXTERIOR CLOSURE

The following are options for providing the exterior closure. The Contractor has the option to use these systems if energy code requirements and design aesthetics as prescribed in the BEAP are provided:

1) A brick/masonry veneer cavity wall exterior wall closure.
2) A precast concrete panel veneer exterior wall closure with applied thin brick. This system must be a barrier system with sealed joints.
3) A site precast tilt-up concrete exterior wall closure or cast in place concrete exterior wall closure (load bearing) with applied thin brick cladding. This exterior closure is a barrier system with sealed joints.
4) A plant precast and site assembled precast concrete exterior wall closure (load bearing) with applied thin brick cladding. This exterior closure is a barrier system with sealed joints.

All exterior closure wall options where the exterior wall concrete (precast or cast in place) is exposed to moisture (at the exterior face of the wall or the base of the wall) must be designed with a plant added admixture to prevent moisture migration within the concrete to prevent the failure of applied thin brick systems, and prevent water migration into the interior of the building.

Thin brick placed on the exterior load bearing walls must be attached with systems that will ensure that the brick will not separate from the wall or form efflorescence. In addition, adequate control/construction joints must be incorporated into the concrete wall system to prevent thin brick cracking and adhesion issues.

B201002 EXTERIOR WALL BACKUP CONSTRUCTION

The backup systems for masonry and precast concrete veneer systems must be of single wythe reinforced concrete masonry. The backup wall system must be integrated with other exterior wall system requirements as indicated in B201003, Insulation and Air Barriers.

Exterior bearing walls consisting of metal studs as the primary floor or roof supporting structural element are not permitted.

For concrete exterior bearing walls (precast or cast in place) the backup wall system is defined in ESR C10, Interior Construction.

B201003 INSULATION and AIR BARRIERS

Provide continuous insulation, vapor retarder and air barrier to meet or exceed requirements of project's energy savings requirements.

Provide a continuous air barrier to control air leakage into, or out of, conditioned spaces. The building envelope shall include all elements of the facility that are exposed to the outside environment or outside environmental conditions such as roof, walls, floors, and compartmentalized unconditioned portions of the facility such as garages, and negatively pressurized spaces. Permanently seal penetrations through the air barrier, joints in the air barrier, adjoining construction, and transitions to different air barrier materials.

Confirm air barrier compliance with Air Barrier Performance Test in RFP Part 4.

Provide thermal envelope performance testing through infrared thermography in accordance with RFP Part 4. Coordinate thermal imaging testing with air barrier testing construction schedule

B201004 PARAPETS

Parapets will not be required for this building since sloped roof areas (with gutter/downspouts) are to be provide over the entire building.

B201005 EXTERIOR LOUVERS & SCREENS

Provide exterior louvers and screens, where required, that match the finish of the existing windows and detailed to integrate with the architecture of the building, as appropriate to the design of the building. Provide insect screens at all louvers.

B201006 BALCONY WALLS & HANDRAILS

NOT USED

B201007 EXTERIOR SOFFITS

Provide a pre-finished exterior soffit system and associated rake and eave trim as indicated in the BEAP – Section 4.2 Hadnot Point. Color as defined in the BEAP.

B201009 EXTERIOR PAINTING AND COATINGS

Provide a field applied exterior coating on all items that are not prefinished, and to prefinished items when required to provide a color other than a standard prefinished color.

B201010 EXTERIOR JOINT SEALANTS

Provide exterior application of joint sealants to seal joints and prepare for finish material installation.

B201011 SUN CONTROL DEVICES (EXTERIOR)

Provide fixed, horizontal or vertical fixed type as requited to provide sun control and prevent any direct sunlight hitting work surfaces of offices and classrooms. Sun control devices shall be detailed to integrate with the architectural wall system.

B201012 SCREEN WALL

Provide screen walls where required to screen mechanical units, electrical substations, loading docks, and trash receptacles/dumpsters. Screen walls shall be per the Camp Lejeune, Base Exterior Architectural Plan, 2010, Section 4.2 Hadnot Point. Rooftop mechanical screens are not required since roof mounted mechanical equipment is prohibited.

B2020 EXTERIOR WINDOWS

Windows and other fenestration systems that provide daylighting must be provided in regularly occupied spaces that include offices and classrooms as indicated in UFC 1-200-02 and reference to ASHRAE 189.1 sections.

Due to the location of classrooms other areas away from exterior walls in the II MEF Simulation Training Center block diagram, the design must provide fenestration systems that will comply with the daylighting requirements prescribed in the aforementioned UFC.

Windows must meet the defined prescriptive AT/FP requirements per UFC 4-010-01. If is permissible to use curtain wall systems in lieu of window or storefront systems, if necessary, to meet AT/FP or other design requirements.

The daylighting provided by windows and other fenestration systems must not compromise the visual acuity and comfort within the room.

Provide a sample window installation in a complete exterior wall, as determined by the DOR and approved by the Contracting Officer. If approved, this sample window installation will become a permanent part of the building.

B202001 WINDOWS

Windows must be pre-finished aluminum and fixed.

Provide a mockup of one combination window unit for the project to be used for a field mockup test in compliance with AAMA 502 Method A and Method B.

B202002 STOREFRONTS

Storefronts shall be pre-finished aluminum and, if provided, must meet the requirements defined for windows in relation to providing daylighting and meeting AT/FP requirements.

Provide a mockup of one designated storefront system unit for the project to be used for a field mockup test of compliance with AAMA 502 Method A and Method B.

B202003 CURTAIN WALLS

Curtain walls are a permissible option for fenestration if determined necessary to meet applicable codes and UFC requirements. Curtain walls, if provided, must meet the requirements defined for windows in relation to providing daylighting and meeting AT/FP requirements.

The curtain wall system must be a standard architectural type Stick or Unit and Mullion system, with mullions, horizontal rails, and/or non-integral spandrel panels. Fully coordinate curtain wall system components/accessories that are directly incorporated and adjacent to contiguous related work (i.e. wall systems). Ensure materials compatibility, deflection limitations, thermal movements, and clearances and tolerances in the design of the curtain wall system and in coordination of the curtain wall design with adjacent exterior enclosure systems.

The system must incorporate a pressure equalized method to control air and water infiltration. Face sealed systems and water managed systems are not allowed.

System must be a combination of glazed panels and opaque panels as required by the design.

Provide a mockup of one designated Curtain Wall System unit for the project to be used for a field test of compliance with AAMA 503 Method A and Method B.

B202004 EXTERIOR GLAZING

Glazing color and reflectance must be provided and approved by Camp Lejeune’s Architectural Review Board. Glazing must be a heat absorbing insulated laminated glazing unit with the inner most pane being laminated glazing to meet the prescriptive AT/FP requirements of UFC 4-010-01 and code/UFC prescribed wind load requirements.

B202090 OTHER EXTERIOR WINDOWS

NOT USED

B2030 EXTERIOR DOORS

All exterior doors must be weather protected and provided with weatherstripping/sealant and thresholds that stop water penetration and comply with ABA. Provide heavy duty overhead closers at all exterior doors. It is required for main front doors to be double doors. It is required that exterior back doors be 4’-0” wide single doors. AE2 is responsible for code compliance in regard to egress requirements and doors. Government will review and approve AE2 door selection.

B203001 SOLID DOORS

Provide insulated solid steel door assemblies other than at storefront/curtainwall entrances.

Doors must be Extra Heavy-Duty Doors -– ANSI /SDI A250.8, Level 3, physical performance Level A, Model 1.

Provide steel doors fabricated from hot dipped galvanized steel and provide a rust inhibitive factory finished primer coating. Finish coats are to be field painted.

B203002 GLAZED DOORS

Provide exterior aluminum framed glazed doors and entrances systems integrated into storefront/curtain wall system at main entry of the building or at secondary access points that incorporate storefront/curtain wall systems. Doors must be factory-finished aluminum framed door assemblies with heat absorbing insulated laminated glazing, frames, and hardware.

Glazing shall match the storefront/curtain wall system glazing.

Glazing in any hollow metal or glazed exterior door is required to meet the same prescriptive requirement for glazing as required for windows and other fenestration systems.

B203004 OVERHEAD AND ROLL-UP DOORS

Design door and opening for a loading entrance at Shipping/Receiving and all mechanical rooms with exterior access. Provide lockable doors with automatic operation with protected pushbuttons electric controls.

Accomplish door operation by UL Listed electric motor operation with electric controller and an auxiliary hand chain operation. Provide slat profile. Also provide counterbalance, heavy duty springs, wear strips, full perimeter weather-stripping, continuous button pressure safety operation, electric or infrared safety edge, galvanized hardware, and manufactured trims and closures pieces. Protect the wall door jamb opening with guards designed to resist abuse from the type of material and vehicles that are transported through the opening.

For overhead doors that open into inhabited spaces, provide the doors with a tether system or intercepted walls to reduce the likelihood of the overhead doors from translating into the inhabited areas.

Provide insulated overhead roll-up doors. Provide powder coat painted finish with custom colors for the door and accessories to match facility color scheme. Design the galvanized steel overhead roll-up slats and door width to withstanding the design wind loading of ASCE 7 and operate normally.

B203006 BLAST RESISTANT DOORS

NOT USED

B203008 EXTERIOR DOOR HARDWARE

Provide the services of a certified door hardware consultant to prepare the door hardware schedule. Verify all door hardware requirements with the User.

Provide a programmable CAC enabled electronic locking system at all exterior swinging man doors. The exterior locking system must be capable of locking all doors via a “kill switch” (tied to a central monitoring location), and all doors are to be provided with a manual key override. Exterior door locks must be consistent with prescribed regulations for Open Storage Secret (OSS) spaces.

Door hardware finish must be satin stainless steel or an alternate system that matches satin stainless steel if stainless steel is not available.

B203090 OTHER EXTERIOR SPECIALTY DOORS

NOT USED

--End of Section—

B30 ROOFING – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

B30 GENERAL SYSTEMS DESCRIPTION

Roof systems shall be watertight. Provide complete roof system design and construction services for the entire new facility roof system, including all ancillary and incidental work necessary for a complete, new, watertight roof system installation.

Submittal Requirements: Components of a minimum roof submittal shall include the roof plan, method of drainage, standard details and details unique to the project, wind load calculations and requirements.

Provide a Pre-Design Roofing Conference (if required in RFP Part 4) and Pre-Construction Roofing Conference to assure roof design and construction is properly coordinated before construction begins.

Refer to UFC 3-110-03, *Roofing*, UFC 3-101-01, *Architecture*, and UFC 1-200-02 *High Performance Sustainable Buildings* for additional roofing requirements such as Energy Star qualified products.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

B3010 ROOF COVERINGS

B301001 STEEP SLOPE ROOFING SYSTEMS

Provide a SSMR (standing seam metal roof system). The slope and configuration of the roofing is suggested in the Base Exterior Architectural Plan (BEAP), 2010, Section 4.2, Hadnot Point. Refer to Part 3, Chapter 2 for prescribed roof slope.

The roof system shall be designed and attached to resist wind uplift pressures calculated in accordance with ASCE 7. Uplift resistance shall be validated by applicable Factory Mutual (FM), Underwriters Laboratories (UL) or ASTM uplift resistance test procedures. The roof material must be 3004 aluminum, ASTM B209M ASTM B209..

Organic Coatings for the metal roof must be a PVDF coating as specified in Part 6, Roof specification section 07 61 15. 00 20 Aluminum Standing Seam Roofing. All other material and construction for metal roofing are per Part 6 specification section.

The spacing of standing seams shall between 12 inches and 18 inches on center as prescribed in the BEAP.

Sub-purlins for the Structural Metal Roof System shall be galvanized and shop painted.

SSSMRS Warranty Certificate. – Provide warranty requirements as defined in Part 6, Roof specification section 07 61 15. 00 20 Aluminum Standing Seam Roofing.

Specular Gloss of Finished roof surfaces must have a specular gloss value of 10 or less at an angle of 85 degrees or 30 plus or minus the value specified in the project program at 60 degrees when measured in accordance with ASTM D 523.

B301002 LOW SLOPE ROOFING SYSTEMS

NOT USED

B301003 ROOF INSULATION AND FILL

Provide roof insulation values no less than in accordance with UFC 1-200-02 High Performance and Sustainable Buildings and UFC 3-110-03 Roofing.

B301004 FLASHINGS AND TRIM

Provide flashing and trim for the Aluminum Standing Seam Metal roof per specification section 07 61 15. 00 20 Aluminum Standing Seam Roofing in Part 6 of this RFP.

B301005GUTTERS AND DOWNSPOUTS

Provide gutters and downspouts compatible with roofing material and finish. Concealed (interior) gutters and downspouts are prohibited.

B301006 ROOF OPENINGS AND SUPPORTS

NOT USED

B301090 OTHER ROOFING

Provide lightning protection, without penetrating the roofing or flashing components.

--End of Section--

C10 INTERIOR CONSTRUCTION – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Interior construction includes interior partitions, interior doors, and fittings.

Provide durable construction appropriate for the building function. Acoustic properties of materials, as well as durability, shall be considered during material selection.

Provide an acoustical engineer to participate in the design and provide design quality reviews throughout the design. The acoustical engineer must be an active participant in the design of the Simulation and FIRE classrooms, Ready Room/Auditorium, and any other space or portion of the design with special acoustical requirements. The engineer must evaluate and give input on, but not limited to, acoustical partitions carrying Sound Transmission Coefficient (STC) ratings, applied acoustical treatments, integration of audio-video components, and door and frame performance, The acoustical engineer must carry a bachelor's degree in Engineering, Physics, Architecture, or a related field, hold a PE or membership in a recognized acoustical professional organization, and demonstrate a minimum of 7 years of acoustical design/engineering consulting on similar projects

Interior construction of secure rooms must be appropriate for their function. This includes full volume enclosure of the room to make it inaccessible from any direction and compatible door hardware. Project secure areas include Secure VTC Room, Secure Workstation and Simulation Control Secure Communications Room. The latter two rooms are referred to as “vaults.”

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Areas of the Project subject to abuse require that "Impact Resistant" systems be provided.

C1010 PARTITIONS

To the greatest extent possible, provide partitions consisting of metal studs with gypsum board on each side. Concrete masonry partitions may be considered if durability is a primary concern.

Gypsum board for partitions in moist and humid areas and areas with water use on floors (e.g., toilets, locker rooms, and mechanical rooms) must be 5/8-inch, moisture and mold resistant gypsum board panels. ASTM C1396, ASTM D3272 - Rating of 8 to 10, ASTM C473, Water Absorption less than 5 percent. Provide impact-resistant versions of this gypsum board for abuse prone areas.

C101001 FIXED PARTITIONS

Provide fixed interior partitions, except where retractable partitions are specifically required by the "Room Requirements."

UFC defined acoustic requirements in UFC 3-101-01, Section 4.8 and Figure 4-1 is not applicable to this project. Partitions requirements are defined using STC ratings in this RFP.

Sound-rated partition assemblies must meet the interior acoustic requirements for typical spaces as follows or as indicated in Chapter 3, Part 5, Additional Room Requirements:

- Simulation Classrooms STC 45
- Brief/Debrief Rooms STC 45
- Ready Room/Auditorium STC 45
- Mother's Room STC 45
- Heads/Locker Areas STC 45
- Break Rooms STC 45
- Library/File/Storage/Plotter STC 45
- Private Offices STC 45**

  ** Private office STC may be reduced to a lower STC in association with a high CAC acoustical ceiling or increased to STC 50 based on the requirements of the individual user. The requirements for each individual user must be verified during the design process.

- Mechanical Rooms (when wall is adjacent to occupied space) STC 50

C101002 DEMOUNTABLE PARTITIONS

NOT USED

C101003 RETRACTABLE PARTITIONS

Provide retractable partitions to include operable panel partitions (noted as Folding Partition in the Architectural Block Diagram. Sound-rated partition assemblies shall have a minimum STC to match the fixed partition in the room in accordance with ASTM E90 or ASTM E413 for frequency data. Coordinate finishes with Section C30 Interior Finishes.

In the pocketed stored position provide for a partitioned pocket area so the system panels when folded are not exposed in the room.

C101004 INTERIOR GUARDRAILS AND SCREENS

Provide balustrades where required by code. Provide screens where required to prohibit view of a particular area.

C101005 INTERIOR WINDOWS

Provide interior windows systems of aluminum if required by the design in rooms for borrowed light to occupied spaces.

If interior windows are provided at rooms of STC 45 or above, provide a window with laminated glazing to provide acoustical control.

All interior window systems must have a pre-finished coating finish or anodized finish.

C101006 GLAZED PARTITIONS & STOREFRONTS

Provide aluminum-framed, glazed storefront system in rooms as required by the design to allow borrowed light into occupied rooms.

If interior glazed storefront is provided, provide acoustically rated glazed systems to match the acoustical rating of the adjacent partition.

All interior storefront systems must have a pre-finished coating finish or anodized finish.

C101007 INTERIOR GLAZING

Interior glazing must be clear or patterned glass that is annealed / tempered based on code requirements. If necessary, provide laminated glazing to obtain STC/NIC requirements.

If necessary, provide laminated glazing for sound control as indicated elsewhere in this section.

Interior glazing when provided in fire rated doors and glazed partitions must utilize fire rated glazing to meet code requirements. Wire glass must not be used in fire-rated doors or partitions.

C1020 INTERIOR DOORS

It is required that 4’-0” wide single doors be included in all simulation classrooms, FIRE, auditorium, exercise control, simulation control and server admin. AE2 is responsible for code compliance in regard to egress requirements and doors. Government will review and approve AE2 door selection.

C102001 STANDARD INTERIOR DOORS

Provide flush interior doors.

Provide wood or hollow metal interior doors in hollow metal frames.

Provide wood doors at all administrative office area rooms, classrooms, heads, lounges/break rooms.

Provide hollow metal doors at all mechanical rooms, electrical rooms, and telecom rooms.

Hollow metal doors must be Level 4 with physical performance level A throughout the facility

Flush wood doors must be WDMA I.S.1A-04, premium grade, extra heavy duty for classrooms, heads, break rooms, auditorium/ready room and heavy duty for all other spaces. Flush wood doors shall be SCLC-5 5-ply structural composite lumber core or FD core, as required by code.

Doors must have Factory Finish of AWI Quality Standards Section 1500, specification for Conversion varnish alkyd urea or catalyzed polyurethane.

Provide vision glazing within doors if it is deemed advantageous to be able to see through the door, either for safety of pedestrian traffic or other functional reasons. If vision glazing within doors is provided, it must have the provision to be blanked off during an active shooter event. This would require an easily activated shade, flap, or other device that would obscure vision through the door lite.

Provide 50 STC sound rated door assemblies for doors leading into Room(s) as indicated in Part 3, Chapter 5 – Additional Room Requirements. The pre-manufactured door assembly shall be per material listed in the Room Requirements and include all hardware and seals necessary to achieve the required rating. Install in accordance with the manufacturer's instructions.

Provide acoustic seals and gasketing to match acoustical rating of the surrounding partition. After installation, test the doors with a flashlight to determine if any gaps in the sound seals allow light to be viewed on the opposite side of the door.

C102002 GLAZED INTERIOR DOORS

Provide Aluminum/Glass glazed interior door or all glass door as a part of an interior glazed partition as indicated in C101006 for spaces that do not require acoustical control.

C102003 FIRE DOORS

Provide interior fire doors, in fire rated partitions as required by Code.

C102004 SLIDING AND FOLDING DOORS

NOT USED

C102005 INTERIOR OVERHEAD DOORS

NOT USED

C102006 INTERIOR GATES

NOT USED

C102007 INTERIOR DOOR HARDWARE

Provide the services of a certified door hardware consultant to prepare the door hardware schedule in conjunction with the approval of the client and to meet specific requirements outlined in this section or other referenced documents. Verify all door hardware requirements with the User.

Interior door locks must be consistent with prescribed regulations for Open Storage Secret (OSS) spaces. Provide a programmable, CAC-enabled electronic locking system at all areas requiring controlled access.

Provide lock and latch hardware with levers as follows:

- Use Series 1000, Operational Grade 1, Security Grade 2 for corridors, classrooms and labs, suite entrances, toilets, and other high-use interior doors. Use Series 4000, Grade 1 for locations not using Series 1000 hardware.
- Mortise Locks and Latches - BHMA A 156.13, Series 1000, Operation Grade 1, Security Grade 2.
- Bored Locks and Latches - BHMA A 156.2, Series 4000, Grade 1, or Grade 2.

Provide cylinders/cores and keying system as indicated in Part 4, C102007 specifications. Other related door hardware requirements for hardware beyond locking devices is as indicated in Part 4, C102007 specifications. Lock cores shall match the BEST system.

Door hardware finish must be satin stainless steel or an alternate system that matches satin stainless steel if stainless steel is not available.

C102090 OTHER INTERIOR SPECIALTY DOORS

NOT USED

C102091 OTHER INTERIOR PERSONNEL DOORS

NOT USED

C1030 SPECIALTIES

C103001 COMPARTMENTS, CUBICLES, & TOILET PARTITIONS

Provide solid plastic (HDPE) toilet partitions in all toilet rooms (Heads) with more than one water closet or urinal.

Provide floor-mounted, overhead-braced toilet partitions.

C103002 TOILET AND BATH ACCESSORIES

Provide toilet and bath accessories:

TOILET & BATHROOMACCESSORY SCHEDULE						
ACCESSORY	SPACE					
	MALE RESTROOMS	FEMALE RESTROOMS	MOTHER'S ROOM	MEN'S & WOMEN'S SHOWERS	HEAD	JANITOR'S CLOSETS
Dual roll toilet tissue dispenser for each water closet (Typical supplies available at base supply)	●	●			●	
Seat cover dispenser for each water closet	●	●				
Coat hooks for each water closet stall	●	●				
ABA Grab bars for toilet (in restrooms with multiple stalls, grab bars required only for ABA water closet stall)	●	●			●	
ABA Grab bars for shower				●		
Paper towel dispenser in each room (Typical supplies available at base supply)	●	●	●		●	
Electric hand dryers with motion sensors in each room; HEPA filtered, Certified hygenic by NSF and HACCP (same quantity as lavatories)	●	●			●	
Full length mirror in each room (refer to note below)	●	●	●	●	●	
Stainless steel convenience shelf on wall near entrance doors in each room. Minimum dimensions: 6" deep by 36" long.	●	●		●	●	
Sanitary napkin disposal for each water closet		●				
Surface mounted double coat hook (2 required in rooms with showers)			●	●	●	
Utility shelf integrated with 5 hooks and 4 broom/mop holders						●
HDPE Shower bench. Minimum 15" deep by 36" long					●	

Note: At heads with counters with integral sinks, provide mirrors the full length of toilet lavatory counters in width and from backsplash to the light cove above in height.

C103003 MARKER BOARDS AND TACK BOARDS

Provide marker (dry erase) boards and tack boards as indicated in Chapter 5 "Room Requirements" portion of this RFP.

Marker boards and tack boards must be mounted with the lower edge at 42" above finished floor. Unless otherwise noted, boards must have anodized aluminum trim. Marker boards and

tack boards must have tool trays and one set of tools provided for each room. Coordinate with building construction to include appropriate blocking or structural support for the installation of marker boards and tack boards.

Glass marker boards must be frameless, opaque back-painted glass type and must attract standard magnets (rare-earth magnets not required) and be constructed of 1/4-inch-thick, shatter resistant, tempered glass, solid in color with non-staining finish, polished edges and eased corners and mounted with stainless steel standoffs. Provide magnetic accessory trays for glass markerboards.

Enclosed tack boards must be heavy gauge aluminum, with tackable interior surface, tempered glass sliding doors and lock. Provide selection from full range of manufacturer's finishes. Provide tack board dimensions as follows: Size: 3'-0" H by 4'-0" L.

Marker boards and tack boards are funded as part of the construction contract.

C103004 IDENTIFYING DEVICES

All necessary interior signage must be incorporated as part of the architectural drawings. Interior signage is not collateral equipment. Interior signage must demonstrate complete coordination with the facility design, SID and FF&E submittals. Provide interior directional signage for facility wayfinding. Provide an identifying device at each interior door. Signs must meet ABA requirements. Refer to UFC 3-120-01, Design: Sign Standards, for more information.

Exterior building signage is required and must be provided. This includes exterior door signs on any mechanical, electrical, and telecommunications room with exterior doors. All exterior signage and their components must be resistant to ultraviolet light and must withstand a marine corrosive environment. This includes any other building signage attached to the building envelope, such as building name or number.

Specific exterior signage requirements follow:

Provide exterior signs at all building primary and secondary entrances stating, "ELECTRONIC DEVICES INCLUDING CELLULAR PHONES PROHIBITED." Applicability must be verified by AE2 with MCB Camp Lejeune.

Provide exterior signs at all building primary and secondary entrances stating, "DO NOT ENTER IF IDS INDICATOR LIGHT IS ON. ALARM WILL SOUND." Applicability must be verified by AE2 with MCB Camp Lejeune.

C103005 LOCKERS

Lockers and cell phone lockers are funded as part of the construction contract.

Lockers – Provide 18-inch-wide by 18-inch-deep by 72-inch-high, single-tier, high-density polyethylene (HDPE) personnel lockers. Provide perforated top and doors for better air flow. Each door must be engraved with a minimum 5/8-inch-tall number in sequential order starting with "101." Provide 6-inch-height, continuous HDPE base, sloped tops, metal garment bar, metal double hook, and latching hardware to accommodate padlocks.

Cell Phone Lockers – Provide 8-inch-deep cell phone lockers in quantity shown in Part 3: Chapter 5 - Room Requirements.

C103006 SHELVING

There is no built-in fixed shelving in this project.

C103007 FIRE EXTINGUISHER CABINETS

Provide semi-recessed fire extinguisher cabinets for fire extinguishers in all finished spaces, including corridors and lobbies, as required by the RFP. Cabinets shall be coordinated with interior finishes. Where cabinets are installed in fire rated partitions, cabinets must be tested and listed in accordance with ANSI/UL-1479 for membrane and penetration firestops. Fire extinguishers required in spaces not typically occupied, such as mechanical, electrical, and telecommunication rooms, may be surface-mounted with a bracket listed for the size and weight of the required fire extinguisher. Installation of all fire extinguisher cabinets and mounting brackets must be in strict compliance with NFPA 1, NFPA 10, and the manufacturer's installation instructions. Refer to ESR Section D40.

C103008 COUNTERS

Provide solid surfacing material for countertops and back splashes in Heads, Break Rooms and Mother’s Room.

Countertops must be priced as a medium particulate to give users some budget with which to work.

C103009 CABINETS

Provide cabinetry, drawers, and millwork items with associated accessories. Cabinetry shall be AWI premium grade plywood construction with concealed hinges and adjustable standards for shelves. All exposed surfaces will be covered with high pressure plastic laminate and interior surfaces must be melamine.Provide cabinetry in administrative break rooms and other rooms as indicated in Part 3, Chapter 5, Room Requirements section of this DB RFP.

C103010 CASEWORK

NOT USED

C103011 CLOSETS

NOT USED

C103012 FIRESTOPPING SYSTEMS

Provide all sleeves, caulking, and flashing for firestopping penetrations.

All firestopping systems shall be performed by one experienced firestop contractor. Experienced firestop contractor is defined as following:

1. FM Research approved in accordance with FM 4991, or
2. Operating as a UL Certified Firestop Contractor, or
3. A contractor completed the manufacturer accredited firestop specialty contractor program. Certified, licensed or otherwise qualified by the firestopping manufacturer as having the necessary staff, training, and a minimum of 3 years of experience in the installation of manufacturer’s products in accordance with specified requirements. Submit documentation of this experience. A manufacturer’s willingness to sell its firestopping products to the contractor or to an installer engaged by the Contractor does not in itself confer installer qualifications on the buyer.

Individual building system subcontractor, such as Mechanical, Electrical, Plumbing, Gypsum wall, etc., is not permitted to install firestopping systems.

A single complete submittal including Shop Drawings, Product Data, UL details must be provided for all firestopping systems throughout entire project.

C103013 SPRAYED FIRE-RESISTIVE MATERIALS

The requirement for sprayed fire-resistive materials is determined by the building code analysis prepared by the design/build contractor's Qualified Fire Protection Engineer (QFPE). If required, provide sprayed fire-resistive materials to the building’s framework.

C103014 ENTRANCE FLOOR GRILLES AND MATS

Provide recessed walk-off floor mats or surface-mounted/loose-lay floor mats at building entrances in sizes as indicated in RFP Part 3, Chapter 5 Room Requirements and RFP Part 6 drawings. Recessed walk-off floor mats are part of the construction contract. Surface-mounted or loose-lay floor mats are part of the of the FF&E package. Provide sealed concrete underneath recessed walk-off floor mats.

Provide recessed walk-off floor mats with a carpet insert (100 percent solution dyed) designed for high-traffic areas. Recessed walk-off floor mats must have T5 aluminum alloy frame with anodized finish. Provide architectural surface pattern with combination of inserts, finish colors, aluminum slots, and aluminum framework. Inserts must include monofilament abrasive fibers, and finish colors must be offered in a broad range of standard neutral and bright colors. Floor mat surfaces must comply with ASHRAE 90.1 and ASHRAE 189.1 requirements.

C103015 ORNAMENTAL METAL WORK

NOT USED

C103090 OTHER INTERIOR SPECIALTIES

NOT USED

--End of Section--

C20 STAIRS – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Provide ladders as required by the building code for access to platforms and mezzanines, if necessary, and roof areas. The requirements of this section are included in the RFP in the case that stairs or ladders may be required for operations.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEMS REQUIREMENTS

Provide stairs and ladders conforming to UFC 1-200-01, *General Building Requirements*.

C2010 STAIR CONSTRUCTION

C201001 EXTERIOR STAIRS

NOT USED

C201002 FIRE ESCAPE STAIRS

NOT USED

C201090 HANDRAILS, GUARDRAILS, AND ACCESSORIES

Provide painted or galvanized steel handrails, guardrails and ladders, as required by code. Exterior systems must be coated or galvanized to withstand extreme wear and weathering conditions. Provide handrails, guardrails and ladders with smooth, unbroken surfaces throughout the length of the stair or ladder, as required by code.

Provide metal ladders and railings complying with OSHA requirements for access and protection to all mechanical mezzanines, lofts and similar spaces.

--End of Section--

C30 INTERIOR FINISHES – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Interior finishes include wall finishes, floor finishes, wall base finishes, and ceiling finishes.

Provide aesthetically pleasing, functional, durable finishes appropriate to the building function. Acoustic properties of materials, as well as durability and ease of maintenance, must be considered during material selection. Maximize the use of sustainable materials.

All interior finish products must be from manufacturer's standard running line offerings. Manufacturer's submitted materials must be made available for purchase at NO MINIMUMS for not less than 7 years from the date of the original product order. Custom fabrications must not be allowed unless otherwise noted.

Finish selections for this project will require the use of wall, floor, and ceiling material accents to enhance the interior design and architecture of the building. Provide an interior finish design scheme that includes a minimum of two different accent colors, to be used throughout the facility. Refer to Part 3, Chapter 6, ESR E20 for Structural Interior Design (SID) requirements and Part 3, Chapter 5, Room Requirements for required locations. Submit floor pattern and accent wall location drawings, indicating proposed interior finish locations with the Structural Interior Design submittal.

GENERAL SYSTEMS REQUIREMENTS

See Part 3 Chapter 5 Room Requirements for specific requirements on "Interior Finishes."

C30 SSPC QP 1 CERTIFICATION

The Project requires industrial coatings on exposed steel surfaces. All contractors and subcontractors that perform surface preparation or coating application must be certified by the Society for Protective Coatings (formerly Steel Structures Painting Council – SSPC) to the requirements of SSPC QP 1 prior to contract award and must remain certified while accomplishing any surface preparation or coating application.

C3010 WALL FINISHES

Provide architectural feature wall consisting of wood veneer panel and wood acoustical panel in key public locations to include Lobby and Auditorium/Ready Room. Acoustical fabric wall panels must be used in the Auditorium/Ready Room and Brief/Debrief rooms.

Add graphic elements to walls in areas that may be subjected to heavy abuse or to create design features using wall coverings, graphic art panels, or modular textured panels.

C301001 CONCRETE MASONRY WALL FINISHES

Interior wall finish materials must be filled and polished ground face concrete masonry units.

C301002 PLASTER WALL FINISHES

NOT USED

C301003 GYPSUM WALLBOARD FINISHES

All interior wall finish materials must be finished and painted gypsum wall board, as indicated in the Part 3 Chapter 5 Room Requirements.

In all locations where concrete or concrete masonry walls exist in conjunction with GWB over metal stud construction within a space, all walls must be finished with GWB. Moisture-resistant gypsum wall board must be used in all wet or humid areas including, but not limited to vestibules, toilet rooms and locker room areas. Gypsum walls, fascia, and soffits must receive latex primer and two coats of Architectural Latex in a satin or eggshell finish. Refer to Part 4, PTS, C304001 GENERAL REQUIREMENTS for the MPI standards for more information.

Regular and moisture-resistant gypsum wall board must be used in spaces indicated in the Part 3 Chapter 5 Room Requirements.

C301004 PORCELAIN TILE WALL FINISHES

Porcelain Tile

Provide through-body color, rectified porcelain unglazed wall tile, minimum size of 12-inch x 12-inch with manufacturer recommended minimum width grout joints. Tile must be minimum Grade B, per ANSI 137.1 (1988), with a wide range of accent colors available. Accent tile pattern must be provided in another size or color.

Provide coordinating designer decorative accent strips or coordinating accessory tile shapes, minimum Grade D, as an integral part of the wall tile system. Porcelain wall tile must be installed full-height to ceiling on all walls, and on cementitious backer board substrates. Provide grouted-in stainless-steel edge protection strips at all inside and outside corners. Stainless-steel cove transition must be used where wall tile and floor tile meet.

Backer Board: Cementitious, water-durable board surfaced with fiberglass reinforcing mesh

on front and back, long edges wrapped, and complying with ANSI A118.9 and ASTM C 1325.

Provide coordinating epoxy grout for all tile finishes. Avoid light colored grout.

Aesthetic Classifications: Provide tile with an aesthetic classification of V2 Similarly colored with variations in texture and/or pattern.

Install tile to full height of wall in a running bond pattern.

C301005 WALL COVERINGS

Corner Guards

Corner Guards must be outside corners in all high-traffic interior exposed corners in corridors, except on walls of CMU construction and must be 3-inch width. They must be surface-mounted in a through-color, recycled, extruded PETG finished aluminum material. Corner guards must extend from top of cove base and extend 8 feet high and be mechanically installed with a concealed continuous aluminum retainer. Double stick tape and adhesive mounted corner guard methods are not acceptable.

Wall Protection

Provide stainless-steel wall protectors at mop sinks in janitor rooms.

C301006 ACOUSTICAL PANELS ADHERED TO WALLS

Provide sound absorbing acoustical fabric wrapped wall panels reinforced edges in locations as identified in Part 3 Chapter 5 Room Requirements.

Provide wood veneer acoustical wall panels that are factory-assembled, and factory finished. Panels must be perforated and backed with an acoustic textile product for optimum acoustical quality with limited textile visibility when installed. Veneer selection must be selected from an A grade range of stain grade veneer with minimal graining. Species and finish must coordinate with other wood finishes on interior finish schedule. Include all required corner, transition and base components for a quality installation. Refer to Part 4 Section C103009 for veneer quality and graining of wood finish materials.

C301090 OTHER WALL FINISHES

Solid Surfacing Wall Finishes

Provide 100 percent Acrylic Polymer in a solid color or with small-size particulate solid surface material for shower surround and window stools.

Exterior windows will receive a window stool.

100 percent acrylic solid surface at Break Rooms: 1/2-inch solid surface wall panel will extend width of sink to top cabinetry from backsplash to underside of wall cabinets.

100 percent acrylic solid surface at Showers: 1/2-inch solid surface wall panels will extend vertically from top of shower pan. Solid surface material will overlap top of shower pan with an air gap, as required by manufacturer installation instructions. Wall panels in shower areas will extend horizontally beyond the “wet area” to the exterior line of the shower receptor threshold. A solid surface transition will be required where solid surface meets wall tile. Locate wall panel seams at corners only. No material seams will be acceptable, except at corners. All shower seams at corners will be lap joints with solid surface corner trim from floor to ceiling. Chemically fuse seams. Include a matching corner shower shelf in each shower compartment. Full-height solid surface transitions will be provided at adjacent wall surfaces. Substrate behind solid surface shower walls will be equal to cementitious ceramic tile backer board. Solid surface shower receptors will be installed prior to wall system. Shower pan receptors will be a minimum thickness of 1/2-inch thick, with a 3/4-inch thick area at least 12 inches in diameter at the drain. Receptors will be one-piece, factory formed shower pans with integral thresholds. Thresholds will have structural supports every 4 inches on center.

Modular Architectural Panels / Decorative Paneling System

Provide modular architectural paneling wall system consisting of wood veneer acoustical panel in key public locations to include Lobby and Ready Room/Auditorium.

System must utilize ¾ inch thick panels in a rail and spline fastening system with 1/4-inch-wide or 1/2-inch-wide channel reveals, rails, splines and edge trim.

All exposed hardware must be black satin factory finished, anodized aluminum. Panel sizes must be a minimum of 4 x 8 feet.

Water-based Epoxy Coating

Water-based epoxy coating must be used in the Janitor’s Closet as noted in Part 3 Chapter 5 Room Requirements. Coating system must be a 10 to 12 mil thick wall system over adequate wall patching compound/wall prep. Wall coating system must consist of one coat of water-based

epoxy primer, a waterproofing membrane, two coats of water-based epoxy body/bonding coat, and gloss finish/seal coat from a single coating system manufacturer for a uniform, monolithic, slightly textured surface with rounded 1-inch radius inside corners, wall-to-ceiling and floor-to-wall transitions. All plumbing, floor-to-ceiling and wall-to-floor transition details must be a recommended by wall and floor coating manufacturer.

Plywood

Telecomm closets must receive floor-to-ceiling, 3/4-inch plywood, Class A fire-rated, sanded, face-grade plywood on side and back walls.

C3020 FLOOR FINISHES

Provide floor finish materials to meet the following requirements.

C302001 TILE FLOOR FINISHES

Porcelain Tile Floor Finishes

Provide large-format, through-body, rectified porcelain tile in a minimum size of 12-inch x 12-inches with matching 6-inch-high cove tile base with flat top and bottom edge, or with stainless steel coved transition between floor and wall tile in all restrooms. The cove base must have a flat top/bottom edge. Grout joints in a maximum width of 3/16 inch must be provided. Tile must be non-slip, with a light texture. Texture of tile must be analyzed regarding maintenance and selected based on a minimal maintenance program. Provide grouted-in stainless steel metal transition strips at expansion joints, corners (inside and outside), and transition between floor and wall tile.

Provide coordinating epoxy grout for all tile finishes. Avoid light colored grout.

C302002 TERRAZZO FLOOR FINISHES – BID OPTION

Resinous (Epoxy) Flooring Requirements: Provide resinous (epoxy) flooring as identified in RFP Part 3, Chapter 5 Room Requirements, and as directed below. See Part 4 PTS for additional requirements.

Moisture Testing: Perform tests recommended by manufacturer and as follows:

a. Perform relative-humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.
b. If the relative humidity exceeds 75 percent, then manufacturer approved primer moisture mitigation system must be installed prior to resinous flooring installation. Slab-on-grade substrates without a vapor barrier require a moisture mitigation system.
c. Poured-Epoxy Terrazzo Floor System – A 3/8-inch thick (minimum) epoxy terrazzo floor system in accordance with the “NTMA Epoxy Thin Set Terrazzo Specification” and manufacturer specifications, whichever is more stringent. Terrazzo floor system must include (but not be limited to) moisture vapor primer system, crack isolation membrane, zinc divider strips, aggregates, and epoxy terrazzo topping. Aggregate mixture to include marble and/or granite chips, 15 percent minimum colored glass chips and 20 percent minimum recycled mirror chips. Incorporate a base color, three accent colors, and divider strips in a pattern to create a design of interest. Provide an 800-grit level polished finish. Wall base must be separate, 6-inch-height, top set, precast epoxy terrazzo, flat tile base matching the floor field color. See Part 4, Section A103001 Standard Slab on Grade for additional requirements.

C302003 WOOD FLOORING

NOT USED

C302004 RESILIENT FLOOR FINISHES

Luxury Vinyl Tile Flooring

Provide resilient luxury vinyl tile, in lobby, corridors break rooms, Mother's Room and other high traffic areas for floors with high durability, low maintenance, high slip-resistance requirements. Luxury vinyl tile will be planks or square tiles as indicated in Part 3 Chapter 5 Room Requirements. Luxury vinyl tile must fall under Product Classification Class III, Type B per ASTM F1700 and use Class III printed film that conforms to ASTM F1700. Luxury Vinyl Tile must not contain ortho-phthalates. Luxury Vinyl Tile must have a minimum Coefficient of Friction of >0.5. All products must be from manufacturer's standard running line offering. Custom products or products with a minimum order quantity are prohibited.

20 mil and 30 mil wear layer products will be accepted if they have the following characteristics: factory applied UV-cured polyurethane finish containing anti-scratch particles and anti-scuff qualities, a test result of B1 or B2 on the Martindale Procedure B Test - BS EN 16094:2012 Procedures B (which assesses the scratch performance of the topical factory applied finish treatment that enhances clean ability and durability), passes ASTM F970 for Static Loads resulting in Pounds per Square Inch (PSI) minimum of 1000 PSI (to avoid materials that have the potential to severely indent and/or break with heavy static loads), and must carry a 20 year manufacturer's written warranty.

40 mil wear layer product with a 20-year manufacturer's written warranty is required.

C302005 CARPETING

a. Carpet Requirements

CARPET CHARACTERISTIC	MINIMUM CARPET REQUIREMENTS
Surface Color	Multi-colored and Patterned with no less than three separate dark colored yarns in the weave, (not variation of color within the fiber) in addition to accent colors, to create a multi-hued background with excellent soil and stain masking properties.
	Heathered carpet is not allowed.
Surface Texture	Loop or Textured Loop
Modular	24' x 24 or Plank (except on Raised Access Floor)
Yarn Weight	22 oz. minimum for Type 6 Nylon; 18 oz. minimum for Type 6.6 Nylon
Gauge	1/12
Density	7000 oz./cubic yard minimum for Type 6 Nylon 6000 oz./ cubic yard minimum for Type 6.6 Nylon
Dye Method	Minimum 100% Solution Dyed
Backing	Attached cushion
Fiber	Type 6.6 or Type 6 Commercially Branded nylon

Stain Resistance	Inherent or permanent stain resistance
Texture Appearance Retention Rating (TARR)	Severe > 3.5
Service Life	10 Year Warranty
Environmental	15% Post-Consumer Recycled Content
	NSF 140 Gold Label Service Life

C302006 MASONRY & STONE FLOORING

NOT USED

C302007 WALL BASE FINISHES

Resilient Wall Base

Provide rubber cove wall base, throughout areas with 6-inch resilient flooring and straight rubber for carpeted areas as indicated in Part 3 Chapter 5 Room Requirements.

Tile Base

In areas where wall tile is required, or otherwise specified, tiled floor must have matching 6-inch high cove base or stainless-steel cove transition strips between floor tile and wall tile. In areas where no wall tile is specified, tiled floor must have matching 6-inch high cove base. When tile cove base is used, base must have flat top and bottom edges to join evenly with adjacent tiles. Resilient base must be 120’ coils. Rounded edges are not allowed. Tile cove wall base units must be pre-formed; cut tiles are not allowed.

Provide coordinating epoxy grout for all tile finishes. Avoid light colored grout.

Terrazzo Floor Base – BID OPTION

Terrazzo floor base must be 6-inch high, pre-cast with cove. Base must be finished with a smooth vertical surface and smooth top edge to match adjacent floor finish.

C302008 STAIR FINISHES

NOT USED

C302009 FLOOR TOPPINGS AND TRAFFIC MEMBRANES

NOT USED

C302010 HARDENERS AND SEALERS

Concrete Floor Requirements

Finish concrete surfaces smooth enough to meet the minimum requirements of this RFP or the floor finish manufacturer's smoothness requirements, whichever is the most restrictive. Provide hardener in concrete mixture in accordance with the manufacture requirements. Exposed concrete floors that are not required to have an applied floor finish, must receive a minimum of three coats of the manufacturer's approved sealer.

Provide concrete flooring as identified in RFP Part 3, Chapter 5 Room Requirements, and as directed in the following.

Sealed Concrete: Finish concrete surface smooth enough to meet the minimum requirements of this RFP or the floor finish manufacturer’s smoothness requirements, whichever is the most

restrictive. Apply both penetrating and topical sealers on exposed concrete floors that are not required to have an applied floor finish.

a. Water-based, clear, penetrating sealing compound blend of silane and siloxane for salt protection that penetrates into the pores of the concrete. Sealer must limit intrusion of moisture and chlorides into the concrete.
b. Water-based, topical, non-yellowing, clear, acrylic curing and sealing compound meeting the following requirements.
    I. ASTM C 309, Type 1, Class B
    II. ASSHTO M 148, Type 1, Class B
    III. ASTM C 1315, Class A, Section 6.4.1 – non-yellowing
    IV. ASTM C 1315, Section 6.6 – exceed 50 MPa (70 psi) adhesion.

All polished concrete floor surfaces must be moist-cured, integrally colored and polished to a low gloss level, as required in the Part 4 section of this RFP. A Dynamic Coefficient of Friction of 0.42 minimum must be achieved, tested and documented for all polished interior floor surfaces, as determined by ANSI A137.1-2012. An 8’ x 8’ mock-up of the polished concrete floor must be produced using the same process that will be used to produce the final polished concrete floor surfaces.

C302011 RAISED ACCESS FLOORING

Raised flooring must be interchangeable, 24-inch x 24-inch square module panels, capable of supporting design loads with a height of 24 inch minimum from the top of the access floor panels to the concrete slab. Finish must be vinyl tile - on module. Raised flooring locations must be as indicated in Part 3 Chapter 5 Room Requirements. Raised flooring must accommodate data and electrical systems. Majority of Raised Flooring components must be available on GSA Schedule.

C302090 OTHER FLOORING & FLOOR FINISHES

NOT USED

C3030 CEILING FINISHES

Finished surface of ceiling tiles must be selected to address acoustical, maintenance, moisture or impact resistance requirements of the room. Provide a feature/accent ceiling for Ready Room/Auditorium. Provide interest to ceiling with soffits, acoustical panels, clouds, curved feature ceilings or wood feature ceilings.

C303001 ACOUSTICAL CEILING TILES & PANELS

Acoustic Ceiling Panels

Suspended Acoustical Panel System: Primary ceiling finish will be 24-inch x 24-inch by 5/8-inch minimum thickness suspended acoustical panel ceiling system, except provide a suspended gypsum board ceiling in entrance lobby. Acoustical panels will have a square edge, closed pore panel surface unless as noted. Select finished surface of ceiling tiles to address acoustical, maintenance, moisture or impact resistance requirements of the room. Provide sustainable panels.

Provide interest to ceilings in gathering spaces or where the opportunity exists where applicable.

C303002 GYPSUM WALLBOARD CEILING FINISHES

Gypsum Wallboard Ceiling Finishes

Provide Regular Gypsum Board and Moisture-Resistant Gypsum Board as indicated in the Part 3 Chapter 5 Room Requirements. Moisture-Resistant gypsum wall board must be used in all wet or humid areas include, but not limited to vestibules, toilet rooms and locker rooms areas.

C303003 PLASTER CEILING FINISHES

NOT USED

C303004 WOOD CEILINGS

NOT USED

C303005 SUSPENSIONS SYSTEMS

Provide 24-inch by 24-inch aluminum or steel non-corroding intermediate-duty standard grid system for lay-in acoustical panels (ASTM C635). Finish must be factory applied white baked enamel. Provide manufacturer’s hold down clips for fire rated assemblies and wall or edge molding. Hang grid system as recommended by manufacturer but with no less than 0.106-inch diameter wires (ASTM A641A, A641M, Class 1), or with one by 3/16-inch galvanized steel straps conforming to ASTM A653A, A653M (for light commercial zinc coating) or ASTM A366A, A366M (with an electrodeposited zinc coating, Type RS). Use ASTM A580/580M, composition 302 or 304, condition annealed stainless steel, 0.106 inches in diameter over high humidity areas such as commercial kitchens and pools. Install suspended grid system with acoustical sealant (ASTM C843, non-staining and ASTM C636). Recycled content must be a minimum of 25%.

C303006 METAL STRIP CEILINGS

NOT USED

C303009 OTHER CEILING & CEILING FINISHES

Ceiling finishes must be as indicated in Part 3 Chapter 5 Room Requirements portion of this RFP.

C3040 INTERIOR COATINGS AND SPECIAL FINISHES

C304001 GENERAL REQUIREMENTS

Spray paint all interior exposed surfaces including metal items, such as interior grilles, registers, diffusers, access panels, and panel boxes with a minimum of two coats in color to match adjacent surfaces, unless otherwise indicated. All primer and paint systems must be the manufacturer’s highest premium quality, professional grade. All materials must be moisture and mildew resistant and easily cleaned.

C304002 CONCRETE FINISHES

NOT USED

C304003 CONCRETE MASONRY FINISHES

Provide Concrete Masonry Units from polished ground face concrete masonry as indicated in the Part 3 Chapter 5 Room Requirements.

A. Fire Performance Characteristics: Where indicated, provide materials and construction which are identical to those of assemblies, equivalent thickness, whose fire endurance has been determined by testing in compliance with ASTM E 119 by means acceptable to authorities having jurisdiction.

B. Single Source Responsibility for Masonry Units: Obtain exposed masonry units of uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from one manufacturer for each different product required for each continuous surface or visually related surfaces.

C. Single Source Responsibility for Mortar Materials: Obtain mortar ingredients of uniform quality including color for exposed masonry, from one manufacturer for each cementitious component and from one source and producer for each aggregate.

D. Field constructed Mock-Ups: Prior to installation of masonry work, erect representative sample wall panels to further verify selections made for color and texture characteristics, under sample submittals of masonry units and mortar and to establish a standard for complete masonry work for qualities of appearance, materials construction and workmanship.

E. Sustainability Characteristics: Normal weight units with at least 40% recycled SCM’s (supplementary cementious materials), medium weights units with at least 40% recycled SCM’s and up to 20% recycled post-industrial aggregate replacement, light weight units with at least 40% recycled SCM’s and up to 50% recycled post-industrial aggregate replacement.

C304004 METAL FINISHES

NOT USED

C304005 INTERIOR WOOD FINISHES

NOT USED

C304006 GYPSUM WALLBOARD FINISHES

Gypsum walls, gypsum wall board ceilings, fascia and soffits must receive latex primer and two coats of Architectural Latex in a satin or eggshell finish. Include a minimum of two paint selections for accent walls as indicated in Part 3 Chapter 5 Room Requirements.

C304007 SPECIAL COATINGS ON WALLS

NOT USED

--End of Section--

D10 CONVEYING SYSTEMS – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

NOT USED

--End of Section--

D20 PLUMBING – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

The plumbing system consists of all fixtures, potable cold and hot water piping and equipment, piping insulation, water heating equipment, sanitary waste and vent piping systems, and other specialty piping and equipment within 5 feet of the building.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Provide working space around all equipment. Provide concrete pads under all equipment. Provide all required fittings, connections and accessories required for a complete and usable system. Install all equipment per the criteria of PTS section D20 and the manufacturer's recommendations. Design and install plumbing systems in accordance with IPC and UFC 3-420-01, *Plumbing Systems*. Where the word "should" is used in the manufacturer's recommendations, substitute the word "must".

Include the hot and cold water systems to list of systems to be commissioned in accordance with UFGS 01 33 29.05 20 Sustainability Requirements for Design Build

Refer to RFP Part 3 – Project Program, Chapter 2 for commissioning requirements.

D2010 PLUMBING FIXTURES

Provide quantity and type of plumbing fixtures required for the use and functions described for this facility. Obtain occupancy from the owner. Refer to Part 3 Chapter 5 Room Requirements Section for additional specific requirements for spaces with plumbing fixtures. Provide handicapped fixtures in accordance with the referenced criteria in the Project Program.

D201001 WATER CLOSETS

Provide floor mounted flush valve water closets with hard-wired automatic flush control with push button backup. Maximum flushing volume is 1.28 gallons.

D201002 URINALS

Provide flush valve urinals with hard-wired automatic flush control with push button backup. Maximum flushing volume is 0.125 gallons.

D201003 LAVATORIES

Provide solid surface lavatories with integral sinks with hard-wired sensing faucet with automatic control and battery backup.

D201004 SINKS

Provide brushed stainless steel undermount sink in the pantry/break areas. Provide swivel faucet.

Provide service sink in the mudroom.

Provide mop sink in janitor's closets.

D201005 SHOWERS

All showers are to be the low flow type, 2.0 gpm. The shower heads to be located at a stationary position pointed away from the shower entrance opening and to keep from spraying toward the shower entrance opening and causing water damage. The shower faucet and spray head are to be a surface mount unit complete with prefabricated stainless steel mount and enclosure panel, temperature compensating shower valve with metal stem handle and integral service stops, and a shower head with flow control on institutional bracket.

D201006 DRINKING FOUNTAINS AND COOLERS

Provide hi low drinking fountains. Each drinking fountain must have a bottle filler.

Provide wall recess or side walls to protect drinking fountains.

D201090 EMERGENCY FIXTURES

Provide emergency shower and eyewash in the with privacy curtain and rail.

Provide tepid water (60F to 100F) with water tempering valve assembly.

Provide alarms and appurtenances for service within NEMA type 4 enclosures.

D2020 DOMESTIC WATER DISTRIBUTION

Perform a flow test to determine the potable water pressure at the building and calculate piping system requirements.

D202001 PIPES AND FITTINGS

Provide Copper piping Type L for above ground and Type K for buried. Press fittings are not allowed.

D202002 VALVES & HYDRANTS

Provide isolation valves at supply to each floor. Provide hose bibbs in mechanical rooms and within 25 feet of all exterior equipment with coils. Provide wall hydrants along the building exterior such that all points along the perimeter can be reached with a 100 foot long hose.

D202003 DOMESTIC WATER EQUIPMENT

Provide backflow preventers of types and at points within domestic water systems as specified by IPC. Locate inside the mechanical room on service entrance lines where not provided exterior to the building.

Perform calculations to determine the water heater capacity to supply hot water to the fixtures.

Provide electric or natural gas water heater for heating of domestic water.

Provide water tempering valve assembly.

Provide domestic hot water recirculation system with high efficiency recirculation pump and recirculation loop with all associated fixtures, equipment, and appurtenances. Provide inline circulator for domestic hot water distribution system. Provide balance valves throughout system to allow for system balance to achieve required maximum wait times per International Energy

Conservation Code. Provide domestic water balance per UFGS 23 05 93.00 22 *Testing, Adjusting, and Balancing for Mechanical Systems*.

If water flow test shows inadequate water pressure, provide domestic water booster system for domestic water distribution system.

Provide water meter on the building main. Water meters must be appropriately sized for the building load. The water meter register must display gallons and must be clearly visible for inspection. The register must be compatible with the Itron 100W encoded radio transmitter (ERT). Refer to Itron's documentation for a compatibility list.

Contact: United Systems & Software, Incorporated

Jody Cline

800.455.3293

jodyc@united-systems.com

The ERT must be an Itron 100W+ with encoded output. The ERT must be installed per Itron installation guidelines. The contractor must supply all necessary mounting material, cabling, etc.

For meters installed inside of facilities (e.g. Mechanical room), the ERT must be mounted on the outside wall of the room.

Meters installed in pits must utilize the appropriate "through the LID" antenna.

The ERT must be proven to be capable of communicating with Itron's Advanced Meter Reading (AMR) and/or Advanced Metering Infrastructure (AMI) technology. Camp Lejeune's current AMR technology includes Mobile Collector Lite (MC Lite). AMR technology consists of Choice Connect version 5, with Cell Collector Units (CCUs). Prior to acceptance, all installations must prove successful communication between the meter endpoint (ERT) and Camp Lejeune's endpoint AMR and/or AMI communication equipment (i.e. MCLite/FC300 handheld and/or CCU).

The contract must submit the following information for each location (meter) included in the project.

Meter: Make, Serial Number, Size, Compound (Y/N)

Register (aka Encoder): Make, Model, Dials, Multiplier, Unit of Measure (i.e. gallons)

ERT: Make, Model, ID, Latitude, Longitude.

D202004 INSULATION & IDENTIFICATION

Provide cellular glass insulation with vapor barrier on domestic hot water supply piping and on domestic cold water supply piping. Provide identification for piping and equipment.

D202005 SPECIALTIES

NOT USED

D202090 OTHER DOMESTIC WATER SUPPLY

Provide piping supports in accordance with the IPC. Provide inspections, disinfection, and testing in accordance with the IPC.

Provide recessed water-outlet boxes for ice and coffee makers.

D2030 SANITARY WASTE

D203001 WASTE PIPE & FITTINGS

Above ground provide cast iron hubless pipe with rubber gasket and stainless-steel banding. Below ground provide hub and spigot. Line trenches with gravel for continuous slope and support prior to the 10' column testing. Provide easy access for inspection of each joint on all sides during the test. Encase all direct buried sanitary lines in a minimum of 12" gravel on all sides after successful completion of the column test and prior to backfill and tampering. Provide slab anchored hangers for buildings with pile foundation systems.

D203002 VENT PIPE & FITTINGS

Provide cast iron hubless pipe and fittings, rubber compression gasket joints and stainless steel banding.

D203003 FLOOR DRAINS

Provide floor drains in mechanical rooms, restrooms, break rooms, in proximity to emergency eyewashes and showers and overhead doors and plumbing chase areas.

Provide floor sinks to receive condensate from air handling units.

D203004 SANITARY & VENT EQUIPMENT

NOT USED

D2040 RAIN WATER DRAINAGE

D204001 PIPE & FITTING

Above ground provide cast iron hubless pipe with rubber gasket and stainless-steel banding. Below ground provide hub and spigot. Line trenches with gravel for continuous slope and support prior to the 10' column testing. Provide easy access for inspection of each joint on all sides during the test. Encase all direct buried sanitary lines in a minimum of 12" gravel on all sides after successful completion of the column test and prior to backfill and tampering. Provide slab anchored hangers for buildings with pile foundation systems.

D204002 ROOF DRAINS

Provide roof drains that are compatible with the roofing system.

D204004 INSULATION & IDENTIFICATION

Domestic, Storm and Condensate piping.

D204090 OTHER RAIN WATER DRAINAGE SYSTEM

NOT USED

D2090 OTHER PLUMBING SYSTEMS

D209001 SPECIAL PIPING SYSTEMS

Obtain natural gas pressures from the local gas utility provider. Contractor must invite the utility provider to the design reviews. Contractor is responsible for any applications and permits, and

must provide the complete natural gas system from the load side of the utility meter to the heating equipment. Provide steel natural gas piping system. Include gas distribution piping from the gas meter to points of usage. Follow Camp Lejeune design standards for piping pressures inside the building.

The Contractor must provide the projected loads to the gas utility provider 6 months prior to in-service date. The Contractor must have the local gas utility provider install piping and appurtenances up to the load side of the meter. Tie the gas meter into the Building Automation System (BAS) and the existing Advanced Metering Infrastructure (AMI) metering system.

Natural Gas Utility Provider Information:

Piedmont Natural Gas

Invite the following to Design Reviews:

D209090 OTHER SPECIAL PLUMBING SYSTEMS

NOT USED

--End of Section--

D30 HVAC – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Provide the following type of high performance system:

Provide a variable air volume (VAV) system with shut-off terminal units and hot water heating coils. The VAV AHU will feature a chilled water-cooling coil and a hot water preheating coil. Ventilation air will be provided via the VAV AHU(s). Provide a total enthalpy fixed plate heat exchanger energy recovery section in the VAV AHU. Chilled water will be generated by an air-cooled chiller, and hot water will be generated by condensing gas boiler[s]. Size the AHU coils, chillers, and boilers for full capacity, in the event of an energy recovery system failure.

The primary air from the VAV AHU will be ducted to the terminal units by medium-pressure galvanized metal ductwork. Supply air from the terminal unit to the zone and return air from the zone to the AHU will be ducted by low-pressure galvanized metal ductwork.

Roof-mounted equipment is not permitted.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Provide working space around all equipment. Provide all required fittings, connections, and accessories required for a complete and usable system. Install all equipment in accordance with the criteria in Performance Technical Specification Section D30 and the manufacturer's recommendations. Where the word "should" or “must” is used in manufacturer’s instructions, substitute the word "must."

Economizer cycles must not be used.

The new facilities must not use rooftop heating, ventilation, and air conditioning (HVAC) equipment. All major HVAC equipment must be located in mechanical rooms. Consider attic and above-ceiling placement of AHU equipment only when absolutely necessary. Stairs are required for any above-ceiling or attic located air-handling equipment (excluding VAV terminals). Attic space may be used for mechanical equipment if there is a 6-foot-wide stairway with double doors for maintenance purposes. Equipment with cooling coils placed above ceilings must have secondary drain pans with approved gravity drainage piping.

Provide corrosion protection for ALL exterior HVAC equipment, including air-handling units (AHUs), heat exchanger coil surfaces, equipment casings, air-cooled water chiller coils, heat pumps, and air conditioning units that are exposed to the weather. Corrosion protection is also required on HVAC equipment within buildings that are subject to the outside weather conditions. Specifically, equipment requiring protection is defined as the first HVAC equipment (unit coils) met by the outside air in the supply air ductwork system. The corrosion protection must meet or exceed the requirements of a 3000-hour salt spray test in accordance with ASTM International (ASTM) B117. The specified capacities on the plans and specifications must be the capacities after the required corrosion protection coatings are applied. Specify manufacturer's standard off

the-shelf anti-corrosion options for "coastal" or "sea coast" installations that meet or exceed the requirements stated above.

Provide radiant barriers in the exterior wall system. Optimize the building envelope and window requirements to exceed ASHRAE 90.1-2013.

Provide premium-efficiency motors, chillers, and boilers, and optimize the HVAC system.

Provide Seal Class A on all ducts to reduce duct losses. Increase thermal insulation on mechanical systems and use radiant barriers to reduce thermal losses.

Provide chemical shot feeders, air separators, and bladder type expansion tanks for hydronic systems. Provide inline centrifugal pumps with inlet suction diffusers, isolation valves, discharge check valves, balancing valves, drain valves, differential pressure gauges, and flexible pipe connectors and coupling guards.

Single-phase fractional horsepower alternating current motors must be high-efficiency types corresponding to the applications listed in National Electrical Manufacturers Association (NEMA) Motors and Generators (MG) 11. Select polyphase motors based on high-efficiency characteristics relative to the applications listed in NEMA MG 10. Additionally, all polyphase squirrel-cage medium-induction motors with continuous ratings must meet or exceed energy-efficient ratings per Table 2-10 of NEMA MG 1. Provide controllers for three-phase motors rated 1 horsepower (hp) and above with phase voltage monitors designed to protect motors from phase loss and over-/under-voltage. All motors 1 hp and larger must be premium efficiency. Provide the means to prevent automatic restart by a time-adjustable restart relay. For packaged equipment, the manufacturer must provide controllers including the required monitors and timed restart. Provide reduced-voltage starters for all motors 25 hp and larger.

Provide minimum 4-inch (100 mm) thick concrete housekeeping pads and vibration isolators under all floor-mounted equipment.

Provide factory painted finishes that are designed for 3000-hour duration test for outside equipment and for equipment bringing in outside air.

Provide a manufacturer approved coating system for coastal environments on mechanical equipment, cooling, heating, and condenser coils on units with more than 5 tons of cooling capacity. The submittals must indicate heat transfer rating of coated coils.

The facility must have a complete air and water balanced HVAC system. Calculations must be provided and show the air and water systems are balanced. Drawings must also show balanced air and water systems.

Provide air conditioning and heating for spaces as indicated and for the following Design conditions:

Outside Conditions

Summer	91	Degrees F dry bulb	Winter	26	Degrees F
	79	Degrees F wet bulb	Dehumidification	140	Grains/lb

Outside Design Conditions for Air Cooled Equipment

Summer	95	Degrees F dry bulb			

Inside Conditions – Heated and Cooled Area (unless otherwise noted in Room Requirements - Chapter 5)

Summer	78	Degrees F dry bulb	Winter	68	Degrees F
	50	%RH			

Heating and Ventilating Conditions – Electrical Rooms, Mech Rooms with Heat producing equipment (Boilers, Water Heaters, etc)

Summer	10	Degrees F dry bulb above ambient	Winter	55	Degrees F

Inside Conditions – Cold Mechanical Rooms (AHUs and pumps)

Summer	N/A	Degrees F dry bulb	Winter	55	Degrees F
	55	Degrees F Dew Point			

Inside Conditions – Communication and IT Rooms

Summer	78	Degrees F dry bulb	Winter	NA	Degrees F
	55	Degrees F Dew Point			

Provide Ventilation rates and systems per ASHRAE Standard 62.1-2010, *Ventilation for Acceptable Indoor Air Quality*. Provide CO2 sensors to limit CO2 concentration to 800ppm in spaces with 25 or more occupants per 1,000 square feet.

Provide carbon monoxide (CO) sensors with audible and visual alarms if CO concentration is greater than 25 ppm in areas where internal combustion engines will be operating.

Noise levels must comply with the requirements in the latest edition of the ASHRAE Applications Handbook. The design must provide noise level control by requiring maximum noise levels as well as noise separation areas for the Mechanical Rooms. The drawings must specify the maximum equipment noise level. Classrooms must not be adjacent to mechanical rooms

Mechanical room(s) and electrical room(s) with heat producing equipment must each be a separate zone, heated and ventilated only. Mechanical rooms with combustion units (boilers, water heaters, and similar) must be provided supply fans instead of exhaust fans as required in UFC 3-410-01

Cold mechanical rooms(s) (AHU's, chilled water pumps) must each be a separate zone, heated and dehumidified.

Provide a separate zone for IT closets, telecom rooms and server rooms. These zones shall be served by dedicated DX split system equipment.

The HVAC system must provide each zone with the choice of heating or cooling year-round unless otherwise indicated. Provide each zone with its own thermostatic range of control.

Zone the HVAC system as follows:

Administrative spaces such administrative areas, offices, shops, maintenance control, quality assurance, ready rooms, conference rooms, flight equipment, training rooms, tool rooms, restrooms, lockers, elevator lobbies, break rooms, corridors, and project rooms must be zoned separately, such that each administrative space greater than 175 square feet (SF) is its own zone, and any spaces less than 175 SF must be grouped into a single zone.

- Provide a dedicated AHU and ductwork to serve the secure portion of the facility.
- Provide a dedicated AHU and ductwork to serve the unsecure portion of the facility.
- Corridors must not be on separate zones. Locate thermostats for corridors in separate occupied spaces.
- Provide a separate zone for the boiler room, heated and ventilated only. Mechanical rooms with combustion units (boilers, water heaters, and similar) must be provided supply fans instead of exhaust fans as required in UFC 3-410-01.
- Provide a separate zone for IT closets, telecom rooms, and server rooms.
- Provide a separate zone for electrical rooms.
- Provide a separate zone for the chilled water pump and AHU rooms, heated and dehumidified only, no ventilation.
- Provide a separate zone for the Warehouse/Storage areas.
- Provide separate zones as indicated on the room information sheets.

For unoccupied mode, provide the following night setback temperatures:

- For winter, 10 degrees F lower than indoor heating design conditions, but no lower than 55 degrees F.
- For summer, 5 degrees F higher than indoor cooling design conditions, but no higher than 85 degrees F.
- Year round, 60 percent RH maximum.

Provide thermostats and temperature sensors with occupant adjustment control of +/- 3 degrees F.

D3010 ENERGY SUPPLY

D301001 OIL SUPPLY SYSTEM

NOT USED

D301002 GAS SUPPLY SYSTEM

Provide a natural gas supply system for the heating of the facility. Natural gas must be the energy source (at a supply pressure of 5 inches water column [w.c.] minimum to 7 inches w.c. maximum) for all building heating systems. Provide a complete natural gas supply system as detailed in the specification in accordance with National Fire Protection Association (NFPA) 54, the North Carolina Building Code, the North Carolina Mechanical Code, and natural gas supplier requirements. Size natural gas piping to carry 15% more flow than is required by heating loads. Obtain natural gas pressures from the local gas company, Piedmont Natural Gas (PNG). The Contractor is responsible for coordinating with PNG and the Contracting Officer regarding the natural gas requirements for each facility. Provide a complete natural gas system, including any applications and permits. PNG will provide the natural gas to within 5 feet of each facility.

D301003 STEAM SUPPLY SYSTEM (FROM CENTRAL PLANT)

NOT USED

D301004 HOT WATER SUPPLY SYSTEM

NOT USED

D301005 SOLAR ENERGY SUPPLY SYSTEMS

NOT USED

D3020 HEAT GENERATING SYSTEMS

Provide a heating system for this facility consisting of at least two boilers. Each boiler must be no greater than 399,000 Btu/hr. For loads less than 399,000 Btu/hr provide two boilers with 100% redundancy. For loads greater than 399,000 Btu/hr and two boilers are needed based on size limitations, each boiler must supply no less than 65% of the heating load. Where more than two boilers are required to meet size limitations, size each boiler for 1/N of the total load, where “N” is the total number of boilers. On multiple boiler installations with the largest boiler off line, the remaining boiler(s) must be capable of carrying not less than 65% of the maximum winter design load. The boiler fuel train must be compatible to match the available source at the project site. Use the building block load to size the heating plant.

Refer to Part 3, Chapter 2, Paragraph 2.3.9 Air Quality Management, for air emission permit information. Air Emission permit is required for each combustion device provided.

All combustion sources are subject to the NC Air Toxics Permitting requirements.

D302001 BOILERS

Provide packaged gas-fired condensing type boilers. Provide minimum 90% efficiency boilers with stainless steel heat exchangers. All heating equipment boilers must have the ENERGYSTAR label. Provide a stainless steel, multi-wall insulated boiler stack. The stack must be pre-engineered and pre-manufactured, Underwriters Laboratory (UL) listed, and must meet

NFPA 211. Fuel for boilers must be natural gas. Provide boiler(s) with a condensate neutralization tank/kit.

All vents on gas control valves must be routed outdoors as required by NFPA 54. All gas lines serving gas-fired equipment must be fitted with UL or Factory Mutual approved gas trains suitable for the gas being provided.

D302002 FURNACES

NOT USED

D302003 FUEL-FIRED UNIT HEATERS

NOT USED

D302004 AUXILIARY EQUIPMENT

NOT USED

D302005 EQUIPMENT THERMAL INSULATION

Provide all hot water equipment with cellular glass insulation with vapor barrier jacket or molded fiberglass with vapor barrier jacket.

D3030 COOLING GENERATING SYSTEMS

D303001 CHILLED WATER SYSTEMS

HVAC refrigeration and air conditioning compressors must have full 5-year warranties including all parts and labor from the time of Beneficial Occupancy

Provide 2 chillers sized at 50% each to meet the block cooling load. Provide backup power.

Provide rotary screw or scroll air-cooled chillers. Provide high-efficiency air-cooled chillers. Provide constant primary/variable secondary pumping systems. Keep flow through the chiller constant; do not use variable primary flow. A buffer tank must be provided on all systems to provide thermal inertia.

The chillers must be located in an exterior equipment yard area and properly spaced from each other and other equipment away from building perimeter. The air-cooled chiller(s) must be located outside on a 150 mm (6-inch) thick reinforced concrete housekeeping pad. Provide heat tape to ensure freeze protection as low as 10°F on chilled water piping and any other associated appurtenances. Refer to the MCB Camp Lejeune mechanical policy for the requirements for phase and voltage protection requirements for chillers. Provide emergency chiller connections consisting of isolation valves and blind flanges.

Low ambient capability must be provided to allow chillers to operate in temperatures as low as 15°F (-9.4°C).

All coils must have the approved coatings that pass a salt-spray test conducted per ASTM B117 for duration of at least 3,000 hours and provide a minimum of loss of heat transfer due to the thickness of the coating.

Provide the approved quantity, size, spacing, material, and height of bollards around all yard equipment.

Provide blind flanges with butterfly isolation valves at the chiller location for emergency portable chiller connection. Coordinate site plan design to accommodate access needed for an 18-wheeler flatbed to park near the flange location.

Provide chiller controls with BACnet communication protocol.

Provide complete start-up and operational testing of chiller equipment.

Provide insulation and vapor barriers on all chilled water equipment.

Provide complete system flushing and start-up for the entire chilled water system including piping.

Provide air vents at all terminal equipment and system high points, drains at system low points, and provide chemical treatment equipment for chilled water piping system.

Startup must include operational testing of chiller equipment and full commissioning.

D303002 DIRECT EXPANSION SYSTEMS

Provide a dedicated air-cooled DX ductless split system cooling only unit for IT closets, telecom rooms, and server rooms and any other space requiring independent conditioning. If the unit does not have a BACnet system interface, provide a room temperature sensor and a current sensor, tied to the building DDC system, to determine the operating status of the system. Size DX cooling equipment at 120% of IT equipment load. Provide low ambient cooling.

D3040 DISTRIBUTION SYSTEMS

D304001 AIR DISTRIBUTION, HEATING & COOLING

Provide a dedicated air handler and air distribution system for the secure portion of the building. Provide dedicated air handler and air distribution system for the unsecure portion of the building. Provide man bars, flexible connections and all other security measures required when crossing unsecure/secure boundaries.

Provide shutoff-type terminal units with hot water reheat coils to serve zones. To maximize energy savings on this project: the shutoff-type terminal units must comply with ASHRAE 55 and sized to meet indoor design conditions (temperature, humidity, ventilation, etc.) that are used in the design; do not size shutoff-type terminal units to maintain a minimum of 4 AC/Hr in occupied mode.

Provide insulated, galvanized steel ductwork in concealed locations constructed, braced, reinforced, installed, supported, and sealed in accordance with the IMC and Sheet Metal and Air Conditioning Contractors National Association (SMACNA) standards. For exposed ductwork, provide insulated, double walled, galvanized steel duct.

Provide medium-pressure duct from VAV AHU to shutoff-type terminal unit. Provide round or flat oval primary supply air duct. Size the medium pressure duct according to the static regain method. Provide low-pressure supply air duct from the terminal unit to the zone being served. Provide low-pressure return air duct from the zone to the VAV AHU. Provide a minimum of 6 diameters of rigid straight duct at the inlet to each VAV terminal to maintain a uniform velocity

profile at the valve inlet for airflow measurement accuracy. Flexible duct connection to the primary air inlet of VAV terminal is not permitted.

Provide shutoff-type terminal units typically above lay-in ceilings. Provide terminal units above hard ceilings with lockable access panels.

Provide aluminum grilles, registers, and diffusers. Provide linear slot diffusers including manufacturer insulated plenum.

Provide manual balancing dampers for all main and branch ducts. Incorporate product requirements identified in the UFGS 23 00 00 Manual Balancing Damper Editing Guide, in RFP, Part 6, into project specifications.

Install all metal duct to Seal Class A standard. Insulated flexible duct may be installed in low-pressure supply duct but may not exceed 5 feet in length or provide more than a 45-degree change in direction. Flexible duct may not be installed in return or exhaust air duct.

Provide AMCA 540 and 550 rated louvers.

Size low pressure supply ductwork at 0.08"/100LF and negative pressure return/exhaust at 0.05"/100LF (max).

Provide rigid foil faced board insulation where ducts are exposed in mechanical spaces. Provide pre-manufactured double wall ductwork on building exterior or where ducts are exposed in occupied spaces. Insulate all ductwork.

Mineral fiber blanket wrap must meet the requirements of ASTM C1136, ASTM C1290, ASTM C1338, ASTM E84, UL 723, NFPA 90A, and NFPA 90B.

Rigid mineral fiber must meet the requirements of ASTM C553, ASTM C612, ASTM C1136, ASTM 1393, ASTM E84, and UL 723.

Make duct penetrations of all walls with sheet metal ducts. Flexible duct penetrations of walls are not acceptable.

Coordinate locations of all air devices with ceiling mounted equipment. Maintain minimum of 3'-0" from ceiling mounted smoke detectors.

Provide unvaned radius elbows with a radius equal to 1 ½ times the duct width. Provide all 90-degree mitered square elbows with turning vanes with a radius equal to 2 times the duct width. Provide access doors upstream of all elbows with turning vanes.

Do not hangs duct from other ducts.

Provide canvas duct connectors for all equipment ductwork connections containing fans. Provided grounding across flexible connections with flexible copper grounding straps. Grounding straps must be bolted or soldered to both the equipment and the duct.

Ductwork and air handling equipment must be sealed and protected from dirt and debris during the entire construction duration.

Provide separate chases for ductwork and piping. Do not install ductwork and piping in the same chase.

Route all ductwork perpendicular and parallel to the building structure.

Where sheet metal is visible through the face of air terminals, paint sheet metal with a flat black enamel finish.

Manual Balancing Dampers (Accessible): Round type is not acceptable. Provide pre-manufactured rectangular type with 16 gage galvanized steel channel frame with corner braces. Blades will be opposing type 16 gage with a maximum width of 8". Provide with a 20 gage blade stop on units 12" high and under. Provide with position lock, molded synthetic bearings, and square shaft.

Manual Balancing Dampers (Inaccessible): Provide cable operated remote controlled volume dampers in inaccessible branch ducts feeding diffusers. Dampers must be adjustable through the diffuser face with standard hand tools, providing positive balancing of multiple airflows to maintain design air throw and noise criteria. Radial damper must be direct actuated by a brass plated rotary cable which is fixed at the damper end in an integral support bracket. Rotary cable must have a minimum torque service factor of 200% when installed in accordance with manufacturer furnished instructions. The entire assembly must be furnished as one piece for installation with no linkage adjustment required or miscellaneous small parts. Each unit must be factory tested as a complete assembly prior to shipment (100% testing). Accessible cable end must be secured with a factory furnished nylon clamp, allowing maximum placement flexibility. Positive, direct, two-way damper control must be provided without sleeves, springs, or screw adjustments (that may loosen after ceiling closure).

Motorized dampers frame must be 16 gage (1.6) galvanized steel structural hat channel with tabbed corners for reinforcement for 11 gage (3.05) structural equivalence. Blades must be 14 gage (2.0) equivalent thickness galvanized steel, roll-formed airfoil type for low pressure drop and low noise generation. Blade edge seals must be suitable for -72°F to +275°F and mechanically locked into the blade edge. Adhesive or clip-on type seals are unacceptable. Jamb seals must be flexible metal, compression type to prevent leakage between blade end and damper frame. Blade end overlapping frame is unacceptable. Bearings must be corrosion resistant, permanently lubricated stainless steel sleeve type turning in an extruded hole in the damper frame. Axles must be hexagonal positively locked into the damper blade. Linkage must be concealed out of airstream, within the damper frame to reduce pressure drop and noise. Submittal must include leakage, maximum air flow and maximum pressure ratings based on AMCA Publication 500. Dampers must be equipped with factory installed damper position indication switch package. The switch package must include two position indication switches linked directly to the damper blade to provide full open and full closed damper blade position. The switch package must be capable of interfacing with the HVAC control system and provide remote damper blade position status. Factory mounted damper actuators with adjustable memory stops must be furnished and mounted by the damper manufacturer in their factory. Each damper must be cycle tested at the factory prior to shipment.

D304002 STEAM DISTRIBUTION SYSTEMS

NOT USED

D304003 HOT WATER DISTRIBUTION SYSTEMS

For exterior buried Hot Water Distribution Systems see Section G30, *Site Civil/Mechanical Utilities*.

Provide a variable speed pumping system to serve the HVAC hot water equipment throughout the facility. Provide two pumps, each sized at 100% of building load. Provide insulated steel or copper hot water supply and return piping to serve the HVAC equipment throughout the facility.

Provide valves and related hot water system appurtenances. Provide a bladder type expansion tank and air/solids separator for the hot water system. Provide a shot type feeder for manual chemical feed to the hot water piping system.

Provide insulated steel or copper hot water supply and return piping to serve the HVAC equipment throughout the facility. Insulate piping with mineral fiber insulation.

Provide system flushing and startup for the hot water piping system.

Provide air vents at all terminal equipment and system high points, drains at system low points, and provide chemical treatment equipment for hot water piping system.

Provide complete startup and operational testing of all hot water systems.

Hot-water piping 4-inch and smaller must be ASTM B 88 Type K (below ground) or L (above ground) copper. Electric resistance welded or seamless Schedule 40 black steel pipe conforming to ASTM A 53/A 53M must be used for piping greater than 4-inch.

Provide insulation for piping exposed to outdoor ambient temperatures; provide heat tracing to ensure freeze protection down to 10°F. Heat trace must be UL listed and self-regulating cable construction consisting of two 16 AWG, stranded, nickel plated copper bus wires, between which a positive temperature coefficient conductive polymer heating element is placed. Cable must be provided with tinned copper metal braid for additional protection and path for ground fault currents, and a thermoplastic over jacket.

D304004 CHANGEOVER DISTRIBUTION SYSTEMS

NOT USED

D304005 GLYCOL DISTRIBUTION SYSTEMS

NOT USED

D304006 CHILLED WATER DISTRIBUTION SYSTEMS

For buildings with less than 60 tons of cooling load, provide a constant primary pumping system to serve the HVAC chilled water equipment throughout the facility. For buildings with more than 60 tons of cooling load, provide a constant primary/variable secondary pumping arrangement with a single primary pump per chiller. For buildings with more than 160 tons of cooling load, provide a constant primary/variable secondary pumping arrangement with one primary pump per chiller. In all cases, keep flow through the chiller constant.

For building less than 160 tons, provide two primary pumps or two secondary pumps as appropriate with each pump sized for 100% flow. For buildings with more than 160 tons, provide three secondary pumps, each sized for 50% of maximum building flow. Two pumps must operate as duty pumps and the third must act as standby. Provide a control sequence to rotate pump duty/standby assignments monthly and equalize running hours.

Provide valves and related chilled water system appurtenances. Provide a bladder type expansion tank and air/solids separator in chilled water system. “Triple duty” or “multi-purpose” valves that combine a check valve, throttling valve, and shut-off valve must not be used for the

chilled water system. Provide air vents at all terminal equipment and system high points for air control.

Provide steel and copper chilled water supply and return piping to serve the HVAC equipment throughout the facility. Insulate piping with cellular glass insulation on all above ground chilled water distribution piping.

Provide air vents at all terminal equipment and system high points for air control. Provide a shot type feeder for manual chemical feed for the chilled water piping system.

Provide thermal mass capability in the chilled water system to insure proper control and longevity of chillers by using inertia tanks. Provide inertia tanks, sized per chiller manufacturer recommendation to ensure stability of operation and temperature setpoint control. Total chilled water system volume must be a minimum of 7 gallons per ton of cooling. Provide an insulated storage tank within the mechanical room in order to meet this requirement.

Provide insulation, vapor barrier, and aluminum jacketing on piping exposed to outdoors. Install heat tracing on piping to ensure freeze protection to 10°F.

Provide system flushing and startup for the chilled water piping system.

Provide complete startup and operational testing of all chilled water systems.

Provide insulation for piping exposed to outdoor ambient temperatures; provide heat tracing to ensure freeze protection down to 10°F. Heat trace must be UL listed and self-regulating cable construction consisting of two 16 AWG, stranded, nickel plated copper bus wires, between which a positive temperature coefficient conductive polymer heating element is placed. Cable must be provided with tinned copper metal braid for additional protection and path for ground fault currents, and a thermoplastic over jacket.

Provide threaded joints for steel pipe 2" or less and welded or bolted flange for sizes greater.

Provide flanged connections with flexible braided stainless steel connectors at all equipment connections.

Provide pre-manufactured dual containment system consisting of carrier pipe, cellular glass carrier insulation, air space, steel conduit, polyurethane outer insulation, and seamless extruded HDPE casing for direct buried piping. The carrier pipe must be ASTM A53 steel schedule 40 or 80 as scheduled. The product must be rated for corrosion resistance without the need for cathodic protection. Provide with leak detection system.

Chilled-water piping 4-inch and smaller must be ASTM B 88 Type K (below ground) or L (above ground) copper. Electric resistance welded or seamless Schedule 40 black steel pipe conforming to ASTM A 53/A 53M must be used for piping greater than 4-inch.

D304007 EXHAUST SYSTEMS

Provide ductwork constructed, braced, reinforced, installed, supported, and sealed per the IMC and SMACNA standards. Install exhaust duct according to Seal Class A.

Provide ducted exhaust ventilation rate according to ASHRAE 62.1.

D304008 AIR HANDLING UNITS

Provide separate AHUs for the secure portion and the unsecure portion of the building.

Provide central station VAV AHUs to provide constant temperature primary supply air to all terminal units. Provide hot water preheating coils, chilled water-cooling coils, variable-speed fan

sections, ultraviolet coil disinfection systems, and energy recovery sections. Units must include additional sections as necessary to facilitate ready access to all maintainable components.

The energy recovery section must be a fixed plate total enthalpy heat exchanger with MERV 8 prefilters and MERV 13 filters upstream of the unit in both the outside air and exhaust air streams. If AHU manufacturers are unable to provide these filters in the central station unit, provide ducted filter boxes outside the unit in a location accessible for filter replacement.

Provide the means to measure filtered outdoor airflow to verify proper ventilation.

Provide modular, central station, air handlers with the following:

Unit panels must be 2-inch solid. Exterior surfaces of the unit casing must be factory painted to withstand ASTM B117 90 3,000-hour salt spray requirements.

All interior casing panels must be made of stainless steel.

Casing air leakage must not exceed leak class 9 (CL = 9) per ASHRAE 111.

Panel insulation must provide a minimum thermal resistance (R) value of 13 $ft^2 \cdot h \cdot {}^oF/Btu$ throughout the entire unit.

Access doors must be 2-inch double-wall construction with latching door handles.

Provide factory-mounted, weather-resistant, light emitting diode (LED) fixtures in sections of the unit for maintenance and service visibility.

Provide a fan array for the supply and return. The fans must be direct drive, single-width, single-inlet plenum. The fan blades must be aluminum backward-inclined airfoil. Fan array fans must be controlled using a common control signal, such as the duct static control signal, to modulate the fan speed.

The fan and motor assembly must be internally isolated from the unit casing, furnished and installed by the unit manufacturer.

Provide with factory mounted VFD for control of fan speed to modulate the airflow.

Provide 24-inch-long (min.) modular inspection sections with removable doors on both sides of the chilled water coil module.

The coil must have a factory applied flexible epoxy polymer coating (1 mil min. thickness) uniformly applied to all coil surface areas without material bridging between fins.

Provide two sets of spare filters for each AHU.

Provide a factory-installed dial type differential pressure gauge piped to both sides of the filter to indicate status.

A mixing section module must be provided to support the damper assembly for outdoor, return, and/or exhaust air. Dampers must modulate the volume of outdoor, return, or exhaust air. The dampers must be of double-skin airfoil design with metal, compressible jamb seals and extruded-vinyl blade-edge seals on all blades. The blades must rotate on stainless-steel sleeve bearings. Airfoil dampers must be rated for a maximum leakage complying with ASHRAE 90.1.

Provide an air blender section to mix outside and return air, minimize stratification, and reduce the risk of frozen coils.

Fully modulating 2-way hydronic coils. If the AHU is at the end of the water loop, a 3-way valve arrangement at the final coil connection is acceptable in lieu of a bypass.

Provide a factory installed combination VFD/disconnect for each fan motor. Each VFD/disconnect must be properly sized, factory mounted in a full metal enclosure, wired to the fan motor (s), and commissioned. VFD/disconnects must include a circuit breaker disconnect with a through-the-door interlocking handle designed to rest only in the full ON or OFF state and must be lockable in these states. A concealed defeater mechanism must allow entry into the enclosure when the handle is in the ON position. The VFD package must also include:

- Electronic manual speed control
- Current limited stall prevention
- Auto restart after momentary power loss
- Speed search for starting into rotating motor
- Anti-windmill with DC injection before start
- Phase-to-phase short circuit protection
- Ground fault protection

D304090 OTHER DISTRIBUTION SYSTEMS

Provide inline pumps with variable frequency drives.

Hangers, Clamps, Rollers, and Supports must comply with MSS SP-58 unless otherwise noted. Steel channel strut and angle iron are acceptable materials for field constructed trapeze hanger assemblies where the rated load limit is not exceeded. Provide with MSS type carbon-steel hanger rods, nuts, saddles, and U-bolts.

Provide dielectric pipe unions or grounding and other required measures when crossing the secure/unsecure boundary.

Run all horizontal piping above ceiling unless otherwise noted.

Provide full line size valves and strainers prior to reducing pipe size to make connections to equipment, control valves, or balancing valves.

Automatic flow control valves are not permitted.

Provide extended plugs and labels where piping is insulated. Provide removable insulation over plugs.

Provide manual air vents at all high spots and the ends of all piping loops. Do not use automatic air vents in any place other than mechanical rooms where floor drains are already provided for. Provide 1/2" drain valves at low points in piping. Provide minimum pitch sufficient to insure adequate venting and draining.

Provide permanent flushing isolation valves and tees at both sides of all hydronic equipment. Provide tees with ¾” hose end connection and removable brass cap.

Do not hang pipe from other pipe.

Do not use flexible braided pipe to change direction at equipment connections regardless of manufacturer documentation.

Do not bend pipe or pipe hangers to correct poor alignment.

Route all piping perpendicular and parallel to the building structure.

Maintain a minimum of 3'-6" of ground cover over all underground HVAC piping.

Install piping so that all valves, strainers, unions, traps, flanges, and other appurtenances requiring access are accessible from below.

Install valves so that the valves will remain in service when equipment or piping on the equipment side of the valve are removed.

Provide balancing valves with position indicators and maximum adjustable stops (memory stops).

Provide chain wheel operators for all valves in equipment rooms mounted greater than 7'-0" above floor level; chain must extend to 7'-0" above floor level.

Install unions and/or flanges at each piece of equipment, in bypasses, and in long piping runs (100 feet or more) to permit disassembly for alteration and repairs.

Install all piping without forcing, springing, or bending.

Tap all branch lines from top of piping mains (45 degrees preferred, 90 degrees acceptable).

All valves must be set up and adjusted for smooth and easy operation.

All piping work must be coordinated with all trades involved. Offsets in piping around obstructions must be provided at no additional cost to the government.

Provide stainless steel flexible connections in all piping systems connected to pumps, chillers, cooling towers, and other equipment which require vibration isolation. Flexible connections must be provided as close to the equipment as possible.

Unless otherwise noted, all chilled water and hot water piping must be no less than ¾".

All piping must clear doors and windows.

Provide dielectric fittings at all pipe connections of dissimilar metals.

All piping must be free of dirt, debris, and moisture prior to installation of insulation. Chilled water systems must be disabled, brought to room temperature, and free of external moisture prior to insulation installation.

Install piping in accordance with the latest editions of MSS SP-58 and ASME B31.9. Use MSS type hangers and supports. Provide saddles and base supports. All-thread rod is acceptable for tension support applications only, not compression.

Select thermometers and pressure gages where the operating condition falls within the middle third of the range.

Provide chrome plated escutcheon plates for exposed pipe penetrations in occupied spaces.

Do not route pipe risers in duct shafts. Do not penetrate fire rated shafts with pipe unless the shaft is specifically allocated for that service.

Size all hydronic piping between 1 feet and 4 feet total dynamic head pressure drop per 100' length.

Grooved piping and press fittings are prohibited in all applications.

D3050 TERMINAL & PACKAGE UNITS

D305002 UNIT HEATERS

Provide gas fired or hot water unit heaters to serve the heating requirements of mechanical and air handler rooms of the facility.

D305003 FAN COIL UNITS

Provide 4-pipe vertical type fan coil units and controls to serve the heating and cooling requirements of the facility. Provide one vertical fan coil unit for each zone and locate it within a mechanical closet. Provide lockable mechanical closet and allow adequate space for maintenance. Provide each fan coil unit with a return filter grille to ease maintenance requirements. If space does not allow for vertical fan coil units, provide horizontal fan coil units in the overhead with a means for removal and maintenance of the units through lockable access panels. Provide auxiliary drain pans with overflow sensors below fan coil unit and appurtenances.

D305004 FIN TUBE RADIATORS

NOT USED

D305005 ELECTRIC HEATING

NOT USED

D305006 PACKAGE UNITS

Provide 100% Outside Air Makeup Air Conditioning Units to precondition outside air prior to distributing to fan-coil units, or terminal units.

D305007 COMPUTER ROOM AIR CONDITIONING (CRAC)

Provide downblast 4-pipe hydronic CRAC units for all spaces utilizing modular raised floor systems with N+1 redundancy for each underfloor supply plenum. Provide floor sinks in slabs below CRAC units. CRAC units must utilize modulating hot water reheat coils for process humidity control.

D3060 CONTROLS AND INSTRUMENTATION

D306001 HVAC CONTROLS

D306001 1.1 DIRECT DIGITAL CONTROL SYSTEM (DDCS)

Provide a complete Direct Digital Control (DDC) system to comply with UFGS 23 09 00.00 22 Instrumentations and Control for HVAC, UFGS 23 09 13.00 22 Instrumentation and Control Devices for HVAC, and UFGS 23 09 23.02 22 BACnet Direct Digital Control Systems for HVAC and Other Building Control Systems for the facility. All Camp Lejeune specific standards and requirements in Division 23 sections in Part 5 of this RFP must be incorporated into the design where applicable.

The DDCS must utilize intelligent distributed controllers, which communicate over a controller network in accordance with ASHRAE Standard 135-2016, BACnet – A Data Communication

Protocol for Building and Control Networks. Provide all necessary hardware, software and control devices to perform the optimal operation of the entire HVAC system and other building systems.

The Energy Management Control System (EMCS) has an existing front-end system managed by DPW. The government is responsible for integration of the building onto the base-wide network and integration of new buildings into the front-end. Contractor point of demarcation is the field point of contact (FPOC) and will be designed using BACnet protocol for future integration. The EMCS building level system must be designed and commissioned to match the existing ATO level of L-M-M. Contractor must use DDC equipment and Meters selected from base ATO approved equipment listing or must provide forty (40) hours testing time and support for DPW cybersecurity testing and hardening at the base's test environment. Only equipment capable of meeting cybersecurity hardening requirements will be accepted for use.

Provide two (2) CAT6 cables from the Supervisory Panel to the telecommunications closet. Incorporate requirements identified in the UFGS 23 09 00.00 22 provided in RFP, Part 5, into project specifications.

Provide meters, monitored by DDC, on the following incoming utilities of the building: Domestic water, natural gas, electricity. Tie the gas meter into the existing Advanced Metering Infrastructure (AMI) metering system. For electrical energy monitoring refer to Section D50, *Electrical,* paragraph entitled, *Service Entrance Equipment.* For potable water meter refer to Section G30, *Site Civil/Mechanical Utilities,* paragraph entitled, *Potable Water Distribution.*

Preferred location for water meter is in the mechanical room.

Provide meters, monitored by DDC, on the following subsystems for steam, gas and water: HVAC and processes.

Provide ASHRAE Standard 135 building controller as the main interface for the building control system.

Provide notebook computer(s) and complete application software with all licenses.

Provide patch panel in the mechanical equipment room for ease of connection and disconnection of equipment.

Provide panels with locks and alarms. The alarms must include both a flashing light and an audible alarm inside the mechanical room. The alarms must also be a networked alarm (e.g. switch connected to controller DI) with alarm events recorded remotely for a period not less than one year.

Provide flow rate meters, monitored by the DDC system, for central, chilled, and hot water flow.

Provide air handlers and all terminal units, including VAV boxes, with discharge/supply temperature sensors.

Provide air handler unit outside air flow monitoring stations.

Provide a DDC option for automatic operation of building circulating pumps whenever outdoor air temperature is below 35 degrees F or when there is a high potential for freeze damage.

Provide control to automatically start back-up pumps (or other HVAC equipment) if the primary device fails. Primary and back-up equipment starter circuits must be wired to prevent both pieces of equipment from operating at the same time. Rotate primary and back-up HVAC equipment monthly (adjustable) with a lead/lag control routine.

Provide the following phase monitors for all 3 phase equipment:

1. Phase loss protection
2. Phase reversal protection
3. Phase unbalance protection

Provide the following phase monitors for all 3 phase chillers:

1. Phase unbalance protection
2. Over/under voltage protection
3. Phase loss protection
4. Delay of break timer to delay automatic restarts
5. Non critical fault delay
6. Programmable auto/manual restart
7. Load and line side monitoring
8. Phase reversal
9. Phase unbalance

Provide new DDCS front-end notebook computer loaded with all necessary application software displaying graphic floor plan, equipment graphics, control diagrams, and complete sequence of operations graphic pages. Provide all alarming, trend services, and schedules and other BACnet services and configurations as described in the UFGS 23 09 23.02 22. Provide and incorporate all new control points and sequences by creating new graphics, alarms, trends, schedules, and system reports. In addition, provide each graphic screen of mechanical equipment with links to the applicable as-built written sequence of operation that fully describes every operating routine and as-built DDC wiring diagram.

Non-BACnet compliant or proprietary equipment or systems, including gateways/protocol convertors, are not desired and are to be avoided unless a conflict dictates, at which time Government review and approval will be required.

The Contractor must be responsible for developing construction documents in accordance with United Facilities Criteria (UFC) for the design of standard HVAC control systems including:

1. UFC 3-410-02, Direct Digital Control for HVAC and Other Building Control Systems, dated 18 July, 2018
2. UFC 4-010-01, DoD Minimum Antiterrorism Standards for Buildings, with Change 1; 1 October 2013 – Standard 18, Emergency Air Distribution Shutoff

DDC System Design: Submit all design documents to be reviewed and approved by Government. Control system design must include the following:

1. EMCS Control Diagrams showing the configuration of each system and equipment with applicable schematic flow diagram, control/field devices, device tags, input/output designations, and applicable field/interlock wiring in accordance with UFC 3-410-02.
2. EMCS Network Riser Diagram showing the layout of DDC system network, all network hardware, controllers, and notebook computer(s) in the building. The diagram must show the locations of notebook computer(s), network hardware, switches/router/hubs and network routing, distinguishing between different forms of media (i.e. Fiber, Category 5/6, shielded twisted pair, coaxial cable, etc.). Various types of LANs must be identified and distinguished from each other.

3. The Sequence of Operation describing all control processes and operation that are controlled by the control system must be included. The sequence of operation must be clearly shown in a text narrative form in order to demonstrate a clear understanding of how the system is to operate and be specific to the control system equipment used.
4. The DDC System Point Schedules indicating, at a minimum, the control point name, input/output designation, device code/tag, fail mode/position, software functions, alarms and alarm limits in accordance with UFC 3-410-02.
5. Provide control system specification to ensure that all of the components, which are expected to be used in the DDC system installation, are properly specified. In addition, the control system specifications must also specify detailed requirements for testing and commissioning of the DDC system. The control system specifications must also include all training requirements.
6. Provide graphic screens including mechanical floor plan indicating control locations and front-end graphic screens of mechanical equipment controls. The graphics must be submitted during construction stages for review and approval by Government.

DDC System Network Architecture:

1. The primary DDC system network, including DDC system network hardware, supervisory/building controllers (BC), Advanced Application Controllers (AAC) for major mechanical equipment, and DDC system notebook computer(s), must communicate via a dedicated DDC system network backbone using BACnet over IP (BACnet/IP). Using the Government Local Area Network (LAN) for DDC system communication is strictly prohibited.
2. The field controllers such as Advanced Application Controllers (AAC) and Application Specific Controllers (ASC) for small mechanical equipment, terminal units and miscellaneous/unitary equipment must be connected to the associated DDC system network hardware and supervisory/building (BC) controllers, and communicate via secondary DDC system network using BACnet MS/TP.
3. Network controllers, switches and/or routers must be provided to extend DDC system network throughout the facility, where necessary.
4. Non-BACnet-compliant or proprietary equipment or systems including gateways using a proprietary communication protocol are not acceptable and are strictly prohibited. For the existing equipment communicating with the existing control system using a proprietary or non-BACnet communication protocol, provide necessary gateway or network interface directly connected to the new DDC system network using a BACnet communication protocol.

Critical Systems:

1. For the DDC system associated with the critical equipment, provide separate controllers for primary and back-up HVAC units, which provide redundant HVAC service to critical spaces, to ensure that failure of any one controller will not cause the loss of the entire service to the critical space. The equipment must be distributed across multiple controllers in such a manner that no more than one unit must be powered, controlled and monitored using a single controller.

2. Each BC, AAC and network hardware such as Ethernet switch and router must be provided with an Uninterruptible Power Supply (UPS) that can supply electrical power for at least four hours to the attached load. This load must include the power required for HVAC equipment or field/control devices such as damper and control valves, etc.
3. For the HVAC equipment serving critical spaces or configured for redundant operation, a controls scheme for manual operation, which will bypass the automatic control through the DDC system, must be incorporated. Provide a HOA switch, if not provided as part of electrical equipment, so the equipment can be manually started and operated in Hand mode. The control valves and dampers associated with chilled water system and air handling units must be configured with necessary fail position so the equipment can operate manually and provide temporary cooling and/or ventilation if there is a failure in the control system.
4. When switching the redundant units during the rotation, the unit in the next sequence must be enabled or started before the previously enabled or started unit is disabled or stopped. If enabled unit should fail, an alarm must be generated at the DDC system and it must automatically enable the stand-by unit to replace the failed unit. Once the newly started unit is in operation, the failed unit must be disabled.

DDC System Software: Provide new DDCS and notebook computer(s) with new front-end software and other utilities and tools as necessary. All software necessary for the configuration, operation, and maintenance of the installed DDC system must be provided, with licenses residing with the Government. Where new software, including application and tools, is provided, the latest tested, compatible and reliable version of the software available at the time must be installed prior to system testing and personnel training. In general, the front-end software must allow each authorized operator to execute the following functions as a minimum:

1. Security: Provide security function that prevents unauthorized use unless operator is logged on. Access must be limited to operator's assigned functions when user is logged on. Each operator's terminal must provide security for 10 users as a minimum. Each user must have an individual User ID/Name and Password. System user must be allowed individual assignment of only those control functions and menu items to which that user requires access. Each user must also have a set security level, which defines access to displays and individual objects the user may control. System must include minimum of 5 separate and distinct security levels for assignment to operators. Software must be initially configured to allow government personnel responsible for system administration full, unrestricted access. All default access passwords and user authentication identification must be documented and provided to the Government.
2. Schedule: Operators must be able to view scheduled operating hours of each schedulable piece of equipment on a weekly or monthly calendar-based graphical schedule display; to select and adjust each schedule and time period; and to simultaneously schedule related equipment. Operators must be able to schedule holidays and special events directly from the calendar.
3. Alarm: The notebook computer(s) must provide audible, visual, and printed means of alarm indication. System input and status objects must be configurable to alarm on departing from and on returning to normal state. Operator must be able to enable or disable each alarm and to configure alarm limits, alarm limit differentials, alarm states, and alarm reactions for each system object. Alarms must be BACnet alarm objects and must use BACnet alarm services.

4. Trend Log: Operator must be able to configure trend sample or change of value (COV) interval, start time, and stop time for each system data object and must be able to retrieve data for use in spreadsheets and standard database programs. Controller must sample and store trend data and must be able to archive data to the hard disk. Coordinate items to be trended and trend configurations with the facility maintenance personnel. Trends must be BACnet trend objects.
5. Graphical Displays: The notebook computer(s) must display all data associated with project as required. The notebook computer(s) must display all data using two and/or three-dimensional graphic representations of all mechanical equipment. System must be capable of displaying graphic file, text, and dynamic object data together on each display. Information must be labeled with descriptors and must be shown with the appropriate engineering units. All information on any display must be dynamically updated without any action by the user.

Control Damper and Actuators:

1. Control Dampers: Motorized control dampers must have opposed blade dampers for modulating service and parallel blade dampers for 2-position service. Frames must be of five inch by one inch extruded aluminum hat channel with a minimum of 0.125-inch wall thickness. Blades must not exceed six inches wide and must be of heavy gage extruded aluminum airfoil shape to minimize pressure loss across the damper. Damper blades must be injected with CFC free, two part high density polyurethane foam. Each blade must include a thermal isolation gap. Dampers must be rated for minimum 2000 fpm air velocity at 2.5 inches static pressure and damper leakage must not exceeding 0.5 percent of total CFM (4.00 CFM/sq. ft.) based on 2000 fpm and one-inch static pressure when tested per AMCA Publication 500. Damper must be rated for a temperature range of minus 70 to 200°F
2. Provide electric type, direct shaft mount damper actuators with bracket arrangement for location outside of the air stream. Actuators must provide at least 125 percent of the required torque to effectively operate the damper. Actuator drive time for 90 degree rotation must be 150 seconds maximum. Actuators must be normally open, normally closed, or fail in position as required to obtain the operation as required by the application. Normally open and normally closed dampers must return to their normal position in the event of a power failure to the actuator. Provide auxiliary switches or damper position switches, rated as required, to provide specific operation. Provide transformers and accessories as required. Actuators requiring linkages, crank arms, connecting rods, or ball joints are not acceptable.

Control Valves and Actuators:

1. Characterized Control Ball Valves (up to and including 3 Inches): Nickel-plated forged brass body, valve trim must utilize stainless steel ball and stem, fiberglass reinforced Teflon PTFE seats with O-rings, 2 EPDM O-rings packing. A flow characterizing disc, made of Tefzel Teflon must be installed in the inlet of 2-way characterized control ball valves. 3-way valves must utilize flow characterizing discs at both input ports. Standard ball valves without this feature are not acceptable. 2-way valves must have equal port percentage characteristics; 3-way valves must have linear characteristics. Operators must close valves against pump shutoff head. Control valves must be selected for the pressure drop calculated to ensure proper control valve authority for the application.

2. Globe Pattern Control Valves (over 3 inches): Iron body, bronze trim, 316 stainless steel rising stem, bronze plug-type disc, flanged ends, renewable bronze seat and disc, TFE V-ring packing. It must have replaceable plugs and seats of stainless steel or bronze. 2-way valves must have equal percentage characteristics; 3-way valves must have linear characteristics. Operators must close valves against pump shutoff head. Control valves must be selected for the pressure drop calculated to ensure proper control valve authority for the application.
3. Valve Actuator: Provide electric valve actuators, which are two-position or modulating as required by application. Actuators must be of ample capacity to handle the required load under all conditions and as a minimum must close valves against pump shutoff head pressure of 55 psi. Unless otherwise indicated, valves must be arranged to return to the normal (fail-safe) position in the event of a power failure to the actuator.

Air Flow Measuring Stations (AFMS): For all air handling units with outdoor air intake, provide AFMS to continuously monitor the outdoor ventilation air in CFM values.

1. Provide high performance, thermal dispersion type AFMS. Pitot tubes, arrays, Piezo rings and other differential pressure based devices are not acceptable. AFMSs must contain an airflow straightener if required by the AFMS manufacturer's published installation instructions. The straightener must be contained inside a flanged sheet metal casing, with the AFMS located as specified according to the published recommendation of the AFMS manufacturer. In the absence of published documentation, airflow straighteners must be provided if there is any duct obstruction within 5 duct diameters upstream of the AFMS. Air-flow straighteners, where required, must be constructed of 0.125 inch aluminum honeycomb and the depth of the straightener must not be less than 1.5 inches. Sensing probe must be constructed of extruded aluminum or of stainless steel tubes. The operating humidity range must be 0 to 99% RH and direct exposure to water must not damage the sensing elements. AFMSs must have an accuracy of +/- 2% of reading with air velocity range of 0 to 5,000 fpm. The transmitter must have local LCD display, continuously displaying airflow and temperature and be calibrated for the appropriate operating range based on the required operating range.

Water Flow Meters: Provide electromagnetic type flow meters for water service where required by application. The flow meter must have the DC powered electromagnetic coils and electrodes, and measure the induced voltage across the electrodes as a conductive fluid flows through the magnetic fields. The voltage is proportional to the average flow velocity of the fluid and then amplified and processed digitally by the converter to produce the signal for flow rate and totalization. Flow meter must be located to provide the most efficient and accurate reading recommended by the manufacturer.

Commissioning: The controls Contractor must provide the services of a factory-authorized service representative to start control systems and provide the commissioning the coordination and support required during the commissioning process.

D306001 1.2 ELECTRONIC CONTROLS

NOT USED

D3070 SYSTEMS TESTING AND BALANCING

Provide complete Testing and Balancing (TAB) of all air distribution systems, water distribution systems, including domestic hot water systems, and HVAC equipment. TAB must be provided by a tier one contractor. Provide duct air leakage testing and duct pressure testing. The Designer of Record must provide a duct construction and leak testing schedule on the drawings.

Clean entire duct system in accordance with National Air Duct Cleaners Association (NADCA) ACR after duct air leakage testing (DALT), and before test and balance (TAB). Document duct cleaning, prepare a written report, and submit report to the Construction Manager (CM) with signature of the ductwork contracting foreman indicating the test has been completed.

Acceptable Cleanliness Level: Net weight of debris collected on the filter media must not exceed 0.75 mg/100 sq. cm. Coordinate with other trades working in the building. Duct cleaning must be performed only after the building has been sealed and the completion of construction activities resulting in airborne particles has been completed. Examples of activities producing airborne particles include but are not limited to grinding, cutting, sanding, drywall installation, grout work, etc. Should the CM note construction dust contamination or openly unprotected ductwork and/or equipment after the initial cleaning, repeat duct cleaning on entire system after the final instance of airborne particle production within the building envelope at no additional cost.

Provide complete testing and balancing (TAB) of all air and water distribution systems and HVAC equipment after successful completion of the DALT testing and duct cleaning. Include all troubleshooting attempts and measurements within the TAB report. The TAB contractor must offer recommendations where flowrates cannot be kept within tolerance. Coordinate with and support Commissioning Authority effort during entire project duration. All system devices must be accessible during the TAB effort. Flush all strainers and replace air filters prior to TAB. Verify that air vents have been installed at every high point in the hydronic system(s); confirm the absence of air by testing every air vent prior to starting tests.

D307003 HVAC COMMISSIONING

Refer to RFP Part 3 - Project Program, Chapter 2 for Building Commissioning requirements. All mechanical systems will be commissioned as required.

D3090 OTHER HVAC SYSTEMS AND EQUIPMENT

D309001 GENERAL CONSTRUCTION ITEMS

Provide access to all mechanical equipment rooms through the building exterior walls. Provide roll up doors for mechanical room access. Arrange mechanical equipment so that any piece of equipment can be replaced without removal of other equipment.

All equipment and materials will be free of damage. Bent coil fins will be combed out. Where bent coil fins cannot be straightened, replace with new.

Locate and size 4" thick reinforced concrete housekeeping pads for base mounted equipment in mechanical rooms in accordance with actual equipment purchased. Extend pad beyond equipment for 6" in all directions. Provide with chamfered edges.

D309002 ROLL UP DOOR HEATING

Provide heated curtain fans at roll up doors.

D309003 SECURE AREA HVAC REQUIREMENTS

Ducts and pipes passing from unsecured to secured areas must have man bars and other security measures as required. See the Marine Corps physical security measures in MCO 5530.14A and UFC for specific requirements.

The building will have unsecured areas and areas that will be secured. There will be a vault area that will always be secured. Provide physical security measures when passing from unsecured to secured. Also provide security measures for the vault area.

D309090 OTHER SPECIAL MECHANICAL SYSTEMS

Provide fixed plate enthalpy energy recovery in the air handling system.

The HVAC equipment will be powered by a backup generator in case of power loss. Provide chiller with voltage monitor. Stage HVAC equipment restart to minimize step loads on the generator.

--End of Section--

D3090 OTHER HVAC SYSTEMS AND EQUIPMENT

D309001 GENERAL CONSTRUCTION ITEMS

Provide access to all mechanical equipment rooms through the building exterior walls. Provide roll up doors for mechanical room access. Arrange mechanical equipment so that any piece of equipment can be replaced without removal of other equipment.

All equipment and materials will be free of damage. Bent coil fins will be combed out. Where bent coil fins cannot be straightened, replace with new.

Locate and size 4" thick reinforced concrete housekeeping pads for base mounted equipment in mechanical rooms in accordance with actual equipment purchased. Extend pad beyond equipment for 6" in all directions. Provide with chamfered edges.

D309002 ROLL UP DOOR HEATING

Provide heated curtain fans at roll up doors.

D309003 SECURE AREA HVAC REQUIREMENTS

Ducts and pipes passing from unsecured to secured areas must have man bars and other security measures as required. See the Marine Corps physical security measures in MCO 5530.14A and UFC for specific requirements.

The building will have unsecured areas, flexible secured areas that will be used for unsecured and secured purposes dependent on facility needs, and areas that will be secured. There will be a vault area that will always be secured. Provide physical security measures when passing from unsecured to flexible secured and from flexible secured to secured. Also provide security measures for the vault area.

D309090 OTHER SPECIAL MECHANICAL SYSTEMS

Provide fixed plate enthalpy energy recovery in the air handling system.

The HVAC equipment will be powered by a backup generator in case of power loss. Provide chiller with voltage monitor. Stage HVAC equipment restart to minimize step loads on the generator.

--End of Section--

D40 FIRE PROTECTION – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

Refer to Part 4 Section D40 for performance requirements of the building elements included in the fire protection systems. Comply with the latest editions of UFC 1-200-01, UFC 3-600-01, UFC 4-021- 01 and NFPA codes at the time of contract solicitation.

SYSTEM DESCRIPTION

Provide an integrated fire alarm/ mass notification system and fire suppression system capable of notifying building occupants inside the facility of an emergency event. This scope of work includes the installation of equipment and components and completing all programming necessary to fully control/interface/supervise building systems and transmit all alarm signals to the base reporting system.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Provide working space around all equipment. Provide all required fittings, connections and accessories required for a complete and usable system. All equipment must be installed per the criteria of PTS section D40 and the manufacturer's recommendations. Where the word "should" is used in the manufacturer's recommendations, substitute the word "must".

All Design Documents, (i.e., Fire Protection Design Analysis, Building Code Analysis, Life Safety Analysis, plans, specifications, and calculations) developed for Section D40 must be prepared by, or under the supervision of the design/build contractor's Qualified Fire Protection Engineer (QFPE) as detailed in UFC 3-600-01 and FC 1-300-09N.

The services of a Fire Protection Quality Control Specialist (FPQC) are required. Roles and responsibilities of the FPQC are defined in Specification Section 01 45 00.05 20 (Design and Construction Quality Control). The QFPE and the FPQC must be registered professional engineers who have passed the Fire Protection Engineering written examination administered by the National Council of Examiners for Engineering and Surveying (NCEES) and have relevant experience. The QFPE may serve as the FPQC.

GENERAL DESIGN AND INSTALLATION REQUIREMENTS

Prior to the start of design, the QFPE must meet with the NAVFAC FPE to discuss and confirm the extent and types of fire protection systems and engineering services required. All work must comply with the requirements of the applicable NFPA standards, including recommended portions of the text and explanatory notes, which must be considered mandatory, and with UFC documents, including UFC 1-200-01, UFC 3-600-01, and UFC 4-021-01. Develop specifications for all fire protection work using the Unified Facilities Guide Specification format (UFGS), except for UFGS Section 28 31 76, *Interior Fire Alarm and Mass Notification System, Addressable*, which is included in Part 6 of this RFP. The designer is responsible for incorporating design elements and deliverables described in the “Editor’s Notes” included with all UFGS sections.

GENERAL INSTALLATION

All work for fire protection systems (Including fire alarm, fire suppression, and firestop systems) must be provided by contractors licensed to perform such work.

Workmanship must be neat and professional. Protect systems from damage during construction. Provide parts and components Listed for their particular service. Provide labels for all valves, addressable devices, panels, and controls. For any device located above a ceiling, provide legible, typed label on the ceiling to identify its purpose and location. With the exception of detection devices at ceiling level, mount all valves, panels, and controls no more than 5 ft above the finished floor. Provide clearance for access, inspection, maintenance, repair, and removal.

All conductors must be installed in conduit (EMT minimum). Pull all conductors splice free and be continuous from device to device. The use of wire nuts, crimped connectors, or twisting of conductors is prohibited. All devices must have screw terminals. Where devices are only provided with pigtails from the manufacturer, pigtails must be landed on terminal strips mounted within the junction box. All terminations must be at a terminal strip or the device screw terminals. Terminal strips are only permitted where direct connection to a device is not possible.

Provide a Knox Box at the building entrance approved by the fire department. Provide an additional Knox Box for any project including a gated and secured perimeter fence. Locate this supplemental Knox Box at the primary vehicle entrance point. Mount the Knox Box at the key pad access pedestal to allow fire department access if a gate/fence will be secured after hours.

DESIGN DRAWINGS/SPECIFICATIONS

Design drawings, specifications, and Basis of Design must be prepared by, or under the direct supervision of, the QFPE. Design submittals must comply with the FC 1-300-09N (Navy and Marine Corps Design Procedures), including but not limited to, Section 4-6 (Fire Protection Investigations and Survey), Section 5-8 (Fire Protection Basis of Design), Section 6-8 (Fire Protection Calculations), and 7-10 (Fire Protection Drawings)..

INSTALLATION SHOP DRAWING REQUIREMENTS

Installation drawings, shop drawings or working plans, calculations, other required pre-construction documentation and as-built drawings must be prepared by, or under the direct supervision of a NICET engineering technician who holds a current certification in the field of Fire Protection Engineering Technology with minimum certification in the appropriate subfield as noted below.

- Fire Alarm Systems only (no Mass Notification element) – Level III
- Combination Fire Alarm/Mass Notification Systems – Level IV
- Fire Sprinkler Systems (water only) – Level III

All installation drawings, shop drawings or working plans, calculations, and other required pre-construction documentation must be reviewed by the QFPE prior to submission to government for review. Documents must be signed and sealed or letter attached that is signed and sealed indicating QFPE review of submittal. All plans received without documentation of QFPE review will be rejected and returned without review.

CONTRACTOR INSTALLATION REQUIREMENTS

All fire protection systems installation work must be performed by, or under the supervision of a NICET technician having minimum Level lll certification who must conduct onsite inspections each week that work is performed. Submit licenses and certifications to the Contracting Officer prior to the start of work. Signed weekly inspection reports confirming compliance with the Contract and NFPA standards to the Contracting Officer's Technical Representative each week. Record of Completion forms must be signed by the NICET certified supervising installer for each fire protection system.

COMMISSIONING REQUIREMENTS

Commissioning procedures must comply with NFPA and NAVFAC criteria. All fire and life safety systems must be fully pre-tested by the contractor with the QA/QC manager present. Pre-final acceptance testing must be witnessed by the QFPE. Final acceptance testing must be requested by the QFPE in writing after successful completion of the pre-final acceptance test. The final acceptance test will be witnessed by the NAVFAC FPE for government acceptance. Once the system is accepted, it will be placed in service prior to occupancy. The Contractor is responsible for all cost and time delays caused by system retesting as a result of final acceptance testing failure.

D4010 FIRE ALARM/DETECTION AND MASS NOTIFICATION SYSTEMS

Provide an integrated fire alarm/detection and mass notification system capable of notifying building occupants inside and near the facility in accordance with the latest editions of UFC 3-600-01, including but not limited to Chapter 9, Section 9-18, UFC 4-021-01 and NFPA 72. Provide equipment manufactured by Simplex, Notifier or Fire-Lite. Provide a complete, electrically supervised, addressable intelligent, manual and automatic, annunciated fire alarm and detection system throughout the facility. Provide a voice evacuation type system that also serves as a mass notification system. Provide integrated systems capable of notifying building occupants by means of tones, strobes, prerecorded and live voice announcements. The fire reporting portion of the system must be compatible with the existing base fire reporting system.

Provide all fire alarm circuits in Electrical Metallic Tubing (EMT) or Intermediate Metal Conduit (IMC) unless noted otherwise. All raceways must be factory painted red. Flexible Metallic Conduit (FMC) must not exceed 6 feet and is only be permitted for connections from junction boxes to field devices, Provide a raceway listed for the installation in wet locations, such as Rigid Metallic Conduit (RMC) and Liquidtight Flexible Metal Conduit (LFMC). Wet locations are considered any location within a 5 ft radius of fire suppression equipment, throughout a fire pump room/building, and as defined by NFPA 70.Provide a laminated building floor plan (22” by 34”) mounted at the main entrance of the building, adjacent to the annunciator. Identify the location of the FMCP, LOC, remote power supply panels, and all initiating devices. The drawing must include room numbers.

Provide a steel Document Cabinet with a hinge-mounted door and lock with lock cylinder keyed the same as the FMCP. Mount the Document Cabinet on the wall adjacent to the FMCP.. Prominently label the exterior of the cabinet "SYSTEM RECORD DOCUMENTS". Cabinet must include paper copies and a CD of Fire Alarm As-Built drawings, List of Contact ID descriptions for the fire alarm addressable devices, Sprinkler As-Built drawings, NFPA 72 & NFPA 13

Records of Completion. CD must also include site-specific software and O&M manuals stored in a CD jewel case. Cabinet must be of a minimum size to accommodate all required documents.

Provide a steel Parts Box with a hinge-mounted door and lock with lock cylinder keyed the same is the FMCP. Mount the Parts Box on the wall adjacent to FMCP. Cabinet must be of a minimum size to accommodate all spare parts as defined in the project specifications, plus four fuses for each fused circuit.

FMCP REQUIREMENTS

The fire alarm control unit and mass notification control unit (FMCP) must be capable of handling a minimum of 500 individually identified addressable devices. Provide Class B Notification Appliance Circuits (NACs), Class B Signaling Line Circuits (SLCs), and Class B Initiation Device Circuits (IDCs). Each NAC and SLC must include 25 percent spare capacity based on load and voltage drop. Mount FMCP and associated cabinets such that the top of each cabinet is no more than 6 ft above the finished floor. Provide conduit fill calculations to ensure 40% fill does not exceed limits of NFPA 70.

A lockout code must not be installed in the hardware, firmware, or software of the fire alarm system. Installer and operator codes must remain as the factory default setting.

Provide amplifiers sized for 25% spare power capacity. Battery calculations must be based upon 48 hours of standby time and 15 minutes of alarm time or 60 minutes of alarm time, whichever is greater.

Provide a factory-trained instructor to teach a five-day technical training classroom instruction for at least five Government personnel at Camp Lejeune. The technical training must include classroom instruction as well as hands-on programming, troubleshooting and diagnostics exercises. Provide three laptops for the government’s retention. Laptops must be Windows 10 based and include system software, special connecting cable(s), proprietary equipment necessary for the maintenance, testing and reprogramming of the fire alarm equipment and system. Factory training must occur within six months of system acceptance.

Provide a LCD remote annunciator located at the designated primary entrance. Coordinate final installation location with user and NAVFAC. Provide remote annunciator with control functions the same as the FMCP. Control functions must be accessible only by user code or secured behind a locked panel.

Provide a local operating console (LOC) at the primary entrance vestibule. Coordinate final installation location with user and NAVFAC. Microphone and pre-recorded buttons at LOC must be accessible and not installed behind a locked panel.

Obtain prerecorded mass notification messages from the installation fire alarm technician. Program mass notification pre-recorded message buttons to be non-latching that do not require a full system reset to activate or deactivate. Program pre-recorded message buttons such that a higher priority message will override a lower priority message. Once the higher priority message button is deactivated the lower message that is still activated must begin playing again. Program the system to allow any mass notification message to override the fire message. Upon deactivation of the mass notification message, the fire alarm message must automatic resume. Program live voice microphone paging to override all fire alarm and pre-recorded mass notification message. Microphone activation must not require more than two functions. Post clear instructions for operation (keying the microphone and turning a key switch to activate is an example of two functions).

The government will provide the TRX-401 mass notification transceiver. Provide space, antenna, conduit, cable, pull strings, and equipment as shown on the TRX-401 installation detail provided in Part 6.

Prior to building demolition, contact base fire alarm technicians and allow time for their retrieval of fire alarm and/or mass notification panels, devices, appliances, etc. Contact David Jones (910) 376-0437 to schedule the removal of the existing fire alarm system components. If unsuccessful, contact the construction manager who will coordinate with the Public Works Department.

INITIATION DEVICES

Provide a complete and useable fire alarm system including manual stations, system smoke detectors, aspirating smoke detection, duct smoke detectors, audio/visual notification appliances, electrical supervision of all sprinkler system alarm and supervisory devices. Provide an individual monitor module for each fire sprinkler system water flow switch. Provide all initiation devices with a permanent label adhered to the device identifying the addressable point. Handwritten labels are not permitted.

Provide flush-mounted manual pull stations. Provide manual pull stations within 5 feet of all exterior doors, including but not limited to mechanical rooms, electrical rooms, and communication rooms with direct exterior access. Provide double action type manual pull stations with mechanical reset features. Break glass type manual stations are not permitted.

Protect server rooms as specified in Chapter 4-11.3 of UFC 3-600-01 for “Electronic Equipment Areas” and NFPA 75. Provide aspirating smoke detection for electronic equipment areas (server rooms) designed, installed, and programmed for very early warning response. Design and install the air sampling network to monitor total room/zone concentration of smoke. Accomplish the design using a computer program based on sound fluid dynamic principles and is approved by Factory Mutual Engineering (FM) FM APP GUIDE or listed by Underwriters Laboratories (UL) UL Fire Prot Dir for its intended use. This type of design requires that air samples be continuously drawn from the areas being protected. The detector must provide no less than three distinct alarm threshold levels (Alert, Action, Fire) and must alert equipment operators at every level of detection. Alarm Level 1 (Alert) must initiate a local alarm condition at a constantly attended location in the building. Alarm Level 2 (Action) initiates a supervisory condition at the building FMCP, which transmits a supervisory condition to the Installation Fire Department. Level 3 (Alarm) initiates a general building fire alarm condition at the FMCP, which transmits the fire alarm condition to the Installation Fire Department. The detection system must be installed to provide very early warning of fires at the ceiling level within the server room, beneath raised access flooring where the subfloor area contains cables, in the exhaust/return air stream where aisle containment systems are used, and in the return air stream where the above ceiling area is used as a return air plenum. Where server rooms are provided with suspended ceiling systems, locate sampling piping above the suspended ceiling system utilizing flexible capillary tubing attached to an approved manufacturer’s capillary sample port supported by the ceiling. The size of capillary tubing and sample ports must be in accordance with manufacturer’s recommendations and must be verified and confirmed by calculations using the Manufacturer's proprietary computer-based design modeling software.

Server Room electronic equipment power disconnect provisions must comply with Section 411.6 of UFC 3-600-01, NFPA 70, and NFPA 75. Coordinate with ESR Section D50.

Magnetic door hold-open devices must release upon activation any fire alarm initiating device of the building fire alarm system or upon loss of primary power to the FACP. Smoke detectors dedicated to door release are not permitted.

Provide carbon monoxide detectors in accordance with UFC 3-600-01. Detector activation must initiate a distinct message on all notification appliances and transmit an independent dedicated signal to the base reporting system.

NOTIFICATION APPLIANCES

Provide combined fire alarm and mass notification appliances. Provide white notification appliances with factory applied, permanent, red "ALERT" lettering with clear strobe lenses. Provide ceiling-mounted notification appliances in all areas with suspended ceiling systems. Where exterior speakers are required by UFC 4-021-01, provide exterior weatherproof notification speakers “bull horn” style. All conduit penetrations for exterior equipment must enter the junction box or equipment from the bottom to minimize water intrusion. Provide duct seal inside all conduits that penetrate exterior walls per NFPA 70, Section 300.7.

Visual notification appliances are required in all public use areas, common use areas, and employee work areas to include office suites and areas intended to have more than four desks/occupants. Offices that are designed for a single office worker, regardless of the calculated occupant load, do not require a strobe unless the room is designated as an ABA compliant space.

FIRE ALARM REPORTING

All fire alarms, supervisory alarms and trouble conditions indicated at the FMCP must be transmitted to the fire alarm receiving station. Provide point specific transmission via contact ID format with the address, location, and description of the condition as it appears on the FMCP.

Provide a point reporting digital alarm communicator transmitter that is compatible with the Sur-Gard System III Multi-platform Digital Telephone Receiver. Provide two CAT 6 UTP cables inside one-inch conduit from the FMCP to the telephone equipment room. Make connections to telephone equipment per the base’s telephone requirements. See Part 6 for schematic drawing of the FARS and the mass notification equipment.

D4020 FIRE SUPPRESSION WATER SUPPLY AND EQUIPMENT

The water supply information below is provided for bidding purposes. A hydrant flow test was conducted on 05 August 2019 in proximity to the project site along McHugh Blvd north of Greenway Trail. Refer to Part 6 for the water flow test report and test hydrant locations.

Hydrant flow test summary:

Static pressure: 70 psig (gauge). Residual pressure: 66 psig (gauge).

Measured Flow: 885 gpm

The proposed design point of connection to existing water supply must be approved by the Contracting Officer prior to proceeding with any work.

The QFPE must conduct additional flow tests after contract award prior to any design submissions. Water flow testing must be coordinated through the Contracting Officer. The Contractor is responsible for providing all flow testing equipment. Perform flow testing in accordance with NFPA 291. The QFPE must prepare and submit a flow test report to the

Contracting Officer for review by the NAVFAC FPE. This report must compare the flow test results with the hydrant flow test summary provided above.

Hydraulic calculations must be based upon a waterflow test was performed no more than 6 months prior to submission of the calculations.

Provide a reduced pressure zone backflow preventer. for the incoming sprinkler service. Include a forward flow test connection, with one 2 ½" hose connection for every 250 gpm of anticipated flow of the fire sprinkler system.

Hydraulic calculations for the fire suppression system shall include a 12 psi loss through the backflow preventer.

Sleeve all incoming supply piping and provide thrust rods at floor penetrations. Sleeve all wall penetrations of incoming supply piping.

Provide a UL Listed post indicating valve (PIV) for the underground fire service main. Locate the PIV a minimum distance from the building equal to the height of the building plus fifteen feet. Provide bollards where the PIV could be subject to vehicular damage.

Provide a freestanding pedestal type fire department connection (FDC) at the main vehicle entrance just outside the compound fence line. Provide a 5" Storz connection on a 30-degree galvanized elbow at the FDC. Check valve on FDC must be installed at fire protection system manifold inside the building. Provide ball drip valve on the FDC pipe. Provide bollards where the FDC could be subject to vehicular damage.

D4040 SPRINKLER SYSTEMS

Provide automatic wet pipe sprinkler protection system throughout the facility in accordance with the latest editions of UFC 3-600-01, including but not limited to Chapter 9, Section 9-7 and NFPA 13. Sprinkler system design demand and minimum sprinkler K-factor must be as specified in Table 9-3 and Table 9-4 of UFC 3-600-01.

Provide wet pipe sprinkler systems with pressure relief and air venting in accordance with NFPA 13.

Provide quick-response sprinklers with ordinary temperature rating in areas with finished ceilings. Provide quick-response upright sprinklers with ordinary temperature rating in areas with exposed ceilings. Utilize higher temperature ratings where required by NFPA 13.

Protect server rooms as specified in Chapter 4-11.4 of UFC 3-600-01 for "Electronic Equipment Areas".

For server rooms, provide quick-response having an intermediate temperature rating (175 degrees F). Provide concealed sprinklers with white cover plates in server rooms with finished ceiling systems. Provide upright sprinklers with sprinkler guards in server rooms with unfinished ceilings.

The use of flexible sprinkler hose and mechanical-T outlets are prohibited.

Provide training for the active systems consisting of a minimum of two (2) eight (8)-hour sessions to accommodate all shifts of the base fire department and allow for rescheduling for unforeseen fire department responses.

D4090 OTHER FIRE PROTECTION SYSTEMS

PORTABLE FIRE EXTINGUISHERS

Fire extinguishers are required by the FY20 National Defense Authorization Act that contradicts UFC 3-600-01. Provide fire extinguishers as required by NFPA 101 and NFPA 10. Include fire extinguishers in the Furniture, Fixtures & Equipment (FFE) Package. Refer to ESR Section C103007 for fire extinguisher cabinets and brackets. Electronic Monitoring of fire extinguishers and cabinets is not required. Provide clean agent fire extinguishers utilizing FE13 fire extinguishing agent for electronic equipment installations (server rooms). Locate the clean agent fire extinguisher within the server room adjacent to the primary egress door.

CLEAN AGENT FIRE SUPPRESSION SYSTEMS

Clean agent fire suppression systems will not be required for protection of server rooms.

--End of Section--

D50 ELECTRICAL – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SCOPE

The scope of this section is to describe the systems, components, and installations within buildings and extending no more than 5 feet beyond building exterior walls. Exterior systems and components are described in ESR G40 of this RFP.

Provide systems complete in place, tested, and approved, as specified throughout this RFP, as needed for a complete, usable, and proper installation. Install all equipment per the criteria of PTS Sections D50 and G40 and the manufacturer's recommendations. Where the words "should" or "shall" are used in the manufacturer's recommendations and in referenced Codes and Standards, substitute the word "must."

DOCUMENTATION REQUIREMENTS

Use standard NAVFAC lighting plates, where possible, for all interior and exterior lighting applications. Provide more specific details where warranted but provide a plate or detail for each luminaire used in the project.

The electrical legend and symbols used throughout the design must be similar to those defined in Appendix D of TSEWG TP-12. Reference all electrical details used in the drawing set. Detail bubbles or notes used on the floorplan sheets must clearly reference where in the set of drawings the detail resides. Coordinate and use the same annotation symbol graphics for details on the electrical and telecommunications plans as those used in architectural and other building design discipline drawings.

Lighting and power plans must clearly diagrammatically denote all branch circuit information, complete with homeruns and raceway graphics to logically group circuits and devices together. Providing a circuit number adjacent to the device on the electrical floorplans, without interconnecting raceway drawing graphics, is prohibited.

Provide sensor layout drawings to demonstrate sensor coverage and that overlap requirements are met. Sensor layout drawings must depict minor and major coverage patterns, obstructions, and the impact the obstructions have on the coverage patterns.

In addition to the lighting calculations required in the referenced UFCs, provide light trespass calculations to demonstrate that the installed lighting design does not intrude on adjacent properties. Provide scaled drawings indicating the point outside the boundary of the project where the light levels drop below 0.1 horizontal foot-candles.

SYSTEM DESCRIPTION

This project includes the construction of buildings and structures as listed below. Refer to site plans for building locations.

Provide an interior electrical system consisting of, but not limited to, service entrance wiring and equipment, distribution and lighting panelboards, dry type transformers, conduits, feeder and branch circuits, motor control equipment, lighting and branch wiring, communications, security and alarm systems, emergency generator, emergency lighting and power, grounding, lightning protection, and UPS, including accessories and devices as necessary and required for a complete and usable system.

Select electrical characteristics of the power system to provide a safe, efficient and economical distribution of power based upon the size and types of electrical loads to be served. Use distribution and utilization voltages of the highest level that is practical for the load to be served.

Provide separate normal, standby, and life safety distribution systems.

Install interior electrical distribution equipment and components in spaces accessibly only by qualified persons. Provide a main electrical room to house the service entrance switchboard and branch circuit distribution equipment. Provide additional electrical rooms as required throughout the building to minimize branch circuit length to less than 200 feet for 120V circuits and 400 feet for 277V circuits. Provide electrical panels in mechanical rooms, computer rooms, and telecommunications rooms to serve loads within each respective room.

Provide branch circuit panelboards rated at 480Y/277V to serve lighting and large mechanical equipment. Provide dry-type transformers feeding 208Y/120V panelboards to transform the voltage where necessary to serve receptacle loads and small (less than ¾ hp) motor loads.

Provide individual feeders to each panelboard or transformer. A distribution system consisting of cable taps and/or through-feed panels is prohibited.

Provide distribution equipment that is fully rated for the symmetrical short circuit current available at the terminals. Series rating is prohibited.

Design the electrical distribution system to achieve selective coordination throughout the system. Provide calculations to demonstrate the selective coordination.

Provide a minimum of 15 percent spare circuit and load capacity at all levels of the power distribution system, including life-safety and stand-by power systems.

Provide electrical connections for all systems, equipment, and devices requiring electrical service.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

EQUIPMENT ENCLOSURES

Provide enclosures for equipment described in this section at installed locations with the following environmental ratings:

- Indoor, Dry and Clean Locations: NEMA 250, Type 1.
- Outdoor Locations: NEMA 250, Type 4X, stainless steel
- Kitchen and Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
- Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.
- Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids; equipment in Mechanical Rooms, Plumbing Rooms, and Elevator Machine Rooms; equipment in unconditioned spaces: NEMA 250, Type 12.
- Hazardous Areas: NEMA 250, Type 7 with cover attached by Type 316 stainless steel bolts.

SUSTAINABILITY

Provide electrical systems and components that support project sustainability and energy goals.

ANTITERRORISM

Provide bracing of electrical equipment which is suspended and weighs more than 31 pounds.

SEISMIC BRACING

Provide bracing of electrical equipment to resist seismic events based on site seismic design criteria and building importance factor.

ELECTRICAL TESTING

Test new electrical equipment in accordance with NETA acceptance testing specifications. Test existing electrical equipment remaining in service in accordance with NETA maintenance testing specifications.

COMMISSIONING

Commission all systems in accordance with RFP Part 3 Chapter 2, Section 01 33 29.05 20 *Sustainability Requirements for Design Build* and UFC 01-200-02 *High Performance and Sustainable Buildings*.

EQUIPMENT IDENTIFICATION

Provide instruction and warning signs, identification labels and nameplates, and markings for equipment, wiring, raceways, boxes, and cabinets. Coordinate naming convention with Camp Lejeune Public Works Department.

Provide multi-line engraved nameplates on the exterior of panelboards, switchboards, switchgear, enclosed switches and breakers, transformers, and packaged equipment enclosures with the following information:

- Device identification
- Device rating (voltage, phase, ampacity, kVA, etc.)
- Power source (source panel and circuit number)

See the following figures for examples of equipment identification.

Figure 1: Transformer Identification Example

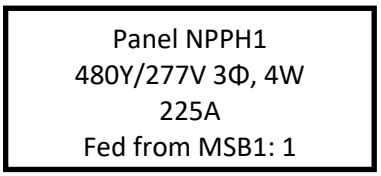

Figure 2: Transformer Identification Example

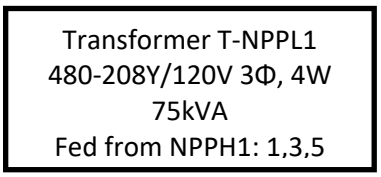

Figure 3: UPS Identification Example

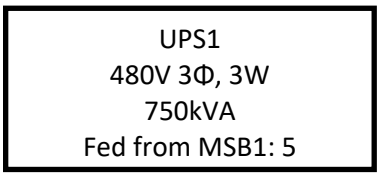

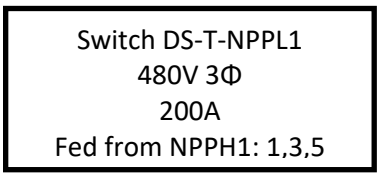

Figure 4: Disconnect Switch Identification Example

CONDUCTOR IDENTIFICATION

Label conductors with source panel circuit number at each junction box and termination point.

D5010 ELECTRICAL SERVICE AND DISTRIBUTION

Provide insulated copper conductors in conduit for all feeders. Refer to D502001 for raceway application for feeders.

D501001 MAIN TRANSFORMERS

Main transformer(s) are defined in Section G40, *Site Electrical Utilities*.

D501002 SERVICE ENTRANCE EQUIPMENT

Provide an underground service into the facility.

Provide a main distribution switchboard as service equipment. Provide the main distribution switchboard with a main circuit breaker, fixed, group-mounted, molded case distribution circuit breakers, and surge protective device (SPD). Fused or bolted pressure switches are prohibited. Provide switchboard with spaces for future use that are fully bused with necessary hardware and connections for installation of future overcurrent devices without disturbing existing devices.

Provide switchboards with copper phase, neutral, and ground buses. Neutral bus capacity must be equal to the phase buses.

Provide molded case thermal-magnetic type circuit breakers with fixed trips for breakers sized up to 225A. Provide breakers from 250A to 600A with adjustable magnetic trip elements. Provide breakers 600A and larger with microprocessor controlled electronic trip units with adjustable instantaneous trip, long- and short-time pickup, long- and short-time adjustments, and ground-fault pickup. Provide ground-fault pickup only where required by the NEC. Provide circuit breakers with continuous current trip ratings 1200A and higher with an Arc Energy Reduction system.

Provide a multi-function digital meter integral to the main switchboard that monitors and records the following values at a minimum:

- Voltage (per phase and 3-phase)
- Current (per phase and 3-phase average)
- Real power (per phase and 3-phase average)
- Reactive power (per phase and 3-phase average)
- Apparent power (per phase and 3-phase average)
- Power factor (3-phase total)
- Frequency
- Total harmonic distortion (voltage and current)

D501003 INTERIOR DISTRIBUTION TRANSFORMERS

Provide enclosed and ventilated dry type transformers to step down secondary voltages for general purpose outlets and other low voltage equipment.

Terminate the transformer secondary at a single overcurrent protection device. Double-lugging the secondary terminals to serve multiple panelboards is prohibited.

Provide transformers with two 2.5 percent taps above and four 2.5 percent taps below normal full capacity.

D501004 PANELBOARDS

Provide distribution and branch circuit panelboards to serve the loads.

Provide panelboards with copper phase, neutral, and ground buses. Neutral bus capacity must be equal to the phase buses. Where fed from K-rated transformers, neutral buses must be 200% the capacity of the phase buses.

Provide panelboards with bolt-on circuit breakers. Plug-in circuit breakers may be used in distribution panelboards if provided with an individual positive locking mechanism that requires operation for removal of the breaker. Load centers are prohibited. Fused switch panelboards are prohibited.

Provide panelboards with spaces that are fully bused with necessary hardware and connections for installation of future overcurrent devices without disturbing existing devices.

Provide panelboards with main circuit breakers where they are not located within sight of their upstream overcurrent protective device or disconnecting means and where otherwise required by Code.

Provide panelboards with fully hinged front covers with a hinged door for accessing circuit breaker handles (door-in-door arrangement).

Provide molded case thermal-magnetic type circuit breakers with fixed trips for breakers sized up to 225A. Provide breakers from 250A to 600A with adjustable magnetic trip elements. Provide breakers 600A and larger with microprocessor controlled electronic trip units with adjustable instantaneous trip, long- and short-time pickup, long- and short-time adjustments, and ground-fault pickup. Provide ground-fault pickup only where required by the NEC. Provide circuit breakers with continuous current trip ratings 1200A and higher with an Arc Energy Reduction system.

D501005 ENCLOSED CIRCUIT BREAKERS

Provide molded case thermal-magnetic type circuit breakers with fixed trips for breakers sized up to 225A. Provide breakers from 250A to 600A with adjustable magnetic trip elements. Provide breakers 600A and larger with microprocessor controlled electronic trip units with adjustable instantaneous trip, long- and short-time pickup, long- and short-time adjustments, and ground-fault pickup. Provide ground-fault pickup only where required by the NEC. Provide circuit breakers with continuous current trip ratings 1200A and higher with an Arc Energy Reduction system.

Provide enclosed circuit breakers with an enclosure suitable for the environment in which it will be installed.

D501006 MOTOR CONTROLLERS

Provide individual motor starters with disconnect switches, combination motor starters, variable speed drives, and manual motor starters for motor controls as required by mechanical equipment. Provide all circuits and connections for motors.

Provide variable speed drives without external bypass.

Provide variable speed drives with 5% bus reactors.

D501090 OTHER SERVICE AND DISTRIBUTION

SURGE PROTECTIVE DEVICES

Provide transient voltage surge protective devices (SPD) at the main switchboard and at panelboards located in computer rooms serving the computer equipment.

SAFETY DISCONNECT SWITCHES

Provide 600V rated, heavy-duty type fused and non-fused, safety disconnect switches with external operating handle and lock-out, tag-out provisions. Provide switches with an enclosure suitable for the environment in which it will be installed.

D5020 LIGHTING AND BRANCH WIRING

Provide lighting and general-purpose receptacles throughout all spaces.

Provide the necessary special receptacle configurations to serve special equipment.

Provide one duplex receptacle at each television/display monitor. Locate the receptacle behind wall-mounted equipment.

Where equipment or furniture is located on a wall, provide receptacles and/or connections serving that equipment or furniture on the wall. Where equipment or furniture is located away from a wall, provide receptacles and/or connections in multi-service floor boxes. Use of power poles is prohibited. Locate devices such that they are not made inaccessible by furniture panels and supports or fixed equipment after the furniture and equipment is installed.

Provide one multi-service recessed floor box under the table in each conference room. Center the box under the table.

Provide duplex receptacles with USB charging capability where receptacles are required on Auditorium, Briefing Room, Conference Room, and Classroom walls. Provide one wall mounted duplex receptacle with USB charging capability for each table in Break Rooms and Lounges.

Provide one wall mounted duplex receptacle with USB charging capability at the seating area in Lobbies, Waiting Rooms, and Reception areas.

CIRCUITING REQUIREMENTS

Connect no more than six (6) duplex convenience receptacles to a single 20A circuit.

Connect no more than two (2) multi-service floor boxes to a single 20A circuit in Classrooms and Simulator/Training areas.

Provide individual dedicated circuits and receptacles or connections for each instance of equipment rated at 8 full load amps (FLA) and higher and for each of the following equipment:

- Copier
- Printer
- Multi-function device
- Fax machine
- Shredder
- VTC console
- Projector
- Refrigerator
- Coffee maker
- Microwave oven
- Garbage disposer
- Toaster
- Electric water cooler
- Vending machine
- Ice machine
- Washer
- Dryer
- Hand dryer
- Fire alarm control panel
- EPO control panel (multiple dedicated circuits may be required as described elsewhere)
- EMCS control panel
- Telecommunications and/or server equipment cabinet (multiple dedicated circuits may be required as described elsewhere)
- Telecommunications and/or server equipment rack (multiple dedicated circuits may be required as described elsewhere)

- AV equipment cabinet (multiple dedicated circuits may be required as described elsewhere)
- AV equipment rack (multiple dedicated circuits may be required as described elsewhere)

Provide dedicated circuits for televisions/display monitors. Multiple receptacles that support televisions/display monitors may be circuited to the same dedicated circuit.

WIRING DEVICES

Provide wiring devices connected to the normal power source with either a white body or dark brown body, as determined by the surrounding wall finish. Provide dark brown or black devices where installed on dark surfaces and white devices where installed on light surfaces.

Provide stainless steel face plates for interior wiring devices and empty outlet boxes.

Provide exterior receptacles with thermoplastic enclosures rated as “weatherproof while in use”.

Provide receptacles with USB charging capability with a combination125VAC NEMA 5-20R duplex receptacle and two 5VDC USB ports; one Type A port capable of delivering a maximum 2.4A of charging capacity and one Type C port capable of delivering a maximum of 3.0A of charging capacity (5A total charging capacity).

MULTI-OUTLET RACEWAYS

Provide extruded aluminum with clear anodized finish, dual-compartment, surface-mounted multi-outlet metal raceways with internal divider. Provide separate snap-on covers for each compartment. Provide the power compartment with NEMA 5-20R duplex receptacles at 18” on center. Where more than four (4) receptacles are installed in a raceway, connect adjacent receptacles to alternating circuits Refer to D5030 for communications & AV faceplate requirements.

UNDERFLOOR MODULAR WIRING SYSTEM

Provide a modular power wiring distribution system in spaces with raised access flooring to provide power to desks, tables, work benches, and equipment.

Provide a complete modular underfloor power wiring distribution system comprised of power distribution boxes, home run cables, multi-service recessed floor boxes, and all necessary interconnecting cables and accessories.

Provide pre-fabricated underfloor power distribution system components with plug-and-play modularity for use below Raised Access Flooring systems. Components and conductors must be listed for use in environmental air handling spaces. Provide manufacturer’s dust caps on unused plug-in connectors.

Install underfloor power distribution system components with adequate clearance to allow access to wiring compartments, removal of covers, and access to plug-in connector ports. Arrange the underfloor components such that no plug-in connector ports are obstructed.

Locate power distribution boxes in readily accessible locations below the Raised Access Floor. Identify the location of the distribution boxes on the ceiling grid above the box using a label placed at the intersection of the grid Ts. Provide one (1) spare circuit in each power distribution box.

MULTI-SERVICE RECESSED FLOOR BOXES

Provide multi-service recessed floor boxes with independent wiring compartments capable of accepting duplex receptacles, AV faceplates, and telecommunications faceplates. Provide telecom adaptor plates to accept current Base Telephone standard jack sets per local 27 10 00. Provide the power compartment with two (2) NEMA 5-20R duplex receptacles.

Provide boxes with stamped steel or cast-iron construction, as applicable to the installation location, and provide each compartment with multiple conduit knockouts capable of accepting conduit sizes up to and including 1 1/4” diameter.

Provide die-cast aluminum covers with self-closing cable egress doors. Covers must open 180° and close flush with the finished floor while in use. When closed, covers must comply with requirements for UL scrub water exclusion. Provide black covers in dark floor finishes and natural aluminum covers in light floor finishes.

Where raised access floors are provided, provide multi-service recessed floor boxes that are compatible with the modular wiring system and install floor boxes flush in raised access flooring.

D502001 BRANCH WIRING

Provide insulated copper THHN-2/THWN-2 or XHHW-2 single conductors in raceway for all branch wiring. Type AC and MC cables are prohibited.

Provide solid conductors for #10 AWG and smaller and stranded conductors for #8 AWG and larger. The minimum power and lighting conductor size is #12 AWG.

Provide a neutral conductor with each phase conductor in circuits feeding single phase loads requiring line-to-neutral service. Shared neutral conductors are prohibited.

RACEWAY APPLICATION FOR FEEDERS AND BRANCH WIRING

Provide expansion fittings in raceways crossing building expansion joints and seismic joints to compensate for building expansion and contraction.

The minimum raceway size for interior and above grade exterior applications is ¾” diameter. The minimum raceway size for below grade exterior applications is 1” diameter.

Outdoors: Apply raceway products as specified below unless otherwise indicated:

- Exposed Conduit: GRC.
- Concealed Conduit, Aboveground: IMC.
- Underground Conduit: RNC, Type EPC-40-PVC direct buried.
- Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.

Indoors: Apply raceway products as specified below unless otherwise indicated:

- Exposed, Not Subject to Physical or Severe Physical Damage: EMT.
- Exposed and Subject to Physical or Severe Physical Damage: GRC.
- Concealed in Ceilings and Interior Walls and Partitions: EMT.

- Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.
- Connection to Recessed and Semi-Recessed Luminaires: FMC, except use LFMC in damp or wet locations.
- Damp or Wet Locations, Unconditioned Spaces, Spaces Subject to High Humidity: IMC.

D502002 LIGHTING EQUIPMENT

Provide a complete lighting system consisting of exit and emergency lighting, area lighting, and manual and automatic controls. Controls include manual wall stations, occupancy sensors, vacancy sensors, daylighting controls, automatic lighting shutoff systems, and dimming systems.

LUMINAIRES

Provide luminaires designed for LED sources. Luminaires designed for other sources that use retrofit LED lamps are not acceptable.

Provide drivers that provide smooth and continuous dimming from 100% output to 10% output for standard-performance dimming luminaires and 100% output to 1% output for high-performance dimming luminaires. Step dimming drivers are prohibited.

Provide high-performance dimming drivers in conference rooms, classrooms, training rooms, and auditoriums.

Provide vanity luminaires above all mirrors in single-occupancy restrooms.

Provide blue beacon luminaires in classified spaces that are directly accessible from a corridor to alert the occupants of the space of the presence of uncleared persons in the space.

Pendant luminaires may use lenses, baffles or louvers, or perforated housings to shield the downlight component. Do not provide pendant luminaires in continuous lengths exceeding 16 feet.

Provide luminaires with the following minimum luminaire efficacy (LE):

- Recessed 1x4, 2x2, or 2x4 troffer: 90 Lumens per Watt (LPW)
- Surface or recessed downlight: 80 LPW
- Track or accent: 40 LPW
- High Bay/Low Bay: 90 LPW
- Linear Industrial or Strip Light: 80 LPW
- Suspended linear or non-linear ambient: 85 LPW
- Surface linear or non-linear ambient: 80 LPW
- Recessed linear or non-linear ambient: 85 LPW

LIGHTING CONTROLS

Provide devices including, but not limited to, wall stations, occupancy sensors, vacancy sensors, time-based scheduling, architectural dimming controls, and daylight dimming controls.

Devices using wireless radio frequency, Bluetooth, Wi-Fi, or other wireless technologies are prohibited. Obtain written approval from the COR to use devices that have infrared transmitters/receivers.

Provide occupancy and vacancy sensors to provide 100% minor motion coverage of the room or area controlled by the sensor. Where multiple sensors are provided to control a single room or area, provide overlapping minor motion sensor coverage taking into consideration all obstructions to include FF&E, collateral, and other Government furnished equipment that could impede the sensor coverage.

Provide light switches controlling uncleared visitor indicator luminaires with a gray body. Provide the faceplate containing switches controlling uncleared visitor lights with a label reading “Uncleared Visitor Lights” above the switch controlling the uncleared visitor indicator luminaires.

Provide low voltage control stations with momentary push-buttons with pilot light or indicator light to confirm operation.

Do not group public spaces into a single lighting control zone. Lighting control zones must not control luminaires on different floors.

Provide programmable multi-zone, multi-scene, architectural dimming controls in conference rooms, classrooms, training rooms, and auditoriums.

Architectural dimming controls consist of a master control station and additional wall stations used to recall preset lighting “scenes” consisting of multiple zones of lights and/or motorized shades and screens. Provide a minimum of six pre-programmed scenes, plus full on and full off, for each space or room with architectural dimming controls unless noted otherwise. Provide the capability to adjust each lighting zone individually from the master station without overwriting the scene programming.

Provide dimmers, modules, and controls that are capable of smoothly dimming LED lighting sources from 100% to a minimum of 1% of full light output.

Dim luminaires connected to life safety power sources along with the normal lighting in the space. Upon loss of normal power, or upon receiving a signal from the fire alarm system, the designated life safety luminaires must automatically return to full brightness regardless of selected scene or occupancy.

In spaces with moveable partitions, the lighting controls must be capable of operating independently when the partition(s) are closed and in unison when partition(s) are open. Provide partition sensors that automatically initiate combined and individual space operation modes based on the position of the moveable partition. Devices that require occupant input to select combined and individual operation modes are prohibited.

D5030 COMMUNICATIONS AND SECURITY

The following sub-element sections contained in D503001-D503090 identify locations for communications and security systems and equipment. Additional communications requirements can be found in Part 5 Specifications 27 10 00 and 33 82 00.

D503001 TELECOMMUNICATIONS SYSTEMS

Provide a main distribution frame (MDF) to house telecommunications equipment and cabling as well as service provider equipment and cabling. Additionally, provide floor or area serving intermediate distribution frames (IDF) to house telecommunications equipment and cabling.

Provide fiber and copper exterior and interior backbone cabling to each MDF and IDF. Provide copper horizontal cabling from each IDF with cable tray and conduit pathways to each Work Area Outlet (WAO).

Provide a complete Telecommunications horizontal and backbone distribution system per user requirements, maintainer requirements, latest Local provider and applicable Using Military Department standards and criteria, UFC 3-580-01, ANSI /TIA 568C, 569, 606, 607C, and 758 standards for support of Non-Secret Internet Protocol Router Network (NIPRNet) and Secret Internet Protocol Router Network (SIPRNet). Voice and data communications for building 1338 SIM Training Center Telecommunications systems must include, but not limited to, horizontal and vertical pathways consisting of underground duct bank systems, sleeves, cable tray, conduit, pull boxes, pull cords and outlet boxes, patch panels, equipment racks, cable management, telecommunications ground bus system, fire rated plywood backboards as required to support the user requirements. Voice and data system cabling and outlets will consist of Category 6 or higher rated horizontal UTP cabling and multimode fiber, patch panels, patch cords, 8-pin/8 contact (8P/8C) RJ-45 connectors, SC fiber connectors, copper and fiber backbone cabling, and cross connect equipment.

BACKBONE CABLING

Secondary fiber backbone: Provide (1) 24 strand OS2 single-mode armored type fiber optical and (1) 24 strand OM4 multi-mode fiber optic cable from the MDF to each new Intermediate Distribution Frame (IDF). Provide fiber optic rack-mounted termination cabinets required to support classified, unclassified, and training networks. Provide backbone cabling for communications training networks (i.e. MCEN,JTEN,NCTE, etc.). Coordinate with government for requirements.

Secondary copper backbone: Provide 50 pair CAT 3 cabling from the MDF to each IDF. Provide copper terminal equipment for termination in each IDF; copper terminal equipment selection per the latest Local provider and applicable Using Military Department standards and criteria.

Provide 48 strand multi-mode fiber per enclave (Classified/Unclassified) from CACCTUS IG servers to CACCTUS Switch racks.

HORIZONTAL CABLING

Provide (4) CAT 6 UTP green color for unclassified networks (i.e NIPR, etc.) and CAT6A UTP for simulation networks (i.e. CACCTUS, etc) from rack-mounted patch panels (in each IDF) to each WAO. Provide (2) CAT 6 UTP green color for WAP /DDC / FACP/ Elevators/ TV displays/ Utility Monitoring or metering. Provide (4) CAT 6 UTP red color for classified networks (i.e. SIPR). Provide (1) CAT 5e UTP green color for each synchronized clock / wall phone. Jack colors must be the same as CAT 6 cable colors. Provide a dedicated above ceiling basket-type cable tray system for NIPR/VOIP, SIPR and Training Networks.

Provide the following Telecommunications Work Area Outlets (WAO):

Ready Room/Auditorium

- Provide WAO every 6 feet along each wall.
- Provide WAO sets in multi-service, recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service, recessed floor boxes.

- Each WAO set includes:
  - (MCEN-N/POTS Phone)
  - (MCEN-S/VOSIP)
  - (Exercise NIPR)
  - (Exercise SIPR)

    Exercise NIPR or SIPR could contain MTWS/CACCTUS/DVTE, plus system station tables can have multiple network devices (Simulation Laptop/Desktop, VOIP, POTS Phone and C2 System devices (Email, C2PC, AFATDS and others)

Brief and Debrief Room

- Provide WAO every 6 feet along each wall.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service recessed floor boxes.
- Each WAO includes:
  - (MCEN-N/POTS Phone)
  - (MCEN-S/VOSIP)
  - (Exercise NIPR)
  - (Exercise SIPR)

    Exercise NIPR or SIPR could contain MTWS/CACCTUS/DVTE, plus system station tables can have multiple network devices (Simulation Laptop/Desktop, VOIP, POTS Phone and C2 System devices (Email, C2PC, AFATDS and others)

Exercise Control Room

- Provide WAO every 4 feet along each wall.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service recessed floor boxes.
- Each WAO includes:
  - (MCEN-N/POTS Phone)
  - (MCEN-S/VOSIP)
  - (Exercise NIPR)
  - (Exercise SIPR)

    Exercise NIPR or SIPR could contain MTWS/CACCTUS/DVTE, plus system station tables can have multiple network devices (Simulation Laptop/Desktop, VOIP, POTS Phone and C2 System devices (Email, C2PC, AFATDS and others)

Secure VTC Room

- Provide WAO at location of VTC equipment.

- Provide one WAO on each wall.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service recessed floor boxes.
- Each WAO set includes:
  - (MCEN-N/POTS Phone)
  - (MCEN-S/VOSIP)
  - (Exercise NIPR)
  - (Exercise SIPR)

Classified Simulation Room

- Provide WAO every 4 feet along each wall.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service recessed floor boxes.
- Each WAO set includes:
  - (MCEN-N/POTS Phone)
  - (MCEN-S/VOSIP)
  - (Exercise NIPR)
  - (Exercise SIPR)

    Exercise NIPR or SIPR could contain MTWS/CACCTUS/DVTE, plus system station tables can have multiple network devices (Simulation Laptop/Desktop, VOIP, POTS Phone and C2 System devices (Email, C2PC, AFATDS and others)

Unclassified Simulation Room

- Provide WAO every 4 feet along each wall.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service recessed floor boxes.
- Each WAO set includes:
  - (MCEN-N/POTS Phone)
  - MCEN-S/VOSIP)
  - (Exercise NIPR)
  - (Exercise SIPR)

    Exercise NIPR or SIPR could contain MTWS/CACCTUS/DVTE, plus system station tables can have multiple network devices (Simulation Laptop/Desktop, VOIP, POTS Phone and C2 System devices (Email, C2PC, AFATDS and others)

Simulation Control Secure Comm Room - Vault

- Provide WAO every 4 feet along each wall.
- Each WAO set includes:
  - (MCEN-N/POTS Phone)
  - (MCEN-S/VOSIP)
  - (Exercise NIPR)
  - Exercise SIPR)
- Provide (2) 24 port CAT 6 connection panels, one from unclassified panel and one from classified panel to Sim Control Room connection panel.
- Provide fiber connectivity to Simulation Control Secure Comm Room and TR. Coordinate fiber types and counts with user.

Simulation Operator

- Provide WAO at each workstation.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020.
- Each WAO set includes:
  - (MCEN-N/POTS Phone)
  - (Exercise NIPR)

Secure Workstation Room - Vault

- Provide WAO at each workstation.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020.
- Each WAO set includes:
  - (VOIP/POTS Phone)
  - (MCEN-S/VOSIP)

FIRE Rooms

- Provide WAO every 4 feet along each wall.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service recessed floor boxes.
- Each WAO set includes:
  - (Exercise NIPR)
  - (Exercise SIPR)

    Exercise NIPR or SIPR could contain MTWS/CACCTUS/DVTE, plus system station tables can have multiple network devices (Simulation Laptop/Desktop, VOIP, POTS Phone and C2 System devices (Email, C2PC, AFATDS and others)

- Provide WAO (MCEN-N/POTS Phone) located both sides of door

Simulation Control Room

- Provide WAO every 4 feet along each wall.
- Provide WAO in multi-service recessed floor boxes described in Part 3 Chapter 5 and D5020. Install classified voice and data WAO and unclassified voice and data WAO in separate multi-service recessed floor boxes.
- Each WAO set includes:
  - (MCEN-N/POTS Phone)
  - (MCEN-S/VOSIP)
  - (Exercise NIPR)
  - (Exercise SIPR)

    Exercise NIPR or SIPR could contain MTWS/CACCTUS/DVTE, plus system station tables can have multiple network devices (Simulation Laptop/Desktop, VOIP, POTS Phone and C2 System devices (Email, C2PC, AFATDS and others)
- Provide two 24 port CAT 6 connection panels, one from unclassified panel and one from classified panel to Simulation Control Secure Comm Room connection panel.
- Provide fiber connectivity to Simulation Control Secure Comm Room and TR. Coordinate fiber types and counts with user.

WORK AREA OUTLET

Provide double-gang steel electrical boxes for voice/data work area outlets. Provide boxes with a minimum dimension of 5-inches square in standard gypsum board walls and 4-11/16 inches square in CMU block walls. Provide a 1-1/4-inch conduit from each double-gang outlet box to the cable tray system. Mount voice/data work area outlet boxes at 18” above finished floor and minimum 6 inches away from any power receptacle. Provide voice/data outlet locations with a 4-position faceplate with four RJ-45 (8P8C) connectors. All work areas will contain a minimum of two communications face plates. Any work area larger than 80 sq. feet will require additional face plates to service any work location in the room within 6 feet of a faceplate. Refer to section 27 10 00 for WAO details. Provide RJ-11 jack at synchronized clock locations.

Provide single gang steel electrical boxes at wall telephone locations with a 1-inch conduit from the outlet box to the cable tray system. Example locations for wall telephones are utility spaces, IDF. Mount wall telephone work area outlet boxes at 48” AFF. Provide wall telephone outlet locations with a 1-position faceplate with metal mounting studs.

INTERMEDIATE DISTRIBUTION FRAME (IDF)

Provide minimum dimensions of 10 feet by 10 feet, or larger as needed to provide adequate working clearance around equipment. Adequate working clearance is defined as a minimum of 42 inches from an adjacent wall and 36 inches in aisles between racks. All telecommunications rooms will be securable in order to restrict access to authorized government personnel only.

The IDF will be considered a dedicated space and not house any equipment not specifically associated with the telecommunications infrastructure. Each IDF will house Ethernet switches, an active equipment rack, relay racks, patch panels to serve horizontal network cabling, fiber-

optic cable termination cabinets for NIPR and SIPR networks. Provide a minimum 39" separation between NIPR and SIPR cabinets. Provide a wall telephone in each room.

Provide a dedicated IDF for training network servers and distribution equipment. Coordinate with government for requirements.

SIMULATION CONTROL SECURE COMM ROOM - VAULT

- Provide (4) 19-inch enclosed equipment racks to house network equipment.

SIMULATION CONTROL ROOM

- Provide (4) 19-inch enclosed equipment racks for CACCTUS equipment per enclave (2 NIPR, 2 SIPR racks), with 8 rackmount computer shelves per rack.
- Provide (2) 19-inch enclosed equipment racks for Unclassified MTWS equipment (Servers), with 8 rackmount computer shelves per rack.
- Provide (2) 19-inch enclosed equipment racks for Classified MTWS equipment (Servers), with 8 rackmount computer shelves per rack.
- Provide (3) 19-inch equipment racks per enclave (Exercise Classified, Unclassified) network and patch panel to simulation rooms.

MAIN DISTRIBUTION FRAME (MDF)

Provide minimum dimensions 10 feet by 10 feet or larger as needed to provide adequate working clearance around equipment. Adequate working clearance is defined as a minimum of 42 inches from an adjacent wall and 36 inches in aisles between racks. All telecommunications rooms will be securable in order to restrict access to authorized government personnel only.

The MDF will be considered a dedicated space and not house any equipment not specifically associated with the telecommunications infrastructure. The MDF will house Ethernet switches, an active equipment rack, relay racks, patch panels to serve horizontal network cabling, fiber-optic cable termination cabinets for NIPR and SIPR networks. Provide a minimum 39" separation between NIPR and SIPR cabinets. Provide a wall telephone in each room.

LABELING AND TESTING

Label and terminate backbone, horizontal cabling, and termination hardware in accordance with the latest Local provider and applicable Using Military Department standards and criteria.

Test UTP Category 6 and 6A cabling in accordance with the minimum standards established in ANSI/TIA-568-C.1 and ANSI/TIA-568-C.2-1.

Test fiber optic cables and terminations in accordance with the minimum standards established in ANSI/TIA-526-7B and ANSI/TIA-526-14B.

Perform tests at both ends of cables.

D503002 PUBLIC ADDRESS SYSTEMS

Provide a Public Address system with speakers in all common spaces and exterior speakers for outside activity spaces.

Interface the Public Address System with the Mass Notification System.

D503003 INTERCOMMUNICATIONS SYSTEMS

NOT USED

D503004 TELEVISION SYSTEMS

Provide RG-6 coaxial cabling and (2) CAT 6 green cables from the closest IDF to each television location. Provide coax cabling that traverses a secure boundary with an RF filter. Terminate coaxial cabling at outlet side, coil coaxial cabling inside IDF. Leave enough cabling to terminate anywhere inside the IDF.

D503005 SECURITY SYSTEMS

An Electronic Security System (ESS) is the integrated electronic system that encompasses one or more of the following subsystems; access control system (ACS), and intrusion detection system (IDS).

Provide ESS for this project meeting the requirements of UFC 4-021-02, *Electronic Security Systems*

Provide an ESS consisting of empty raceways with pull strings, outlet boxes, cover plates, and associated power outlets to enable system installation by the ESS supplier

Provide an electronic security system (ESS) including equipment and supporting infrastructure complete, tested, and operational. Provide ESS that is compatible with the Installation's central monitoring system and monitored within the secure/protected area and at the Installation central monitoring station.

Provide an ACS utilizing credential devices to monitor and control personnel movement into the secure area. The ACS must log and archive all transactions and alert authorities of unauthorized entry attempts. must

Locate equipment containing access control software, authorization data, card-encoded data, personnel identification data, or verification data within the secure area

The IDS system head-end equipment, sensors, cabling, and associated appurtenances will be GFGI. The following infrastructure will be provided support the IDS system:

- Continuous EMT conduit with compression fittings with pull wires and back boxes will be provided between IDS components and head-end equipment locations.
- IDS equipment including, but not limited to motion detectors, door contacts, control panels, and wiring will be GFGI.

Provide an IDS to detect attempts or access by unauthorized personnel into secure/protected area s. Provide point sensors on all windows, doors, and man-passable openings. Provide volumetric sensors within secure/protected areas to detect movement within the area. System must annunciate and archive all alarm within the secure/protected area and at the Installation central monitoring station.

Emergency exit doors must be alarmed 24 hours per day. Alarm condition must result in an audible annunciation that alerts occupants within the secure/protected area of an attempted egress. Locate system sensors and the premise control units (PCU) within the secure area. System must be configured to only allow cleared personnel located within the secure/protected area to initiate changes in access modes or alarm conditions.

Provide 8 hours of emergency uninterruptable backup power. Backup power may be provided by batteries, uninterruptable power supply, generators, or combination thereof.

D503090 OTHER COMMUNICATIONS AND ALARM SYSTEMS

GPS SYSTEM

Provide LMR400 Coaxial cable (or approved equivalent) from the training network server room to GPS Model 8225 antenna. Coordinate with government of location of antenna. Provide mount for GPS.

AUDIO VISUAL SYSTEMS

Provide a complete audio- visual system for each program space described below. System design must be completed by an individual with a CTS-D certification. Refer to E20 for the Best Value Determination process for AV systems.

Ready Room/Auditorium

Provide a wall-mounted videowall display system to support the user's PC/media presentation requirements. The display must support AV inputs from a presentation desk or lectern containing NIPR, SIPR and SIM computers. Provide an integrated VTC system that can enable NIPR and SIPR video calls within the space. Provide ceiling microphones and wall-mounted cameras at both the front and rear of the room to capture the local participants during a video call. Provide in-ceiling speakers for program audio playback and VTC far site audio. Provide a touch panel AV/VTC system controller located at the presenter's station.

Provide the following:

- Capability to mount videowall with the sources coming from the front and side of the room.
- Capability to play video from video equipment (HDMI/VGA, CATV, Blue Ray and VCR's)
- VTC capability on MCEN-S or Exercise SIPR networks
- Capability to push VTC video and sound to Exercise Control Room (EXCON) and pull a VTC camera feed from EXCON as well

Brief and Debrief Room

Provide an audiovisual system with large format display to support the user's PC/media presentation requirements. The system must support AV inputs from the conference table as well as dedicated SIPR and NIPR in-room PCs. Provide in-ceiling speakers for program audio playback. The user must control the AV system from a touch panel controller located at the table. Provide a tabletop touch panel AV system controller. Provide a tabletop conference phone to support audio calls over the facility's VoIP phone system.

Exercise Control Room

Provide a wall-mounted videowall display system to support the user's visual monitoring requirements. Mount the videowall across room front and side walls with the sources coming from the front and middle of the room. The display must support AV inputs from various servers in the server room as well as four computers located at a local control desk. Provide in-ceiling speakers for program audio playback. Provide a touch panel AV system controller located at the control desk. Provide a digital intercom system to support instantaneous commination between

the Exercise Control room and individuals in any of the simulation spaces. The intercom system must consist of speaker/microphone headsets for each user and a central controller allowing on the fly workstation group and sub-grouping controlled through a single control interface.

Provide the following:

- Capability to play video from video equipment (HDMI/VGA, CATV, Blue Ray and VCR's) to remote connections within the training rooms (MTWS and CACCTUS).
- Capability to participate in a VTC in the Ready Room/Auditorium
- Capability to receive video from Auditorium
- Capability to receive cable service and display on section of videowall

Secure VTC Room

Provide an audiovisual system with large format display to support the user's PC/media presentation requirements and conferencing requirements. The system must support AV inputs from the conference table as well as dedicated SIPR and NIPR in-room PCs. Provide an integrated video teleconferencing (VTC) system that can enable NIPR and SIPR video calls within the space. Provide ceiling microphones and a wall-mounted camera to capture the local participants during a video call. Provide in-ceiling speakers for program audio playback and VTC far site audio. Provide a tabletop touch panel AV/VTC system controller. Provide a tabletop conference phone to support audio calls over the facility's VoIP phone system.

Classified Simulation Room

Provide a single, wall-mounted LCD display in each Simulation Room to display SIM data. Provide a video distribution system to transmit video from servers to each display. Provide the capability to receive video from video equipment (HDMI/VGA, CATV, Blue Ray and VCR's) located in Exercise Control or Auditorium.

Unclassified Simulation Room

Provide a single, wall-mounted LCD display in each Simulation Room to display SIM data. Provide a video distribution system to transmit video from servers to each display. Provide the capability to receive video from video equipment (HDMI/VGA, CATV, Blue Ray and VCR's) located in Exercise Control or Auditorium.

Simulation Control Room

Provide three areas (Classified, Unclassified) of shelf tables with four areas of use (floor level, desktop level, shoulder level, and top-of-head level) to house computer monitors, laptop severs, and C2 equipment for each enclave.

FIRE Rooms

Provide the capability to receive video from video equipment (HDMI/VGA, CATV, Blue Ray and VCR's) located in Exercise Control or Auditorium.

Break Rooms

Provide a wall-mounted LCD display for TV programming. Provide a wall-mounted touch panel to control the display in addition to the manufacturer provided handheld remote. The display must include an internal ATSC/NTSC/QAM tuner and built-in speakers. Provide the capability to receive video from Video equipment (HDMI/VGA, CATV, Blue Ray and VCR's) located in Exercise Control or Auditorium.

Lobby

Provide wall-mounted LCD monitor to display PC content from the reception desk. Provide a wall-mounted touch panel behind the reception desk to control the display in addition to the manufacturer provided handheld remote. The display must include an internal ATSC/NTSC/QAM tuner and built-in speakers.

D5090 OTHER ELECTRICAL SERVICES

D509001 GENERAL CONSTRUCTION ITEMS (ELECTRICAL)

Provide General Construction Items (Electrical) including, but not necessarily limited to, all connections, fittings, boxes and associated equipment needed by this and other sections of this RFP as required for a complete and usable system.

Firestop conduits, cable trays and busways that penetrate fire-rated walls, fire-rated partitions, or fire-rated floors in accordance with Section C10, Interior Construction.

D509002 EMERGENCY LIGHTING AND POWER

Provide power and wiring for emergency lights and exit lights throughout the facility.

EMERGENCY LIGHTING AND EXIT SIGNS

Emergency lighting must be unswitched except where required for energy savings and where control is required to achieve complete darkness to meet the needs of the space (conference/briefing rooms, simulation spaces, auditorium, etc.). Where emergency lighting is switched or dimmed, the designated emergency lighting fixtures must immediately return to full brightness upon loss of normal power or signal from the fire alarm system. Devices necessary to facilitate this function must be UL Listed for the application and for use in emergency circuits.

Provide exit signs with cast aluminum housing and brushed aluminum stencil face(s).

ENGINE GENERATOR

Provide a Level 1 Type 10 diesel engine generator set to provide emergency/life safety, legally required standby, and optional standby power to the entire facility. Provide each service from separate automatic transfer switches in accordance with NEC Articles 700, 701, and 702.

The generator must support all building loads, including the building fire pumps.

Provide generators installed outdoors in vandal-resistant, Level III sound-attenuating, weatherproof steel enclosures that are wind resistant up to 175 mph. Provide the generator housing with multiple removable, lockable panels to provide adequate access to components requiring maintenance. Panels must be removable by one person without tools. Mount instruments, controls, protective devices, and engine muffler within the enclosure.

Diesel fuel engines greater than 50 break horsepower (bhp) must comply with the requirements of the Airborne Toxic Control Measure (ATCM) for Stationary Compression Ignition (CI) Engines (17CCR 93115) adopted by the California Air Resource Board (CARB). For additional information go to http:www.sdapcd.org .

UNINTERRUPTIBLE POWER SUPPLY

Provide a facility UPS power system to support the computer room rack loads.

The UPS system must provide a minimum of 15 minutes of reserve time at full load.

Provide an on-line double conversion UPS system with an external maintenance bypass. In on-line double conversion operation, the UPS system must achieve the following minimum efficiencies:

- 95.9% @ 25% nominal load
- 96.5% @ 50% nominal load
- 96.3% @ 75% nominal load
- 96.3% @ 100% nominal load

D509003 GROUNDING SYSTEMS

Provide a complete grounding system for the facility electrical and telecommunications systems.

The grounding system must bond all building systems and equipment in accordance with applicable Codes and standards including but not limited to: medium voltage distribution equipment, generators, metal equipment support structures, outdoor transformers, fencing, building structure, building electrical and mechanical systems, raised access floor systems, lightning protection system, and communications systems to the grounding electrode system.

Provide UL listed copper, tinned copper, or silver-plated copper grounding conductors, lugs, connectors, and ground bars.

Provide a grounding electrode system for each building or structure.

Provide driven ground rods at each building column and bond to the building structure with minimum #4/0 AWG. Interconnect the building structure ground rods with a bare conductor grounding grid. Provide a bare conductor building counterpoise to bond the power system grounding electrodes, building structure grounding grid, building lightning protection grounding electrodes, and adjacent structures' grounding electrode systems. The minimum size of the counterpoise and grounding grid conductors is #4/0.

Provide copper-clad steel ground rods; minimum 3/4 inches by 10 feet in length, driven such that the top of the rod is 24 inches below grade, except in test wells.

Provide exothermic welds for below grade connections, except at test wells. Provide mechanical type connectors for above grade connections, in test wells, and in other locations where welded connections are not required.

Provide ground bars in electrical and telecommunications rooms. In multi-story buildings, provide a common grounding electrode riser to bond the secondary electrical ground bars (EGB) to the electrical main ground bar (EMGB) located in the main electrical room.

Provide a main telecommunications ground bar (TMGB) in the main Communications Equipment Room and bond to the EMGB. Provide secondary telecommunications ground bars (TGB) in each secondary telecommunications room and bond to the TMGB using a common bonding conductor. The common bonding conductor and common grounding electrode must be separate conductors.

Provide minimum 24”x4”x1/4” copper main ground bars minimum 12”x2”x1/4” copper. secondary ground bars. Provide electrical ground bars pre-drilled with a standard NEMA two-hole configuration for the entire length of the bar. Provide telecommunications ground bars pre-drilled with a TIA-607 hole pattern for the entire length of the bar. Provide each ground bar with

a clear 3/16-inch thick polycarbonate or acrylic cover 2 inches larger in each direction of the bar it shields.

Install ground bars at 18 inches above finished floor (AFF) in areas without Raised Access Floor (RAF) or 18 inches above RAF in areas with RAF.

Provide a grounding conductor with all circuits and feeders. Conduits cannot be used as the sole grounding conductor. Where multiple circuits are contained in a conduit, they may share the grounding conductor.

D509004 LIGHTNING PROTECTION

Provide a complete lightning protection system with a UL Lightning Protection Inspection Certificate certified to UL 96A, including, but not necessarily limited to, strike termination devices, conductors, ground terminals, interconnecting conductors, surge protective devices, and other connectors and fittings required for a complete and usable system.

Conceal LPS down conductors within the building envelope. Provide access panels or other means for inspection of down conductors in accordance with NFPA 780 requirements.

Lightning Protection Systems must not void the roof warranty. Adhesive bases are prohibited on standing seam metal roofs.

D509005 ELECTRIC HEATING

Provide power wiring and connections as required for all electric heating systems and equipment.

D509006 ENERGY MANAGEMENT CONTROL SYSTEM

Provide power wiring and connections as required for all systems and equipment including meters and controls. Coordinate connection requirements with switchgear and pad mounted transformer kWh metering.

D509007 BUILDING PHOTOVOLTAIC SYSTEM

NOT USED

D509090 OTHER SPECIAL SYSTEMS AND DEVICES

EMERGENCY POWER OFF (EPO) SYSTEMS

Provide maintained contact, mushroom type, twist to reset EPO buttons with a clear flip-up cover. EPO systems must disconnect power to IT equipment within the room, disconnect power to dedicated HVAC equipment within and serving the room, and perform other operations in accordance with NEC Article 645.

Provide the EPO control panel with two sources of power, one originating from the Life Safety Power source and one from a Normal Power source. The Life Safety Power source is the preferred source. Neither power source is permitted to originate from a source affected by operation of the EPO system.

Provide the EPO control panel as an integrated control and monitoring system with electrically operated contactors. Provide contactor voltage and current ratings consistent with type of load served. Provide the control panel in a surface mounted enclosure with key lock and with door-mounted control and pilot devices. Provide with two spare output relays of each type.

Provide the EPO control panel with the following door-mounted pilot lamps and switches:

- Preferred Power Source Available (Green lamp)
- Alternate Power Source Available (Green lamp)
- Maintenance Bypass Override(Key switch)
- Normal Operation (Green lamp)
- Maintenance Bypass (Amber lamp)
- EPO Activation (Red lamp)
- System Reset (Momentary push button or switch)
- Lamp Test (Momentary push button or switch)

Provide an output signal to Fire Alarm System from each room's EPO system to provide the following status points per room:

- EPO system power available
- EPO activation
- EPO system in maintenance bypass

Placing EPO system in "Maintenance Bypass" allows testing of the EPO system without interrupting power to the IT or space support systems.

Locate the EPO control panel and EPO button adjacent to the entrance to the space. Where more than one entrance is provided, provide an EPO button adjacent to each entry point.

--End of Section--

E10 EQUIPMENT P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

GENERAL SYSTEMS REQUIREMENTS

E1010 COMMERCIAL EQUIPMENT

Obtain the services of equipment specialists to specify audiovisual equipment, as indicated in E102009. Equipment specialists shall not have any affiliation with the product specified.

All specialty equipment will be installed by qualified installers regularly engaged in installing the specialty equipment.

Provide energy using equipment per criteria listed in UFGS 01 33 29.05 20 Sustainability Requirements for Design Build.

E101003 VENDING EQUIPMENT

Government to provide and install vending equipment (four units) under separate contract. Users to provide requirements of electrical and plumbing devices to be provided by Contractor to properly support the complete functional operation of the vending equipment. Design the break rooms to provide space, utilities, and cooling to accommodate the vending equipment.

E101005 SECURITY AND VAULT EQUIPMENT

NOT USED

E1020 INSTITUTIONAL EQUIPMENT

E102003 LABORATORY EQUIPMENT

NOT USED

E102009 AUDIOVISUAL EQUIPMENT

Coordinate design requirements with the end user/Command IT personnel, and provide equipment specifications, and procurement and installation of the Audiovisual (AV) equipment. Obtain the services of an audiovisual equipment specialist with CTS-D certification to design and specify the audiovisual equipment.

AV Equipment including electronics potentially connected to data/IT, must be coordinated with design and construction but planned for and funded by the user or Budget Submitting Office sponsoring the user. AV equipment must include but is not limited to: intercom/sound systems, smartboards, flat screens, projectors, video teleconferencing, interactive wall systems and CCTVs.

AV equipment is funded is funded separately. The AV Equipment is identified on the AV Cost Estimate Worksheet. Refer to E20 for the Best Value Determination process for AV systems.

E1030 VEHICULAR EQUIPMENT

NOT USED

E1040 GOVERNMENT FURNISHED EQUIPMENT

Rough-in and provide connections for Government-furnished equipment such that equipment will operate as intended, including providing miscellaneous items such as plugs, receptacles, wire, cable, conduit, flexible conduit and outlet boxes or fittings. Equipment shall remain in control of the Government until such time as the Contractor is ready to install. Contractor shall provide 30 days advance notice of expected installation date and pick up equipment at the location provided by the Government and transfer to site for installation. Testing requirements of Government Furnished equipment shall be the responsibility of the Contractor and shall follow the same guidelines as though the Contractor had provided the equipment.

E1090 OTHER EQUIPMENT

E109002 FOOD SERVICE EQUIPMENT

Provide light commercial kitchen equipment design to meet the needs of the end user. All light commercial electric kitchen equipment to be coordinated to provide a functional facility. Project includes the preparation of specific detailed information for each selected item. Each submittal must demonstrate thorough interaction with the end user requirements and complete coordination with the facility design. Equipment must include, but is not limited to, refrigerator, microwave, coffee maker, and ice maker.

--End of Section--

E20 FURNISHINGS – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Furnishings must include fixed furnishings as part of the Structural Interior Design (SID) and the design and documentation of the movable furnishings, the Furniture, Fixtures, and Equipment (FF&E) Package and Audio/Visual (A/V) Equipment Package.

The design and documentation of both must be funded as part of the construction contract. The purchase and installation of the FF&E and A/V Package must be funded separately as part of Collateral Equipment.

The movable furniture and furnishings (FF&E) for this facility may include, but are not limited to movable furniture systems, freestanding furniture, area/accent rugs, artwork, appliances, flat screen TVs (not connected to data), accessories, shop equipment, fire extinguishers, specialty equipment (specified by the Activity) and other miscellaneous items to support facility functions.

FF&E is estimated in the amount of $3,059,638.60 and AV is estimated in the amount of $1,866,146.18. This Government FF&E and AV budgets must not be altered by Contractors during the bid process.

This estimate does NOT include the Contractor’s Handling and Administration Rate (HAR).

Fixed furnishings (items that are fixed to the structure), such as specialty equipment, drying cages, weapon racks, lockers, fixed shelving, fixed display furnishings, marker boards, cork boards, motorized projection screens, blinds/shades, etc. are part of the construction contract.

The Audio Visual (AV) Equipment must be identified as a separate line item, priced separately from the FF&E and funded as a planned modification. The A/V Package must include shipping, freight, handling, installation, applicable state sales tax, and the Contractor's A/V Handling and Administration Rate (HAR) percentage as applied to the final A/V total cost. Refer to Part 3 Section E10 EQUIPMENT and D50 ELECTRICAL of this RFP.

GENERAL SYSTEMS REQUIREMENTS

Design and provide fixed and movable furnishings for all areas as developed during Activity programming and as indicated in the Room Requirements (refer to Part 3 Section 5 of this RFP) and other portions of this RFP to provide a fully usable and complete facility. Design a complete FF&E package and A/V package and prepare supporting plans and procurement data. The design, procurement, and installation of the A/V package must comply with all of the same requirements as those defined for the FF&E package in this specification section. FF&E and A/V items identified in this RFP are to be used as a guideline to assist in establishing the minimum facility requirements and do not relieve the Contractor's Interior Designer and CTS-D from developing a complete and accurate design package that incorporates ALL of the Activity’s FF&E and A/V requirements determined during the design process. Design per specific UFC (i.e. Youth center, BEQ, etc.) and in conjunction with UFC 03-120-10, Interior Design.

The contractor must retain the services of an Interior Designer with a minimum of one of the following credentials: National Council for Interior Design Qualification (NCIDQ) certification or state, locality and/or jurisdiction Interior Design Certification, Registration, or License. This same Interior Designer must prepare both the SID and the FF&E Package, attend and participate, in entirety, all kick-off meetings, existing site visits, design meetings, to include, but not limited to,

design charrettes, concept design workshops, and review meetings to develop the building design, floor plan, and the FF&E package.

When A/V is required, or other specialty equipment, i.e. shop, A/V, shop, or specialty equipment., is required in the project, the Contractor must obtain the services of the appropriate Equipment Specialists to specify the specialty equipment.

A Certified Technology Specialist-Design (CTS-D) is required for the design and preparation of A/V packages. The CTS-D must attend and participate, in entirety, all design meetings, to include, but not limited to, design charrettes, concept design workshops, presentations and review meetings to develop the floor plan and the A/V package. The NAVFAC approved Specialist(s) must provide separate Best Value Determinations (BVDs) for this equipment, if required by NAVFAC.

The Contractor's Interior Designer and CTS-D, the Design Firm Owner(s), and any Specialists must not have any affiliation with the products specified. The NAVFAC Contracting Officer reserves the right to approve/disapprove the qualifications of the Contractor's Interior Designer based upon review/recommendation of the NAVFAC Interior Designer Per UFC 3-120-10, the FF&E includes the design, selection, specification, color coordination and procurement documentation of the required items necessary to meet the functional, operational, sustainability, and aesthetic needs of the facility.

FF&E specifications must be based on NAVSUP Blanket Purchase Agreements (BPA's), GSA schedules, and other Federal contracts and complying with priorities found in FAR Part 8.404. The utilization of the current NAVSUP BPA list is required for BVD Analysis Request for Pricing. The current NAVSUP BPA list is located at http://www.wbdg.org/ffc/navy-navfac/collateral-equipment.

The CTS-D must provide A/V floor plans indicating equipment locations and A/V riser diagrams for all A/V systems and coordinate equipment locations and power requirements with power plans. The Final FF&E and A/V package must utilize the most current generation technology. All fixed and movable furnishings and A/V selections and designs must be closely coordinated with Parts 3 and 4 Sections C10, C30, E10, D50, and all other parts of this RFP. All fixed and movable furnishings and A/V must be fully integrated with the final design, to include all building finishes, and all building systems (HVAC, Plumbing, Fire Protection, Communications, Electrical, Data, Architecture, etc.) construction and schedule. All outlets, switches, thermostats, etc. must be fully accessible. All sprinkler heads, fire extinguishers, ADA, etc., clearances must be accommodated. The Contractor's Interior Designer and equipment specialists must be responsible for designing and providing specifications for procurement of all FF&E, A/V and specialty equipment, to include delivery and installation, for the facilities built under this contract as directed by the NAVFAC Interior Designer. The Contractor must be responsible for installing all A/V, communications, data, and power cabling within systems and freestanding furniture raceways and performing connections to the building, as required.

The FF&E and A/V package must be fully integrated into the design and construction schedule for the building. All submittal due dates for the SID, A/V and FF&E must be reflected in the Contractor’s construction schedule. The Contractor and the Contractor’s Interior Designer must strictly adhere the FF&E submittal schedule defined prior to the 35% design development to ensure that the final FF&E package is submitted at least 4 months prior to FF&E funding deadlines and no later than 9 months prior to building completion. Requests to change the SID or FF&E schedule must be submitted to the NAVFAC Interior Designer for review/recommendation and approved by the NAVFAC Contracting Officer.

INTERIOR DESIGN SUBMITTAL AND MEETING REQUIREMENTS

STRUCTURAL INTERIOR DESIGN (SID)

The SID submittal process must begin following the award of the RFP. The SID submittal must include Interior Design programming documents, FF&E Floor Plans, and exterior & interior finish/color and material sample boards and binders. Refer to this RFP Part 4 Section Z10 General Performance Technical Specifications and Part 2 UFGS Section 01 33 10.05 20, Design Submittal Procedures.

The Contractor's Interior Designer must document and submit minutes of all meetings and phone calls to the NAVFAC Interior Designer's Representative within 7 days of each occurrence.

Provide the following SID meetings and submittals:

a. Concept Design Workshop (CDW) (10%-15%) or Initial Design Meeting: The Contractor's Interior Designer must meet with the Activity and IDD/Base Property for Marine Corps projects to develop the Interior Design SID programming documents, which must include a preliminary Furniture, Fixtures, and Equipment Plan and the FF&E Summary List. The Contractor's Interior Designer must conduct in-depth, room-by-room interviews to confirm Activity requirements (SIS, FF&E, AV, etc.) for the new facility(s). These interviews must occur during the CDW and must include building walk-through(s) at the Activity's current location and/or similar facility(s), if possible.

b. Design Development (35%-50%) Submittal: The Contractor's Interior Designer must provide a conceptual Finish Schedule, proposing finish materials to be used in all spaces. The Furniture and Equipment Plan, FF&E Summary List, and a preliminary Cost Estimate should be further developed and included in this submittal.

c. SID "Over-the-Shoulder" Review: Prior to the Prefinal (100%) Submittal, the Contractor's Interior Designer must meet with the NAVFAC Interior Designer's Representative for an "over-the-shoulder" review meeting to present a minimum of three options for the interior building finishes/colors/materials. Manufacturer choices and cost range of materials must be pre-approved by the Contractor to prevent any substitutions during the submittal process. Finish option samples for NAVFAC review must be clearly labeled and in a "loose" format for preliminary approval prior to the presentation to the Activity. Options must include manufacturer's label/specifications/data sheets. The over-the-shoulder review meeting must be held via conference call.

d. SID Presentation to Activity: The Contractor's Interior Designer must present a minimum of two (2) NAVFAC Interior Designer-approved options for the interior building finishes/colors/materials to the Activity for approval. Finishes must display manufacturer's label/specifications and be presented in a "loose" format for approval. The meeting must be held NAVFAC MIDLANT, located in Norfolk, VA. Photos documenting the selected finish option and preliminary finish schedule for that option must be emailed to NAVFAC Interior Designer's Representative within 7 business days.

e. Prefinal (100%) Submittal: The Contractor's Interior Designer must submit the Activity-approved interior building finishes/color/material selections. These drawings and all approved finishes must be submitted in 8-1/2" x 11" binder format, using heavy duty plastic sheet protectors. Mount finishes to heavy duty card stock. Four (4) sets of the

Prefinal SID Binder Submittal must be distributed to the NAVFAC Interior Designer's Representative and ROICC.

These finish options must be documented and submitted for review and approval as follows:

Submittal to NAVFAC Project Manager for distribution to the NAVFAC Interior Designer's Representative:

1. Updated Furniture and Equipment Plan
2. Floor Finish Plan(s) w/ floor patterns and accent wall locations
3. Finish Legend
4. Finish Schedule
5. Pre-Final Finish Selections and Physical Samples (photocopies of samples are not acceptable.)
6. CD copy of submittal in binder

f. Final Submittal: The Contractor's Interior Designer must incorporate the final approved Furniture and Equipment Plan, Finish Schedule, Floor Finish Plan and Finish Legend into the Contractor's final drawing set. These drawings and all approved finishes must be submitted in 8-1/2" x 11" binder format, using heavy duty plastic sheet protectors. Mount finishes to heavy duty card stock. Four (4) sets of the Final SID Binder Submittal must be distributed to the NAVFAC Interior Designer's Representative, ROICC, IDD, and the Activity.

The Final Submittal must include the following:

1. Updated Furniture and Equipment Plan
2. Floor Finish Plan(s)
3. Finish Legend
4. Finish Schedule
5. Final Finish Selections and Samples
6. CD copy of submittal in binder

SID CONSTRUCTION SUBMITTALS

No substitutions must be made to the SID finishes once they have been approved by NAVFAC during the design phase. In the event that revisions may be required due to unforeseen conditions such as discontinued product, such revisions must be submitted to the FEAD/ROICC and NAVFAC Interior Designer's Representative for approval by the NAVFAC Interior Designer before substitutions can be made.

FIXTURES, FURNISHINGS AND EQUIPMENT AND AUDIO VISUAL (FF&E and A/V)

The FF&E and A/V design process must begin at the CDW and develop concurrently with the building design. The submittals shall include fixtures, furnishings, and equipment specifications in accordance with the Activity requirements to produce an optimally functional facility. FF&E are all items that are not fixed to the structure, but are fully integrated with the floor plan, building systems, and finishes. Refer to RFP Part 4 Section Z10 General Performance Technical Specification and Part 2 UFGS Section 01 33 1-.05 20, Design Submittal Procedures.

Develop design as described and in accordance with the Activity requirements. Include in the design all loose furnishings required to produce an optimum functional facility, consistent with quality commercial design. This project also includes the preparation of specific detailed information for each selected item. Each submittal must demonstrate thorough interaction with the Activity requirements and complete coordination with the facility design and the SID.

These are minimum requirements and the Contractor must be prepared to provide any/all additional meetings and submittals that may be necessary to support the Interior Design effort/FF&E and A/V coordination. The Contractor’s Interior Designer and CTS must document and submit minutes of all meetings and phone calls to the NAVFAC Interior Designer’s Representative and Electrical Engineer’s Representative within 7 days of each occurrence.

Provide the following FF&E and A/V meetings and submittals:

a. FF&E and A/V Procurement Requirements Meeting (Interior Design Orientation): This meeting must occur at NAVFAC MIDLANT, located in Norfolk, VA prior to the Design Development (35%-50%) Submittal and the development of the FF&E package. The NAVFAC Interior Designer and NAVFAC Electrical Engineer must provide the Contractor's Interior Designer current sample documents to be used for the FF&E and A/V BVD Analysis solicitation package and submittals, review the Best Value Determination (BVD) process, discuss the number of Best Value Determinations required and discuss Blanket Purchase Agreement (BPAs), GSA or other mandatory sources to consider.

b. FF&E "Over the Shoulder" Review: Prior to the FF&E Concept Presentation and Best Value Determination (BVD) Analysis the Contractor's Interior Designer and CTS must meet with the NAVFAC Interior Designer and NAVFAC Electrical Engineer for an "over-the-shoulder" review to present a minimum of two preliminary FF&E options and to discuss A/V options. These can be presented in a "loose" format for preliminary approval prior to the Activity presentation. The "over-the-shoulder" review meeting must be held at NAVFAC MIDLANT, located in Norfolk, VA

c. FF&E and A/V Concept Presentation: The Contractor's Interior Designer and CTS must present the NAVFAC approved preliminary FF&E and A/V package to the Activity for approval. This presentation must include loose format samples and catalog cuts. Sample boards are not required. This meeting must occur in conjunction with the SID presentation to the Activity, if possible. NAVFAC OICC, Project Manager, Interior Designer and Electrical Engineer must be invited to this meeting.

d. Best Value Determination (BVD) Analysis "Over the Shoulder Review": Prior to issuing the BVD Analysis solicitation package, the Contractor's Interior Designer and CTS must send an electronic copy and a hard copy in binder format, of the complete FF&E BVD

Analysis solicitation package to the NAVFAC Interior Designer and the complete A/V BVD Analysis solicitation package to the NAVFAC Electrical Engineer for review. The Contractor's Interior Designer and CTS must meet with the NAVFAC Interior Designer and NAVFAC Electrical Engineer for an "over-the-shoulder" review of all required solicitation packages and to review the most current NAVSUP BPA vendor list and discuss GSA Contract Audio Visual vendors. The "over-the-shoulder" review meeting must be held at NAVFAC MIDLANT, located in Norfolk, VA.

BVD Analysis Solicitations must include the following:

1. Copy of the BVD Analysis Request for Pricing cover letter – Indicate all revisions to NAVFAC-provided template utilizing “Track Changes.” NAVFAC-approved revisions may be added to this document, but no items may be deleted.
2. BVD Analysis Request for Pricing Spreadsheet/Questionnaire with “basis of design” item product numbers, photos & descriptions
3. Detailed Technical Specifications/Criteria developed for each FF&E and AV item in NAVFAC MIDLANT’s standard format to establish minimum acceptable FF&E requirements for comparable bids.
4. Project Specific Room/Furniture Typicals
5. Furniture and AV Plans with Legends coded to the BVD Analysis RFP (PDF format)
6. Contractor’s subcontract agreement/terms and conditions (if applicable)
7. Contractor’s Interior Designer must request the most current BPA Contract Holder vendor information prior to sending out the bid solicitations.

e. BVD Submittal and "Over the Shoulder" Review - The Contractor's Interior Designer must submit one (1) hard copy in binder format of the BVD package to the NAVFAC Interior Designer’s Representative, NAVFAC Electrical Engineer’s Representative, and one (1) copy to IDD/Base Property for Marine Corps projects. An electronic copy must be sent to the NAVFAC Contracting Officer, the NAVFAC Interior Designer and the NAVFAC Electrical Engineer. Additional back-up information from specific bid packages may be requested on an as-needed basis. The "over-the-shoulder" review meeting will be held via conference call to review the results of the solicitation and determine a best value recommendation. Submit the following in 3-ring binders and include a CD copy in each for review and approval:

   The BVD Submittal must include the following:

   1. Cover Title Page (project name, project #, location, submittal date, submittal title)
   2. Table of Contents
   3. Point of Contact List
   4. Narrative of Interior Designer Objectives
   5. Copy of all information sent to bidders and documentation that all required sources were contacted

6. Technical Specifications used in bid request for all furniture, AV, etc.

7. BVD Analysis Request for Pricing Spreadsheet/Questionnaire completed by each bidder
8. Back-up Information submitted by each bidder (cut sheets/highlighted pricing sheets/technical specifications, pricing, dealer and manufacturer qualification for each product showing that products meet all requirements.)
9. Responses from UNICOR (FF&E only)
10. Completed BVD Analysis Pricing Evaluation Spreadsheet comparing bidder quotes/responses
11. Contractor's Interior Designer/Electrical Engineer's recommendation for the Best Value vendor and justifications
12. CD copy of the FF&E and A/V BVD Submittal binder(s)

f. The Contractor's Interior Designer must coordinate a mock-up for best value review of FF&E items as required by NAVFAC for at least the top three (3) BPA vendors submitting the highest rated FF&E proposals, as determined by NAVFAC. The reviewers must include the Contractor's Interior Designer, NAVFAC Interior Designer, Contracting Officer, IDD/Base Property, and the Activity.

g. Preliminary FF&E and A/V Submittal(s): The Preliminary submittal(s) must be due at pre-final (100%). It must be presented to the Activity and NAVFAC Interior Designer's Representative and NAVFAC Electrical Engineer's Representative in loose format at a meeting to occur at the Activity. Presentation will consist of loose samples to include all cut sheets and finishes from the recommended vendors. Immediately following this meeting, the Preliminary FF&E and AV submittal binders must be submitted. Five (5) submittals are required:

   One each for the NAVFAC Interior Designer's Representative, NAVFAC Electrical Engineer's Representative, three for the ROICC and IDD/Base Property, and one for the Activity.

   Submit the following in a 3-ring binder for review and approval:

   The Preliminary FF&E and A/V Submittal(s) must include the following:

   1. Cover Title Page (project name, project #, submittal date, and submittal title identified on binder cover and spine)
   2. Table of Contents
   3. Manufacturer Point of Contact List (includes contact info for recommended Best Value BPA Holder(s) vendors and subcontractors)
   4. Preliminary FF&E and A/V list(s) (Cost Summary) to include shipping, freight, handling, professional installation, project management, HAR and applicable sales tax
   5. Preliminary Procurement Data Spec Sheets completed for each product. Indicate general appearance as well as proposed finish and fabric selections

6. Furniture and A/V placement plans coded to the FF&E and A/V list(s) and Procurement Data Spec Sheets; include electrical and AV plans for coordination.
7. Pre-Final Finish/Fabric Selections and Samples in 8-inch by 10-inch binder format mounted on heavy-duty card stock in edge-reinforced heavy-duty plastic sheet protectors.
8. Copy of Quote(s) and Bill of Materials (BOM) from the vendor(s) determined to be the best value. Copy BOM line items to Cost Summary Item Codes.9.Indicate and provide explanations for all changes to quantities and/or pricing that occur between accepted vendor proposal and Final Submittal.
10. Copy of Final Quote Summary, broken out by line item of product and related services and applicable taxes, on letterhead from the vendor(s) determined to be the best value.

h. The Contractor and his Interior Designer must coordinate an on-site mock-up and review of FF&E items as required by NAVFAC with the selected, best-valued BPA vendor(s). Building finishes and fixtures must be installed in the affected area(s) to the greatest extent practicable in order to assess building systems/fixture coordination. The reviewers must include the NAVFAC Interior Designer and Construction Manager, the Contractor's Interior Designer, IDD, Base Property, and the Activity. The BPA vendor must be available on-site to respond to questions. The mock-up exercise must be completed prior to the submittal of the Final FF&E submittal and award of the modification for turnkey furniture procurement.

i. Final FF&E and A/V Submittal: The Contractor's Interior Designer must submit the Final FF&E and A/V Package(s) within 30 to 90 calendar days following the receipt of review comments on the preliminary FF&E submittal. **All required documentation revisions of price changes and product reselection due to price increases or discontinued product must be the responsibility of the Contractor's Interior Designer.** Five (5) submittals are required; (1) for the NAVFAC Project Manager for distribution to the NAVFAC Interior Designer's Representative, NAVFAC Electrical Engineer's Representative, (3) for the FEAD/ROICC and IDD/Base Property, and (1) for the Activity.

   The Final submittal must include the following:

   1. Cover Title Page (project name, project #, submittal date, submittal title identified on binder cover and spine)
   2. Table of Contents
   3. Manufacturer Point of Contact List (includes contact info for recommended Best Value BPA Holder(s), vendors and subcontractors)
   4. Final FF&E and A/V list(s) (Cost Summary) to include shipping, handling, freight, professional installation, project management, HAR and any applicable sales tax.
   5. Final Procurement Data Spec Sheets completed for each product. Indicate final finish and fabric selections. Provide images of item and finishes to be represented.
   6. Final Finish Selections and Memo Samples for the FF&E submitted in 8 x 10 binder format, mounted on heavy-duty card stock, using heavy-duty plastic sheet protectors.

7. Final Furniture and AV Placement Plans coded to the FF&E and AV list(s), Procurement Data Sheets, and specifications; include electrical and AV plans for coordination.
8. Copy of Final Quote(s)/Bill of Materials (BOM) on letterhead from the vendor(s) determined to be the Best Value. Code BOM line items to FF&E Cost Summary Item Codes.
9. Indicate and provide explanations for all changes to quantities and/or pricing that occur between accepted vendor proposal and Final Submittal.
10. Best Value Determination Guidelines sheets (completed and signed by the Contractor's Interior Designer and CTS-D).
11. Copy of Final Quote Summary, broken out by line item of product and related services and applicable taxes, on letterhead from the vendor(s) determined to be the best value.
12. CD copy of the final FF&E and AV binder(s).

j Punch List: The Contractor's Interior Designer (and A/V consultant or other specialty consultants, if applicable) must attend at least two punch list site visit with the installation dealer(s), NAVFAC Interior Designer and the Base Representative/Activity Contact. The first site visit must identify all punch list items (at installation dealer's 98 percent completion resolved and the second (at 100 percent completion).

FF&E CONSTRUCTION SUBMITTALS

Submit any revisions or deviations caused by discontinued items to the Contracting Officer for approval by the NAVFAC Interior Designer.

SD-10 Operation and Maintenance Data

List Operation and Maintenance Manuals for seating, systems furniture and keyboard trays.

E2010 FIXED FURNISHINGS (SID)

Fixed furnishings (SID) are funded as part of the construction project and are not funded as part of FF&E Each submittal must demonstrate complete coordination with the facility design and with the package for movable furnishings.

Develop design as described herein and provide storage shelving, equipment racks, and window treatments. Cross reference C10 Interior Construction, and C30 Interior Finishes, for performance requirements. Each submittal must demonstrate complete coordination with the facility design and with the package for movable furnishings.

E201001 FIXED ARTWORK

As required, graphics, artwork and/or logo of activity must be included in public and meeting spaces. Coordinate with Activity and NAVFAC MIDLANT Interior Designer's Representative for placement locations.

E201002 WINDOW TREATMENTS

Provide manually operated double-roller sunscreen and room darkening shades at all exterior windows. These fixed window treatments are considered SID and are funded as part of the construction project.

E201003 FIXED SEATING

As required, but not limited to, provide fixed locker room benches, auditorium fixed seating and site furniture, including waste receptacles.

Provide auditorium seating with tablet arms. Arm caps must be molded vinyl. Seatbacks must be molded vinyl. Interior seat and back must be padded and fully upholstered.

E201004 INTERIOR LANDSCAPE (FIXED)

NOT USED

E201006 LOBBY AREA

Design and provide lobby areas consistent with quality commercial design, architecturally significant in scale, and coordinated with the interior finishes for each facility. Lobby areas must reflect the mission of the client and must be designed to accommodate the function and program required for the facilities. Lobby areas must include the following elements: fixed artwork, graphic floor inlay, and decorative lighting. Lobby elements noted above are part of the construction contract.

E2020 MOVABLE FURNISHINGS

The design of the FF&E package is funded as part of the construction contract base bid. The purchase and installation coordination of FF&E is a planned modification to the contract and funded separately as part of Collateral Equipment. The specific process is outlined in PTS E20 in Part 4 of this RFP. If a Collateral Equipment list is provided within this RFP, the costs associated with the purchase and installation of these items are NOT to be included in the base bid. The estimated Collateral Equipment cost is provided for information purposes only. The Contractor only needs to propose the Handling and Administrative Rate (HAR)

Design and provide a FF&E package in accordance with UFC 03-120-10, *Interior Design,* and other portions of this RFP for all areas as developed during Activity programming to provide a fully usable and complete facility. Collateral Equipment may also include specialty items specified by the Activity and the Contractor's Interior Designer is responsible for incorporating these into the FF&E and/or the A/V package. The estimated Collateral Equipment cost(s) are provided for information purposes only. Actual requirements may vary, and it is the responsibility of the Contractor’s Interior Designer and/or Equipment Specialist to determine the specific requirements of the End User during the design phase and design to these requirements.

The FF&E Package must include shipping, freight, handling, and professional installation, project management, applicable sales tax, and HAR.

A Best Value Determination must be performed on a minimum of three manufacturers and UNICOR for orders exceeding the micro-purchase threshold from an individual manufacturer/vendor. Multiple BVDs may be required in order to complete the final FF&E and

A/V package. The required quantity of BVDs to be performed must be determined by the NAVFAC Interior Designer's Representative during the design phase and is dependent on the appropriate NAVSUP BPA category(s) to be utilized and specific project requirements. Documentation must be provided to the Government with the final FF&E package. Specific Documentation is indicated in Part 4 of the RFP. The BVD Statement must be completed and signed by the contractor's interior designer. Sample BVD forms and instructions must be reviewed during the FF&E Procurement Requirements Meeting. Forms can be obtained from the WBDG at http://www.wbdg.org/ffc/navy-navfac/collateral-equipment.

The Contractor, as a planned modification, must be authorized by the Government Contracting Officer to procure all furniture/furnishings in the approved final FF&E and A/V package using predominately negotiated Federal contracts as directed by the Contracting Officer and the NAVFAC Interior Designer and Electrical Engineer. When the modification for turnkey furniture and A/V procurement is exercised, the Contractor's proposed Handling and Administrative Rate (HAR) must not exceed 5% of the total cost of the FF&E, and A/V shipping, freight, handling, project management, and installation. The HAR includes all of the contractor's efforts related to the storage, coordination, handling and administration of subcontractors, deposits, bonds and all other associated costs and profit for the procurement of FF&E and A/V. No other charges, fees, or markups must be authorized. The contractor must establish and submit a fixed percentage figure, for the administration effort of this modification (HAR), with the initial project proposal as part of the contractor's Pricing Schedule.

E202001 MOVABLE ARTWORK

Provide movable artwork as required by Activity/User and NAVFAC Interior Designer's Representative. Movable artwork is part of the FF&E package.

E202002 MODULAR PREFABRICATED FURNITURE

Provide modular freestanding workstations as required. Minimize the use of electrified panel furniture systems. Provide at a minimum, an articulating keyboard tray with left- or right-handed mouse extension for each computer location.

E202003 FREESTANDING FURNITURE AND FILES

Provide ergonomic task seating, lounge, reception and guest seating, storage and filing, tables, as required.

E202004 RUGS & ACCESSORIES

Provide area rugs, lamps, soft window treatments (drapery and hardware) interior landscaping, and other decorative items as required.

E202005 MULTIPLE SEATING (MOVABLE)

NOT USED

E202006 INTERIOR LANDSCAPING (MOVABLE)

Provide interior landscaping (planters, site furnishings, etc.) as required.

E202090 OTHER MOVABLE FURNISHINGS

Provide waste receptacles, recycling containers, fire extinguishers, clocks, literature racks, microwave ovens, refrigerators, non-plumbed coffee makers, and other appliances as required.

--End of Section--

F20 SELECTIVE BUILDING DEMOLITION – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

A group of individual buildings are to be removed in their entirety as a part of the scope of this RFP. Refer to the list in F2010 Building Elements Demolition.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEMS REQUIREMENTS

Perform all off-site work necessary to meet the requirements of the project, local codes, reference standards, technical specifications and performance criteria.

Identify and obtain all permits to comply with all federal, state, and local regulatory requirements associated with this work. The contractor must submit complete the "Permits Record of Decision" (PROD) form with the first design submittal package. A blank PROD form is in the UFC 3-201-01, *Civil Engineering*. Contractor must determine correct permit fees and pay said fees. Copies of all permits, permit applications, and the completed PROD form must be forwarded to the EFD Environmental Reviewer.

Coordinate and obtain approval from the Contracting Officer for proposed haul route(s), work site access point(s), employee parking location(s) and material laydown and storage area(s).

F2010 BUILDING ELEMENTS DEMOLITION

This project includes the complete demolition of the following: Buildings 125, 125A, 127, H13 and Prefab trailers 125B and 125C.

F2010 1.1 GENERAL DEMOLITION

Completely remove all shallow foundations, foundation walls, slabs, pits, pile caps, etc. Remove existing deep foundations, such as piles, to a depth of 48 inches below existing grade.

F2010 1.2 UTILITIES

Remove all existing utility service connections including but not limited to water, sanitary sewer, natural gas, electric, and telecom. All service connections must be demolished to the service main and capped per all State and Federal requirements.

Demolish the buildings' associated electrical utility transformers and primary and secondary service feeders and pathways.

Demolish the buildings' associated telecommunications services and pathways.

Utility demolition must be coordinated with on-site personnel for planned outages.

F2010 1.3 DUST CONTROL

Prevent the spread of dust and debris to occupied portions of the building and avoid the creation of a nuisance or hazard in the surrounding area.

F2010 1.4 TRAFFIC CONTROL

Where pedestrian or vehicle safety is endangered, use traffic barricades to reroute traffic to safe routes.

F2010 1.5 WEATHER PROTECTION

NOT USED

F2010 1.6 BURNING

Where burning is permitted, the Contractor must adhere to federal, state and local regulations. Contractor must comply with Base Bulletin 5090 (Open Burning of Vegetation Debris aboard Marine Corps Base Camp Lejeune and Marine Corps Air Station New River). Refer to Part 6 Attachments – General for the Base Bulletin 5090.

Coordinate all open burning with the Air Quality Manager at MCBCL (910-451-5836).

F201001 SUBSTRUCTURE & SUPERSTRUCTURE

Brief descriptions of the buildings to be demolished follow. Refer to Demolition Site Plans in Part 6 for additional information.

Constructed in the 1940s, Building 125, approximately 250 ft long x 74 ft at its widest, is generally a one-story rectangular masonry structure, but has a second floor component near the center section of the building. The building is supported on shallow foundations (continuous strip footings at the perimeter and individual spread footings at interior columns). The first floor comprises a structured one-way concrete slab and joist system spanning between grade beams and foundation walls. The slab is 2 inches thick, and the joists are 10 inches deep and spaced at 2 feet on center. The second floor comprises a 2 ½ inch thick concrete slab supported by 9 inch deep steel joists (beams) spaced at 2 feet on center. The joists are supported by load bearing walls and concrete girders. The roof comprises a series of structural steel trusses spanning between columns and load bearing walls. Building 125A is a small (< 200 sf) single story masonry shed building adjacent to Building 125. Buildings 125B and 125C are prefabricated mobile structures.

Building 127 is a single-story T-shaped masonry building, approximately 60 ft wide x 137 ft long, of the same vintage and similar construction to 125.

Building H13 is a single-story masonry building built in the late 1980s on shallow foundations. It is approximately 95 ft wide x 140 ft long with a bump-out of approximately 22’-0” x 32’-0” at its entry.

F201002 EXTERIOR CLOSURE

Buildings 125, 125A, 127 and H13 have a masonry exterior closure in red brick.

F201003 ROOFING

Buildings 125 and 127 have high slope roofs with shingles on wood over steel trusses. Building H13 has a flat roof with membrane roofing on insulation over metal decking.

F201004 INTERIOR CONSTRUCTION & FINISHES

Interior construction of these buildings appears to be that of typical office interiors, i.e. gypsum board partitions and acoustical or gypsum board ceilings.

F201005 CONVEYING SYSTEMS

No conveying systems are being demolished.

F201006 MECHANICAL SYSTEMS

Demolish mechanical and plumbing systems. Follow Camp Lejeune Mechanical Design Guidance for proper refrigerant handling.

F201007 ELECTRICAL SYSTEMS

Demolish existing buildings' electrical distribution systems in their entirety, including equipment, luminaires, devices, wiring, and pathways. Contact Tony Beckwith at (910) 451-2790 to coordinate electrical demolition. If unsuccessful, contact the construction manager who will coordinate with the Public Works Department.

Demolish existing buildings' communications systems in their entirety, including equipment, devices, wiring, and pathways.

Demolish existing buildings' fire alarm systems in their entirety, including equipment, devices, wiring, and pathways. Prior to demolition, contact base fire alarm technicians and allow time for their retrieval of existing fire alarm system panels, devices, appliances, etc. Contact David Jones (910) 376-0437 to schedule the removal of the existing fire alarm system components. If unsuccessful, contact the construction manager who will coordinate with the Public Works Department.

F201008 EQUIPMENT & FURNISHINGS

Equipment and furnishings must be removed by the Contractor prior to the removal of the building.

F201090 OTHER NON-HAZARDOUS SELECTIVE BUILDING DEMOLITION

NOT USED

F2020 HAZARDOUS COMPONENT ABATEMENT

A Hazardous Material Survey Report will be provided by the government for each building listed in Section F2010 above. The reports are to be provided after the issuance of this BD RFP but prior to the award of the project.

F2020 1.1 PRIVATE QUALIFIED PERSON (PQP)

The General Contractor is required to hire as a first tier subcontractor a PQP to ensure compliance with the approved work plans and perform independent inspections, testing and verification of the hazardous components work including asbestos, lead containing paint, and any other hazardous material identified in the Destructive Hazardous Materials Survey Report.

F2020 1.2 FURNISHINGS

All furnishings in the listed buildings will be removed prior demolition.

F2020 1.3 ASBESTOS

Refer to F2020 above.

F2020 1.4 LEAD BASED PAINT

Refer to F2020 above.

F2020 1.5 PAINT RELATED WORK

Refer to F2020 above.

F2020 1.6 MERCURY & LLR COMPONENTS

Refer to F2020 above.

F2020 1.7 PCB'S

Refer to F2020 above.

F2020 1.8 OZONE DEPLETING SUBSTANCES (ODS)

Refer to F2020 above.

F2020 1.9 ANIMAL DROPPINGS

Refer to F2020 above.

F2020 1.10 MOLDS AND SPORES

Refer to F2020 above.

F2020 1.11 DISPOSAL

F202001 SUBSTRUCTURE & SUPERSTRUCTURE

Refer to F2020 above.

F202002 EXTERIOR CLOSURE

Refer to F2020 above.

F202003 ROOFING

Refer to F2020 above.

F202004 INTERIOR CONSTRUCTION & FINISHES

Refer to F2020 above.

F202005 CONVEYING SYSTEMS

No conveying systems are to be demolished

F202006 MECHANICAL SYSTEMS

Refer to F2020 above.

F202007 ELECTRICAL SYSTEMS

Refer to F2020 above.

F202008 EQUIPMENT & FURNISHINGS

Refer to F2020 above.

F202090 OTHER HAZARDOUS SELECTIVE BUILDING DEMOLITION

NOT USED

--End of Section--

G10 SITE PREPARATION – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Provide site preparation that supports project sustainability goals of UFGS 01 33 29.05 20 Sustainability Requirements for Design Build.

The site preparation system consists of site clearing, demolition, salvage, relocation, earthwork, and hazardous waste remediation necessary to ready the site for other work associated with the project.

GENERAL SYSTEM REQUIREMENTS

Develop the project site and perform all off-site work necessary to meet the requirements of the project, antiterrorism criteria, local codes, reference standards, technical specifications and performance criteria.

A topographic survey of the existing site has not been performed for the site. The Contractor is required to perform a topographic survey of the project area in accordance with UFC 1-300-09N, *Design Procedures*, that will be impacted by his work. Include this topographic survey in all design submittals. The concept plan provided in Part 6 are based GIS information field verified to the extent practical. Underground utility sizes and exact locations were not able to be verified. The GIS topographic information has been provided to show the location of existing facilities, areas of new work required by this RFP and the character of the sites. Prior to starting work, physically verify the location of all existing utilities and obtain all additional survey data required to provide a quality final design. The existence, size and/or location of the utilities are not guaranteed by the GIS surveys provided. The Contractor must show subsurface utility locations on the topographic survey in accordance with ASCE 38-02 Quality Level B. Where critical utility crossings or conflicts are likely, show subsurface utility locations on the topographic survey in accordance with ASCE 38-02 Quality Level A. Verify the location of all utilities prior to construction.

Prior to beginning excavations, the Contractor must contact the Public Works Office. The Contractor must hire a private utility locating service to locate all Government owned utilities. Contractor will be responsible for obtaining permits, prior to excavation and will be responsible for maintaining utility markings and calling to have utility remarked if utility markings are not preserved. Contractor must add all located underground utilities to the topographic survey and must provide to the Government both a hard copy and in electronic format.

Unless otherwise noted, provide new facilities at the locations indicated on the drawings in Part 6.

Minimize the impact of construction activity on operations and neighboring facilities.

Identify and obtain all permits to comply with all federal, state, and local regulatory requirements associated with this work. Submit a complete "Permits Record of Decision" (PROD) form with the first design submittal package. A blank PROD form can be obtained at the Download Tab of Part 6 of the NAVFAC Design-Build website at the following link http://ndbm.wbdg.org/system/html/6/453 . Determine correct permit fees and pay said fees. Forward copies of all permits, permit applications, and the completed PROD form to the Government's Civil Reviewer and Environmental Reviewer. Perform work in accordance with the obtained permits.

Jurisdictional tidal and non-tidal wetlands have not been identified on the project site.

Coordinate and obtain the Resident Officer In Charge of Construction's (ROICC) approval for proposed haul route(s), work site access point(s), employee parking location(s) and material laydown and storage area(s).

Refer to Site Analysis and Building Requirements Sections for additional site preparation functional program information.

Provide site preparation that supports project sustainability goals.

GOVERNMENT PROVIDED GEOTECHNICAL INFORMATION

Subsurface soil information is included in Part 6 – Attachments. Refer to Part 3, Section 6, ESR A10 for additional information concerning the Government provided subsurface data and the pre-bid and post-award requirements of the Contractor and Geotechnical Engineer.

GEOTECHNICAL ENGINEERING CONSULTATION AND STUDY

Refer to Part 3, Section 6, ESR A10 for the pre-bid and post-award requirements of the Contractor and Geotechnical Engineer.

GEOTECHNICAL EARTHWORK REQUIREMENTS

Refer to Part 3, Section 3, Site Analysis for base bid requirements concerning earthwork and site preparation.

G1010 SITE CLEARING

G101001 CLEARING

Preserve trees at the perimeter of the project site.

The Camp Lejeune Forest Management Program has first right of refusal for all merchantable timber on Camp Lejeune. If the first right of refusal is not waived, the Government will, by separate Contract, harvest saleable timber from the project site. Design Build Contractor must clear and dispose of remaining timber, limbs, tops, stumps, tree tops, and logging slash debris.

If the first right of refusal is waived, timber on the project site noted for clearing and grubbing will become the property of the Design Build Contractor. Remove all timber from the project site and dispose of it off installation. See G101002 TREE REMOVAL.

Provide MCB Camp Lejeune Forest Management final government approved clearing limits for Timber Management determination on merchantable timber first right of refusal before commencement of site construction work. Provide geospatial data shape file per Part 6 Chapter A MCIEAST Specs for geospatial data deliverables. See GIS DATA DELIVERABLES Section 01 78 30.00 22 in Part 2 – General Requirements.

Adhere to federal, state and local regulations for burning. Design Build Contractor must comply with MCIEAST-MCB CAMLEJBul 5090 (Open Burning of Vegetative Debris). Refer to Part 6 Attachments – General for the Base Bulletin 5090.

Coordinate all open burning with the Air Quality Manager at MCBCL (910-451-5836).

G101002 TREE REMOVAL

Remove and dispose of all as required for project construction.

To reduce the incidental take of migratory birds and their nests, trees with active nests should not be cleared. If tree clearing is proposed between April and July, contact the LWRS Biologist for additional guidance.

G101003 STUMP REMOVAL

Remove all stumps under building foundations, roads, parking areas, hard stands, and storage areas as required for project construction.

G101004 GRUBBING

Remove all root mat and organic debris under building foundations, roads, parking areas, hard stands, and storage areas as required for project construction.

G101005 SELECTIVE THINNING

NOT USED

G101006 DEBRIS DISPOSAL

Dispose of all grubbing and clearing residue, demolished material, rubbish and debris generated by this project by hauling off-site and off station.

Dispose of or recycle waste materials in accordance with Part 2 Section 01 57 19, *Temporary Environmental Controls.*

G1020 SITE DEMOLITION & RELOCATIONS

This project requires the mass demolition of multiple buildings and service utilities.

G102001 BUILDING MASS DEMOLITION

The buildings to be demolished are Buildings 125, 125A, 127 and H13. Two prefabricated trailers, Buildings 125B and 125C, must be removed from their current locations. Refer to Section F2020, "Hazardous Component Abatement" for requirements regarding removal of hazardous components.

G102002 ABOVE GROUND SITE DEMOLITION

Remove and salvage the existing light poles along McHugh Boulevard.

Remove and dispose all other existing site features that conflict with the construction of the project, including asphalt and concrete pavements.

G102002 1.1 ABOVE GROUND STORAGE TANKS

An aboveground storage tank report is not provided to support this project.

Prior to starting work, conduct any additional testing that may be needed to provide a final design and comply with all applicable federal, regional, state and local regulations. Refer to UFC 3-800-10N, *Environmental Engineering for Facility Construction*, for additional requirements and criteria.

Remove and dispose of any aboveground storage tanks at existing buildings being demolished.

G102003 UNDERGROUND SITE DEMOLITION

Preserve the following underground site elements: All existing utilities required for the proposed project.

Remove or relocate existing utilities under or within 10 feet (3.0 m) of any new facilities or building additions. Existing utilities include but are not limited to piping, structures and conduits. Remove all appurtenances associated with the utility to be removed so there is no presence of the utility at ground surface..

Remove existing utility structures, not within the building footprint, to 3 feet below existing or new adjacent grade, whichever is greater. Break up bases to permit drainage. Fill with clean sand.

Abandon utility systems in a manner that conforms to applicable codes and regulations. When piping is abandoned in place, fill abandoned piping with flowable fill.

Do not open cut pavement that is to remain to demolish utilities. Fill piping and/or conduits under pavements with flowable fill.

Remove all utility service connections of demolished buildings back to the main and cap per State and Federal regulations.

G102003 1.1 UNDERGROUND STORAGE TANKS

An underground storage tank report is not provided to support this project.

G102004 BUILDING RELOCATION

Refer to Section F2020, "Hazardous Component Abatement" for requirements related to removal of hazardous components.

G102005 UTILITY RELOCATION

Comply with the requirements of the utility provider concerning the utility relocation of the phone and fiber optic utilities. Comply with NAVFAC requirements and all applicable UFCs concerning other utility relocations..

Relocate overhead electrical service lines and associated poles along McHugh Boulevard and Birch Street to accommodate the proposed site work.

Refer to the Part 3 narratives and Part 6 for additional utility relocation information and GIS utility information that is within the proposed site area respectively.

G102006 FENCING RELOCATION

NOT USED

G102007 SITE CLEANUP

Waste materials will become the property of the Contractor; transport, dispose of or recycle waste materials in accordance with Part 2 Section 01 57 19, *Temporary Environmental Controls.*

G102090 OTHER SITE DEMOLITION & RELOCATIONS

NOT USED

G1030 SITE EARTHWORK

The Designer of Record is required to utilize UFGS Section 31 23 00.00 20, Excavation and Fill, for the project specification, and to submit the edited specification section as a part of the design submittal for the project.

G103001 GRADING

Grading shall conform with UFC 3-201-01, *Civil Engineering*.

G103002 COMMON EXCAVATION

Perform common excavation with equipment of sufficient size to accomplish the work required. Over excavation of areas to obtain additional satisfactory material for the contractor's use is not permitted.

Preserve natural topographic features to minimize cut and fill requirements. All excavated materials which cannot be reused on the project as common fill (surplus soils) must be transported to one of the designated locations on Government property. Refer to RFP Part 2, Specification 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS for locations and contact information. No surplus material will leave Government property without written approval of the installation Environmental Program Manager and the Contracting Officer.

G103003 ROCK EXCAVATION

Blasting will not be permitted.

G103004 FILL & BORROW

Provide borrow and select fill from off-base sources.

A grading plan has not been designed, therefore it has not been determined if common fill, backfill and fill material, select fill or top soil is available on site in the required quantities.

On-site soils that are determined as clean fill by the geotechnical engineer via testing must be backfilled and compacted in accordance with the requirements in this section.

G103004 1.1 REQUIREMENTS FOR OFF SITE SOIL

For each borrow site, provide borrow site testing for hazardous materials characteristics from a composite sample of material, collected in accordance with standard soil sampling techniques. Do not bring material onsite until tests results have been received and approved by the Contracting Officer.

G103005 COMPACTION

Perform compaction per the Performance Technical Specifications or the Contractor's geotechnical report, whichever is more stringent.

G103006 SOIL STABILIZATION

The following methods of soil stabilization will not be allowed: lime slurry, and pressure grouting.

G103007 SLOPE STABILIZATION

Provide slope stabilization through appropriate grading and site design for a minimum factor of safety of 1.5 or slope that does not exceed the maximum slope per local code requirements.

G103008 SOIL TREATMENT

Treat the area around the entire foundation of each building for termite control in accordance with manufacturer's instructions.

G103009 SHORING

Provide shoring, bracing, and sheeting, etc. as required to prevent undermining of foundations, pavement, utility pipes, structures, and slabs and prevent slippage or movement in embankments or slopes adjacent to excavations to facilitate construction. Shoring will be in accordance with Section 25 A and B of EM 385-1-1. Provide a sheeting and shoring plan if required by local codes and/or OSHA. The plan must be signed and sealed by a professional engineer.

G103010 TEMPORARY DEWATERING

Provide pumps, temporary ditching, and grading required to maintain groundwater levels at the Contractor’s geotechnical engineer’s recommended level below footings and or pavements during construction. Ensure that there are no groundwater conditions that will promote deterioration of the soil or interruptions to the construction progress.

All dewatering effluent must be filtered per NCDEQ erosion and sediment control requirements prior to discharge to minimize sediment to surface waters.

G103011 TEMPORARY EROSION & SEDIMENT CONTROL

Obtain an Erosion and Sediment Control permit required for the proposed work from NCDEQ. Submit the permit application to the COR for approval prior to submitting to NCDEQ.

G103090 OTHER SITE EARTHWORK

NOT USED

G1040 HAZARDOUS WASTE REMEDIATION

A contaminated soil/groundwater report is not provided to support this project.

Prior to starting work, conduct any additional testing that may be needed to provide a final design and comply with all applicable federal, regional, state and local regulations. Refer to UFC 3-800-10N, *Environmental Engineering for Facility Construction*, for additional requirements and criteria.

G1040 1.1 CONTAMINATED SOIL AND GROUNDWATER

The project site does require contaminated soil or groundwater work.

Perform contaminated soil or groundwater work in accordance with the specifications and plans provided in Parts 5 and 6.

--End of Section--

G20 SITE IMPROVEMENTS – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

Provide site improvements that support project sustainability goals of UFGS 01 33 29.05 20 Sustainability Requirements for Design Build.

The site improvements system consists of pavements and pavement related features, landscaping and other exterior site development work related to this project. Provide a pavement design by a licensed Professional Engineer familiar with conditions local to the project site. Site design, including but not limited to design of parking and pedestrian circulation, will include coordination with the Civil Engineer and the Landscape Architect.

GENERAL SYSTEMS REQUIREMENTS

Provide site improvements as required to make a useable facility that meets functional and operational requirements, incorporates all applicable anti-terrorism, force protection and physical security requirements and blends into the existing environment.

Provide accessibility in conformance with applicable ADA/ABA requirements and requirements of UFC 1-200-01 , *General Building Requirements*.

Identify and obtain all permits to comply with all federal, state, and local regulatory requirements associated with this work. Complete the "Permits Record of Decision" (PROD) form with the first design submittal package. A blank PROD form can be obtained at the Download Tab of Part 6 of the NAVFAC Design-Build website at the following link http://ndbm.wbdg.org/system/html/6/453 . Determine correct permit fees and pay said fees. Forward copies of all permits, permit applications, and the completed PROD form to the Government's Civil Reviewer. Perform work in accordance with the obtained permits.

Provide site improvements that support project sustainability goals.

Minimize the impact of construction activity on operations and neighboring facilities.

Refer to Site Analysis and Building Requirements Sections for additional site improvement functional program information.

G2010 ROADWAYS

Provide roadways and roadway repairs, as required, to allow for safe, convenient and logical circulation, while discouraging through traffic. A segregated MOV-only drive aisle must be provided for access to the outdoor training areas. Emergency vehicle access, designed with required turning radius for emergency vehicles, immediately adjacent to the building and associated gates must be provided. The design of pavements must include the anticipated daily traffic over the life of the project (20-years) as well as the existing soil conditions at the site. See part 3 Site Analysis for pavement section bid criteria.

Provide roadways of bituminous pavement or Portland cement concrete (PCC) where indicated on the drawings in Part 6. Permeable pavement must not be used. Aggregate pavement may be used for access roads to mechanical equipment if approved by NAVFAC.

Provide new roadway and other pavement sections as required by soil conditions and determined by the Designer of Record. Design pavement sections in accordance with UFC 3-201-01 *Civil Engineering*.

Provide other roadway improvements including traffic signalization, markings, and signage.

G201001 BASES & SUBBASES

The following materials will not be allowed for base or subbase courses: lean concrete, cement stabilized, sand-clay, lime rock, or shell.

G201002 CURBS & GUTTERS

Concrete curb and gutter may be used to tie into adjacent facilities. Concrete curbs and gutters may be used in accordance with the NCDOT standards or as specified in UFC 3-201-01, Civil Engineering, whichever is more stringent. Where NCDOT do not include concrete materials for curbs and gutters, provide concrete in accordance with the standard mix of NCDOT for a minimum compressive strength at 28 days of 3500 psi concrete.

G201003 PAVED SURFACES

Provide Portland cement concrete with a minimum design flexural strength of 650 psi (4.48 MPa) in not more than 28 days.

Recycled asphalt pavement material may be used for bituminous concrete pavement as permitted by the NCDOT.

G201004 MARKING & SIGNAGE

Provide pavement markings including crosswalks per UFC 3-201-01.

Provide signage per UFC 3-201-01 and the BEAP.

Provide temporary pavement markings and signage throughout construction to meet phasing requirements indicated in the project program. Provide temporary signage in accordance with the Manual on Uniform Traffic Control Devices (MUTCD) latest edition.

G201005 GUARDRAILS & BARRIERS

Provide guardrails, wheelstops and bollards in accordance with the UFC 3-201-01, *Civil Engineering*.

G201006 RESURFACING

Provide resurfacing of existing pavement by milling and bituminous overlay.

G201090 OTHER ROADWAYS

NOT USED

G2020 PARKING LOTS

Provide parking for 400 vehicles for the project. The design of pavements must include the anticipated daily traffic over the life of the project (20-years) as well as the existing soil conditions at the site.

Provide parking lots of bituminous pavement or Portland cement concrete (PCC) pavement where indicated on the drawings in Part 6. Aggregate pavement may not be used.

Provide new parking and other pavement sections as required by soil conditions and determined by Designer of Record. Design pavement sections in accordance with UFC 3-201-01 *Civil Engineering*.

Provide other parking improvements including parking entrances for two-way traffic, signage, concrete dumpster pad, and landscaping.

Provide handicapped parking in accordance with UFC 1-200-01, General Building Requirements.

Provide parking in accordance with UFC 3-201-01, Section 2-9.6 Parking Areas and SDDCTEA Pamphlet 55-17.

See G2050 LANDSCAPING and G205005 PLANTINGS for parking lot landscape requirements.

G202001 BASES & SUBBASES

Crushed concrete meeting NCDOT specifications for gradation for aggregate base or subbase courses may be used.

G202002 CURBS & GUTTERS

Provide concrete curbs and gutters in accordance with the NCDOT standards or as specified in UFC 3-201-01, Civil Engineering, whichever is more stringent.

G202003 PAVED SURFACES

Provide Portland cement concrete with a minimum design flexural strength of 650 psi (4.48 MPa) in not more than 28 days.

Recycled asphalt pavement material may be used for bituminous concrete pavement as permitted by NCDOT.

G202004 MARKING & SIGNAGE

Provide permanent and temporary markings (pavement, curb and object), signage (regulatory, warning and guidance) and other traffic control devices as required to facilitate proper utilization of the parking areas.

Provide pavement markings including crosswalks Provide parking in accordance with UFC 3-201-01 and SDDCTEA Pamphlet 55-17.

Provide signage in accordance with UFC 3-201-01 and SDDCTEA Pamphlet 55-17.

Provide temporary pavement markings and signage to meet phasing requirements indicated in the project program. Provide temporary signage in accordance with the MUTCD.

G202005 GUARDRAILS & BARRIERS

Provide guardrails, wheel stops, and bollards in accordance with the UFC 3-201-01, *Civil Engineering*.

G202006 RESURFACING

Provide resurfacing of existing pavement by milling and bituminous overlay.

G202007 MISCELLANEOUS STRUCTURES AND EQUIPMENT

NOT USED

G202090 OTHER PARKING LOTS

NOT USED

G2030 PEDESTRIAN PAVING

Provide a network of Portland cement concrete (PCC) sidewalks, separated from, but connected to vehicular circulation systems, to allow for pedestrian circulation between various new and existing elements of the project. Interface new pedestrian circulation systems with existing pedestrian circulation systems and include input from the Civil Engineer, Architect, and Landscape Architect.

Provide sidewalks of Portland cement concrete pavement with 4 inches thick minimum. Provide concrete sidewalk in accordance with Section G201003 or with the standard NCDOT mix for a minimum compressive strength at 28 days of 3,500 psi. For PCC sidewalks, provide a broomed finish. Reference BEAP for sidewalk widths.

Unless indicated otherwise, provide a transverse slope not to exceed 1/4”/foot. Limit variation in cross section to 0.25 inch in 5 feet.

Existing trail along frontage of McHugh and Birch must be replaced in-kind as required with asphalt.

Provide, as indicated in BEAP 3.2.8 PLAZAS AND COURTYARDS – EXTERIOR USE ARES, entrance plazas and pedestrian spaces to create outdoor meeting spaces and reinforce the arrival sequence from parking lot to building entrance(s). Size and placement must reflect functional needs and the appropriate importance to the setting. Forecourts may serve as outdoor plazas, courtyards or smaller landings and be furnished with benches, trash receptacles, plantings, lighting and distinctive architectural treatment and may include provisions for bicycle parking. Bike racks must be provided to support 5% of the building FTE and can be divided into more than one location. See PART 3 – CHAPTER 2 Antiterrorism Force Protection for additional requirements for plazas and pedestrian areas for a fully coordinated design

G203001 BASES & SUBBASES

Provide as required and per the Contractor’s geotechnical engineering report.

G203002 CURBS & GUTTERS

NOT USED

G203003 PAVED SURFACES

NOT USED

G203004 GUARDRAILS & BARRIERS

NOT USED

G203005 RESURFACING

NOT USED

G203006 OTHER WALKS, STEPS & TERRACES

NOT USED

G2040 SITE DEVELOPMENT

G204001 FENCING & GATES

Provide an 8’ tall ornamental (not chain-link) Restricted Security Fence required for classification of exercises. It must envelope the building, concrete and grassed training areas, and staff parking area directly adjacent to the building to the northwest, all accessible by gates.

Provide zinc-coated steel fencing components in accordance with FS RR-F-191/1, Type 1 for the fencing system.

G204002 RETAINING AND FREESTANDING WALLS

Provide retaining walls in areas of significant grade change. Follow the requirements set forth in Part 4, Performance Technical Specifications.

Provide concrete retaining walls with applicable safety protective measures. Retaining walls must match new facility exterior.

Provide retaining walls to permanently resist soil pressures as well as live loads. Provide wall drainage to minimize lateral loading and protect wall materials against degradation.

Retaining walls are required to comply with UFC 3-220-01. The DOR must obtain building permits for retaining walls greater than five feet in height.

G204003 EXTERIOR FURNISHINGS

All site furnishings are required to conform to the Base Exterior Architectural Plan (BEAP). For the picnic area provide picnic tables, trash receptacles, benches, barbecues, recycling receptacles, hot ash receptacles.. Provide a trash and ash receptacle at the designated smoking area.

Design picnic areas to accommodate up to 50 people.

All site furnishings must be anchored to concrete pavement below.

G204004 SECURITY STRUCTURES

Provide concrete curbing at the edges of all parking areas to identify the site perimeter and prevent parking in the 33-foot unobstructed space.

G204005 SIGNAGE

Provide building identification signage, building number signage, and way finding signage in accordance with the Activity's BEAP.

G204006 FOUNTAINS & POOLS

NOT USED

G204007 PLAYING FIELDS

NOT USED

G204008 TERRACE AND PERIMETER WALLS

NOT USED

G204009 FLAGPOLES

NOT USED

G204090 OTHER SITE IMPROVEMENTS

Provide heavy-duty concrete dumpster and utility pads. Provide dumpster enclosures conforming to the Activity's BEAP. BEAP 3.4.10 indicates that dumpster areas should be located on structural concrete pads with adequate radius, approach length, and overhead clearance from trees, utilities, and structures. The dumpster enclosure must be located in the 100-stall employee parking lot. Screening should be provided on three sides by a 7-foot-tall masonry wall to block views of the containers. The dumpster enclosure's materials and style must complement the facility it serves. For each dumpster, install a minimum of two bollards at the rear of the enclosure to protect the rear wall from damage and a minimum of two bollards on each side of the dumpster. The contractor must provide separate vehicular and pedestrian access to the dumpsters within the enclosures.

Provide a heavy-duty concrete pad for an on-site standby generator outside the building so it can be easily taken off line and removed once the base upgrades their power grid at a subsequent date.

Provide a 50,000 square foot open cell concrete paver training space. Outdoor space must be grass-pave to support emergency vehicles and turf areas for communications tents.

Provide a 50,000 square foot grass training space. Outdoor space must be grass-pave to support emergency vehicles and turf areas for communications tents.

G2050 LANDSCAPING

Provide complete landscaping consisting of lawn, groundcover, trees, shrubs, ornamental grasses and organic and inorganic mulches as required to provide a quality, cost-effective, functional and visually appealing landscape program that will enhance the development, while complying with all applicable anti-terrorism, force protection and physical security requirements. The landscape design must reinforce the facility entry and complement existing landscapes in the vicinity. Provide a 5' wide inorganic rock cobble mulch mow strip around the building with weed barrier fabric below rock. Provide concrete edging along mow strip where edging is adjacent to a turf area. Provide landscaping resistant to deer.

Trees, shrubs, and ground covers are acceptable within the AT/FP unobstructed space. Trees must have a 3-inch minimum caliper and branching structure that provides a 3-foot clear zone above the finished grade. Shrubs must be trimmed to provide a 3-foot clear zone above the finished grade and ground covers must not exceed 6-inches in height.

Provide high quality plants that comply with the criteria found in the American Standard for Nursery Stock, ANSI Z60.1. With the exception of streetscape tree plantings, do not exceed 10% of any one tree species. Areas of the site not covered by buildings or other structures and impervious paving or walkways within the project limits must be considered landscape area and must receive landscape improvements.

Guarantee all landscaping for a period of one year. Provide a one-year Establishment and Maintenance period. Landscaping Guarantee and Establishment and Maintenance periods must commence on the date that the inspection by the Contracting Officer shows that all landscaping under this contract has been satisfactorily installed.

Provide complete landscaping maintenance, including but not limited to, routine lawn mowing, edging, pruning, pest inspection/treatment, re-mulching of mulch products, watering, weeding, fertilizing, and restaking, throughout the guarantee period.

Provide mechanical equipment screening wall on three sides of new equipment.

Provide shrubs or small growing trees if feasible for screening of mechanical equipment/walls, dumpster enclosures, and other obstructions that do not present an aesthetic view from the street.

G205001 FINE GRADING AND SOIL PREPARATION

Provide 4 inches of topsoil for all lawn areas and fine grade.

G205002 EROSION CONTROL MEASURES

Prevent erosion from occurring by providing erosion control measures as required by state and federal requirements.

Erosion control temporary or permanent seeding must not be considered a permanent turf condition. Provide centipede sod for permanent turf.

G205003 TOPSOIL AND PLANTING BEDS

Provide a planting soil mixture composed of 50% native soil blended with 50% topsoil and other amendments as recommended by the soil testing laboratory around root balls of shrubs, trees, groundcovers, perennials, and ornamental grasses that is at a minimum, twice as wide and equally as deep as the plant's rootballs. Set tops of plant rootballs 2 inches above adjacent grades

G205004 SODDING

Sod areas indicated to be turfed in Part 6. Restore existing turf areas disturbed by Contractor operations that are to remain as turf areas. Restore by means of sodding and provide same guarantee and maintenance as for new landscape areas. Sod species must be Centipede – Eremochioa ophiuroides.

G205005 PLANTINGS

Preserve existing trees to the greatest extent possible.

MATERIAL SELECTION:

Select plant material from Master Plant Lists found within the Base Exterior Architecture Plan (BEAP), NC State Extension and the North Carolina Native Plant Society. Other plants not found on these lists may be used if approved by the reviewing Government Landscape Architect. Provide high quality plants that comply with the criteria found in the American Standard for Nursery Stock, ANSI Z60.1. Final approval of new plant materials rests with the reviewing Government Landscape Architect. With the exception of streetscape tree plantings, do not exceed 10% of any one tree species.

Shade trees must be a minimum size of 3-inch caliper at breast height and 14 to 16 feet tall minimum unless specified for Antiterrorism Force Protection measures where the trees are integrated into the vehicle-deterrent perimeter. See Antiterrorism Large Diameter Trees in PART 3 - CHAPTER 2 PROJECT OBJECTIVES. Flowering trees must be minimum 2-inch caliper and evergreen trees 8-10 feet tall. In general, select trees that have a normal lifespan over 60 years

and a strong branch and limb structure. Trees must be relatively clean and free of potential nuisances such as fruit, berries, sap, thorns and pitch. In addition, trees must not have surface roots which will potentially uplift sidewalks and pavements. For palm trees, identify sizes on plans by brown trunk height (BTH) or clear trunk height (CTH). Unless otherwise approved by the reviewing government landscape architect, provide minimum BTH or CTH of 8 feet.

GENERAL PLANTING GUIDELINES:

All planting must adhere to any fence clear zone requirements for security and AT/FP criteria set forth in this RFP. Plantings must adhere to the Base Exterior Architectural Plan (BEAP). Coordinate with MCB Camp Lejeune for project specific requirements at CDW. Provide small trees and ground cover plantings at building main entrances to accentuate the entrances. Provide plantings to frame the new building and lessen the visual impact of parking areas. Provide planted strip between any sidewalk and any Primary, Secondary and Tertiary streets.

For inorganic granular mulch applications, provide 3- to 5-inch diameter river stone mulch over weed control fabric at mow strips around buildings. For organic mulch applications, provide 3 inches of shredded hardwood mulch over weed control fabric at planting beds except for spreading groundcover planted areas.

Encompass planting beds not used for bioretention filters with concrete edging.

Provide 6-inch-wide (minimum) by 12-inch-deep concrete band edging for each of the following conditions: between rock mulch/cobble area and turf area, between rock mulch/cobble area and planting area, and between turf area and planting area. Contain turf areas adjacent to building walls, site walls, columns, stairs, and other structures by a 6-inch-wide (minimum) concrete header with a minimum separation of concrete header from walls, columns, and other structures of 2 feet to minimize damage to site improvements.

Provide a 6-foot-wide grass sod border around the entire bioretention filter. Grass sod species must be Centipede. Ensure that the bioretention filters are not compromised by sediment deposits during construction. Install bioretention filters only after upstream areas tributary to the bioretention filter location have been fully stabilized.

If used for stormwater management, provide bioretention filters, plants, plant quantities, and soil mix in accordance with the State's Stormwater Design Manual.

TREE PLANTING GUIDELINES:

Preserve existing trees to the greatest extent possible. Provide trees at the minimum rate of one (1) tree per 1,000 square feet of TOTAL LANDSCAPE AREA for this project.

Site trees such that their mature canopy will not negatively affect any building. Include no trees within utility easements. Coordinate tree planting locations with electrical site lighting for a fully coordinated and integrated design that allows tree and lighting to be complimentary. See G4020 SITE LIGHTING Plant trees a minimum of 10 feet from building, edge of sidewalks, curbs, and underground water and sewer lines. Provide root barrier for all trees planted within 8 feet of any utility, wall, curb or pavement.

Stake all trees as required to ensure a stable, true plumb form is established. Protect trees from damage from staking materials. Unless otherwise directed by the Contracting Officer, all staking materials must be removed prior to the end of the contract. Provide a five-foot watering basin around each tree, and also provide a 5-foot diameter mulch ring with a 3-inch layer of organic mulch.

Provide informal street tree plantings that encompass all base streets within the project limits with an average spacing of 30 to 40 feet on center unless noted otherwise.

PARKING LOT GUIDELINES:

A minimum of 10% of any at grade POV parking lot must be landscaped; Reference Section 5 of ASHRAE 189.1.

POV parking lots must have a minimum of one (1) canopy tree every five (5) parking spaces around parking lot perimeter including entrance drives and service areas. Tree plantings along perimeter of lot must follow the Camp Lejeune Base Exterior Architecture Plan (BEAP) for a natural, native appearance. Parking lots must have no more than two tree species unless authorized by Government Landscape Architect.

Provide deciduous shrubs along the parking lot perimeter to create an informal opaque screen.

Interior plantings must consist of a minimum of (1) tree per every 300 square feet of island area. Planting medians must have a minimum inside dimension width of 9 feet. Any parking lot that abuts a service drive or base road for the project must be separated by planted green space with a minimum inside dimension width of 9 feet.

Provide 3 inches of shredded hardwood, pine bark or pine needle mulch at all planting beds.

G205006 PLANTERS

NOT USED

G205007 IRRIGATION SYSTEMS

NOT USED

G205090 OTHER LANDSCAPING

Deliverables must include plans, details and specifications to accurately and completely convey design intent. Plans must identify all plants, turf, hardscapes, site furnishings, buildings and site features and other pertinent landscape elements.

Provide a plant schedule indicating as a minimum, quantity, species, (Latin and Common Name) spacing, and size and condition of each proposed plant as well as mulch materials. Provide the height and width of plant at time of planting for Contracting Officer.

Provide on Landscape Plans a 'Landscape Material Summary' which includes but is not limited to 'Mulches'(by type), Concrete Header, Pavers, and other landscape materials utilized in the project.

Document all field changes to the Landscape Planting drawings including changes in sod area, concrete header lengths, hardwood and stone mulch bed areas, , planting location, and type and number of plant(s). Any field changes made to the Landscape layout must be shown on the Landscape Planting drawings - also revise the data found in the 'Landscape Material Summary' and 'Plant Material Schedule' found on the Landscape Planting drawings.

Specifications must include the minimum following sections for Landscape Architecture:

- 01 78 00, Closeout Submittals
- 12 93 00, Site Furnishings
- 32 05 33, Landscape Establishment

- 32 93 00, Exterior Plants
- 32 92 23, Sodding

The Contractor must provide plant and grounds maintenance during the plant establishment period. The plant establishment period must extend one full year after completion of planting.

Maintenance during planting operation must ensure installed plants are maintained in a healthy growing condition from time of planting through plant establishment period. The typical growth habit of individual plants must be retained.

Maintenance during the establishment period must include as a minimum:

- Straightening and tightening of tree stakes and guying material
- Mowing and edging of turf protecting plant areas from erosion
- Maintaining edging of planter beds and checking for girdling of trees, watering of all plant material and turf, weeding, and removing and replacing unhealthy plants
- Watering of all project trees with slow release watering bags
- Controlling pests, diseases, fungi and rodents
- Removing dead or broken branches by pruning in accordance with ANSI A300 Part 1
- Fourteen (14) days prior to the end of the maintenance period, mow and edge lawn, re-mulch beds (if required depth or coverage of mulch is not met) and water and fertilize all plants
- Removal of all tree staking and slow release watering bags at end of establishment period

Warranties: All trees and plants must be guaranteed for a period of one year after final acceptance of the project, or area/s.

--End of Section--

G30 SITE CIVIL/MECHANICAL UTILITIES – P1338F II MEF SIMULATION/TRAINING CENTER REPLACEMENT

SYSTEM DESCRIPTION

The site civil/mechanical utility systems include water supply systems, sanitary sewer systems, storm drainage systems, heating distribution systems, cooling distribution systems, fuel distribution systems and associated appurtenances which are more than 5 feet outside the building.

The site mechanical utility system consists of all piping and appurtenances for chilled water, hot water, and natural gas, including all accessories and devices as necessary and required for a complete and usable system up to 5 feet outside the building.

GENERAL SYSTEM REQUIREMENTS

Develop the site to provide water, fire protection, sanitary sewer, storm drainage, heating, cooling and fuel distribution services that meet the requirements of each applicable regulatory agency that governs, and issues permits for the construction and operation of these systems. Site design is required to comply with UFC 3-210-10, *Low Impact Developments*, as well as state or local stormwater management regulations and applicable project sustainability goals.

Provide each system complete and ready for operation.

Physically verify the location of existing above and below ground utilities prior to starting work.

Identify and obtain all permits to comply with all federal, state, and local regulatory requirements associated with this work. Complete the "Permits Record of Decision" (PROD) form with the first design submittal package. A blank PROD form can be obtained at the Download Tab of Part 6 of the NAVFAC Design-Build website at the following link http://ndbm.wbdg.org/system/html/6/453 . Determine correct permit fees and pay said fees. Forward copies of all permits, permit applications, and the completed PROD form to the Government's Civil/Mechanical Reviewer. Perform work in accordance with the obtained permits.

Minimize the impact of construction activity on facility operations and neighboring facilities.

Obtain final approvals from the Contracting Officer for all utility connection points associated with this work.

Coordinate with the local utility providers and pay any fees or charges required to connect to their utility.

All disciplines involved in site work design must coordinate utility locations with the Civil Engineer and the Landscape Architect.

Refer to Site Analysis and Building Requirements Sections for additional site civil/mechanical utilities information.

Provide all required fittings, connections and accessories required for a complete and usable system. Install all equipment per the criteria of PTS Section G30 and the manufacturer's recommendations. Where the word "should" is used in the manufacturer's recommendations, substitute the word "must".

After installation of the equipment and systems, provide training courses for Government personnel for each of the items listed below, covering items contained in the Operations and Maintenance manuals. Provide one copy of the Operations and Maintenance manuals for each two course attendees. Provide one DVD disc of the training courses to be used as refresher courses and to train additional personnel. Conduct training by the same factory trained engineer that supervised the installation of the system. During training include classroom discussion as well as hands on maintenance, replacement of typical components and repair type maintenance training for parts typically replaced or repaired in the field. Submit training plan 30 calendar days prior to training sessions; include scheduling, content, outline, and training material handouts. Provide training for Cathodic Protection System.

Provide site civil/mechanical utility systems and components that support project sustainability goals.

Leakage tests are required.

Perform post-installation TV inspection of new storm sewer mains.

Imported bedding material must be provided for all utility lines and structures. Bedding material must consist of either ASTM C33 fine aggregate, or NCDOT coarse aggregate size No. 57, No. 67, or No. 78. A minimum of 6 inches of bedding must be provided for all utility lines and a minimum of 12 inches of bedding must be provided for all utility structures. Bedding material backfill must be placed to the spring line of the pipe for all concrete and PVC pipe trench excavations. Utility line and utility structure excavations in existing pavement areas must be completely backfilled to the aggregate base/subbase course elevation excavatable flowable fill meeting NCDOT specifications.

G3010 WATER SUPPLY

The new water system is an extension of the existing water system. The existing water system serving the project site is owned and operated, by the federal government, operated and maintained. Provide the new water system and connections to the existing water system in accordance with UFC 3-230-01, *Water Supply: Storage, Distribution, and Transmission*; the utility provider’s requirements; and the state waterworks' regulations; whichever is more stringent.

Notify the government of the additional demand generated by the proposed facility.

Provide connection to the existing water distribution system.

Design the new water system so that water consumption is measured at a minimum, by one meter for each facility. Ensure the meter is easily accessible, but not obvious. Water Meters must comply with Camp Lejeune Water Meter Specifications included in Part 6 of this RFP. Enable meter data to be collected and automatically transferred to a Meter Data Management (MDM) module in CIRCUITS for utility and energy management within an environment protected from cyber- attack.

G301001 WELL SYSTEMS

NOT USED

G301002 POTABLE WATER DISTRIBUTION

Connect the new potable water distribution system to the existing distribution system along McHugh Boulevard and Birch Street.

Provide cathodic protection on metallic pipe lines.

A water meter on each proposed service line is required. Contractor must provide meters selected from the base ATO approved equipment listing.

Provide meter box.

Provide fire hydrants with 5” Stortz x 4.5” HN/NST Fire Hydrant Converter. Paint fire hydrant barrels yellow. Paint fire hydrant bonnets based on its rated flow capacity in accordance with UFC 3-600-01 and NFPA 291. Consult with the project Fire Protection Engineer to obtain hydrant flow capacities for newly installed fire hydrants. For fire hydrants in or adjacent to vehicle pavements, provide bollards to protect the fire hydrant from vehicular collision.

Backflow preventers are required on all service entrance lines. If not specified in ESR D20 and D40, provide reduced pressure backflow preventers aboveground outside the building. Provide a heated enclosure.

G301003 POTABLE WATER STORAGE

NOT USED

G301004 FIRE PROTECTION WATER DISTRIBUTION

See G301002.

G301005 FIRE PROTECTION WATER STORAGE

NOT USED

G301006 NON-POTABLE WATER DISTRIBUTION

NOT USED

G301007 PUMPING STATIONS

NOT USED

G301008 PACKAGED WATER TREATMENT PLANTS

NOT USED

G301090 OTHER WATER SUPPLY

NOT USED

G3020 SANITARY SEWER

The new sanitary sewer system is an extension of the existing sanitary sewer collection system. The existing sanitary sewer collection system serving the project site is owned, operated and maintained by the federal government. Provide the new sanitary sewer system and connections to the existing sanitary sewer collection system in accordance with UFC 3-240-01, Wastewater Collection; the utility provider’s requirements; and the state sewerage regulations; whichever is more stringent.

Notify the utility provider of the additional wastewater flow generated by the proposed facility.

Provide connection to the existing sanitary sewer collection system along McHugh Boulevard and Birch Street. In identifying a suitable point of connection, evaluate the capacity of the existing collection system.

G302001 SANITARY SEWER PIPING

Provide cathodic protection on metallic pipe lines.

G302002 SANITARY SEWER MANHOLES & CLEANOUTS

Provide precast concrete manholes only.

G302003 LIFT STATIONS AND PUMPING STATIONS

If required, provide in accordance with PTS section G30 1.3.5.5, G301007, G302003.

G302004 PACKAGED SANITARY SEWER TREATMENT PLANTS

NOT USED

G302005 SEPTIC TANKS

NOT USED

G302006 DRAIN FIELDS

NOT USED

G302090 OTHER SANITARY SEWER

NOT USED

G3030 STORM SEWER

The new storm sewer system is an extension of the existing storm sewer system. The existing storm sewer system serving the project site is owned and operated by the federal government. Provide the new storm sewer system and connections to the existing storm sewer system in accordance with UFC 3-201-01, Civil Engineering; the utility provider's requirements; UFC 3-210-10, Low Impact Development the state stormwater management laws and regulations; and applicable project sustainability goals; whichever is more stringent.

Confirm that the existing outfall has adequate capacity to receive the additional stormwater flow generated by the project.

Vehicle wash areas are not to be provided.

G303001 STORM SEWER PIPING

Storm sewer piping materials are required to be polyvinyl chloride (PVC) for diameters less than 12 inches and reinforced concrete pipe (RCP) for diameters 12 inches and greater. Storm piping must meet NCDOT requirements.

G303002 STORM SEWER STRUCTURES

Storm structures must meet NCDOT requirements per the current Standard Specifications for Roads and Structures.

G303003 LIFT STATIONS

Stormwater pump stations are not allowed.

G303004 CULVERTS

All storm sewer piping materials for culverts are required to be reinforced concrete pipe (RCP).

Designer of Record must ensure that culverts and bridges are designed to safely pass the 100-year event. The following upstream controls limit headwater elevation:

- 100-year water elevation must not be higher than 18 inches below the outer edge of the shoulder at its lowest point in the grade.
- Designer of Record must ensure that upstream wetlands are not adversely impacted by crossing
- There must not be any appreciable change in flow, elevation, or wet/dry cycles of existing wetland.

Culverts must meet NCDOT requirements per the current Standard Specifications for Roads and Structures.

G303005 HEADWALLS

Headwalls must meet NCDOT requirements per the current Standard Specifications for Roads and Structures.

G303006 EROSION & SEDIMENT CONTROL MEASURES

Obtain Erosion and Sediment Control permit required for the proposed work from NCDEQ.

Submit permit application to the Contracting Officer for approval prior to submitting to NCDEQ.

G303007 STORM WATER MANAGEMENT

Comply with NDCEQ regulations, UFC 3-201-01 Civil Engineering, UFC 3-210-10, Low Impact Development, FC 1-300-09N Navy and Marine Corps Design Procedures; whichever is more stringent. Consider the following LID features: bioretention, filter/buffer strips, grassed swales, bioretention swales, wet swales, infiltration trenches, and rain gardens. The use of rain barrels, cisterns, permeable pavement/pavers, and tree box filters are not allowed for this project.

Evaluate the drainage conditions and submit sealed calculations to the Government for civil and environmental review documenting how design meets UFC 3-210-10, state or local stormwater regulations, and applicable project sustainability goals. Provide a narrative indicating which criteria governs the design and all assumptions. Technical constraints that limit compliance with UFC 3-210-10 must be documented, reviewed and approved by the Government's Civil Reviewer.

If the project footprint exceeds 5,000 SF and does not maintain the predevelopment hydrology to the maximum extent technically feasible (METF), these constraints must be documented on the NAVFAC Sustainable Energy Data Record Card (NSEDRC) and approved by the Government's Civil Reviewer. The NSEDRC can be found at: http://www.wbdg.org/pdfs/navfac_sustainable_energy_data_record_card.pdf .

The Contractor/DOR is required to design/construct on-site water quality stormwater management facilities to meet NC water quality requirements under this RFP without the option of purchasing nutrient credits.

The contractor must obtain all required regulatory permits required for the proposed work. Coordinate all reports, submittals, and permit applications through the Contracting Officer.

The DOR is responsible for acquiring approval from NCDEQ for any BMPs. A Post-Construction certification will need to be provided to NCDEQ by the DOR. UFC 3-201-01 Civil Engineering Requirements will apply to all sites. Additionally, permitting through the United States Army Corps of Engineers will be required for any wetlands or stream disturbance.

See Part 6 for a copy of the LID calculation spreadsheet. This spreadsheet is to be filled out and included with the design calculations for all applicable submittals.

G303090 OTHER STORM SEWER

NOT USED

G306006 GAS DISTRIBUTION PIPING (NATURAL GAS)

Coordinate with natural gas supply company for service supply to the building gas meter.

G306007 GAS STORAGE TANKS

NOT USED

G306009 OTHER GAS DISTRIBUTION

NOT USED

G306090 OTHER FUEL DISTRIBUTION

Provide warning and identification tape for underground utilities.

G3090 OTHER SITE MECHANICAL UTILITIES

NOT USED

--End of Section--

G40 SITE ELECTRICAL UTILITIES

SCOPE

The site electrical utility system consists of all power and communications cabling from the existing distribution system point of connection including all connections, accessories and devices as necessary and required for a complete and usable system. This section covers installations up to within 5 feet of new (or existing) building location.

Provide site systems complete in place, tested, and approved as specified throughout this RFP, as needed for a complete, usable, and proper installation. Install all equipment per the criteria of PTS Sections D50 and G40 and the manufacturer's recommendations. Where the words "should" or "shall" are used in the manufacturer's recommendations and in referenced Codes and Standards, substitute the word "must."

DOCUMENTATION REQUIREMENTS

Use standard NAVFAC lighting plates, where possible, for all interior and exterior lighting applications. Provide more specific details where warranted but provide a plate or detail for each luminaire used in the project.

The electrical legend and symbols used throughout the design must be similar to those defined in Appendix D of TSEWG TP-12. Reference all electrical details used in the drawing set. Detail bubbles or notes used on the floorplan sheets must clearly reference where in the set of drawings the detail resides. Coordinate and use the same annotation symbol graphics for details on the electrical and telecommunications plans as those used in architectural and other building design discipline drawings.

Lighting and power plans must clearly, diagrammatically denote all branch circuit information, complete with homeruns and raceway graphics to logically group circuits and devices together. Providing a circuit number adjacent to the device on the electrical floorplans, without interconnecting raceway drawing graphics, is prohibited.

Provide sensor layout drawings to demonstrate sensor coverage and that overlap requirements are met. Sensor layout drawings must depict minor and major coverage patterns, obstructions, and the impact the obstructions have on the coverage patterns.

In addition to the lighting calculations required in the referenced UFCs, provide light trespass calculations to demonstrate that the installed lighting design does not intrude on adjacent properties. Provide scaled drawings indicating the point outside the boundary of the project where the light levels drop below 0.1 horizontal foot-candles.

Electrical contractors must possess a valid North Carolina Public Utility electrical contractor's license and be insured to do such work in the State of North Carolina.

SYSTEM DESCRIPTION

This project includes the construction of buildings and structures as listed below. Refer to site plans for building locations.

Provide an exterior electrical system consisting of, but not limited to, service entrance wiring and equipment, conduits, feeder and branch circuits, lighting and branch wiring, communications, security and alarm systems, emergency generator, emergency lighting and power, grounding,

and lightning protection, including accessories and devices as necessary and required for a complete and usable system.

Provide each building with a single utility service with radial power distribution.

Select electrical characteristics of the power system to provide a safe, efficient, and economical distribution of power based upon the size and types of electrical loads to be served. Use distribution and utilization voltages of the highest level that is practical for the load to be served.

Provide separate normal, standby, and life-safety distribution systems.

Provide distribution equipment that is fully rated for the symmetrical short circuit current available at the terminals. Series rating is prohibited. Assume the available fault current at the point of connection to be an infinite bus.

Design the electrical distribution system to achieve selective coordination throughout the system. Provide calculations to demonstrate the selective coordination.

Provide a minimum of 15 percent spare circuit and load capacity at all levels of the power distribution system, including life-safety and stand-by power systems.

Provide electrical connections for all systems, equipment, and devices requiring electrical service.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Provide site electrical utilities systems and components that support project sustainability goals.

Provide identification labels for site equipment, structures, and wiring in accordance with the Camp Lejeune GIS numbering convention provided in Part 6, Attachment 8, *Camp Lejeune Electrical Policies & Criteria.*

Make road crossings using directional boring.

G4010 ELECTRICAL DISTRIBUTION

Connect to the existing overhead 12.47kV, three phase, three wire, 60 Hertz electrical power system at PP1 on either McHugh Boulevard or Birch Street. Coordinate connection point with Camp Lejeune Public Works Department. Provide a fused cutout switch on the pole. Transition from overhead to underground distribution at the pole and extend the primary service to the project site underground in concrete encased ductbank to a Pad Mounted Transformer.

G401001 SUBSTATIONS

NOT USED

G401002 TRANSFORMERS

Provide a three-phase pad mounted transformer to feed the facility.

Provide the following features:

- Dead-Front Design with ANSI specific front plate spacing
- 15kV, 200A minimum, load break connectors

- Three 10kV minimum, surge arresters
- Tap changer with two 2.5% taps above rated voltage and two 2.5% taps below rated voltage
- Biodegradable less-flammable liquid-insulated

Provide a pre-cast concrete box pad for transformers. Refer to the box pad detail provided in Part 6, Attachment 8, *Camp Lejeune Electrical Policies & Criteria*.

G401003 SWITCHES, CONTROLS AND DEVICES

Provide sectionalizing cabinets configured with the existing overhead and or underground distribution system.

Provide a pole-top fused cutout switch configured with the existing overhead distribution system at the connection point for service to the building.

G401004 OVERHEAD ELECTRIC CONDUCTORS

NOT USED

G401005 TOWERS, POLES, CROSSARMS AND INSULATORS

NOT USED

G401006 UNDERGROUND ELECTRIC CONDUCTORS

Provide a medium voltage and a 600-volt secondary underground electrical power distribution system to meet the connection requirements as indicated in paragraph G4010 *Electrical Distribution*.

G401007 DUCTBANKS, MANHOLES, HANDHOLES AND RACEWAYS

Provide a system of concrete encased ductbanks and above-ground junction boxes and above-ground sectionalizer switches.

Underground handholes and manholes are prohibited.

G401008 GROUNDING SYSTEMS

Provide a complete grounding system for the electrical power distribution system.

G401009 METERING

Provide a separate Kilowatt Demand Meter capable of reporting to the existing Camp Lejeune Advanced Metering Infrastructure (AMI) at each Pad Mounted Transformer. The existing AMI is Itron Choice Connect (Fixed Network) version 5.0.

The provided meter must be compatible with the existing Camp Lejeune Itron MCLite and Itron Mobile Advanced Meter Reading (AMR) equipment.

Pre-program meters with Camp Lejeune’s meter program. For programming of meters contact:

Border States Electric Product Manager
Ken Hause
(864) 242-6880 | EXT 11230
khause@borderstates.com

Refer to the Advanced Electric Meter requirements provided in Part 6, Attachment 7, *Water and Electrical Meter Information* for additional features and information.

G401010 CATHODIC PROTECTION SYSTEMS

NOT USED

G401011 EQUIPMENT REQUIREMENTS FOR COASTAL AND HIGH HUMIDITY AREAS

Provide exterior equipment designed for coastal and high humidity areas.

G4020 SITE LIGHTING

Provide site lighting for exterior and security applications including underground distribution, handholes, grounding, poles, fixtures and controls as required for a complete and usable system.

Provide exterior luminaires, poles, and foundations in accordance with the Camp Lejeune Electrical Policies and the Camp Lejeune Base Exterior Architectural Plan. Provide architectural type luminaires for parking lot, walkway, and outdoor gathering area lighting. Provide cobra head type luminaires for roadway lighting.

Coordinate site lighting with plantings and landscape elements to provide a fully coordinated and integrated design that allows the lighting to be complimentary to the landscape design throughout the project site.

Provide luminaires designed for LED sources. Luminaires designed for other sources that use retrofit LED lamps are not acceptable.

Provide an automatic lighting control system for exterior lighting fixtures using lighting contactors, bi-level or dimming drivers, motion sensors, and a centralized photocell. The photocell will automatically turn lights "ON" at dusk and turn "OFF" at sunrise while the motion sensors, in conjunction with the bi-level or dimming drivers, will adjust the lighting levels based on occupancy of the area.

G402001 EXTERIOR LIGHTING FIXTURES AND CONTROLS

Provide Area and Parking Lighting for parking lots, walkways, and outdoor gathering areas.

G402002 SPECIAL SECURITY LIGHTING SYSTEMS

Provide security lighting along the site perimeter fence line.

G402003 OTHER AREA LIGHTING

Provide area lighting for outdoor training areas.

G402004 LIGHTING POLES

Provide aluminum poles complete with foundations for site lighting.

G402005 UNDERGROUND ELECTRIC CONDUCTORS

Provide a complete underground distribution system for all site lighting systems.

G402006 DUCTBANKS, MANHOLES AND HANDHOLES

Provide a direct buried underground system including conduits and handholes to meet the connection requirements indicated in paragraph G4020 "Site Lighting".

G402007 GROUNDING SYSTEMS

Provide a complete grounding system for all site lighting systems.

G4030 SITE COMMUNICATION AND SECURITY

Provide a site communication and security system including, but not necessarily limited to, Voice and Data Telecommunications Systems, Cable Television (CATV) Systems including all conduit and wiring, underground structures, termination equipment, poles and structures, and grounding systems as required for a complete and usable system.

G403001 TELECOMMUNICATIONS SYSTEMS

The connection point for the site telecommunications systems is underground at manhole 15. Extend telecommunications services to the project site underground in a system of manholes and ductbank to the telecommunications equipment room. Provide OSP fiber and copper cabling from existing demarcation point (manhole 15) to the new Main Distribution Frame (MDF). Contractor must coordinate with the base telephone office 30 days prior to demolition of existing telecommunication services. Refer to document (located in part 6 of the RFP) “P1338_Comm OSP Pathways” for additional details.

OSP Pathways and Cabling

Install new site MHE near McHugh Blvd, install min (3) 4" FM site to new site MH (~300'). Install 6 way 4" concrete encased ductbank to tie into existing duct bank at MH15 (~1000'). Install 300 PR OSP copper FM site to MHWC1-2-9 via new and existing ductbank (~2300'). INST 24 FOC FM site to MH15 via new ductbank (~1300'). Leave 50FT. Fiber loop and 30FT. Copper loop at applicable MH locations for Government terminations.

Preserve and protect RORP211-5 and direct buried cabling to FORP211-5.

Preserve and protect HH211-5-4, cabling and ductbank from HH211-5-4 to 1248.

G403002 CABLE TV SYSTEMS (CATV)

Coordinate with local cable television provider for requirements.

G403003 CABLES AND WIRING

Provide cables and wiring for site telecommunications and security systems as indicated in their respective categories.

G403004 DUCTBANKS, MANHOLES AND HANDHOLES

Provide a system of ductbanks, manholes, and handholes for site telecommunications per section G403001.

G403009 GROUNDING SYSTEMS

Provide a complete grounding system for all site communications and security systems.

G4090 OTHER SITE ELECTRICAL UTILITIES

Provide a minimum 225 kVA transformer and a distribution panel to serve power pedestals located at the outdoor training area. Locate the distribution panel outdoors at a location to be selected by the COR. Provide power service from the outdoor distribution panel and terminate at ten power pedestals; five located on the southwest end of the grass training area and five on the northeast end. Coordinate the exact locations with the COR. Provide a 208Y/120V three-phase, four-wire plus ground, 50A feeder to each power pedestal and terminate. Provide each power pedestal with a heavy-duty NEMA 4X stainless-steel, fused disconnect switch with color-coded quick-connect receptacles (one per conductor). Provide each pedestal enclosure with a weather-protected output pathway that will allow user cabling to exit the enclosure with the door closed.

Provide three data pedestals at the outdoor training area. Locate one pedestal centered in the training area at the building exterior wall and two pedestals centered in the training area. Coordinate the exact locations with the COR. Provide each data pedestal with a NEMA 4X stainless-steel 12 rack-unit enclosure that can accept 19-inch, rack-mountable equipment. Provide fiber and copper patch panels in each enclosure for termination of backbone and user horizontal cabling. Provide one 25-pair CAT 6 cable and one 12-strand, single-mode optical fiber cable from the Simulation Control Room to each pedestal and terminate in the patch panels in each enclosure. Provide each pedestal enclosure with a weather-protected output pathway that will allow user cabling to exit the enclosure with the door closed.

G409007 PHOTOVOLTAIC ENERGY SYSTEM

NOT USED

--End of Section--

1.0 PROJECT DESCRIPTION – P1512F LOG OPS SCHOOL

1.1. Overview

The Log Ops School project is a practical application facility that provides entry and intermediate level training for MOS - Motor Transport in the Marine Corps Combat Service Support School (MCCSSS) at Camp Johnson. The new one-story facility will allow for additional marine training throughput; and provide the MCCSSS with a state-of-the art training facility with properly sized and configured spaces for flexibility in motor transport repair training for a variety of the Marine Corps transport vehicle types. This project is one of several projects that is intended to improve the training and in-processing of Marines within the MCCSSS MOS training programs by providing new facilities to replace damaged buildings related to Hurricane Florence, as well as, demolish many of Camp Johnson's older buildings that were damaged by Hurricane Florence in September 2018.

1.2. Project Components

The components found within the SOW for this project include, but are not limited to:

- A one-story building of just over 148,000 GSF that includes high bay vehicle training spaces, classrooms, classrooms/labs, and administrative offices and support spaces.
- Parking areas for staff and advanced students.
- Pavement maneuvering areas to access classroom bays and for deliveries to the special projects area.
- All-weather roadway for emergency vehicle access.
- Concrete dumpster pad and masonry screen wall for trash and recycling containers.
- Site utility connections.
- Reinforced concrete pads for mechanical equipment and a training aid.
- Stormwater management features to comply with Government LID requirements and state stormwater management permit requirements.
- Sidewalks and site features that tie the facility into the adjacent streets and pedestrian sidewalks of Camp Johnson.
- Rerouting of a trail north of the building site.
- Limited wetlands and stream mitigation for areas of wetlands and classified streams that are within the project site boundary.
- Outdoor covered student break areas.

1.3. Project Purpose

The purpose of the new Log Ops School is to give Camp Lejeune and the Marine Corps a motor transport training facility that will meet the MCCSSS Motor Transport training requirements in an efficient and properly planned facility that is based on the current modes of training and provides properly sized space for the vehicles currently used for training. Advancements in training platforms, increased student throughput, integration of largescale infrastructure training

networks and the growth of vehicle platforms have contributed to the obsolescence of the current training facility housed in Building M107. All of these issues are considered in the new facility's siting and planning and will allow the new facility to address the current and future needs of the Log Ops school.

1.4. Most Relevant Codes and Standards

The following Codes and Standards, and those incorporated by reference within the following, are applicable to the project.

This is not a comprehensive list, and the Contractor is responsible for ensuring that the completed project complies with all applicable local, state and federal codes, standards, and regulations.

MCB Camp Lejeune

- MCB Camp Lejeune, North Carolina Public Works Division, Design Branch Electrical Policies & Criteria, 4 Feb 2020.
- Camp Lejeune Mechanical Design Guidance, 01 Jul 17
- MCB Camp Lejeune, BEAP
- Specification 27 10 00 Building Telecommunications Cabling System, 27 Jun 17
- Specification 33 82 00 Telecommunications Outside Plant, 19 Jun 17

Facilities Criteria

- FC 1-300-09N, *Navy and Marine Corps Design Procedures*, with Change 4, 14 Jun 18

Unified Facilities Criteria (UFC)

- UFC 1-200-01, DoD Building Code (General Building Requirements), 08 Oct 19
- UFC 1-200-02, High Performance and Sustainable Building Requirements, with Change 4, 1 Oct 2019.
- UFC 3-101-01, Architecture, with Change 4, 06 Mar 19
- UFC 3-110-03, Roofing, with Change 3, 06 Mar 19

2.0 PROJECT OBJECTIVES

2.1. Mission Statement

Construct a new practical application instruction building to address the space needs of the MCCSSS's LOG OPS Schools and support the mission of this school to provide entry and intermediate level training for MOS Motor Transport. The goal for the design of this facility is to provide the Marine Corps with a building of exceptional cost-effective design that meets key functional, maintenance and security requirements. The programming goal is to provide the building with the optimal mix of instructional space to meet the training mission requirements, as well as, provide spaces that are flexible as teaching methods and technology evolve.

2.2. Facility Function

The LOG OPS School will function as a vehicle repair and operation teaching facility to allow for an increased throughput of marines trained. The function of the new facility is based on providing a simple consistent arrangement of spaces for housing Marine Corp motor transport vehicles used for training along with their associated classrooms and support spaces. The proposed site is in the far northeast quadrant (east of Company Street B and just south of the Physical Fitness Training Trail) of Camp Johnson. The facility location was chosen to improve function by being in close proximity to the Marines it serves; and will be located within a short walking distance to other key Camp Johnson facilities that include dining facilities, the new Joint Reception Center (JRC), and multiple barracks buildings. The building design will be required to meet design guidelines defined in the Camp Lejeune BEAP and this will allow the building to be a part of a continued modern campus aesthetic at Camp Johnson. The building design is required to meet the requirements of current building and codes and UFCs, resulting in a beneficial and improved experience for the Marines that use it. The following chapter will define the priorities and specific technical requirements that the building design for this key MCCSSS instructional facility.

2.3. Project Specific Priorities

2.3.1. Sustainable Design and Construction

All NAVFAC projects are subject to sustainable design criteria and are required to meet the requirements of the Guiding Principles for Sustainable Federal Buildings (HPSB). The Guiding Principles are outlined in a cross disciplinary publication addressing requirements for new building construction and modernization of all federally owned facilities. Sustainable principles will be integrated into the design, development and construction of the project in accordance with Executive Order 13834 and other applicable laws and Executive Orders.

Design and construct the project to comply with sustainability requirements identified in Part 2 Section 01 33 29.05 20, *Sustainability Reporting for Design-Build*. Additional specific sustainability requirements are found in RFP Part 2, Part 3, and Part 4 sections.

Design and construct the project in accordance with UFC 1-200-02, *High Performance and Sustainable Building Requirements.* The UFC provides design, construction and modernization criteria for projects of all sizes. It outlines performance thresholds in energy and water, addresses criteria of indoor air quality, identifies resiliency concerns, addresses planning and design, and establishes a baseline across all of DOD for documenting sustainability. A major

component of the policy established in this UFC is the Sustainable Third-Party Certification requirement for projects that reach specific size and cost thresholds.

Additional, agency-specific requirements can be found in NAVFAC Engineering & Construction Bulletins (ECBs) such as Issue No. 2014-02. ECB 2014-02 describes overall NAVFAC policy and guidance on sustainability and energy requirements.

2.3.2. Stormwater Management - Low Impact Development (LID)

Comply with UFC 3-210-10, *Low Impact Development* and FC 1-300-09N *Navy and Marine Corps Design Procedures*. Additional specific LID and stormwater management requirements are found in RFP Parts 3 and 4, Section G30. In addition to LID, comply with state and local stormwater regulations.

2.3.3. Energy Efficiency

The level of energy performance the Government seeks may only be achieved through coordinated design of architectural, electrical, and mechanical elements of the design. All energy systems must be designed in compliance with the following unless more stringent requirements are noted otherwise:

- UFC 1-200-02, High Performance and Sustainable Building Requirements. Incorporate energy efficiency in accordance with UFC 1-200-02, HPSB requirements
- EPAct 2005
- EISA 2007
- ASHRAE Standard 189.1 - 2014
- ASHRAE/IESNA Standard 90.1-2013.

Energy consuming equipment and products must meet or exceed Energy Star or FEMP efficiency levels. This includes built-in equipment (e.g., lights, HVAC, water heating, and industrial equipment) and collateral equipment (e.g., office equipment, IT, and task lighting). For equipment types not rated by Energy Star or FEMP, equipment efficiencies must be in the top 25 percent of similar products. All purchased electronics must be EPEAT registered. In addition, provide an ECA, which will demonstrate compliance with all energy related requirements in UFC 1-200-02. Measure and record existing building utility consumption, provide design calculated estimated energy savings and post construction documentation and reporting of actual realized energy savings.

2.3.4. Building Commissioning

Provide commissioning to meet requirements identified in Section 01 91 00.15 22 Total Building Commissioning, and UFC 1-200-02 High Performance and Sustainable Building Requirements.

2.3.5. Accessibility Requirements

Provide barrier-free design in accordance with UFC 1-200-01, *General Building Requirements*.

2.3.6. Anti-Terrorism Force Protection

The primary objective for the Marine Corps Base (MCB) security engineering is to ensure compliance with the Antiterrorism Force Protection (AT/FP) program requirements and

applicable Marine Corps physical security measures in MCO 5530.14A, as supplemented by the UFC. The AT/FP program requirements and Marine Corps physical security measures are to safeguard personnel, equipment, and property. A risk analysis and vulnerability assessment (RAVA) has not been performed and a specific Design Basis Threat has not been identified.

The facility is considered Inhabited and will be routinely occupied by 11 or more personnel. The facility must be designed in accordance with the chapter 3 standards of UFC 4-010-01, except that parking is not permitted in the 33-foot unobstructed space around the building. This includes low occupancy portions of the building, as applicable, due to physical security and operational requirements. The facility must also be designed in accordance with the following requirements:

a) **Antiterrorism Architectural Special Requirements** – Installation mission-assurance has requested security-conscious layouts and configurations for the interior layout of the building spaces and entrances to the building. The goal is to improve antiterrorism safety without adding cost, without hardening the building, and without adversely affecting the usability of the building.

b) **Building Entrance Orientation** – Orient the main building entrance such that it does not provide vehicles the capability to drive through the main entry of the building. Where this is impractical, ensure that the entry storefront does not directly face a main hallway or a mass-gathering space. Lay out entrances to be welcoming and accessible, but so that the entrances are visibly protected and inaccessible against a vehicle attempting to force entry. Ensure that building main entrance layouts are also compliant with UFC 4-010-01 Chapter 3-12, Standard 11 “Building Entrance Layout”. Where this section conflicts with Standard 11, Standard 11 must take precedence.

c) **Proximity of Densely Populated Areas to Parking** – To mitigate risks to densely populated areas, locate uninhabited, low-occupancy, and mechanical yard areas adjacent to parking lots. Locate densely populated areas away from parking lots to the maximum extent possible given available site space and building square footage. The preference is to keep densely populated areas 82 feet away from parking spaces, if sufficient site space is available. Uninhabited and low-occupancy spaces include utility rooms, hallways and corridors without seating, and storage areas. Densely populated areas include classrooms, large break rooms, locker rooms, conference rooms, auditoriums, and other areas with a high personnel density. During the CDW, include the installation Antiterrorism Officer (mission-assurance) on discussions for the preferred layout of mass gathering and densely populated administrative areas relative to the proposed site plan.

d) **Antiterrorism Landscape Architecture Special Requirements** – Installation mission-assurance has requested security-conscious landscape features that afford improved protection to the building occupants. The goal is to improve antiterrorism safety without adding cost by utilizing UFC-mandated landscape architecture features to protect vulnerable areas and using excess fill from the project site for landscaped berms. A specific design basis threat for an active shooter or attack vehicle does not apply; therefore, the intent is to complement architectural layouts and civil site features to improve occupant protection within the project scope of work.

e) **Vehicle Deterrent Landscaping** – Landscaping features can provide a significant physical and psychological deterrent to the risk of a vehicle ramming attack as a part of

a vehicle-deterrent perimeter. Landscaping features do not need to be rated passive vehicle barriers to afford greater security to the building occupants.

f) **Unobstructed Space** – Trees, plantings, and site furniture may be located within the 33-foot unobstructed space around each building, provided they are compliant with the UFC 4-010-01 and UFC 3-201-02 requirements for landscaping in the unobstructed space. For berms, ensure berms in the unobstructed space do not exceed a height of 4 feet, 6 inches to eliminate concealment opportunities.

g) **Large Diameter Trees** – Tree species that will grow to a large DBH (greater than 6 inches) provide an aesthetically pleasing and natural barrier to vehicle traffic. It is desirable to position large diameter trees in the space between the building and parking lots or roads where permissible by code and feasible based on available site space. Provide tree plantings with at least 4 inches DBH where the trees are integrated into the vehicle-deterrent perimeter. Multiple staggered rows of trees serve as highly effective vehicle barriers once the trees have grown. Where providing multiple rows of trees stagger and space the trees to eliminate any corridors exceeding a 5-foot width perpendicular to the adjacent roads or drive aisles. Final tree layout, tree spacing, and species must be approved by the Government Landscape Architect and installation Antiterrorism Officer (or their designated representative).

h) **Concrete Site Features** – Concrete benches and picnic tables are excellent deterrents to vehicles. Concrete planters are not desirable due to landscaping maintenance issues and concealment concerns in the unobstructed space.

i) **Berms and Ditches** – Berms and ditches provide protection and can be integrated with the landscaping plan (e.g., trees along tops of berms and creeping juniper on the sides).

j) **Elevated Plazas** – For buildings that require elevated entryway access with stairs and accessible ramps, consider arranging the stairs, ramps, and any low retaining walls or sloped soil so that they are positioned near the edge of the vehicle parking lot and adjacent roadways. A steeper, landscaped, stabilized slope near the edge of the parking lot with a sidewalk in front of it serves as a visible deterrent to illegal parking and approaching vehicles.

k) **Bollards at Building Entrances** – Bollards are an option where other features such as stairs, pedestrian ramps, trees, or berms do not deter direct vehicle access to the main building entrance. Bollards are desirable for sidewalks and plazas leading into the main building entrance provided there is no adverse impact to pedestrian accessibility. A bollard spacing of 4 feet on center will meet ABA/ADA requirements. Architectural bollards near the building entry are a desirable way to improve protection while improving site lighting (for lighted bollards) and appeal. Removable bollards are acceptable and beneficial for future building maintenance. Coordinate with vehicle access control requirements as part of civil site design. Provide the option of either permanent or removable bollards, determined based on customer needs at the CDW and subsequent design review meetings.

l) **Visual Screening Landscaping at Queuing & Entry Areas** –Visual screening affords protection for building occupants and visitors against the potential for vehicular or active shooter threats. Landscaping that provides visual obscuration of building entrances and outdoor queuing or congregation areas is highly desirable to improve protection of personnel in exposed areas.

m) **Anti-Terrorism Civil Site Design Special Requirements** – Installation mission-assurance has requested security-conscious site plans that afford improved protection to the building occupants. The goal is to improve anti-terrorism safety without adding cost by laying out necessary vehicle parking and stormwater features to protect vulnerable areas of the building. A specific design basis threat for an attack vehicle does not apply; therefore, the intent is to complement architectural layouts and landscaping features to improve occupant protection within the project SOW. The unobstructed space and vehicle access control requirements defined below are added scope items to manage nuisance parking and maintain the unobstructed space for base operational considerations.

n) **Vehicle Access Control** – All projects must include consideration for vehicle access control in the form of lockable swing gates and/or lockable removable bollards along driveways and access roads that lead to service areas around the building within the 33-foot unobstructed space. Other open plaza areas must be secured with permanent bollards in combination with removable bollards. Portions of buildings that must be secured within a restricted area fence (e.g. motor pools) are excluded from this requirement.

o) **Service Area Access** – Access for service areas around the building includes roads and driveways that lead to utility rooms, loading docks, mechanical yards, other areas in the unobstructed space that are used for building maintenance, and for roads that are only used for fire access.

p) **Pedestrian Areas** – Open plazas, hardscaping, and other outdoor pedestrian-congregation areas that are adjacent to a roadway must also feature vehicle access control integrated with permanent landscaping and civil site features as part of a vehicle-deterrent perimeter. Removable and fixed architectural bollards (lighted, where beneficial) are preferred for vehicle access control to open plazas, hardscaping, and other outdoor pedestrian-congregation areas with at least four removable bollards in a row for service access to these pedestrian areas. Provide the option of either permanent or removable bollards, determined based on customer needs at the CDW and subsequent design review meetings.

q) **Access Control Requirements** – Where bollards are provided, space bollards 4 feet on center starting at each edge of the road or driveway. Where gates are provided, provide single or double leaf swing gates with posts that start at the edge of the roadway (or behind the curb) and which include receiving posts to secure the gate in the open position. Gates must not encroach on the roadway or driveway while in the open position. Gates and bollards must be high visibility and meet all other UFC requirements for signage, high-visibility, reflectivity, striping, etc., to meet traffic safety requirements. Gates and bollards for vehicle access control to service areas and pedestrian congregation areas need not be crash rated. Refer to UFC 4-022-03 *Security Fences and Gates* for additional requirements for gates.

r) **Vehicle-Deterrent Perimeter** – Gates and bollards must be integrated with landscaping and civil site features to deter vehicles from bypassing the access control by driving around the barriers and to maintain a vehicle-deterrent perimeter.

s) **Consolidating Access Control** – Access roads to service areas around the building can be secured where the access road begins at the adjacent roadway or parking lot,

provided this is integrated with the vehicle-deterrent perimeter, in order to reduce the total cost of providing vehicle access control to the unobstructed space.

t) **Control Vehicle Speed** – Arrange parking lot access roads and drive aisles so that any direct approaches to the building walls or building entrance cannot exceed 25 miles per hour. Speed limit signage alone is not sufficient to constrain vehicle speed. Speed limit control in parking lots and access roads is also desirable to improve pedestrian safety and to reduce the risk of vehicle accidents.

u) **Limit Vehicle Approaches to Building** – Arrange access roads and drive aisles so that no vehicles have long straight approaches directly at the exterior walls of the building, particularly at the building entrance. Keep the long axis of drive aisles parallel with the walls of the building to control the approach direction of a vehicle. Arrange access roads so that personnel do not drive directly facing the building walls or any entrance. For short drive aisles that run perpendicular to the long axis of the parking lot, coordinate with landscape architecture to provide civil site and landscaping features that visually or physically deter vehicle access. Alternatively, locate these perpendicular drive aisles beyond the ends of the building so traffic does not directly face the building walls or any entrance. Loading docks/heavy truck areas need not consider these requirements due to the impracticability of implementing this where building access is a requirement. Provide curb stops in parking spots that are adjacent to the building to discourage vehicle parking in the unobstructed space.

v) **Unobstructed Space & Vehicle-Deterrence** – Provide a minimum 33-foot unobstructed space around the building without new parking, existing parking, new roadways, or new drive aisles. Keep existing drive aisles and roadways out of the unobstructed space to the maximum extent practicable. Provide berms, drainage swales/ditches, and other civil site features between the building and any adjacent parking lots or roadways as part of a vehicle-deterrent perimeter. Berms can also reduce off-site fill disposal costs, provided that fill is verified to be non-hazardous, non-contaminated. The CDW must address how to integrate unobstructed space and vehicle-deterrence needs within the available site footprint in consultation with the installation Antiterrorism Officer.

w) **Unobstructed Space Preferences** – The installation mission-assurance personnel prefer larger unobstructed spaces where feasible based on available site space. Unobstructed space need not exceed 82 feet for larger, open sites. This unobstructed space preference is to the mass-gathering portions of each facility that excludes open hangar areas, apparatus bays, and other areas that are specifically designed to be low occupancy spaces as defined in UFC 4-010-01. Refer to Paragraph C, *Proximity of Densely Populated Areas to Parking*, for more information.

2.3.7. Facility-Related Control System Cybersecurity

Design, acquire and execute all facility related control systems in accordance with UFC 4-010-06 Cybersecurity of Facility-Related Control Systems. Design the project using UFGS 25 05 11, *Cybersecurity of Facility-Related Control Systems*. Government Point of Contact to be utilized in SECTION 25 05 11 is James Mahoney, ICS ISSM for Camp LeJeune, email James.D.Mahoney@usmc.mil. Submit CCIs as attachments to SECTION 25 05 11.

The table below identifies the Facility Related Control Systems which must be included for this facility. Final C-I-A impact levels must be coordinated and approved by the Camp LeJeune ICS ISSM noted above, James Mahoney, James.D.Mahoney@usmc.mil

Authorizing Official	System Owner	System Group	System	Existing Authority to Operate?	C-I-A Impact Level
USMC AO Dr. Ken Bible	DPW	UMCS	HVAC	Existing ATO MCCAST (USMC) to be validated by ISSM	LOW-LOW-LOW – ISSM must validate
USMC AO Dr. Ken Bible	DPW	UMCS	Lighting	Existing ATO in MCCAST (USMC) to be validated by ISSM	LOW-LOW-LOW – ISSM must validate

USMC AO Dr. Ken Bible	Security Forces	ESS	CCTV	Existing ATO in eMASS (Navy) or MCCAST (USMC)?? ISSM to validate.	LOW-LOW-LOW – ISSM to validate

Incorporate cybersecurity requirements into project facility control systems identified in:

- ESR D20, Plumbing

- ESR D30, HVAC
- ESR D40 Fire Protection including Cooper Notification, Inc. WAVES Emergency Notification System
- ESR D50, ELECTRICAL

2.3.8. Secured Areas

Comply with the Marine Corps physical security measures in MCO 5530.14A as supplemented by the Unified Facilities Criteria.

2.3.9. Air Quality Management

When demolition or renovation occurs, ensure that subject buildings are evaluated for asbestos and asbestos-containing materials by a certified professional prior to the demolition/renovation. Ensure that any fugitive dust emissions generated by construction, renovation, or demolition are appropriately controlled.
If the project includes installation of new activities or equipment which generate air emissions, and the sources have not been evaluated for air permitting by MCB CAMLEJ, contact AQ program at (910)451-9017. Please note that air emission sources are required to be permitted prior to their installation and operation. Examples of such sources include, but are not limited to: boilers, water heaters, generators, fuel storage tanks, painting and coating operations, woodworking, welding, abrasive blasting, engine testing, refrigerant recovery devices, and parts ovens.
If the project involves any refrigerant handling or manipulation, ensure that appropriate ODS servicing procedures are followed.
If the project includes removal of any currently permitted air emission sources (see Item 3 for examples), contact AQ program at (910)451-9017.

2.4. Appropriate Design

Design the new building and systems in accordance with all Codes, Standards, UFCs, and criteria explicitly and implicitly stated herein. Employ integrated design principles.

2.4.1. Building Design – Architecture

The LOG OPS School building exterior envelope design must follow the architectural design features prescribed in the Camp Lejeune BEAP, 2010 for Camp Johnson (Section 4.13). This document establishes key exterior materials, material finishes/colors and building façade and roofing design elements to be incorporated into the building's exterior design.

Options for the exterior wall design are listed in Part 3, Chapter 6, B20 Exterior Closure ESR. Any of the listed options is allowed for the design of the exterior wall, as long as the design elements for the exterior wall defined in the BEAP are provided.

In lieu of a 4:12 to 6:12 roof slope that is defined in the BEAP for Camp Johnson, provide a minimum 2:12 roof slope for this building's roofs. Slopes of roofs that cover longer spans must limit the slope to prevent having an excessive attic area.

The building design floor plan must generally follow the arrangement of spaces indicated in the Architectural Block Diagram in Part 3, Chapter 4 of this RFP. Locations of break rooms and restrooms may vary from what is shown in the diagrams if the functions of the primary teaching and instructor spaces are maintained.

The massing of the building and roofing placement will be influenced by the continuous high bay space of the vehicle training bays and the adjoining classroom, administration, and corridor spaces that will require a lower building height.

The high bay vehicle training spaces are a continuation of the training and classroom space and are considered occupied spaces that require daylighting per UFC requirements.

The building design and design documentation must comply with applicable UFCs listed in Chapter 3, Part 1 and applicable building codes.

2.4.2. Civil/Site

The site for the LOG OPS School will provide for military training vehicle access into and out of the classroom bay areas (60-foot minimum out from the bay doors). Due to the infrequent nature of bringing vehicles in and out of the classroom bays, striping for staff parking may be placed within the military vehicle maneuvering area. Provide access for WB-62 vehicle to the special projects point in the building for loading and offloading. The WB-62 design vehicle is a semitrailer vehicle with an effective vehicle wheelbase of 62' as defined by AASHTO (American Association of State Highway and Transportation Officials). Due to high groundwater and flooding concerns, do not provide a sunken loading dock. Pedestrian circulation must be designed for the high volume of students and personnel that will be traversing to other common destinations adjacent to the facility, such as the mess hall. Most students are not allowed cars on base and as such, large groups of Marines often travel by foot together, often in formation. These formations will require wider than normal sidewalks.

Provide parking for staff and advanced students (200 spaces total) adjacent to the facility and provide sidewalks where appropriate from the parking to the facility. Any existing parking removed for construction of this facility must be replaced on a space-for-space basis in an area adjacent to the facility originally being served. These spaces can be co-located with the parking that serves the LOG OPS school if the location will also serve the existing facility.

All-weather access roads to the facility for emergency vehicles and for base maintenance access to mechanical rooms and exterior equipment must be provided.

Being in an already developed portion of Camp Johnson, site utilities (water/sewer) are adjacent to the building site and are readily available for connection.

Provide sufficient area for the dumpster/trash/recycling containers that is convenient for both the building occupants and the solid waste pick-up vehicle.

Stormwater management must comply with UFC 3-210-10 for *Low Impact Development*, and all State stormwater permit requirements for both treatment quality and discharge quantity and rate.

This project must meet Guiding Principles compliance and must comply with UFC 1-200-02, *High Performance and Sustainable Building Requirements*.

2.4.3. Environmental/Conservation/Cultural Resources

NEPA work for this project has been completed by NAVFAC.

2.4.4. Structural

The structural design objective is to construct an efficient, safe and durable building constructed from any of the materials and load bearing systems permitted in the Part 3 ESR narratives and

meeting the reference codes and standards. As part of this objective, the structural design must be coordinated with all disciplines and must meet functional requirements.

To help meet the objective, NAVFAC has provided a significant amount of historic geotechnical information and ECS has performed a preliminary geotechnical investigation of this site. Refer to Part 6 for the ECS preliminary information that includes previous investigations provided by NAVFAC. The NAVFAC and ECS geotechnical information is reliable for preliminary information but must be verified by the Contractor. The Contractor is solely responsible for interpreting available geotechnical information. The Contractor is responsible for conducting an independent geotechnical investigation for foundation design.

2.4.5. Fire Protection

2.4.5.1. Building Code and Life Safety Analysis

Provide a complete building code and life safety code analyses in accordance with UFC 3-600-01 and FC 1-300-09N.

2.4.5.2. Fire Alarm and Mass Notification

Design and provide an integrated fire alarm, mass notification system capable of notifying building occupants inside the facility of an emergency event. Design and install all equipment per the criteria of ESR and PTS Sections D40 and the manufacturer’s recommendations. Where the words "should" or “shall” are used in the manufacturer’s recommendations and in referenced Codes and Standards, substitute the word "must".

2.4.5.3. Fire Protection Sprinkler System

Design and provide a wet pipe fire sprinkler system for complete fire protection coverage throughout the entire building. Design and install all equipment per the criteria of ESR and PTS Sections D40 and the manufacturer’s recommendations. Where the words "should" or “shall” are used in the manufacturer’s recommendations and in referenced Codes and Standards, substitute the word "must". Base hydraulic design on the water supply data provided in ESR Section D40 and Part 6.

This project includes an electric-motor-driven fire pump with an onsite standby generator and automatic transfer switch to serve as the required alternate power source. Power supply at Camp Lejeune does not qualify as a “reliable power source” as defined in UFC 3-600-01. Refer to ESR Sections D40 and D50 for requirements. A diesel-engine-driven fire pump will not be considered as an acceptable alternative to the specified electric-motor-drive fire pump.

2.4.6. Telecommunications

Provide a complete Telecommunications backbone and horizontal distribution system as specified throughout this RFP. Install all equipment, pathways, and cabling per the criteria per the PTS Sections D50 and G40 and the manufacturer’s recommendations. Where the words “should” or “shall” are used in the manufacturer’s recommendations, substitute with the word “must”.

Provide a MDF to house telecommunications equipment and cabling as well as, service provider equipment and cabling. Additionally, provide floor/area serving IDFs to house telecommunications equipment and cabling.

Provide fiber and copper exterior and interior backbone cabling to each MDF and IDF. Provide copper horizontal cabling from each IDF with cable tray and conduit pathways to each Work Area Outlet (WAO).

Provide exterior underground communications duct bank manhole system from existing duct bank(s) and manhole to the MDF inside each building.

The design and installation must be in accordance with the latest TIA standards, all applicable Unified Facilities Criteria documents and the latest local provider and applicable Using Military Department standards and criteria.

2.5. Workflow Process

This facility's mission is to provide training for vehicle repair/maintenance that is performed on motor transport vehicles located in high bay training space, with additional instruction provided in a separate set of classrooms that are located adjacent to the high bay spaces. Access to the building for students since they are pedestrians is primarily into the high bay vehicle training spaces; and the students will be given directions for what bay to enter from instructional directions provided in their curriculum processing documents and day to day instruction from instructors. From the high bay space students can access the separate classroom associated with that particular training bay from each bay. Students, if required, are able to go between each high bay space since they must all be interconnected. Several labs and classrooms are located outside of the vehicle training bays and will require access from the primary building corridor located along the north side of the building. Students at times will be given access to the primary corridor when needing to access break rooms/lounges, other classrooms/lab or the Special Projects space as allowed by instructional staff. Students can use the primary corridors to exit the building at the end of their workload/classes if they are located in spaces that face the primary corridor. However, the large majority of students will stay in the high bay training space and the associated classrooms most of the time.

Instructors and managing administrative staff will have access to the main entry and use the primary building corridor north of the classrooms to navigate to the building. Or they can use a secondary entry located at the southeast quadrant of the building to access the building.

2.5.1. Hours of Operation

Hours of operation are from 0700 to 2000, Monday through Friday for student instruction. Instructors and other administrative staff access to the facility is allowed 24 hours per day, 7 days per week.

2.5.2. Staffing/Occupancy

The LOG OPS School is operating as a training facility and will be occupied primarily during daytime hours by students occupying the training spaces (classrooms and high bay training space) and instructional and administrative staff circulating between office areas adjacent to the training spaces and to the training spaces.

The number of occupants specified in the RFP and indicated in the Building Program in Part 3, Chapter 4 are identified for programming purposes. Determine occupancy load to be used to design building features, such as structural, egress, and plumbing fixtures must be as required in applicable building or life safety codes based on the spaces provided in the building design.

2.6. Special Design Challenges

Special design challenges include the following:

- The large number of MILCON facilities that are to be built at or around the same time as the LOG OPS School at Camp Lejeune may create challenges with both material and labor availability. The design of the building and systems selected for exterior envelope materials should consider these challenges.
- Refer to Part 6 for preliminary construction phasing plan. Develop a detail construction phasing plan as part of the design package for government approval before construction.
- Preliminary planning of the building shown in the floor plan diagram in Part 3, Chapter 4 has established space arrangements and the overall building square footage with all of the functions of the building accounted for. However, providing the final building floor plan with adequate circulation and corridor space and adequate indoor mechanical space without reducing the square footage of required programmed occupied spaces could be a challenge moving forward.
- Working with the user to further define and establish the correct amount of interconnectivity and occupant flow between the spaces of the building.
- Providing daylight per UFC requirements to all occupied spaces.

2.7. Adaptability and Flexibility

The LOG OPS School must be adaptable and flexible in its approach to meeting the training mission needs.

3.0 SITE ANALYSIS – P1512F LOG OPS SCHOOL

3.1. Existing Site Conditions

3.1.1. Site Conditions – Natural Constraints

3.1.1.1. Topography

The proposed site for the LOG OPS School on the Camp Johnson portion of MCB Camp Lejeune. The site in the northeast end of Camp Johnson, just east of Company B Street, just north of and wrapping around the east end of BEQ Buildings M457 and M458, and south of, but slightly overlapping an existing physical fitness trail. Site elevations range from approximately 20 feet down to 14 feet. There is a ditch that runs along the south side of the fitness trail that flows to the east. Base GIS indicates part of this ditch and the larger drainage draw that it flows to as potential wetlands. Potential wetlands are also located to the north, east and south of the proposed site. Several of these wetland areas encroach within the anticipated site boundaries.

3.1.1.2. Vegetation / Landscaping

The portion of the site immediately north of Building M457 is cleared, but the remainder of the site, apart from the parking lot and fitness trail, is wooded. The wooded areas are mostly pine with various understory shrubs such as Wax Myrtle. A stand of approximately one dozen large deciduous trees (±24-inch diameter) is located north of the MAT temporary building. The cleared portion of the project site is turf; site signage indicates it is the “Ground Supply School PT Field”. The adjacent parking areas are generally lined with small flowering trees such as Crape Myrtle and the areas surrounding the existing buildings are generally turf.

3.1.1.3. Natural Resources

There is an existing ditch running along the south side of the fitness trail. A second ditch flowing north/south crossed under the trail at the east end of the project site and combines with the first ditch. This combined ditch then runs to the southeast to combine in a larger drainage draw that ultimately drains to Scales Creek. If the stream is determined to be ephemeral or wetlands, mitigation will be required for all portions that are disturbed by construction.

3.1.1.4. Subsurface Investigation

See Part 4 ESR G10 for information regarding requirements to locate all utilities on the site.

3.1.1.5. Earthwork and Site Preparation

See section 3.3.8 below for information regarding Geotechnical Earthwork and Site Prep/Sitework requirements for this site.

3.1.1.6. Unexploded Ordnance (UXO)

There is no known unexploded ordinance within the project limits.

3.1.1.7. Wetlands

Wetlands are expected within the limits of the proposed project area, though there is not a current delineation. Areas of anticipated wetlands are noted in the Base GIS system within the north and east sides of the project site, as well as wetlands associated with the ditch running along the fitness trail. The approximate GIS wetlands limits are indicated in the project bubble diagram in Part 6.

3.1.1.8. 100-Year Floodplain

Per the FEMA Flood Insurance Rate Maps (FIRM) the project site is in “Area of Minimal Flood Hazard - Zone X”

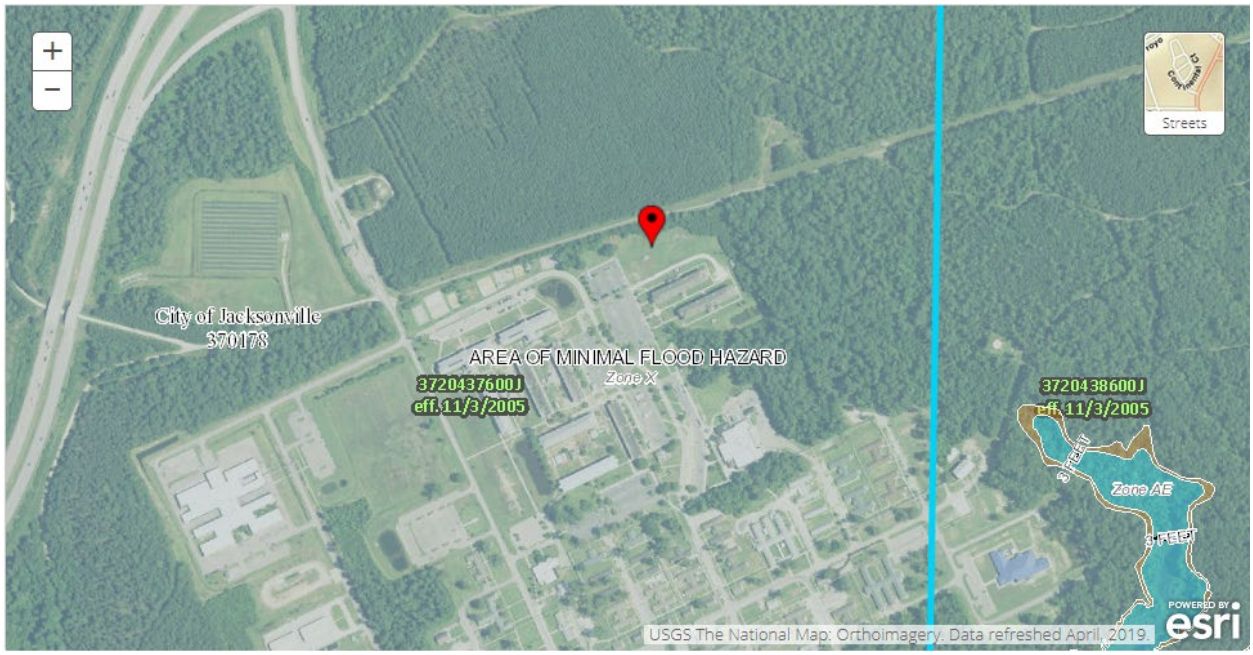

Figure 1: 100-Year Floodplain Map

3.1.2. Site Conditions – Man-made Constraints

3.1.2.1. Existing Vehicular Access and Circulation

There are existing roads and buildings in the vicinity of the location of the new LOG OPS SCHOOL. Company Street B provides direct access to the site from the Entry Control Facility Gate on Montford Landing Road to the west of the site. Several buildings and parking lots exist to the south of the site, including the Student Barracks. The west end of the site adjacent to Company B Street is a parking lot of approximately 75 parking spaces. Additional parking associated with the barracks buildings is south of the temporary MAT Building between Company B Street and Buildings M457 and M458.

3.1.2.2. Site Drainage & Storm Water Runoff (hydrology)

The proposed building site north of the existing fitness trail drains generally to the east to a drainageway that passes under the trail and to a large drainage draw that flows south to Scales Creek. The proposed area for parking generally drains west to east, with some drainage flowing

to the ditch along the fitness path to the north which all drain to the same drainage draw to. The adjacent parking lot and barracks buildings to the west and south collect storm runoff into a closed drainage system that discharges to a stormwater management pond on the southeast corner of Building M458. This pond discharges to a large drainage draw to the south that combines with the draw mentioned above.

3.1.2.3. Site Features

Occupying the parking area west of the proposed parking for this project is a temporary building that houses the MAT group. The Government will have a separate project to remove this temporary building ahead of construction for this project. In addition, there is an asphalt basketball court on the north side of Company B Street just northwest of the parking lot. If the project encroaches over this amenity it must be relocated to the west .

South of the site is Building M457, and its associated parking lot west of the building. There is also a gravel access road along the north face of Building M457 that provides access to the mechanical yard and structure SM457B. This access must be maintained.

In the woods line north of the cleared area north of Building M457 are approximately two dozen concrete “Jersey” barriers and approximately a half-dozen lengths of reinforced concrete pipe (RCP) approximately 24 inches in diameter. Along the east side of the MAT temporary building extending north to the ditch are concrete beams of various lengths and ranging in size from 6 inches by 6 inches to approximately 12 inches by 12 inches, most appear to be between 15 feet and 30 feet in length. Contractor to remove these items from the site.

On the west and south side of the cleared formation area are four light poles. In the southwest corner of the site is a concrete vault structure containing insulated ductile iron pipe and valves that appear to be remnants of the old steam service for the base. Electrical service for the existing barracks enters the site from Company B Street overhead to the east side of the parking lot where it then goes underground to a pad mount transformer to serve the buildings. Water and sanitary sewer service also enter the site from Company B Street generally along the parking lot access lane.

The proposed building site north of the existing fitness trail is primarily wooded with mostly young pine (<+12” Dia). The site will disturb existing wetland areas that will require permitting and mitigation.

3.1.2.4. Existing Site and Building Conditions Photographs

Photographs of the existing site and building can be found in the Part 6.

3.1.2.5. Hazardous Materials and Substances

See section 3.3.8 below for information regarding Geotechnical Earthwork and Site Prep/Sitework requirements for any hazardous materials found on the site.

3.1.2.6. Fencing

There is no fencing on the proposed site.

3.1.2.7. Adjacent Land Use

South of the site are Buildings M457 and M458. These are three-story barracks buildings that house the Marine students. West of Company B Street are several additional barracks buildings. North and east are undeveloped areas.

3.2. Existing Infrastructure Network

3.2.1. Facility Footprint

3.2.1.1. Building Footprint and Building Characteristics

The MAT facility is made up of temporary (mobile) structures arranged to create one larger structure. AE2 to coordinate with NAVFAC regarding their schedule to remove these structures prior to the start of construction for the LOG OPS school.

3.2.2. Vehicular Access and Circulation

3.2.2.1. General

Overall Site Traffic Requirements

The Contractor must develop one Traffic Investigation Report for the entire Camp Johnson site. Traffic Counts (TMC and 24-Hour Tube Counts) must be collected at key entry points and key intersections of the street network of Camp Johnson (see KMZ map of count locations in Figure 2) . Because this is a Controlled Entry Facility, UFC 4-022-01 and Section 2 of the Surface Deployment and Distribution Command Transportation Engineering Agency (SDDCTEA) Pamphlet 55-15 must be used. In addition, UFC 3-201-01 for Civil Engineering, Sections 2-9 and 2-10 must be used, along with AASHTO GDHS and ITE guides, including ITE LP-674B (Highway Capacity Manual) and *Transportation Impact Analyses for Site Development*. The MUTCD and NCDOT Roadway Design Manual must also be used. The Contractor must apply the most stringent requirements from the various manuals.

The Contractor must also create a Temporary Traffic Control Plan for each phase of construction. The Plan must follow the MUTCD and the NCDOT Work Zone Traffic Control guidelines.

Construction of the three buildings in P1512 are anticipated to redistribute rather than generate new traffic volumes. Therefore, traffic impacts are anticipated to be minimal, with the exception of: driveways to the new buildings; enhanced pedestrian crossing facilities on the existing roads of Company B and Neuse Road; and new Pedestrian Paths between destinations.

Current conditions for traffic flow and circulation need to be confirmed through the Traffic Count Data. Projection of Future Traffic Volumes and Conditions must be determined for the Build Year, plus five years (e.g. 2020 and 2025). Peak Periods (2 hour) for the AM and PM must be established. Synchro must be used to determine Levels of Service (LOS) at intersections and queuing at the Controlled Access Gate. The Contractor must conduct an Origins and Destinations Study to determine traffic circulation to, from, and through the site.

Based on the overall Traffic Investigation Report, the Contractor must take into account the specific operations and access needs around the three buildings in P1512 and are outlined in this RFP.

Based on the findings of the Traffic Investigation Report, the Contractor must recommend improvements to mitigate challenges in Traffic Operations, Circulation, Safety, and Access during daily or intermittent base operations. An estimate of magnitude of cost must be provided for such improvements after the Contractor completes the Traffic Investigation Report with the required data collection including traffic counts and an origins and destinations study. Improvements and cost must be discussed with NAVFAC.

The Contractor must create a Temporary Traffic Control Plan (TTCP) for each phase of construction. The function of the TTCP is to provide for the safe and effective movement of road users (motorists and pedestrians) through and around the construction zone while protecting road users, workers, responders to emergency incidents, and equipment. The TTCP should start in the planning phase and continue through the design, construction, and restoration phases. Components of the TTCP shall include the Advanced Warning Area, the Transition Area, the Activity Area, and the Termination Area. In the Advanced Warning Area, road users are informed about the upcoming work zone. In the Transition Area, road users are redirected out of their normal path, as needed. The Activity Area is comprised of the work space, the traffic space, and the buffer zone. In the Termination Area, road users are returned to their normal driving or walking path.

Figure 2: Traffic Count Locations

Building Specific Traffic Requirements

As shown Figure 3, Access for vehicles to the LOG OPS School anticipated to be primarily from Company Street B directly west of the site (and adjacent to Montford Landing Road where the Entry Control Facility Gate is located). It is not desired for vehicular access to be from Company Street B running south of the site. The portion of Company Street B south of the site is intended to provide significant pedestrian access from the student barracks to the LOG OPS SCHOOL and the Mess Hall. Several formations of students travel back and forth across this portion of Company Street B during the day and can cause significant vehicular delay.

Depending on the final layout of the new building, a short road extension may be needed to the school from the desired exit and entrance to Company Street B.

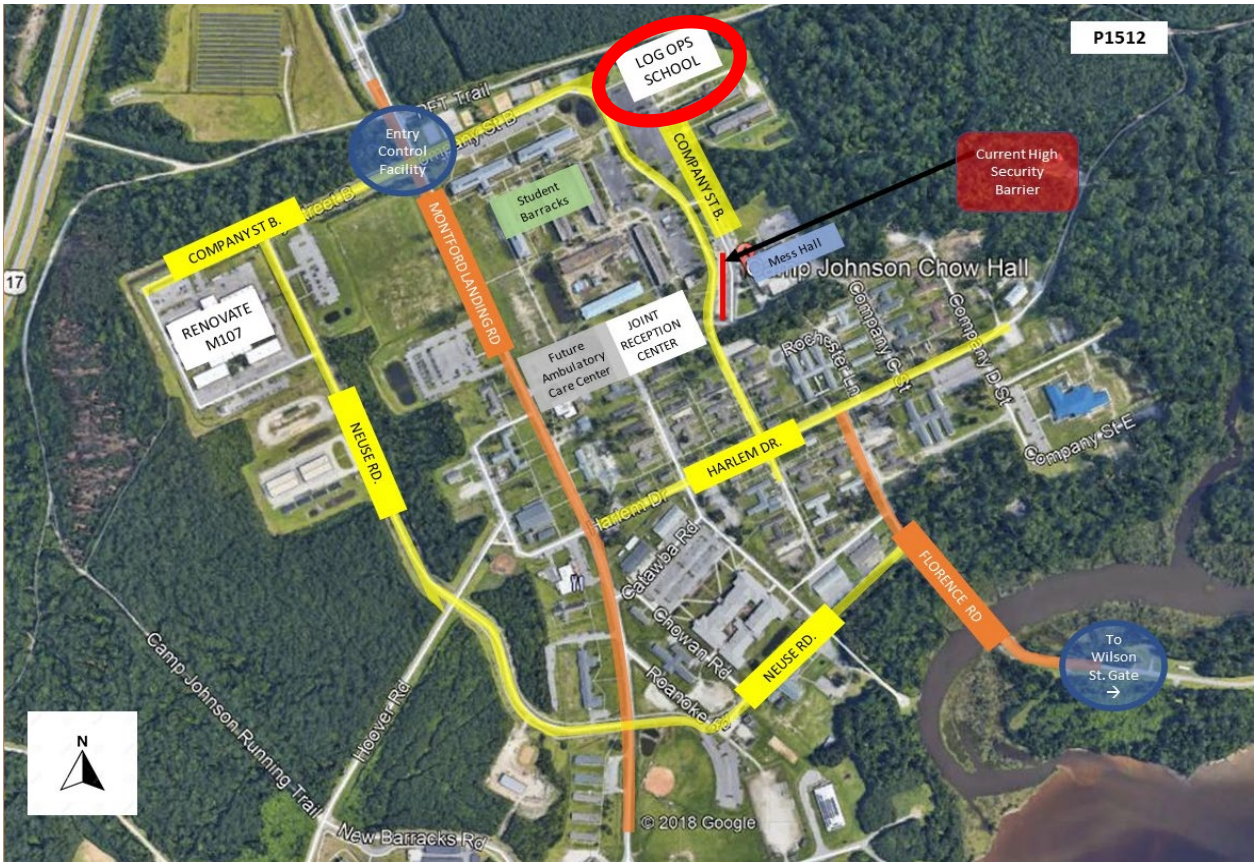

Figure 3: LOG OPS School Location

3.2.2.2. Parking

There are several parking lots south of the site. They are currently underutilized for vehicles, but provide a large space for Student Formations areas several times per day. These parking areas are required for the existing adjacent buildings. An assessment of the parking needs and infrastructure will need to be made in conjunction with ultimate building site layout. If the parking lots are relocated, a gathering space for the Student Formations will need to be found elsewhere and in the vicinity of the Student Barracks.

A majority of students are not allowed to bring personal vehicles to Camp Johnson. Parking lots are for military and civilian staff and advanced students only. Some parking lots are currently used for Solid Waste containers. Specific locations for Solid Waste containers should be determined in locations where there is appropriate access for Solid Waste vehicles.

3.2.2.3. Service Access

The new LOG OPS School will house multiple bays (10-20) for large military vehicles. Appropriate access to these bays will need to be accommodated and circulation to and from the site. In addition, accommodations will need to be made for Solid Waste Trucks and Emergency Vehicles.

3.2.2.4. Pedestrian Access and Circulation (flow, paths, sidewalks, etc.)

One of the most important aspects of the LOG OPS SCHOOL is the pedestrian circulation. Safe access to the LOG OPS SCHOOL and Mess Hall across Company Street B need to be included. Students travel in formations of at least 4 students across and up to 20+ students deep.

Students are not allowed to bring personal vehicles to Camp Johnson and are dependent upon pedestrian travel.

Two types of improvements must be designed for pedestrian access and safety. The first is the presence of Pedestrian Paths between destinations. These must exceed the standards for regular sidewalk and must to be 10-12 feet wide to accommodate the Student Formations.

The second is enhanced pedestrian crossings across Company Street B that allow for efficient and safe movement. The location of the enhanced pedestrian crossing should connect with improved Pedestrian Paths. The location of the pedestrian crossing should be strategically placed to allow convenient movement to the LOG OPS SCHOOL and Mess Hall. Some pedestrian crossings do exist and their locations shall be reevaluated. Rapid Flashing Beacons or other enhancements to enhance visual awareness of pedestrians should be considered.

3.2.3. Landscaping

The wooded areas are mostly pine with various understory shrubs such as Wax Myrtle. A stand of approximately one dozen large deciduous trees (±24-inch diameter) is located north of the MAT temporary building. The cleared portion of the project site is turf. The adjacent parking areas are generally lined with small flowering trees such as Crape Myrtle and the areas surrounding the existing buildings are generally turf.

3.2.4. Site Utilities

Water is available for potable and fire protection needs. The main extends from Company B Street to the barracks Buildings M457 and M458 approximately at the northern parking lot entrance aisle. There is a gravity sanitary sewer manhole at the southwest corner of the cleared PT field.

An overhead primary electrical service line runs along Company Street B and the parking lot west of Buildings M457 and M458.

3.2.5. Signage

Any required signage must comply with Camp Lejeune sign standards and the BEAP.

3.3. Site Development Requirements

3.3.1. General Site

Site development shall be designed in conformance with UFC 3-201-01 “Civil Engineering”. A bubble diagram site plan, with project limits of 15.4 acres, has been created to convey a potential general site layout and is included in Part 6. The bubble diagrams are the user’s preferred general layout; however, the Contractor is responsible for the creation of a complete construction plan set meeting the requirements of this RFP for the construction of the project. The Contractor will be utilizing the documents provided in this RFP to determine their bid as follows:

- Regardless of current use, any existing parking removed with this project must be replaced on a space per space basis in the general area of the buildings currently being served.
- Wetlands, as noted in the existing GIS information, are present within the limits of the project. It is anticipated, based on the conceptual plan, that wetlands will be disturbed as part of this project. It is also anticipated that the project will impact a portion of the classified stream (ditch) system that runs along the existing fitness trail and will require permitting through USACE. Obtain any and all permits for wetlands and stream impacts. Coordinate with the Contracting Officer and MCB Camp Lejeune Base Environmental staff.
- Contractor must maintain adequate drainage for upstream drainage that flows through the site during and after construction.
- The building will require 200 parking spaces for instructor staff and advanced students. Provide a separate VIP parking lot of approximately 20 spaces in the vicinity of the main entrance to the building.
- The vehicle instruction bays require 60 feet of heavy-duty pavement outside of the doors to allow for maneuvering vehicles in and out of the bay. This happens on a very infrequent basis, approximately $\pm$5-10 years when new vehicle types are introduced to the Marine Corps. As such a row of parking can share the pavement outside of the vehicle bays.
- All bay access pavement, drive aisles, dumpster and loading routes, and all pavement anticipated for emergency vehicle access shall be rated for HL-93 loading and the

section must be based upon the Contractor's geotechnical and Designer of Record engineer's calculations and recommendations. The driveway widths are to be a minimum of 30'. See minimum pavement section requirements for bidding in Section 3.3.7.1.

- All parking stalls, not in the bay door access lane, may be light duty pavement based on the Contractor's geotechnical engineer's calculations and recommendations.
- All disturbed area not built upon with impervious surfaces, stormwater management facilities or landscape areas shall be graded to drain and sodded with centipede sod.
- Provide and all-weather access road (pavement or gravel) to the chiller and to any exterior mechanical room access door.
- The existing physical fitness trail is anticipated to be impacted by the construction shall be relocated and reconnected. The trail shall be asphalt and match the existing width and section.
- All weather access must be maintained along the north side of Building M457.
- Provide a 15' wide landscape buffer between the proposed parking area and the access road north of Building M457. Buffer shall be planted with screening shrubs and trees per the BEAP.
- The facility does not require a fenced perimeter.
- Provide each covered break area with 4 picnic tables and AT/FP compliant trash receptacles.
- Provide a concrete dumpster pad for 3 trash dumpsters. The dumpster pad must extend to encompass the front wheels of the pick-up vehicle. The dumpster pad must have a masonry screen wall on three sides and be constructed of building materials similar in color to the proposed facility. Orient dumpster access to facilitate easy collection by solid waste collection vehicles.
- Provide perimeter concrete curb or curb and gutter at parking lot perimeters and locations where anticipated vehicle wheel loads will be within 1 foot of the edge of asphalt pavement. Where curb is provided, an integral concrete gutter is required at any point where water will flow parallel to the bottom of curb.
- Concrete sidewalk shall be provided for pedestrian circulation and shall be a minimum of 10 feet in width unless required to be wider as described above for circulation from the LOG OPS School to other destinations. Demolish all existing sidewalks within the project limits and replace with 10' wide sidewalks.
- Provide a heavy-duty concrete pad and electrical connections and grounding for an existing training apparatus that must be moved from the existing M107 site. Concrete pad size is approximately 15 feet by 25 feet. Final dimensions, thickness, and reinforcement must be designed by the DOR based on contractor obtained geotechnical information.
- Provide a bid option to provide all design, permitting and construction costs associated with adding light-duty asphalt pavement for troop formations between existing BEQ Buildings M445 and M446 and between M445 and M450. For bidding purposes, assume the pavement section is 2-inch NCDOT surface course asphalt, 4-inch NCDOT

aggregate base course and each area is 100 feet by 300 feet. Actual section to be as determined by the Engineer of Record. Bid must include modification of the existing NCDEQ stormwater permit and, if required, new SCM or an expansion/reconfiguration of the existing SCM.

3.3.2. Site Demolition

Demolition of the existing site features will require both above ground and sub-surface demolition. This site will require select demolition, as certain features will be required to remain as is or be relocated as part of this project. Contractor shall ensure access to the adjacent facilities at all times during demolition and construction.

The proposed conceptual site plan anticipates the relocation of the temporary building currently housing the MAT activity in the parking lot at the west side of the site, it is the government's responsibility to relocate this activity and temporary building prior to the start of construction of this project.

Several facilities aboard Camp Johnson must be demolished after final construction of the proposed project, the Joint Reception Facility, and the renovation of Building M107 included in this D/B RFP Package. Demolition must not occur until all units within the facilities have relocated to the facilities constructed with this D/B RFP package. The facilities to be demolished are M90, M90A, M95, M119, M121, M122, M123, M130, M132, M305, M311, M313, M403, M405, M406, M409, M411, M412, M413, M415, M416, M418, M420, and M422. Of these facilities, M305, M413, M418, M420, and M422 are approved for early demolition and may be demolished prior to completion of the new facilities.

The demolition of these buildings includes the complete removal of the building, including shallow foundations, foundation walls, slabs, pits, pile caps, etc. Deep foundations, such as piles, must be removed to a minimum depth of 48 inches below existing grade. Demolish all utilities serving each building as described further in this section and ESR G10. Site demolition will include the demolition and removal of all pavements and sidewalks specific to serving the building. Main circulation sidewalks or pavements serving facilities to remain must not be disturbed. Following demolition, all graded slopes must conform with UFC 3-201-01 and direct runoff towards existing drainage structures or ditches with the flow patterns matching existing to the greatest extent feasible. Any pavement demolition that terminates at existing pavement will be terminated by saw cutting at the limits of demolition in neat straight lines.

Utility service lines to each building must be removed back to the main and capped. Do not demolish existing pavement to remain to facilitate the removal of a utility service line to be demolished. Where underground utilities to be demolished pass under pavement not to be demolished, cut the utility at each edge of pavement and fill the utility remaining under the pavement with flowable fill and abandon in place. Continue removal of the utility to the main on the far side of the pavement if applicable. If the utility main is within the pavement, cut and cap the service line at the edge of pavement and abandon the utility in place in accordance with applicable State or Federal regulations.

Prior to the demolition of any utility, coordinate with the utility owner to ensure the removal of the service line will not disrupt service to facilities to remain. Some telecom services may pass through buildings scheduled for demolition to buildings scheduled to remain.

For natural gas demolition, notify Piedmont Natural Gas (PNG_ when a facility is ready for demolition. Once the facility has been confirmed for demolition, PNG will remove and retire the

meter. PNG will valve off the lateral at the main, and will disconnect both ends of the gas lateral, the meter side and the main side. To depict retirement, PNG will remove the lines 4' to 5' from each end. Remove the remaining line left by PNG. Once a meter is retired the lateral cannot be reused for a new facility.

Any structure or pavement not to be demolished that is damaged during construction or demolition must be repaired or replaced at the expense of the contractor.

Demolition of buildings associated with telecommunications must coordinate with telecommunications services. Demolition of telecommunications pathways must be coordinated with base telephone office.

3.3.3. Utilities

There is an 8-inch water main that runs approximately under the parking lot access aisle from Company B Street to Building M457. This main is the preferred connection point and will serve as the source for both potable and fire protection water service.

There is an existing sanitary sewer manhole east of the existing parking lot northwest of Building M457. This will serve as the connection point for the building's sanitary sewer service.

Connect to the existing overhead primary electrical power system at a pole #4997 near the basketball court and extend the primary service to the pad mounted transformer associated with the Log Ops School.

Existing telecommunications and fiber optics utilities running roughly parallel to the physical fitness trail must be preserved and protected during construction.

PNG will be providing natural gas service to the new facilities. During the design phase, invite PNG representatives to design review meetings, including Michael Lilly – PNG Commercial and Residential Sales Specialist – Michael.lilly@duke-energy.com 252-808-7292 and Bobby Gurganus – PNG Construction – Bobby.gurganus@duke-energy.com 252-670-9613. Coordinate with PNG to depict the gas line routes on the civil utility site plans. The natural gas lines must be included in the project GIS deliverables. Provide projected loads of natural gas equipment to PNG for gas meter sizing. Notify PNG at least 6 months prior to in-service date to install new laterals and meters.

3.3.4. Stormwater Management

Provide a complete stormwater management design that meets or exceeds UFC 3-210-10 Low Impact Development, UFC 3-201-01 Civil Engineering, and North Carolina Stormwater Management requirements. Provide calculations that demonstrate compliance with all three criteria.

A storm drainage system shall be designed and constructed to collect and convey the ten-year peak flow from the building and other new impervious areas into a proposed SCM. Subsurface precast concrete structures such as catch basins and drop inlets will collect stormwater and RCP with watertight joints will convey the stormwater towards the stormwater SCM which will retain and treat the stormwater before it is discharged towards the nearby waterway. Roof downspouts must tie directly to drainage structures underground. The use of grassed swales, pre-treatment areas, and other low impact stormwater strategies throughout the site are encouraged, where appropriate.

A stormwater SCM will be located on site and will be designed to meet the NCDEQ regulations for stormwater detention and water quality.

While specific SCM devices are not required at Camp Lejeune, preferences based upon historic performance of devices are noted. The DOR should be aware of the challenges of providing functioning devices at the sites. The goal is to provide functioning and compliant devices which are not maintenance intensive, nor require specialized or propriety materials. The DOR should be cautioned in the use of sand filters; Camp Lejeune has had experience with the majority of sand filters being compromised by the development of algae crust on the surface of the filters. A third-party inspector is recommended to be specified for the installation of SCMs. A pre- and post-construction infiltration test must be conducted for any SCMs that rely upon infiltration. A 3-day drawdown with a factor of safety of 2 must specified for SCMs to ensure continued stormwater compliance. Do not allow the conversion of sediment traps into infiltration SCMs. The sediment trap must be separate from the SCM to protect against premature failure. The use of heavy equipment in the bottom of infiltration devices will not be allowed due to the risk of compaction.

Overland relief for large storm events shall be analyzed. Calculations must demonstrate that the 100-year storm routed through proposed stormwater management features will not reach higher than 1 foot below the Finish Floor Elevation of adjacent buildings. Demonstrate that the 100-year storm routed through proposed stormwater management features will not flood critical vehicle or pedestrian pathways.

Additional criteria that must be considered by the contractor:

- Project involves the disturbance of over 5,000 square feet. Therefore, Requirements under Section 438 of the EISA will be enforced. The policy directs all DoD construction projects and redevelopment projects with footprints greater than 5,000 square feet to implement Low Impact Development (LID) techniques to maintain predevelopment hydrology to the maximum extent technically feasible. Coordinate with Water Quality Manager, EQB at 451-9518 or Public Works Division, Operations Branch at 451-0869.
- Project involves the disturbance of 1 or more acres of land and will require a State approved sedimentation/erosion control plan and stormwater permit. For questions regarding stormwater requirements coordinate with Water Quality Manager, EQB at 451-9518. To coordinate the permit application, contact Public Works Division, Design Branch at 451-2213. The purchase of nutrient credits in lieu of on-site stormwater quality treatment measures to meet North Carolina water quality requirements is not permitted.
- Project involves addition/construction of 10,000 square feet of impervious surface area. It requires State permitting through the NCDEMLR and the design and construction of approved SCMs (Coastal County Rules). Coordinate with Water Quality Manager, EQB at 451-9518 and the Storm Water Manager, ECB at 451-9657.
- If the project affects any existing BUA (impervious area) that is currently covered under an existing state issued stormwater permit, that permit will need to be modified. Coordinate with Public Works Design Branch at 451-2213.
- If additional new BUA above and beyond the existing amount is proposed, then at a minimum, a high density SCM is required to treat that runoff from the new BUA. If the existing BUA within that drainage area and its runoff cannot be regraded or rerouted, then the proposed SCM must be designed to accommodate all the runoff within its drainage area. A full stormwater permit application will be required. Coordinate with

Water Quality Manager, EQB at 451-9518 or Public Works Division, Operations Branch at 451-0896. Coordinate with Public Works Design Branch at 451-2213.

- Per direction from Public Works Division, each project site is considered to be a separate project. Building demolition, regardless of which project the building is demolished under, can be used to offset impervious area increases from new construction, as long as the demolished building and the new building are adjacent to each other. There is no time limit between the demolition completion and new construction starting.

3.3.5. Erosion and Sediment Control

Erosion and sediment control must be designed, permitted, and installed per the NCDEQ. Obtain all required permits for land disturbance prior to the start of construction.

To prevent potential erosion and sedimentation from entering the surrounding wetlands, numerous erosion control methods and practices shall be utilized. A stone construction entrance will be placed at a strategic location, inside the project limits to serve the site. A sediment basin with skimmer outlets and riser, if required, shall be provided in the initial construction phase. This sediment basin must be separate from any proposed stormwater SCMs. The conversion of a sediment trap or basin to a stormwater SCM is not allowed. Basins may be constructed before the site is cleared and temporary swales graded to direct sediment-laden stormwater towards the basin. A temporary construction fence should be installed around the entire limits of disturbance. Silt fence and silt fence outlets will be used around the perimeter of the of the construction sites to prevent sediment from exiting the disturbed areas. A double row of silt fence will be used along any wetland buffers. The site will then be cleared and graded once these erosion control measures are in place and have been approved by the local erosion control inspector representing NCDEQ.

Once stormwater structures are installed and brought to grade, inlet protection will be provided at all inlets to prevent sediment from entering the storm system. The site will be paved and areas will be stabilized with vegetation near the completion of the project.

Additional criteria that must be considered by the contractor:

- Ensure sediment does not leave a construction site of any size as a result of land-disturbing activities. Coordinate with Water Quality Manager, EQB at 451-9518 and the Storm Water Manager, ECB at 451-9522.
- Project involves the disturbance of 1 or more acres of land and will require a State approved sedimentation/erosion control plan and stormwater permit. For questions regarding stormwater requirements coordinate with Water Quality Manager, EQB at 451-9518. To coordinate the permit application contact Public Works Division, Design Branch at 451-2213.

3.3.6. Landscaping

Landscaping must comply with BEAP guidelines with regards to street trees, parking lot landscaping, outdoor amenities and stormwater management. Landscaping proposed near building must comply with all AT/FP requirements. See also Part 3 – Chapter 6 Section G20 for specific landscape requirements and plant establishment and maintenance requirements.

Company Street B will provide a minimum 6-foot planting strip with deciduous trees planted at approximately 40 feet on-center depending upon proposed utility locations. A physical fitness trail on the north side of the site will need to be re-routed around a new turnaround for the loading/mechanical yard area.

Parking areas must be screened using a variety of tree and shrub planting to reduce visual impact from adjacent roadways. A minimum of 15 percent of the surface area of the parking lot must be shaded by deciduous trees within 10 years of installation. A minimum of 5 percent of the parking lot must be pervious planting bed.

Site furnishings must be provided within outdoor seating areas and will be constructed of durable materials with colors in compliance with the BEAP and surrounding examples.

Site grading must be designed to preserve pockets of existing trees to the extent feasible. Preserved trees must be monitored for one year after construction activity has ceased; dead or dying trees must be removed and replaced as directed by the COR.

Turf areas must be limited to the extent feasible in favor of naturalized planting and groundcover. Turf species in formal lawn areas must be centipede grass; all lawn areas must be sodded with Centipede grass (*Eremochloa ophiuroides*).

3.3.7. Permits

- Erosion and sediment control permit – North Carolina Department of Environmental Quality.
- Stormwater management permit - North Carolina Department of Environmental Quality.
- Water extension permit - North Carolina Department of Environmental Quality.
- Sewer extension permit - North Carolina Department of Environmental Quality.
- Wetlands Disturbance - USACE

3.3.8. Geotechnical Earthwork and Site Prep and Sitework Requirements

3.3.8.1. Criteria for Bidding

Base bids on the following criteria:

- Stripping depth of surficial soil material in existing grass surfaced areas; 4 inches.
- Stripping depth of surficial soil materials and root mat in existing wooded areas; 12 inches.
- Stripping depth of asphalt concrete in existing paved areas; 3 inches for asphalt and 6 inches of stone base.
- Grubbing depth in existing wooded areas; 18 inches.
- Depth and extent of buried demolition debris and/or uncontrolled fill materials; 1 foot in the area of the fitness trail.
- Seasonal high-water table depth; 2 feet.
- Excavated onsite soils will not be suitable for reuse as structural fill.

- Requirements for disposal of surplus soil; Dispose of per Specification 01.57.19. No soil is to leave Camp Lejeune.
- Undercut and replacement with imported structural fill to address geotechnical unsuitable soil conditions; 10 percent of the site.
- Provide surcharging to mitigate excessive consolidation settlement associated with site grading impacts in all areas where finished site grade increases are 2 or more feet above existing site grades.
- Need and depth of predrilling/spudding to facilitate pile installation; 10 feet.
- Provide a preconstruction survey and vibration monitoring during pile installation.
- Provide temporary sheeting, shoring, and dewatering of excavations greater than 3 feet.
- Minimum heavy-duty asphalt pavement section; 2-inches NCDOT surface course asphalt, 3-inches NCDOT base course asphalt, 8-inches NCDOT aggregate base course.
- Minimum light-duty asphalt pavement section; 2-inches NCDOT surface course asphalt, 8-inches NCDOT aggregate base course.
- Minimum sidewalk section; 4-inches – 3,000 psi compressive strength Portland Cement Concrete,
- Minimum dumpster pad/equipment pad section; 8-inches – 5,000 psi compressive strength Portland Cement Concrete, #4 bars at 12 inches on-center each way.

3.3.8.2. Earthwork and Site Preparation Criteria

The Contractor's Geotechnical Engineer shall monitor site stripping operations on a full-time basis. Stripped surficial soil materials will be properly disposed of per Specification 01.57.19. No soils are to leave MCB Camp Lejeune. Imported topsoil will be provided for the project where needed.

The underlying soils that will be exposed after completion of site stripping and undercutting will have a tendency to become softened and unstable when saturated and worked or subjected to construction equipment. Provide the necessary measures to address these marginal subgrade support conditions throughout design and construction to obtain required soil support while maintaining progress for completion on schedule. Do not allow construction traffic to travel directly on exposed subgrades. Provide geosynthetic reinforced haul roads and staging pads to facilitate construction traffic access across the site and to protect the underlying subgrade from deterioration. The Contractor is responsible for all costs associated with any necessary measures to repair subgrades deteriorated by construction traffic and exposure to water. Determination of unsuitable subgrade conditions and need to implement remedial measures will be made by a NAVFAC Geotechnical Engineer and subject to the approval of the Contracting Officer.

Provide control of groundwater and surface water encountered during construction. Provide temporary dewatering and positive site drainage to prevent conditions that will cause deterioration of exposed subgrades and open excavations. Do not allow deterioration of exposed subgrades to create interruptions to the progress of construction. Establish storm drainage features at the earliest stages of site development. Install and maintain all necessary

temporary water containment facilities, channels/ditches, and diversions for ground water and surface water control to include all necessary temporary environmental controls. Provide a multiple well point dewatering system for any utility or foundation excavations that extend down to and below the ground water level.

The site currently contains or may have formerly contained developments such as structures, surface pavements, haul roads, above and below ground utilities, etc. that will require demolition and removal prior to earthwork operations under this contract. The required removal depth of the existing site features is expected to be highly varying. It is reasonable to anticipate that excavations made in areas of known prior development will encounter additional materials beyond what is specifically indicated on the test boring records that will need to be removed.

Imported Select Material and Backfill and Fill Material will be required for filling all undercut excavations, grubbing excavations, excavations resulting from the demolition of existing utilities/foundations as well as new utility/ foundation excavations within the planned building and pavement areas, and for grading fill in pavement and building areas. Provide imported Select Material for the top 2 feet of fill required beneath all pavements, foundations and slabs. Provide imported Backfill and Fill Material in all other structure and pavement locations. Select Material must meet ASTM D2487 classification symbols GW, GP, SW, SP, and SP-SM with not more than 12 percent passing the U.S. No. 200 sieve by ASTM D1140 and plasticity index not greater than zero by ASTM D4318. Backfill and Fill Material must meet ASTM D2487 classification symbols GW, GP, SW, SP, SP-SM, and SM and have a maximum of 20 percent passing the U.S. No. 200 sieve by ASTM D1140 and maximum liquid limit of 30 and maximum plasticity index of 9 by ASTM D4318.

Excavated existing on-site soils will only be reused as general fill beyond the limits of surface bearing structures (i.e. pavements, buildings, pipe trenches, etc.) and beyond the limits of any undercut excavations, provided the material meets the project requirements. All soil material must exhibit the characteristics required to compact the soil to the density and performance specified for the intended locations. Excavated on-site soils will be amended (i.e. mixed with lime, cement, or blended with imported structural materials, etc.) as necessary to facilitate reuse as general fill and Backfill and Fill Material. All fill materials will have a maximum particle diameter of 3 inches and will require moisture conditioning prior placement and compaction to within ± 2 percent of the optimum moisture content as defined by ASTM D698 or ASTM D1557. Chose compaction standard as recommended by Geotechnical Engineer of Record.

The Contractor will be responsible for maintaining erosion control measures, preventing segregation, and moisture conditioning for any excavated onsite soil and aggregate materials and any imported soil and aggregate materials stockpiled onsite.

All excavated materials which cannot be reused on the project as common fill (surplus soils) must be transported to one of the designated locations on Government property. Refer to RFP Part 2, Specification 01 57 19.01 20 SUPPLEMENTAL TEMPORARY ENVIRONMENTAL CONTROLS for locations and contact information. No surplus material will leave Government property without written approval of the installation Environmental Program Manager and the Contracting Officer. The Contractor is responsible for all costs associated with the management and disposal of surplus excavation spoils.

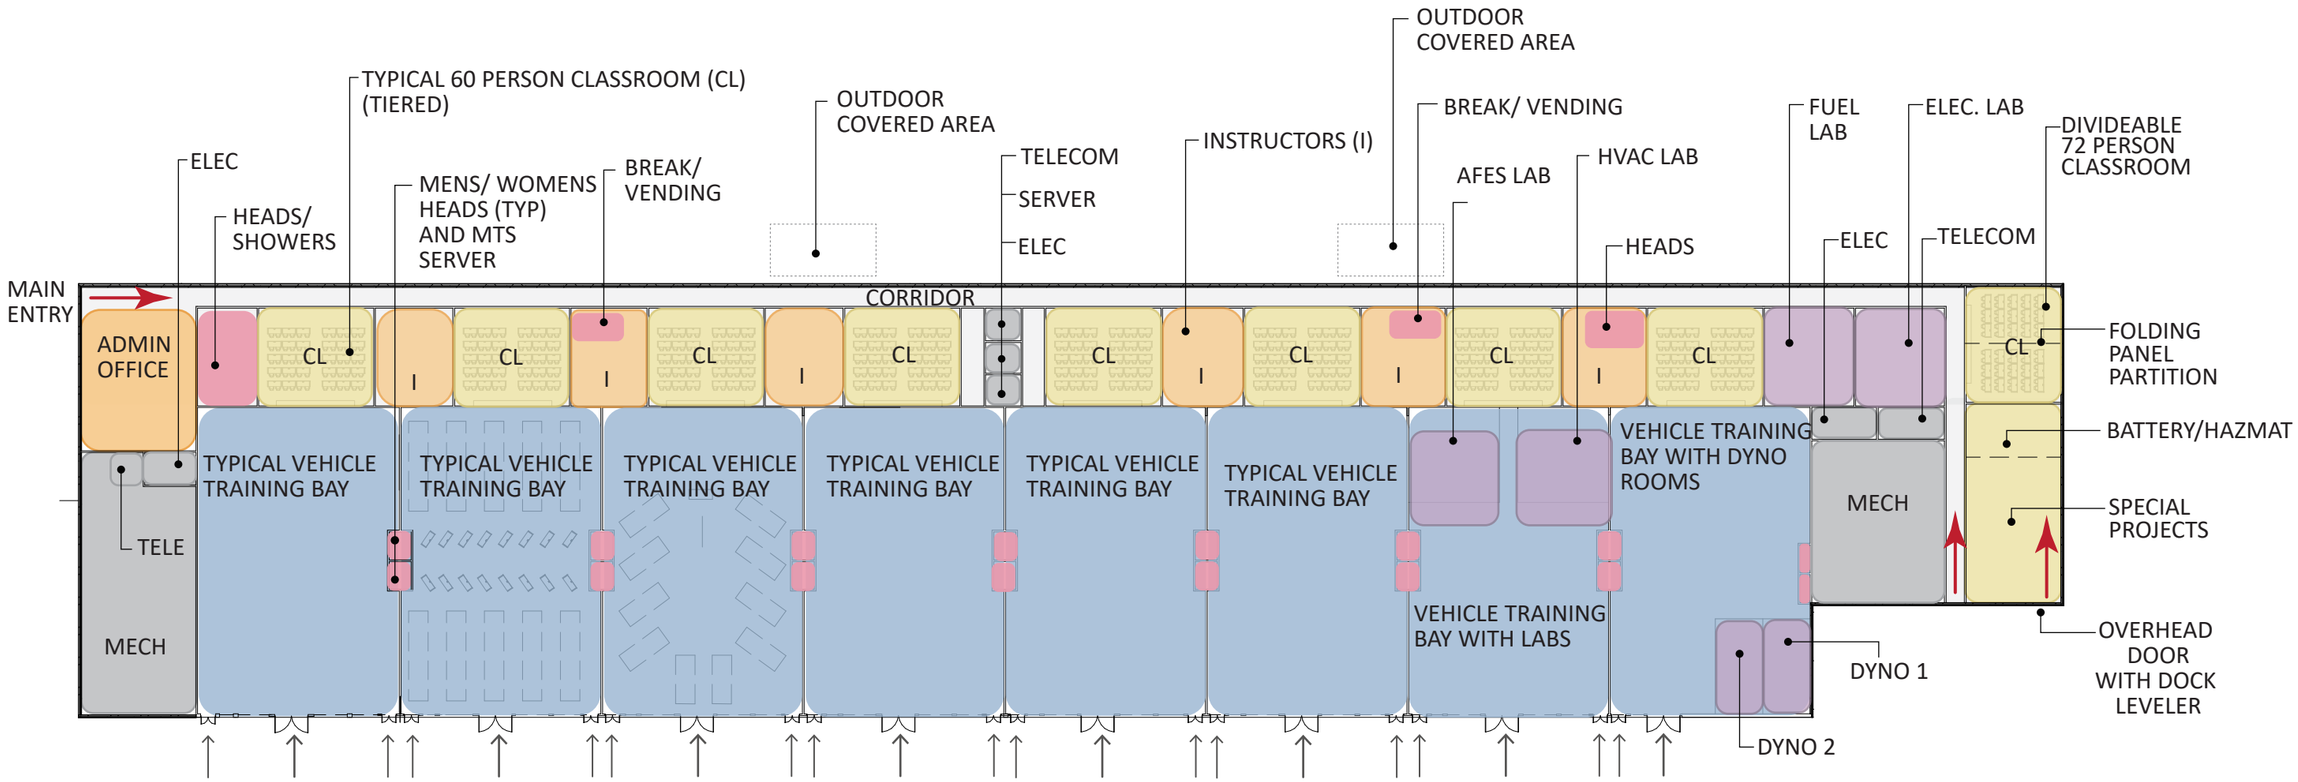
Room Name	Comments	Additional Room Requirements
Support		
Heads (male/female/transgender)	Heads for instructors/admin include showers and lockers as indicated below; heads for students in Training Bays and one other location	
Showers	10 male; 3 female	
Lockers	35 Wall Lockers if not in Instructor head; Lockers for Uniforms/PT gear/Civilian clothes - 56 Male, 14 Female	
Mechanical	Two rooms - 8,755 SF total	
Electrical		
Telecom		
MTS Server	Located above the Heads located in the Vehicle Training Bays	
Fire Pump Room		
Janitor's Closet		
Outdoor Break Area	Two outdoor canopied break areas	

The Contractor shall provide actual area in both square feet and square meters in proposals.



4.2. Space Relationships

Refer to the space arrangement shown in the Architectural Block Diagram at the end of this section. The diagram incorporates the spaces defined in the Space Tabulation. The primary concept incorporated into the building space relationships provides for a continuous linear placement of high bay vehicle training spaces that are directly accessed by a separate classroom and an instructor office space (for each bay). The spaces that remain beyond the continuous cluster of high bay space/ classrooms/instructor space are placed in the east and west portions of the building. All spaces are connected by a primary corridor that runs west to east along the north face of the building from the main building entrance to a secondary building entrance. Each high bay vehicle training space can be accessed directly from the exterior, and access between each high bay must be provided. Per the Architectural Block Diagram the MTS Server is to be located over the heads located in each vehicle training bay with access by stair. This space can be an open area and not enclosed.

The primary formal entrance to the building that is in close proximity to a drop off area with limited parking placed just west of Company Street B is located on the northwest side of the building. It provides access for administrative staff and visitors. The secondary entrance is provided at the southeast area of the building and it provides access for a larger area of parking that accommodates instructors.

4.3. Exterior Character

The exterior character of the Log Ops School as indicated in Part 3, Chapter 2, article 2.4.1 must follow the architectural expression prescribed in the Camp Lejeune BEAP for Camp Johnson (Section 4.13). Building M-79 at Camp Johnson has been pointed out as an exemplary building that follows the BEAP requirements. However, the entire Camp Johnson campus must be considered during design. All building exterior architectural design will be reviewed and approved by the MCBCL Architectural Review Board.

JACOBS

5.0 ROOM REQUIREMENTS – P1512F LOG OPS SCHOOL

5.1. FINISH AND FF&E SCHEDULE

The following chart is provided for defining general room finishes and furniture, fixtures, and equipment (FF&E) items for the LOG OPS School. Special interior finishes and FF&E items beyond those outlined below are provided in the Additional Room Requirements. The intent of each room requirement sheet is to highlight special, unique, additional, or exceptional room-specific requirements. These tables are not all-inclusive, and the requirements listed should be considered as an addition to the typical requirements outlined in the UFCs, ESRs, & PTSs.

FF&E and AV Equipment will be funded separately as a modification to the construction contract, with the exception of fixed furnishings (SID). Infrastructure to support all FF&E and AV is included in the construction contract. Contractor's Interior Designer to determine FF&E requirements based on in-depth interviews with Activity at concept Design workshop (CDW).

Refer to ESR D50 for specific electrical and audio visual (AV) requirements. Coordinate with the Base to determine preferred locations of fixed artwork.

FFE to include Automated External Defibrillators as required by National Fire Protection Association's (NFPA) 101 Life Safety Code and Marine Corps Order (MCO) 11000.11A. Access to an AED shall be provided for all Assembly occupancies, fitness centers and high-risk training centers and as required by NFPA 101.

Room Typical guidelines:

1. Private office required to be a minimum 9'-0" wide (10'-0" wide is preferred).
2. Workstations in open office areas will be a benching / desking system. Powered Cubicle walls will be used minimally.
3. Ceiling heights will be 10'-0" unless notes otherwise. See additional Room Requirements
4. All base to be 6" high

5.2. ADDITIONAL ROOM REQUIREMENTS

Room data sheets are provided for specific rooms in each facility to provide additional information for these rooms; and better define room requirements beyond those provided in the ESR, the Finish and FF&E Schedule located in section 5.1, and other parts of the RFP. If no room data sheet is provided for a space identified in this facility then the general requirements of the RFP, the Finish and FF&E Schedule in section 5.1, and the referenced UFCs, Codes, and Standards apply.

P1512F-LOG OPS SCOOL

AFES and HVAC Lab

Space Characteristics

Function/Adjacencies: These labs are used as a hands-on training space to teach Marine mechanics the AFES and HVAC systems used on various tactical vehicles. They located as separate spaces within a Vehicle Training Bay space.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 10'-0'
Acoustics:
Sound Transmission Class (STC) – Refer to ESR C10 for STC rating.
Access: From vehicle training bay space
Number of Occupants: 8 and instructor
Other/Special Requirements:
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	
C1010	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling) with interior of room. Include sound attenuation in consultation with acoustical engineer.
C1010	Fixed Partitions	SF		Concrete masonry unit partition to underside of roof deck facing the vehicle training bay space.
C1020	Interior Double Doors	EA	(2) 3'x8' double leaf	Steel Doors and Frames- Steel interior doors and frames shall be factory primed, field painted. Provide fire rated doors as required by Code if required. Provide 8" x 38" glazing in one door. Door shall have a minimum STC rating of 40.
C1020	Interior Door Hardware			Provide classroom function hardware. Provide door seals to meet STC rating at double door in this data sheet.
C1030	Marker Boards and Tack Boards		36"h x 48"w	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board. Tool trays and accessory kits shall be provided for each board Top of boards to be mounted at approx. 6'-8" AFF. Provide along full length of two side walls.
C1030	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.
C1030	Identifying Devices			Departmental identification signage and directional signage, as required.

AFES and HVAC Lab

Space Characteristics

Function/Adjacencies: These labs are used as a hands-on training space to teach Marine mechanics the AFES and HVAC systems used on various tactical vehicles. They located as separate spaces within a Vehicle Training Bay space.

Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C3010	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard per Room Requirements Finish and FF&E Schedule in Part 3, Chapter 5, Room Requirements and per ESR C30.
C3010	Corner and Wall Guards	AR	Per ESR	Stainless Steel
C3010	Impact Resistant Wall Panels	LF		Impact Resistant PVC wall panels, installed floor to ceiling with matching connectors and trim, as required
C3020	Resinous Floor System	SF	AR	Per Part 3, Chapter 5, Room Requirements Finish Schedule and ESR C30
C3020	Wall Base Finishes	LF	4" high	Integral wall base (resinous system)
C3020	Hardeners and Sealers	AR	AR	Hardened concrete floors per ESR C30.
C3040	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D201090	Emergency Eyewash and shower			Eyewash IAW UFC 3 420-01
D203003	Floor drain			All Floor drains must have Trap primer
D501004	Panelboards			Provide a minimum of one 208Y/120V panelboard to serve the receptacles and equipment loads in the lab.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones controlled via wall switches and AV podium control.

AFES and HVAC Lab

Space Characteristics

Function/Adjacencies: These labs are used as a hands-on training space to teach Marine mechanics the AFES and HVAC systems used on various tactical vehicles. They located as separate spaces within a Vehicle Training Bay space.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 10'-0'
Acoustics:
Sound Transmission Class (STC) – Refer to ESR C10 for STC rating.
Access: From vehicle training bay space
Number of Occupants: 8 and instructor

Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Provide 3 duplex receptacles per student position.
D503001	Telecommunications Systems			Provide NMCI network drops.
E102009 D503004	AV Equipment/ Television Systems			Provide CATV outlets at appropriate height for all wall-mounted monitors.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).

P1512F-LOG OPS SCHOOL

LOG OPS Classroom

Space Characteristics

Function/Adjacencies: These classrooms are for maintenance training classes for Marine mechanics and most are directly associated with and adjacent to a vehicle training bay space.

BID Option: provide tiered raised flooring to improve sight lines to instructor. Provide 7" between tiered floor levels

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 10'-0"
Acoustics:
Sound Transmission Class (STC) – Refer to ESR C10 for STC rating.
Access: Off major corridor system and from the Vehicle Training Bay space
Number of Occupants: 60 persons typical with one instructor
Other/Special Requirements:
Sound isolation all adjacent rooms
Instructor Podium in association with teaching wall.
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	base bid: Raised access flooring system with 6" depressed slab
C1010	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck. Provide mold/moisture resistant and impact resistant GWB at face of the partition facing the Vehicle Training Bay.
C1010	Retractable Partitions	AR		One classroom not associated with the vehicle training bay space is to be divided into two classrooms.
C1010	Interior Windows / Vision Panels			Windows/vision panels as required to achieve requisite view .
C1020	Interior Wood Doors	EA	3' x 7'	Solid core, flush door with transparent finish, along with hollow metal steel frame, factory primed, field painted. Provide vision panels; integral to door frame (approx. 6" x 18"). Vision panels must have provisions to be covered as a part of the door system.
C1020	Interior Door Hardware			Provide classroom function hardware. Provide seals and door bottom to achieve STC 40-45.
C1030	Marker Boards and Tack Boards		36" H Minimum	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board, on two entire sides of room and on either side of Smartboard/touch screen on main wall of room. Tool trays and accessory kits shall be provided for each board. Top of boards to be mounted at approx. 6'-8" AFF.

LOG OPS Classroom

Space Characteristics

Function/Adjacencies: These classrooms are for maintenance training classes for Marine mechanics and most are directly associated with and adjacent to a vehicle training bay space.

BID Option: provide tiered raised flooring to improve sight lines to instructor. Provide 7" between tiered floor levels

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 10'-0"
Acoustics:
Sound Transmission Class (STC) – Refer to ESR C10 for STC rating.
Access: Off major corridor system and from the Vehicle Training Bay space
Number of Occupants: 60 persons typical with one instructor
Other/Special Requirements:
Sound isolation all adjacent rooms
Instructor Podium in association with teaching wall.
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C1030	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s)
C1030	Projection Screen	1	AR	Ceiling recessed, manual, pull-down projection screen, as required for viewing distances within the area. Mounting location must be coordinated with wall-mounted flat screen monitor.
C3010	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard
C3010	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C3010	Acoustic Wall Panels	6	30" h x 48" ea	Wall-mounted acoustical panels
C3020	Floor Finishes	AR	AR	Per Part 3, Chapter 5 Room Requirements Finish and FF&E schedule and ESR C30. Placed on raised access floor.
C3020	Raised Access Floor		24 X 24	Per ESR C30, Interior Finishes
C3020	Wall Base Finishes	LF	4" high	Rubber cove base in 120' coils
C3030	Acoustical Ceiling Tiles & Panels	AR	24" x 24"	Acoustical Ceiling Tile
C3030	Suspension Systems	AR	AR	9/16" suspended ceiling system

Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C3030	Other Ceiling and Ceiling Finishes	AR	AR	Paint all exposed surfaces in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide (3) duplex receptacles per student position.
D503001	Telecommunications Systems			Provide NMCI network drops.
D503004	Television Systems			Provide CATV outlets.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).

P1512F-LOG OPS SCHOOL

Electric Lab/ Classroom

Space Characteristics

Function/Adjacencies: This lab is used as a hands-on training space to teach Marine mechanics the electrical systems and components used on various tactical vehicles.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height:10'-0'
Acoustics:
Sound Transmission Class (STC) – Refer to ESR C10 for STC ratings for room types.
Access: from major corridors
Number of Occupants: 6 at workbenches and instructor
Other/Special Requirements:
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to Part 3, Chapter 5, Finish and FF&E Schedule.

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	
C1010	Fixed Partitions	SF		Gypsum wallboard (GWB) on metal studs to underside of floor/roof deck (or underside of finished ceiling).
C1010	Ceiling finish	AR	24" X 24"	ACT
C1020	Interior Wood Doors	EA	3'x8'	Solid core, flush door with transparent finish, along with hollow metal steel frame, factory primed, field painted. Provide vision panels; integral to door frame (approx. 6" x 18"). Vision panels must have provisions to be covered as a part of the door system. Door must have a minimum STC rating of 40.
C1020	Interior Door Hardware			Provide classroom function hardware. Provide door seals to provide STC rating noted at Interior Wood Doors.
C1030	Marker Boards and Tack Boards		36"h x 48"w	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board, on two entire sides of room. Tool trays and accessory kits shall be provided for each board. Mount top of board at 6'-8" A.F.F
C1030	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.
C1030	Identifying Devices			Departmental identification signage and directional signage, as required.

Electric Lab/ Classroom

Space will accommodate, at a minimum, the following FF&E and A/V: Refer to Part 3, Chapter 5, Finish and FF&E Schedule.

Uniformat Section	Description	Qty	Size	Specific Requirements
C3010	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard.
C3010	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C3010	Impact Resistant Wall Panels	LF		Impact Resistant PVC wall panels, installed floor to ceiling with matching connectors and trim, as required.
C3020	Resinous Floor Finish	SF	AR	Per Part 3, Chapter 5, Room Requirement Finish and FF&E Schedule and ESR C30.
C3020	Wall Base Finish	LF	4" high	Integral resinous base
C3020	Hardeners and Sealers	SF	AR	Hardened and cured concrete floors.
C3040	Interior Coatings	SF	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D501004	Panelboards			Provide a minimum of one 208Y/120V panelboard to serve the receptacles and equipment loads in the lab.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide 3 duplex receptacles per student position.

Uniformat Section	Description	Qty	Size	Specific Requirements
D503001	Telecommunications Systems			Provide NMCI network drops.
E102009 D503004	AV Equipment/ Television Systems			Provide CATV outlets at appropriate height for all wall-mounted monitors.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).
E1040	Government-furnished Equipment	1	Existing	Relocate Government-furnished Jib Crane from M107 to support test stands.
E1040	Government-furnished Equipment	2	Existing	Relocate two Government-furnished test systems from M107.

P1512F-LOG OPS SCHOOL

DYNO – Engine and Power Train

Space Characteristics

Function/Adjacencies: These two specialized sound insulated test spaces will contain a GFCI Dyno machine, cranes and associated equipment relocated from M107. This Dyno machine will test student Marine rebuilt engines and power trains from training classes. Provide fuel supply lines to engine test stand and coordinate equipment infrastructure with training officials. Provide epoxy floors for wearability during equipment movement. Provide reinforced foundation for crane in Power Train Room. Provide a built-in counter/desk for the control computer outside of room with view to room interiors. Heat and cool via dedicated outdoor air system (DOAS) to maintain environment. Provide a manual control engine exhaust system in the Dyno room.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 25'-0" clear to structure

Acoustics:
Sound Transmission Class (STC) 50
Impact Insulation Class (HC)

Access: via Exterior Overhead door and Interior corridor system

Number of Occupants: 12

Other/Special Requirements: Gypsum Wall Board Soffits,

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	
B2030	Exterior Door Hardware			Outside: Weather-stripping, overhead hold-open device, rain deflector, hinges, ABA-compliant pulls, panic bar exit device, keyed lockset. Inside: Overhead hold-open device, hinges, passage hardware, cypher lock, key card access.
C1010	Fixed Partitions	SF		Acoustic CMU or concrete. Include sound insulation. All STC rated partitions must terminate at underside of floor/roof deck.
C1010	Interior Windows / Vision Panels		3'x5' min	Ballistic rated glazing to observe engine test
B2030	Exterior roll up door Doors	1	10'x12'	Insulated Roll Up door
C1020	Steel Doors	1	3' x 7'	Steel Doors and Frames- Steel interior doors and frames shall be factory primed, field painted. Provide fire rated doors as required by Code if required. Provide 8" x 38" glazing in one door. Door shall have a minimum STC rating of 50.

DYNO – Engine and Power Train

Space Characteristics

Function/Adjacencies: These two specialized sound insulated test spaces will contain a GFCI Dyno machine, cranes and associated equipment relocated from M107. This Dyno machine will test student Marine rebuilt engines and power trains from training classes. Provide fuel supply lines to engine test stand and coordinate equipment infrastructure with training officials. Provide epoxy floors for wearability during equipment movement. Provide reinforced foundation for crane in Power Train Room. Provide a built-in counter/desk for the control computer outside of room with view to room interiors. Heat and cool via dedicated outdoor air system (DOAS) to maintain environment. Provide a manual control engine exhaust system in the Dyno room.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height: 25'-0" clear to structure

Acoustics:
Sound Transmission Class (STC) 50
Impact Insulation Class (HC)

Access: via Exterior Overhead door and Interior corridor system

Number of Occupants: 12

Other/Special Requirements: Gypsum Wall Board Soffits,

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C1020	Interior Double Doors	EA	(2) 3'x8' double leaf	Steel Doors and Frames- Steel interior doors and frames shall be factory primed, field painted. Provide fire rated doors as required by Code if required. Provide 8" x 38" glazing in one door. Door shall have a minimum STC rating of 50. Provide 12" high metal kick plate, both sides.
C1020	Interior Door Hardware			Hinges and stop provide passage hardware.
C1020	Interior Door Hardware			Hinges, stop, astragal, acoustical gaskets, lockset hardware, kick-plate, hold-open devices.
C1030	Marker Boards and Tack Boards		36"h x 48"w	Tack board. Top of boards to be mounted at approx. 8'-0" AFF.
C1030	Identifying Devices			Signage near convenience phone: Indicate after-hours instructions and a list of twelve emergency and maintenance telephone numbers.
C1030	Identifying Devices			Departmental identification signage and directional signage, as required.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C1030	Counters	1	24 SF MIN	24" deep, ½ thick solid surface countertop/built-in desk surface; a minimum of 8'-0" wide. Provide a 12" deep, 1/2" thick standing -height counter surface as well as an ABA compliant area at Check-In Desk location. Provide a fabric covered tack-able surface between standing height counter and desk counter surface. Provide grommets as required for number of computers and equipment.
C2030	Exterior Doors	1	3' x 7'	Provide maximum-duty insulated and painted steel door and frame for life safety. Coordinate door size(s) with room equipment sizes.
C3010	Acoustic Wall Panels	6	30" h x 48" ea	Wall-mounted acoustical panels
C3020	Floor Finishes	AR	AR	Provide 5-part epoxy slip resistant floor system, fuel resistive, with integral base and metal termination bar
C3020	Wall Base Finishes	LF	4" high	Integral epoxy base
C3020	Hardeners and Sealers	AR	AR	Hardened and sealed cured concrete floors.

DYNO – Engine and Power Train

Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C3030	Other Ceiling and Ceiling Finishes	AR	AR	Paint all exposed surfaces in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
C3040	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D2010	Emergency shower and Eyewash			Eyewash IAW UFC 3 420-01 Figure D-1 3 GPM
D2020	Hose bibs			Threaded Hose Bibb
D2030	Floor drain			Trench drain at bay door with sand oil/water separator.
D203003	Floor drain			All Floor drains must have Trap primer (See Part 4 C302004 1.1.4 for drain requirements for the flooring.)
D30	Mechanical			Heat and cool space via DOAS. Interlock heating and cooling with on-demand vehicle exhaust system.

DYNO – Engine and Power Train

Space Characteristics

Function/Adjacencies: These two specialized sound insulated test spaces will contain a GFCI Dyno machine, cranes and associated equipment relocated from M107. This Dyno machine will test student Marine rebuilt engines and power trains from training classes. Provide fuel supply lines to engine test stand and coordinate equipment infrastructure with training officials. Provide epoxy floors for wearability during equipment movement. Access: via Exterior Overhead door and Interior corridor system

Number of Occupants: 12

Other/Special Requirements: Gypsum Wall Board Soffits,

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
D30	Mechanical			On-demand vehicle exhaust system.
D501004	Panelboards			Provide a minimum of one 208Y/120V panelboard to serve the receptacles and equipment loads in the lab.
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide 3 duplex receptacles per student position.
D503001	Telecommunications Systems			Provide NMCI network drops.

P1512F-LOG OPS SCHOOL

Fuel Lab/ Classroom

Space Characteristics

Function/Adjacencies: This lab is used as a hands-on training space to teach Marine mechanics the fuel systems used on various tactical vehicles.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height:10'-0'
Acoustics:
Sound Transmission Class (STC) - Refer to ESR C10 for STC ratings per room type.
Access: from major corridors
Number of Occupants: 6 at workbenches and instructor
Other/Special Requirements:
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to Part 3, Chapter 5, Finish and FF&E Schedule.

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	
C1010	Fixed Partitions	SF		Gypsum wallboard (GWB) over metal studs to underside of floor/roof deck.
C1010	Ceiling finish	AR	24" X 24"	ACT
C1020	Interior Wood Doors	EA	3'x8'	Solid core, flush door with transparent finish, along with hollow metal steel frame, factory primed, field painted. Provide vision panels; integral to door frame (approx. 6" x 18"). Vision panels must have provisions to be covered as a part of the door system. Door must have a minimum STC rating of 40.
C1020	Interior Door Hardware			Provide classroom function hardware. Provide door seals to provide STC rating noted at Interior Wood Doors.
C1030	Marker Boards and Tack Boards		36"h x 48"w	36" high porcelain, magnetic dry erase boards, with tack strips at top and bottom of board, on two entire sides of room. Tool trays and accessory kits shall be provided for each board. Mount top of board at 6'-8" A.F.F
C1030	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.
C1030	Identifying Devices			Departmental identification signage and directional signage, as required.

Fuel Lab/ Classroom

Space Characteristics

Function/Adjacencies: This lab is used as a hands-on training space to teach Marine mechanics the fuel systems used on various tactical vehicles.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height:10'-0'
Acoustics:
Sound Transmission Class (STC) - Refer to ESR C10 for STC ratings per room type.
Access: from major corridors
Number of Occupants: 6 at workbenches and instructor
Other/Special Requirements:
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Refer to Part 3, Chapter 5, Finish and FF&E Schedule.

Uniformat Section	Description	Qty	Size	Specific Requirements
C3010	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard.
C3010	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.
C3010	Impact Resistant Wall Panels	LF		Impact Resistant wall panels, installed floor to ceiling with matching connectors and trim, as required.
C3020	Resinous Floor Finish	SF	AR	Per Part 3, Chapter 5, Room Requirement, Finish and FF&E Schedule and ESR C30.
C3020	Wall Base Finishes	LF	4" high	Integral resinous base
C3020	Hardeners and Sealers	AR	AR	Hardened and cured concrete floors.
C3040	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D2010	Emergency shower and Eyewash			Eyewash IAW UFC 3 420-01 Figure D-1 3 GPM
D2020	Hose bibs			Threaded Hose Bibb
D203003	Floor drain			All Floor drains must have Trap primer. Connect drain to an oil water separator.
D501004	Panelboards			Provide a minimum of one 208Y/120V panelboard to serve the receptacles and equipment loads in the lab.

Fuel Lab/ Classroom

Space Characteristics

Function/Adjacencies: This lab is used as a hands-on training space to teach Marine mechanics the fuel systems used on various tactical vehicles.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height:10'-0'

Space will accommodate, at a minimum, the following FF&E and A/V: Refer to Part 3, Chapter 5, Finish and FF&E Schedule.

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide 3 duplex receptacles per student position.
D503001	Telecommunications Systems			Provide NMCI network drops.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).
E1040	Fuel Test Systems	2		Relocate Government-furnished test systems from M107.

P1512F-LOG OPS SCHOOL

Special Projects

Space Characteristics

Function/Adjacencies: This space is a used for storage of supplies and supplies that are issued to Marine trainees. It is a one stop shop for all student supplies such as seals, hoses, clamps and administrative supplies. It is required to be located adjacent to a site located unloading area with a loading platform and accessed from the exterior by an overhead door. This area also is to have a separate room for HAZMAT storage that includes cleaning supplies and nitrogen cylinders. It also included a separate Battery Room to store lead acid and gel cell type batteries.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height:10'-0'
Acoustics:
Sound Transmission Class (STC) 45
Access: From major corridors and from exterior
Number of Occupants: 2 -5
Other/Special Requirements:
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Storage shelving for supplies, task chairs at counter for issuing supplies

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	
B2030	Overhead Door	1		Provide 10' wide by 9' high overhead doors
C1010	Fixed Partitions	SF		Gypsum wallboard (GWB) on steel studs to underside of floor/roof deck (or underside of finished ceiling). Provide impact resistant GWB in all rooms of suite up to
C1010	Ceiling finish	AR	24 X 24	Acoustical Ceiling Tile
C1020	Interior Doors	EA	3'x7'	Solid core, flush door with transparent finish, along with hollow metal steel frame, factory primed, field painted from main corridor to Special Project space. Provide vision panels if required; integral to door frame (approx. 6" x 18"). Vision panels must have provisions to be covered as a part of the door system.
C1020	Interior Doors	EA	3'x7'	Steel Doors and Frames- Steel interior doors and frames shall be factory primed, field painted. Provide fire rated doors as required by Code if required. For Hazmat and Battery Room Storage.
C1020	Interior Door Hardware			Provide storage room function hardware.

Special Projects

Space Characteristics

Function/Adjacencies: This space is a used for storage of supplies and supplies that are issued to Marine trainees. It is a one stop shop for all student supplies such as seals, hoses, clamps and administrative supplies. It is required to be located adjacent to a site located unloading area with a loading platform and accessed from the exterior by an overhead door. This area also is to have a separate room for HAZMAT storage that includes cleaning supplies and nitrogen cylinders. It also included a separate Battery Room to store lead acid and gel cell type batteries.

Special Dimensions:
Ideal Plan Dimensions:
Minimum Ceiling Height:10'-0'
Acoustics:
Sound Transmission Class (STC) 45
Access: From major corridors and from exterior
Number of Occupants: 2 -5
Other/Special Requirements:
FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V: Storage shelving for supplies, task chairs at counter for issuing supplies

Uniformat Section	Description	Qty	Size	Specific Requirements
C1030	Marker Boards and Tack Boards		36"h x 48"w	Tack board. Top of boards to be mounted at approx. 6'-8" AFF.
C1030	Identifying Devices			Signage on exterior side of room entry door(s). Indicate permanent room name(s) and/or provide slot for occupant/department name.
C1030	Identifying Devices			Departmental identification signage and directional signage, as required.
C1030	Counters			Provide a 10' wide x 30" deep x 36" high solid surface counter with a transaction counter of 42" and 1'-6" wide in the special projects space for the issuing of supplies. The counter and cabinetry to be situated as required for issuing of supplies.
C10	Cabinets			Provide a plastic laminate clad millwork partition to support both counters. Provide toe kicks on the transaction side. Provide a tack surface between the transaction counter and the normal height counter. Provide open shelved base cabinets beyond open space for desk, pencil drawers, and grommets to coordinate with computer equipment.
C3010	Gypsum Wallboard Finishes	AR	AR	Primed and painted gypsum wallboard. Provide acoustic panels for sound attenuation.
C3010	Corner and Wall Guards	AR	1-1/2" flange, Full-Height	Surface-mounted, color-matched, through-color, recycled, extruded PETG corner guards on all outside corners of gypsum wallboard partitions.

Space will accommodate, at a minimum, the following FF&E and A/V: Storage shelving for supplies, task chairs at counter for issuing supplies

Uniformat Section	Description	Qty	Size	Specific Requirements
C3010	Impact Resistant Wall Panels	LF		Impact Resistant wall panels, installed floor to 42" height with matching connectors and trim, as required.
C3020	Resinous Floor Finish	SF	AR	Per Part 3, Chapter 5, Room Requirement, Finish and FF&E Schedule and ESR C30.
C3020	Wall Base Finishes	LF	4" high	Rubber cove base in 120' coils
C3020	Hardeners and Sealers	AR	AR	Hardened and cured concrete floors.
C3040	Interior Coatings	AR	AR	Paint suitable in accordance with Master Painter Institute (MPI) standards for the interior architectural surface being finished.
D2010	Emergency shower and Eyewash			Eyewash IAW UFC 3 420-01 Figure D-1 3 GPM
D20F0	Hose bibs			Threaded Hose Bibb
D2030	Floor drain			Trench drain at bay door with sand oil water separator
D2030	Floor drain			All Floor drains must have Trap primer.
D501004	Panelboards			Provide a minimum of one 208Y/120V panelboard to serve the receptacles and equipment loads in the lab.

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Provide dimmable LED direct/indirect lighting in a minimum of three zones controlled via wall switches and AV podium control.
D5020	Lighting and Branch Wiring			Provide 3 duplex receptacles per student position.
D503001	Telecommunications Systems			Provide NMCI network drops.
E102009	AV Equipment			Provide infrastructure for freestanding AV podium with LCD touchpad equipment controls and wall-mounted LCD monitor (Podium and Monitor to be funded separately in AV Package).

P1512F-LOG OPS SCHOOL

Vehicle Training Bays

Space Characteristics

Function/Adjacencies: These are large vehicle-training classroom spaces that contain 10 large Logistic Vehicle System Replacement (LVSR) vehicles parked 2 deep and 5 wide, or 10 vehicles of various smaller sizes that can be arranged in a similar fashion. The training involves the disassembly and reassembly of tactical vehicles and components by Marine trainees. The vehicles contained in these classrooms will remain in place for years without exiting the building and the exterior envelope at the vehicle access point must be well sealed and protected against air infiltration. The vehicular access from the exterior for the training bays are provided by a double leaf oversize well-insulated swinging steel doors.

Special Dimensions:
Ideal Plan Dimensions: 84'0" wide x 129'-0" long
Minimum Ceiling Height: 25'-0" clear to bottom of Structure

Acoustics:
Refer to ESR C10, Interior Construction for STC rating.

Access: Vehicle access from exterior via swinging doors
Student access from an exterior swinging man door with CAC enabled card readers or access from individual classrooms adjacent to this space.
Access also between each large training bay.

Number of Occupants:

Other/Special Requirements:
Suspended wide screen monitors to display training information.
Overhead hose reels for water, electric power and air to complement the training features of the open bay.
Vehicle exhaust system to allow for the brief running of the LVSR engines for each vehicle.
Overhead lighting must allow for true color rendition for vehicle wiring identification.
Toilets for students within each training bay – provide masonry partition for toilet walls facing the training bay, and GWB furred partition inside of toilets.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
A1030	Slab on Grade	SF	SF	
B2020	Exterior windows, storefront or curtain wall			To provide controlled daylighting per UFC requirements.
B2030	Exterior Doors	1	Oversize	Refer to ESR B303090, Other Exterior Specialty Doors.
B2030	Exterior Doors	2 double leaf doors	3' X 7'	Steel Doors and Frames- Steel doors and frames shall be factory primed, field painted.
B2030	Exterior Door Hardware			Provide CAC enabled electronic door entry at one set of swinging man doors from exterior.

Vehicle Training Bays

Space Characteristics

Toilets for students within each training bay – provide masonry partition for toilet walls facing the training bay, and GWB furred partition inside of toilets.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
C1010	Fixed Partitions	SF		Acoustical Concrete Masonry Unit (CMU) for main walls. Include sound insulation as coordinated with acoustical engineer. All STC rated partitions must terminate at underside of floor/roof deck.
C1010	Interior Windows / Vision Panels			Windows/vision panels as required to achieve requisite view from the corridor system.
C1020	Interior Doors	EA	3' x 7'	Steel Doors and Frames- Steel interior doors and frames shall be factory primed, field painted. Provide fire rated doors as required by Code if required. Provide vision glazing in door. Door shall have a minimum STC rating of 40.
C1020	Interior Door Hardware			Provide classroom function locket and door seals to meet identified Interior Door STC rating.
C1030	Identifying Devices			Signage near convenience. phone: Indicate after-hours instructions and a list of twelve emergency and maintenance telephone numbers.

Vehicle Training Bays

Space Characteristics

Toilets for students within each training bay – provide masonry partition for toilet walls facing the training bay, and GWB furred partition inside of toilets.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
D2020	Hose bibs			Threaded Hose Bibb every 20 feet.
D2020	Hose Reel			Provide hose reel with water supply for each vehicle.
D2020	Ice Machine Connector Box			Connector Box (2.5 GPM) for FLAKE Ice Machine. Filter. Ice Machine to be funded separately in FF&E.
D2030	Floor drain			One long trench drain down the center of the instruction area with an oil/water separator.
D2090	Compressed Air			Provide hose reel with compressed air for each vehicle.

Vehicle Training Bays

Space Characteristics

Function/Adjacencies: These are large vehicle-training classroom spaces that contain 10 large Logistic Vehicle System Replacement (LVSR) vehicles parked 2 deep and 5 wide, or 10 vehicles of various smaller sizes that can be arranged in a similar fashion. The training involves the disassembly and reassembly of tactical vehicles and components by Marine trainees. The vehicles contained in these classrooms will remain in place for years without exiting the building and the exterior envelope at the vehicle access point must be well sealed and protected against air infiltration. The vehicular access from the exterior for the training bays are provided by a double leaf oversize well-insulated swinging steel doors.

Special Dimensions:
Ideal Plan Dimensions: 84'0" wide x 129'-0" long
Minimum Ceiling Height: 25'-0" clear to bottom of Structure

Acoustics:
Refer to ESR C10, Interior Construction for STC rating.

Access: Vehicle access from exterior via swinging doors
Student access from an exterior swinging man door with CAC enabled card readers or access from individual classrooms adjacent to this space.
Access also between each large training bay.

Number of Occupants:

Other/Special Requirements:
Suspended wide screen monitors to display training information.
Overhead hose reels for water, electric power and air to complement the training features of the open bay.
Vehicle exhaust system to allow for the brief running of the LVSR engines for each vehicle.
Overhead lighting must allow for true color rendition for vehicle wiring identification.
Toilets for students within each training bay – provide masonry partition for toilet walls facing the training bay, and GWB furred partition inside of toilets.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
D30	Mechanical			Heat and Cool space via DOAS. Interlock heating and cooling with on demand vehicle exhaust system.
D30	Mechanical			On demand vehicle exhaust system for each vehicle.
D501004	Panelboards			Provide a minimum of one 208Y/120V panelboard to serve the receptacles and equipment loads in the lab.
D5020	Lighting and Branch Wiring			Provide 3 duplex receptacles per student position.
D5020	Lighting and Branch Wiring			Install one Government-furnished 28VDC power converter per vehicle position.

Vehicle Training Bays

Space Characteristics

Function/Adjacencies: These are large vehicle-training classroom spaces that contain 10 large Logistic Vehicle System Replacement (LVSR) vehicles parked 2 deep and 5 wide, or 10 vehicles of various smaller sizes that can be arranged in a similar fashion. Other/Special Requirements:
Suspended wide screen monitors to display training information.
Overhead hose reels for water, electric power and air to complement the training features of the open bay.
Vehicle exhaust system to allow for the brief running of the LVSR engines for each vehicle.
Overhead lighting must allow for true color rendition for vehicle wiring identification.
Toilets for students within each training bay – provide masonry partition for toilet walls facing the training bay, and GWB furred partition inside of toilets.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
D5020	Lighting and Branch Wiring			Mount wall-mounted wiring devices at 60" AFF.
D5020	Lighting and Branch Wiring			Provide one 120V overhead power cord reel, one 28VDC overhead power cord reel, and one overhead light cord reel for each vehicle position.
D5020	Lighting and Branch Wiring			Provide lights suspended to provide a minimum of 25'-0" clear to the bottom of the luminaire. Coordinate placement with each vehicle.
D5030	Telecommunications Systems			Provide NMCI network drops.
D503002	Public Address Systems			Provide audible paging system to each bay.

Vehicle Training Bays

Space Characteristics

Function/Adjacencies: These are large vehicle-training classroom spaces that contain 10 large Logistic Vehicle System Replacement (LVSR) vehicles parked 2 deep and 5 wide, or 10 vehicles of various smaller sizes that can be arranged in a similar fashion. The training involves the disassembly and reassembly of tactical vehicles and components by Marine trainees. The vehicles contained in these classrooms will remain in place for years without exiting the building and the exterior envelope at the vehicle access point must be well sealed and protected against air infiltration. The vehicular access from the exterior for the training bays are provided by a double leaf oversize well-insulated swinging steel doors.

Number of Occupants:

Other/Special Requirements:
Suspended wide screen monitors to display training information.
Overhead hose reels for water, electric power and air to complement the training features of the open bay.
Vehicle exhaust system to allow for the brief running of the LVSR engines for each vehicle.
Overhead lighting must allow for true color rendition for vehicle wiring identification.
Toilets for students within each training bay – provide masonry partition for toilet walls facing the training bay, and GWB furred partition inside of toilets.

FF&E and A/V Information for Coordination:
FF&E and AV Equipment will be funded separately as a modification to the construction contract. Infrastructure to support all FF&E and AV must be included in the construction contract. Contractor's Interior Designer must validate and determine FF&E requirements based on in-depth interviews with Activity at Concept Design workshop (CDW). Space will accommodate, at a minimum, the following FF&E and A/V:

Uniformat Section	Description	Qty	Size	Specific Requirements
D503090	Other Communications and Alarm Systems			Provide AV systems as described in ESR D503090.
E1040	Government-furnished Equipment		Existing	Relocate 28VDC power converters.

A10 FOUNDATIONS – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

Provide foundation systems in accordance with UFC 3-301-01. Foundations must be designed to suit subsurface conditions and must be capable of transmitting all building loads to the ground.

This section addresses both non-structural slabs-on-grade and structured slabs at ground level. For both systems, provide recessed areas as required to accommodate utilities at raised access floors such that the walking surface is one continuous plane throughout each space.

See Section B10, *Superstructure*, for additional loading criteria.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEMS REQUIREMENTS

A10 GENERAL

GOVERNMENT PROVIDED GEOTECHNICAL INFORMATION

Subsurface soil information, including a geotechnical data report prepared specifically for this project and historical subsurface data from other projects in close proximity to the project site, are included in Part 6 – Attachments of this RFP.

The soils information provided in this RFP is for reference only and reflects the soil conditions encountered only at the locations indicated. The Government shall not be responsible for any interpretation or conclusion by the Contractor drawn from the soils information beyond the industry standard of care. Geotechnical engineering reports accompanying the subsurface information are provided only to better convey the encountered data and observed site conditions. Assumptions, analyses and recommendations included in any accompanying report may or may not be applicable to the Offeror's design concept. The Contractor must retain a Geotechnical Engineer to interpret the Government provided information as it relates to the Contractor's design concept prior to submission of the proposal and develop geotechnical requirements to support the design and construction of the project meeting the requirements of this RFP for bidding purposes.

GEOTECHNICAL ENGINEERING CONSULTATION AND STUDY

The Geotechnical Engineer must have a minimum of 5 years of recent relevant experience in the geographic region of the project and must be currently licensed as a professional engineer in the State of North Carolina. In accordance with FAR Subpart 9.5, Organizational and Consultant Conflicts of Interest, the Contractor is prohibited from hiring the Geotechnical Engineer who provided data, reports and any other services on behalf of the Government for this project.

After award, the Contractor's Geotechnical Engineer (Geotechnical Engineer of Record) must provide a site-specific geotechnical study to include in-situ testing, soil borings and supporting laboratory analysis of representative soil samples. The Geotechnical Engineer must prepare a Geotechnical Report providing recommendations for design and construction of foundations, earthwork and site development in accordance with UFC 1-200-01 *DoD Building Code (General Building Requirements)*, UFC 3-220-01 *Geotechnical Engineering*, and FC 1-300-09N *Navy and*

Marine Corps Design Procedures and associated references. Calculations must be provided in the report to support all conclusions and recommendations.

SEISMIC DESIGN

Refer to ESR B10 for seismic design information.

A1010 STANDARD FOUNDATIONS

As determined by the Designer of Record to be applicable, provide a Standard Foundation to support the structure(s) associated with this project. "Standard Foundations" are shallow foundations or deep foundations as addressed in IBC Chapter 18. Do not use masonry unit footings, steel grillage footings, timber footings or wood foundations. Treated timber piles are permitted if deemed appropriate by the Designer of Record.

The structure(s) must be entirely supported by either a shallow foundation system or a deep foundation system as determined by the Designer of Record. Provide foundation materials that are compatible with the environmental exposure. When foundation elements are exposed to corrosive or otherwise aggressive soils, provide protection in accordance with ACI 318 requirements.

Calculate foundation ultimate resistance using multiple established methods. Determine allowable foundation capacity using the factors of safety provided in UFC 3-220-01 Tables 2-2 and 2-3. Develop geotechnical engineering design parameters using in-situ tests, laboratory tests and established empirical correlations. Evaluate upper and lower bound soil capacities based on variations in subsurface conditions at the site. Determine the minimum foundation bearing depth for frost protection in accordance with UFC 3-301-01. Provide minimum foundation widths to avoid failure and with consideration given to placement tolerances, ease of construction, etc.

Determine estimated foundation settlement based on comparison of predicted values from multiple established methods based on reaction loads provided by the Structural Designer of Record. Settlement calculations must include dead and live load components, live load reductions used in the analyses, actual or estimated foundation sizes, planned site grading changes, and expected fluctuations in groundwater levels. Estimated differential settlement must include upper and lower bound foundation settlements based on soil properties, different foundation loading, and variations in subsurface conditions across the building footprint.

The presence of weak and compressible soils may result in excessive settlement that could impact the performance of surface bearing structures and supporting facilities such as foundations, slabs, pavements, sidewalks, and utilities. The magnitude and duration of settlement depends on the composition, depth, and thickness of the weak/compressible soils as well as the Contractor’s selected design concept. The Contractor's Geotechnical Engineer is responsible for evaluating potential global settlement due to designed grade increases and final structural loads, and must develop any settlement mitigation procedures (such as preloading, surcharging, fill monitoring programs, and ground improvement systems) needed to maintain global settlements within tolerable limits. Surcharge material, if required, must remain in place for 90 days minimum.

Design must incorporate measures that limit total and differential settlement to levels that prevent structural or aesthetic damage or impairment of the serviceability and function of the facility or structures, including drainage and utilities. The safety factor for liquefaction potential must meet or exceed Table 2-1 in UFC 3-220-01.

Use the following geotechnical tolerances to design shallow foundation systems:

- Limit slab-on-grade post construction total settlement due to permanent loads to ½ inch maximum;
- Limit total settlement of column and wall footing foundations to one inch maximum; and
- Limit differential settlement of adjacent footings to ½ inch maximum and an angular distortion of 1/500 maximum. Angular distortion is defined as the difference in settlement between two points divided by the distance between the points.

Use the following tolerances for designing deep foundation systems:

- Limit total settlement of individual piles and pile caps to ½ inch maximum under service load conditions as determined by static or dynamic pile load testing.
- Limit differential settlement of adjacent foundations to ½ inch maximum and to an angular distortion of 1/500 maximum. The angular distortion is defined as the difference in settlement between two points divided by the distance between the points.
- Limit lateral deflection of deep foundations to ½ inch, with an applied axial load equal to the expected dead load.

Ensure allowable pile stresses not to exceed limitations specified in IBC Section 1810, Deep Foundations. Evaluate and address time dependent pile capacity conditions (i.e. pile setup), group effects, negative skin friction, lateral squeeze, preboring/jetting, installation sequencing, refusal driving conditions, etc. as applicable. Include requirements for completing pre-construction condition surveys, ground vibration monitoring, structural instrumentation, etc. to mitigate risks of ground vibration damage to nearby structures as applicable for the specific project. The Structural Engineer of Record must design and detail the pile foundations in accordance with IBC Section 1810.3. Submit structural calculations and details for the piles to the Government for review and approval during project design development.

Conduct a test pile program overseen by the Geotechnical Engineer of Record and submit a final signed and stamped report to the Government for review and approval. Monitor and record driving during installation and subject to hammer restrikes in accordance with ASTM D4945, “Standard Test Method for High-Strain Dynamic Testing of Piles.” Evaluate the ultimate load capacity of selected test pile restrike(s) using CAPWAP analyses. Additional load test requirements are stated in Part 4 of this RFP. The Contractor is responsible for all foundation testing and monitoring costs.

A1020 SPECIAL FOUNDATIONS

As determined by the Designer of Record to be applicable, provide a Special Foundation system to support the structure(s) associated with this project. "Special Foundations" are any foundations that are not specifically "Standard Foundations", or which are a combination of Standard Foundations and a site improvement/ground modification system. Incorporate design of these systems in the project plans and specifications following FC 1-300-09N Chapters 7 and 8 and not as a construction submittal. Examples of site improvement/ground modification systems include surcharge preloading, prefabricated vertical drains, over-excavation and replacement, stone columns, rammed aggregate piers, rigid column inclusions, deep dynamic compaction, low and high mobility grouting, vibroflotation, etc. As most "Special Foundation" techniques or systems typically require the use of specialty contractors, a registered Professional Engineer must establish installation and acceptance criteria and supervise the installation. The Designer of Record must submit justification for use, including acceptable evidence of previous successful installation in similar conditions, methods and equipment used in their installation, proposed testing and inspection to be used, supporting test data,

calculations, and any other information related to the structural properties and load capacity of such system. The allowable stresses and testing requirements for pile-like elements used for ground improvement must comply with IBC Section 1810.

A1030 SLAB ON GRADE

As determined by the Designer of Record to be applicable, provide soil supported concrete slab(s) on ground. Provide a vapor retarder and porous fill layer beneath all slabs. Where slab on ground is below the existing adjacent exterior grade, provide waterproofing on foundation walls or grade beams and a perimeter drainage system to remove ground water from the area immediately adjacent to the building. Provide perimeter and under slab insulation in accordance with UFC 3-101-01, *Architecture*.

A1040 STRUCTURALLY SUPPORTED SLAB

As determined by the Designer of Record to be applicable, provide a structurally supported slab. Provide for structural support of all utilities that may be adversely affected by soil consolidation or expansive soils. Provide stainless steel hangers sized adequately to support the in-service utility. Provide a vapor retarder and porous fill layer beneath all slabs. Where the structurally supported slab is below the existing adjacent exterior grade, provide waterproofing on foundation walls or grade beams and a perimeter drainage system to remove ground water from the area immediately adjacent to the buildings. Provide perimeter and under slab insulation in accordance with UFC 3-101-01, *Architecture*.

--End of Section—

B10 SUPERSTRUCTURE – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

The superstructure consists of structural elements above the foundation that provide support for vertical loads and resistance to lateral loads.

This section includes the requirements for the superstructure of the building, including floor and roof framing, columns, interior load-bearing walls and the main lateral-force resisting system. Exterior load bearing walls are addressed in Section B20.

Provide the building framing system in accordance with UFC 3-301-01, *Structural Engineering*.

The building must be constructed with concrete, steel, or masonry. Wood construction is prohibited.

All steel deck used for roofs and structural wall panels must be 20 gauge minimum thickness.

A Special Inspector of Record (SIOR) is required for this project.

Pre-engineered building systems are prohibited.

Load bearing light gage framing systems are prohibited.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Risk Category: II

Design for Live Loads in accordance with IBC 2018 as modified by UFC 3-301-01.

Wind Load Parameters:

Wind speed	Comply with UFC 3-301-01
Exposure	Design must be based on ASCE 7-16. Use Exposure C or D, whichever is applicable. Use of Exposure B is prohibited.

Snow Load Parameters:

Ground snow load	Comply with UFC 3-301-01
Snow load importance factor	1.00
Exposure	Design must be based on ASCE 7-16. Use Exposure C or D, whichever is applicable. Use of Exposure B is prohibited.

Seismic Load Parameters:

A site-specific seismic ground motion study is not required. Use Risk Category II and soil classification D. Determine seismic loading adjusted for site class effects using the ground motion parameters specified by UFC 3-301-01, *Structural Engineering*. Seismic Design Category (SDC) is B.

B1010 ELEVATED FLOOR CONSTRUCTION

Provide elevated floors and mezzanines consisting of any of the following construction types.

1) Non-composite concrete slabs on form deck on steel joists.
2) Non-composite or composite concrete slabs on metal decking on steel beams.
3) Cast-in-place concrete slabs on removable forms.
4) Precast concrete planks or shallow double-tee beams.

Support elevated floors and mezzanines on cast-in place concrete walls, plant or site pre-cast concrete walls (including tilt-up walls), reinforced concrete masonry walls/pilasters, structural steel columns and girders or joist girders. Do not support elevated floors on light gage stud wall construction. Wood framed systems are prohibited.

Provide access platforms constructed of steel grating and supported by structural steel framing.

B1020 ROOF CONSTRUCTION

Provide roof construction consisting of metal decking supported by structural steel framing or open web steel joists and joist girders bearing on load bearing columns or walls. Cast-in-place and precast concrete roof systems are also permitted. Support roof construction on cast-in-place concrete walls, precast concrete walls, reinforced concrete masonry unit walls/pilasters, or structural steel columns. Training rooms and conference rooms must be free of columns and other obstructions. Refer to Architectural sections for roof slopes.

--End of Section--

B20 EXTERIOR ENCLOSURE – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

This system consists of the exterior shell of the facility, which includes all vertical and horizontal exterior closure such as exterior walls, exterior windows, and exterior doors. This system excludes roofing (See Section B30, Roofing). Load bearing exterior walls will be included here, and not in Section B10, Superstructure. Structural frame elements at the exterior enclosure such as columns, beams, and spandrels are included in Superstructure, with all exterior wall elements supported by columns, beams, and spandrels included in this section. Finishes to the inside face of walls which are not an integral part of the exterior wall construction will be included in Section C30, Interior finishes.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEMS REQUIREMENTS

B2010 EXTERIOR WALLS

It is permissible for exterior walls to be load bearing or non-load bearing. Exterior load bearing walls must consist of any of the following construction types and comply with the architectural and functional requirements that follow this list (also refer to B201001 Exterior Closure section for inclusion of load bearing walls in the overall exterior closure design).

1) Reinforced concrete masonry (CMU)
2) Cast-in-place reinforced concrete
3) Site precast concrete (tilt-up)
4) Plant precast concrete

Exterior walls must incorporate the materials directed in the Camp Lejeune, Base Exterior Architectural Plan (BEAP), 2010 – Section 4.13 Camp Johnson.

The primary exterior cladding material of the building must be modular brick per color and finish conforming to the BEAP, along with a water table as prescribed in the BEAP. If thin brick cladding is used, the color and finish of the brick must match as closely as possible to that indicated in the BEAP.

Brick detailing and design of the exterior wall must provide accent banding and design features at windows as prescribed in the BEAP

Provide a cast-in-place, split face masonry (used with veneer exterior wall closure) or precast concrete water table per the proportions shown in diagrams in the BEAP. If the cast-in-place option is chosen, the finish of the concrete is required to be a high quality, rubbed finish with a pattern mimicking CMU masonry joints.

Multiple options for providing the exterior wall system are as indicated in the Exterior Closure and the Exterior Wall Backup Construction sections shown below.

B201001 EXTERIOR CLOSURE

The following are options for providing the exterior closure. The Contractor has the option to use these systems as long as energy code requirements and design aesthetics as prescribed in the BEAP are provided:

1) A brick/masonry veneer cavity wall exterior wall closure.
2) A precast concrete panel veneer exterior wall closure with applied thin brick. This system must be a barrier system with sealed joints.
3) A site precast tilt-up concrete exterior wall closure or cast in place concrete exterior wall closure (load bearing) with applied thin brick cladding. This exterior closure is a barrier system with sealed joints.
4) A plant cast and site assembled precast concrete exterior wall closure (load bearing) with applied thin brick cladding. This exterior closure is a barrier system with sealed joints.

All exterior closure wall options where the exterior wall concrete (precast or cast in place) is exposed to moisture (at the exterior face of the wall or the base of the wall) must be designed with a plant added admixture to prevent moisture migration within the concrete to prevent the failure of applied thin brick systems, and prevent water migration into the interior of the building.

Thin brick placed on the exterior load bearing walls must be attached with systems that will ensure that the brick will not separate from the wall or form efflorescence. In addition, adequate control/construction joints must be incorporated into the concrete wall system to prevent thin brick cracking and adhesion issues.

B201002 EXTERIOR WALL BACKUP CONSTRUCTION

The backup systems for masonry and precast concrete veneer systems must be of single wythe reinforced concrete masonry. The backup wall system must be integrated with other exterior wall system requirements as indicated in B201003, Insulation and Air Barriers.

Exterior bearing walls consisting of metal studs as the primary floor or roof supporting structural element are not permitted.

For concrete exterior bearing walls (precast or cast in place) the backup wall system is defined in ESR C10, Interior Construction.

B201003 INSULATION and AIR BARRIERS

Provide continuous insulation, vapor retarder and air barrier to meet or exceed requirements of project's energy savings requirements.

Provide a continuous air barrier to control air leakage into, or out of, conditioned spaces. The building envelope must include all elements of the facility that are exposed to the outside environment or outside environmental conditions such as roof, walls, floors, and compartmentalized unconditioned portions of the facility such as garages, and negatively pressurized spaces. Permanently seal penetrations through the air barrier, joints in the air barrier, adjoining construction, and transitions to different air barrier materials.

Confirm air barrier compliance with Air Barrier Performance Test in RFP Part 4.

Provide thermal envelope performance testing through infrared thermography in accordance with RFP Part 4. Coordinate thermal imaging testing with air barrier testing construction schedule.

B201004 PARAPETS

Parapets will not be required for this building since sloped roof areas (with gutter/downspouts) are to be provide over the entire building.

B201005 EXTERIOR LOUVERS & SCREENS

Provide exterior louvers and screens, where required, that match the finish of the existing windows and detailed to integrate with the architecture of the building, as appropriate to the design of the building. Provide insect screens at all louvers.

B201006 BALCONY WALLS & HANDRAILS

NOT USED

B201007 EXTERIOR SOFFITS

Provide a pre-finished metal exterior soffit system and associated rake and eave trim as indicated in the BEAP – Section 4.13 Camp Johnson. Colors as defined in the BEAP

B201009 EXTERIOR PAINTING AND COATINGS

Provide a field applied exterior coating on all items that are not prefinished, and to prefinished items when required to provide a color other than a standard prefinished color.

B201010 EXTERIOR JOINT SEALANTS

Provide exterior application of joint sealants to seal joints and prepare for finish material installation.

B201011 SUN CONTROL DEVICES (EXTERIOR)

Provide horizontal or vertical fixed type as required to provide sun control and prevent any direct sunlight hitting work surfaces of classrooms/vehicle training bays. Sun control devices must be detailed to integrate with the architectural wall/window systems.

B201012 SCREEN WALL

Provide screen walls where required to screen mechanical units, electrical substations, loading docks, and trash receptacles/dumpsters. Screen walls must be per the Camp Lejeune, BEAP, 2010, Section 4.13 Camp Johnson.

B2020 EXTERIOR WINDOWS

Windows and other fenestration systems that provide daylighting must be provided in regularly occupied spaces that include offices and classrooms as indicated in UFC 1-200-02 and reference to ASHRAE 189.1 sections. In the LOG OPS School, the vehicle training bays are to be considered classrooms in relation to providing windows and daylighting.

Due to the location of classrooms away from exterior walls in the LOG OPS block diagrams, the design must provide fenestration systems that will comply with the daylighting requirements prescribed in the aforementioned UFC.

Windows must meet the defined prescriptive AT/FP requirements per UFC 4-010-01, and if necessary curtain wall can be used in lieu of window or storefront systems to meet AT/FP or other design requirements.

The daylighting provided by windows and other fenestration systems must not compromise the visual acuity and comfort within the room.

Provide a sample window installation in a complete exterior wall, as determined by the DOR and approved by the Contracting Officer. If approved, this sample window installation will become a permanent part of the building.

B202001 WINDOWS

Windows must be pre-finished aluminum and fixed.

Provide a mockup of one combination window unit for the project to be used for a field mockup test of compliance with AAMA 502 Method A and Method B.

At all interior window sills provide a ½" solid surface window sill trim to cap the wall at the base of windows.

B202002 STOREFRONTS

Storefronts must be pre-finished aluminum, and if provided must meet the requirements defined for windows in relation to providing daylighting and meeting AT/FP requirements.

Provide a mockup of one designated storefront system unit for the project to be used for a field mockup test in compliance with AAMA 502 Method A and Method B.

If applicable when providing storefront that does not extend to the floor and has a wall area at the base/sill of the storefront refer to window sill requirement in B202001 Windows above.

B202003 CURTAIN WALLS

Curtain walls remains an option for fenestration if found necessary to meet applicable codes and UFC requirements. Curtain wall, if provided, must meet the requirements defined for windows in relation to providing daylighting and meeting AT/FP requirements.

The curtain wall system must be a standard architectural type Stick or Unit and Mullion system, with mullions, horizontal rails, and/or non-integral spandrel panels. Fully coordinate curtain wall system components/accessories that are directly incorporated and adjacent to contiguous related work (i.e. wall systems). Ensure materials compatibility, deflection limitations, thermal movements, and clearances and tolerances in the design of the curtain wall system and in coordination of the curtain wall design with adjacent exterior enclosure systems.

The system must incorporate a pressure equalized method to control air and water infiltration. Face sealed systems and water managed systems are not allowed.

System must be a combination of glazed panels and opaque panels as required by the design.

Provide a mockup of one designated Curtain Wall System unit for the project to be used for a field test of compliance with AAMA 503 Method A and Method B.

B202004 EXTERIOR GLAZING

Glazing color and reflectance must be provided and approved by Camp Lejeune's Architectural Review Board.

Glazing must be a heat absorbing insulated laminated glazing unit with the inner most pane being laminated glazing to meet the prescriptive AT/FP requirements of UFC 4-010-01 and building code/UFC prescribed wind load requirements.

B202090 OTHER EXTERIOR WINDOWS

NOT USED

B2030 EXTERIOR DOORS

All exterior doors must be weather protected and provided with weatherstripping/sealant and thresholds that stop water penetration that comply with ABA. Provide heavy duty overhead closers at all exterior doors

B203001 SOLID DOORS

Provide insulated solid steel door assemblies other than at storefront/curtain wall entrances.

Doors must be Extra Heavy Duty Doors -– ANSI /SDI A250.8, Level 3, physical performance Level A, Model 1.

Provide steel doors fabricated from hot dipped galvanized steel and provide a rust inhibitive factory finished primer coating. Finish coats are to be field painted.

B203002 GLAZED DOORS

Provide exterior prefinished aluminum framed glazed doors and entrances systems integrated into storefront/curtain wall system at main entry of the building or at secondary access points that incorporate storefront/curtain wall systems.

Doors must be factory-finished aluminum framed door assemblies with heat absorbing insulated laminated glazing, frames, and hardware.

Glazing must match the storefront/curtain wall system glazing.

Glazing in any hollow metal or glazed exterior door is required to meet the same prescriptive requirement for glazing as required for windows and other fenestration systems.

B203004 OVERHEAD AND ROLL-UP DOORS

Design doors and opening as loading entrances. Provide lockable doors with automatic operation with protected pushbuttons electric controls.

Provide insulated overhead roll-up doors. Provide powder coat painted finish with custom colors for the door and accessories to match facility color scheme. Design the galvanized steel overhead roll-up slats and door width to withstanding the design wind loading of ASCE 7 and operate normally.

Accomplish door operation by UL Listed electric motor operation with electric controller and an auxiliary hand chain operation. Provide slat profile. Also provide counterbalance, heavy duty springs, wear strips, full perimeter weather-stripping, continuous button pressure safety operation, electric or infrared safety edge, galvanized hardware, and manufactured trims and closures pieces. Protect the wall door jamb opening with guards designed to resist abuse from the type of material and vehicles that are transported through the opening.

For overhead doors that open into inhabited spaces, provide the doors with a tether system or intercepted walls to reduce the likelihood of the overhead doors from translating into the inhabited areas.

B203006 BLAST RESISTANT DOORS

NOT USED

B203008 EXTERIOR DOOR HARDWARE

Provide the services of a certified door hardware consultant to prepare the door hardware schedule. Verify all door hardware requirements with the User.

Provide a programmable Common Access Card (CAC) enabled electronic locking system at all exterior swinging man doors. The exterior locking system must be capable of locking all doors via a “kill switch” (tied to a central monitoring location) and all doors be provided with a manual key override.

Exterior door hardware to provide complete weather-stripping, threshold, and rain deflector, and door closers with code compliant hold open devices. Other specific exterior door hardware to be confirmed by user.

Door hardware finish must be satin stainless steel or an alternate system that matches satin stainless steel if stainless steel is not available.

B203090 OTHER EXTERIOR SPECIALTY DOORS

Provide a double leaf oversized swinging insulated steel door at each Vehicle Training Bay. Door width of 14 feet and door height of 20 feet. Doors must be fabricated of core material and door gauges to provide zero tolerance for racking or twisting of any type. Door thickness is a function of the door size and can be greater than 2” if necessary.

Door hardware must ensure and guarantee an easy to operate door without assistance of motor operation and be able to be safely guided and opened by one person. Door hardware must ensure that the door can stop without floor applied stops.

Door hardware must provide weather-stripping and base of door seals to ensure a completely weatherproof seal when closed.

U value of door must meet those prescribed per UFC and the applicable energy code.

--End of Section—

B30 ROOFING – P1512F LOG OPS SCHOOL

B30 GENERAL SYSTEMS DESCRIPTION

Roof systems shall be watertight. Provide complete roof system design and construction services for the entire new facility roof system, including all ancillary and incidental work necessary for a complete, new, watertight roof system installation.

Submittal Requirements: Components of a minimum roof submittal shall include the roof plan, method of drainage, standard details and details unique to the project, wind load calculations and requirements.

Provide a Pre-Design Roofing Conference (if required in RFP Part 4) and Pre-Construction Roofing Conference to assure roof design and construction is properly coordinated before construction begins.

Refer to UFC 3-110-03, *Roofing*, UFC 3-101-01, *Architecture*, and UFC 1-200-02 *High Performance Sustainable Buildings* for additional roofing requirements such as Energy Star qualified products.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

B3010 ROOF COVERINGS

B301001 STEEP SLOPE ROOFING SYSTEMS

Provide a SSMR (standing seam metal roof system). The slope and configuration of the roofing is suggested in the Base Exterior Architectural Plan (BEAP), 2010, Section 4.13, Camp Johnson. Refer to Part 3, Chapter 2 for prescribed roof slope.

The roof system shall be designed and attached to resist wind uplift pressures calculated in accordance with ASCE 7. Uplift resistance shall be validated by applicable Factory Mutual (FM), Underwriters Laboratories (UL) or ASTM uplift resistance test procedures. The roof material must be 3004 aluminum, ASTM B209M ASTM B209.

Organic Coatings for the metal roof must be a PVDF coating as specified in Part 6, Roof specification section 07 61 15. 00 20 Aluminum Standing Seam Roofing. All other material and construction for metal roofing are per Part 6 specification section.

The spacing of standing seams must be between 12 inches and 18 inches on center as prescribed in the BEAP.

Sub-purlins for the Structural Metal Roof System shall be galvanized and shop painted.

SSSMRS Warranty Certificate – Provide warranty requirements as defined in Part 6, Roof specification section 07 61 15. 00 20 Aluminum Standing Seam Roofing.

Specular Gloss of Finished roof surfaces must have a specular gloss value of 10 or less at an angle of 85 degrees or 30 plus or minus the value specified in project program at 60 degrees when measured in accordance with ASTM D 523.

B301002 LOW SLOPE ROOFING SYSTEMS

NOT USED

B301003 ROOF INSULATION AND FILL

Provide roof insulation values no less than in accordance with UFC 1-200-02 High Performance and Sustainable Buildings and UFC 3-110-03 Roofing.

B301004 FLASHINGS AND TRIM

Provide flashing and trim for the Aluminum Standing Seam Metal roof per specification section 07 61 15. 00 20 Aluminum Standing Seam Roofing in Part 6 of this RFP.

B301005 GUTTERS AND DOWNSPOUTS

Provide gutters and downspouts compatible with roofing material and finish. Concealed (interior) gutters and downspouts are prohibited.

B301006 ROOF OPENINGS AND SUPPORTS

NOT USED

B301090 OTHER ROOFING

Provide lightning protection, without penetrating the roofing or flashing components.

--End of Section--

C10 INTERIOR CONSTRUCTION – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

Interior construction includes interior partitions, interior doors, and fittings.

Provide durable construction appropriate for the building function. Acoustic properties of materials, as well as durability, shall be considered during material selection.

Provide an acoustical engineer to participate in the design and provide design quality reviews throughout the design. The acoustical engineer must be an active participant in the design of the classrooms, classroom/labs, and training spaces and any other space or portion of the design with special acoustical requirements. The engineer must evaluate and give input on, but not limited to, acoustical partitions carrying STC ratings, applied acoustical treatments, integration of audio-video components, and door and frame performance, The acoustical engineer must carry a bachelor's degree in Engineering, Physics, Architecture, or a related field, hold a PE or membership in a recognized acoustical professional organization, and demonstrate a minimum of 7 years of acoustical design/engineering consulting on similar projects.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Areas of the Project subject to abuse require that "Impact Resistant" systems be provided.

C1010 PARTITIONS

Provide partitions consisting of metal studs with gypsum wall board on each side as indicated in the Chapter 3, Part 5, Room Requirements portion of this RFP, and at all rooms not defined in the room requirements. Provide concrete masonry partitions as indicated in Part 3, Chapter 5, Room Requirements, or as necessary for spaces where wall durability is a consideration.

Gypsum board for partitions in moist and humid areas, and areas with water use on floors - that include but not limited to toilets, locker rooms, mechanical rooms and labs/training bays - must be in 5/8” moisture and mold resistant gypsum board panels. ASTM C1396, ASTM D3272 - Rating of 8 to 10, ASTM C473, Water Absorption <5%. Provide Impact resistant versions of this gypsum board for abuse prone areas.

C101001 FIXED PARTITIONS

Provide fixed interior partitions, except where retractable partitions are specifically required by the "Room Requirements."

UFC defined acoustic requirements in UFC 3-101-01, Section 4.8 and Figure 4-1 is not applicable to this project. Partitions requirements are defined using STC ratings in this RFP.

Sound-rated partition assemblies must meet the interior acoustic requirements for typical spaces as follows or as indicated in Chapter 3, Part 5, Additional Room Requirements:

- Classrooms and Labs STC 45
- Vehicle Training Bays STC 45

- Dyno Rooms STC 50
- Conference Rooms STC 45
- Mother's Room STC 45
- Heads STC 45
- Break Rooms/Lounges STC 45
- Private Offices STC 45**

** private office STC may be reduced to a lower STC in association with a high CAC acoustical ceiling or increased to STC 50 based on the requirements of the individual user. The requirements for each individual user must be verified during the design process.

- Mechanical Rooms (when wall is adjacent to occupied space) STC 50

C101002 DEMOUNTABLE PARTITIONS

NOT USED

C101003 RETRACTABLE PARTITIONS

If required, provide retractable partitions to include operable panel partitions (noted as Folding Panel Partition in the Architectural Block Diagram). Sound-rated partition assemblies shall have a minimum Sound Transmission Coefficient (STC) to match the room fixed partition in the room in accordance with ASTM E90 or ASTM E413 for frequency data. Coordinate finishes with Section C30 Interior Finishes.

In the pocketed stored position provide for a partitioned pocket area so the system panels when folded are not exposed in the room.

C101004 INTERIOR GUARDRAILS AND SCREENS

Provide balustrades where required by code. Provide screens where required to prohibit view of a particular area.

C101005 INTERIOR WINDOWS

Provide interior window system of aluminum if required by the design in rooms to provide borrowed light to occupied rooms.

If interior windows are provided at rooms with partitions of STC 45 or above, provide a window with laminated glazing to provide acoustical control.

For Dyno Rooms view window into room provide Bullet-resistant/Ballistic rated windows. Windows must meet U.L. Classification Rating Level to match existing window ballistic rating at the current Dyno Rooms in Building M107. Provide anchorage details that adequately transfer loads from the window frame to the adjacent wall. The window frame must be anchored in accordance with published manufacturer's recommendations. Each window shall be a complete factory-assembled unit.

All interior window systems must have a pre-finished coating finish or anodized finish.

C101006 GLAZED PARTITIONS & STOREFRONTS

Provide aluminum framed glazed storefront system in rooms as required by the design to provide borrowed light into occupied rooms.

If interior glazed storefront is provided, provide acoustically rated glazed systems to match the acoustical rating of the adjacent partition.

All interior storefront systems must have a pre-finished coating finish or anodized finish.

C101007 INTERIOR GLAZING

Interior glazing must be clear or patterned glass that is annealed/tempered based on code requirements.

Provide bullet resistant/ballistic rated glazing in the bullet resistant/ballistic rated window units.

If necessary, provide laminated glazing for sound control as indicated elsewhere in this section.

Interior glazing when provided in fire rated doors and glazed partitions must utilize fire rated glazing to meet code requirements. Wire glass must not be used in fire rated doors or partitions.

C1020 INTERIOR DOORS

C102001 STANDARD INTERIOR DOORS

Provide flush interior doors.

Provide wood or hollow metal interior doors in hollow metal frames.

Provide wood doors at all administrative office area rooms, classrooms, labs, heads , and lounges/break rooms.

Provide hollow metal doors at all mechanical rooms, electrical rooms, telecom rooms, high bay vehicle training rooms, Dyno rooms, spaces associated with the Special Projects Room, and any room with hollow metal doors defined in Part 3,Chapter 5, Room Requirements section of this RFP.

Hollow metal doors must be Level 4 with physical performance level A throughout the facility.

Flush wood doors must be WDMA I.S.1A-04, premium grade, extra heavy duty for classrooms, classrooms/labs, heads, lounges and conference rooms and heavy duty for all other spaces. Flush wood doors shall be SCLC-5 5-ply structural composite lumber core or FD core, as required by code.

Doors must have Factory Finish of AWI Quality Standards Section 1500, specification for Conversion varnish alkyd urea or catalyzed polyurethane.

Provide vision glazing within doors if it is deemed advantageous to be able to see through the door, either for safety of pedestrian traffic, or other functional reasons. If vision glazing within doors is provided it must have the provision to be blanked off during an active shooter event. This would require an easily activated shade, flap or other device that would obscure vision through the door lite.

Provide acoustic seals and gasketing to match acoustical rating as identified in Part 3, Chapter 5, Room Requirements. After installation, test the doors with a flashlight to determine if any gaps in the sound seals allow light to be viewed on the opposite side of the door.

C102002 GLAZED INTERIOR DOORS

Provide Aluminum/Glass glazed interior door as a part of an interior glazed partition as indicated in C101006 for spaces that do not require acoustical control.

C102003 FIRE DOORS

Provide interior fire doors, in fire rated partitions as required by Code.

C102004 SLIDING AND FOLDING DOORS

NOT USED

C102005 INTERIOR OVERHEAD DOORS

NOT USED

C102006 INTERIOR GATES

NOT USED

C102007 INTERIOR DOOR HARDWARE

Provide the services of a certified door hardware consultant to prepare the door hardware schedule in conjunction with the approval of the client and to meet specific requirements outlined in this section or other referenced documents. Verify all door hardware requirements with the User.

Provide lock and latch hardware with levers as follows:

Use Series 1000, Operational Grade 1, Security Grade 2 for ,corridors, classrooms and labs, suite entrances, toilets, and other high use interior doors. Use Series 4000, Grade 1 for locations not using Series 1000 hardware.

a. Mortise Locks and Latches - BHMA A 156.13, Series 1000, Operation Grade 1, Security Grade 2.
b. Bored Locks and Latches - BHMA A 156.2, Series 4000, Grade 1, or Grade 2.

Provide cylinders/cores and keying system as indicated in Part 4, C102007 specifications. Other related door hardware requirements for hardware beyond locking devices is as indicated in Part 4, C102007 specifications. Lock cores shall match the BEST system.

Door hardware finish shall be satin stainless steel or an alternate system that matches satin stainless steel if stainless steel is not available.

C102090 OTHER INTERIOR SPECIALTY DOORS

NOT USED

C102091 OTHER INTERIOR PERSONNEL DOORS

NOT USED

C1030 SPECIALTIES

C103001 COMPARTMENTS, CUBICLES, & TOILET PARTITIONS

Provide solid plastic (HDPE) toilet partitions in all toilet rooms (Heads) with more than one water closet or urinal.

Provide floor mounted overhead braced toilet partitions.

C103002 TOILET AND BATH ACCESSORIES

Provide toilet and bath accessories per the following:

Double toilet tissue dispensers – standard roll size, motion sensing paper towel dispenser, wall-mounted trash disposal, manual soap dispensers at each sink, minimum of two coat/towel hooks, grab bars, convenience shelf/purse ledge. For toilets that have lockers/showers provide high efficiency electric hand dryer, shower rod and shower bench.

At janitor's closets provide wall-mounted mop rack with overhead shelf.

At toilets with counters with integral sinks, provide mirrors the full length of toilet lavatory counters in width and from backsplash to the light cove above in height.

C103003 MARKER BOARDS AND TACK BOARDS

Provide marker (dry erase) boards and tack boards as indicated in Chapter 5 "Room Requirements" portion of this RFP.

Marker boards and tack boards must be mounted with the lower edge at 42" above finished floor. Unless otherwise noted, boards must have anodized aluminum trim. Marker boards and tack boards must have tool trays and one set of tools provided for each room. Coordinate with building construction to include appropriate blocking or structural support for the installation of marker boards and tack boards.

Glass marker boards must be frameless, opaque back-painted glass type and must attract standard magnets (rare-earth magnets not required) and be constructed of 1/4-inch-thick, shatter resistant, tempered glass, solid in color with non-staining finish, polished edges and eased corners and mounted with stainless steel standoffs. Provide magnetic accessory trays for glass markerboards.

Enclosed tack boards must be heavy gauge aluminum, with tackable interior surface, tempered glass sliding doors and lock. Provide selection from full range of manufacturer's finishes. Provide tack board dimensions as follows: Size: 3'-0" H by 4'-0" L.

Marker boards and tack boards are funded as part of the construction contract.C103004 IDENTIFYING DEVICES

All necessary interior signage must be incorporated as part of the architectural drawings. Interior signage is not collateral equipment. Interior signage must demonstrate complete coordination with the facility design, SID and FF&E submittals. Provide interior directional signage for facility wayfinding. Provide an identifying device at each interior door. Signs must meet ABA requirements. Refer to UFC 3-120-01, Design: Sign Standards, for more information.

Provide a 36” x 48” Command Photo Board just inside the main entrance vestibule to accommodate a minimum of (7) 8” x 10” Chain of Command photos. Command Photo Board should be durable and support easy photo changing.

Exterior building signage is also required and must be provided. This includes exterior door signs on any mechanical, electrical and telecommunications room with exterior doors. All exterior signage and their components must be resistant to ultraviolet light and must withstand a marine corrosive environment. This includes any other building signage attached to the building envelope, such as building name or number.

Specific exterior signage requirements follow:

Provide exterior signs at all building primary and secondary entrances stating, “ELECTRONIC DEVICES INCLUDING CELLULAR PHONES PROHIBITED.” Applicability must be verified by AE2 with MCB Camp Lejeune.

Provide exterior signs at all building primary and secondary entrances stating, “DO NOT ENTER IF IDS INDICATOR LIGHT IS ON. ALARM WILL SOUND.” Applicability must be verified by AE2 with MCB Camp Lejeune.

C103005 LOCKERS

Provide 18” wide x 18” deep x 72” high single-tier high density polyethylene (HPDE) personnel lockers. Provide perforated top and doors for better air flow. Each door must be engraved with a minimum 5/8” tall number in sequential order starting with “101”. Provide 6” height continuous HDPD base, sloped tops, metal garment bars, metal double hook, and latching hardware to accommodate pad locks.

All enclosed lockers must be fitted with hardware and devices that reduce noise when operating locker doors.

C103006 SHELVING

NOT USED

C103007 FIRE EXTINGUISHER CABINETS

Provide semi-recessed fire extinguisher cabinets for fire extinguishers in all occupied spaces, including corridors and lobbies, as required by the RFP. Cabinets shall be coordinated with interior finishes. Where cabinets are installed in fire rated partitions, cabinets must be tested and listed in accordance with ANSI/UL-1479 for membrane and penetration firestops. Fire extinguishers required in spaces not typically occupied, such as mechanical, electrical, and telecommunication rooms, may be surface-mounted with a bracket listed for the size and weight of the required fire extinguisher. Installation of all fire extinguisher cabinets and mounting brackets must be in strict compliance with NFPA 1, NFPA 10, and the manufacturer's installation instructions Refer to ESR Section D40.

C103008 COUNTERS

Provide solid surfacing material containing recycled content for counter tops and back splashes in Heads, Break Rooms and Mother’s Rooms.

Backsplash height must be a minimum of 4”.

C103009 CABINETS

Provide cabinetry and millwork items with associated accessories as indicated in RFP Part 6 drawings and RFP Part 3, Chapter 5 Room Finish and FF&E Requirements. Cabinetry must be Architectural Woodwork Institute (AWI) premium grade with hardwood plywood construction. Cabinets must have concealed hinges with adjustable recessed standards for shelves. Exposed surfaces must be covered with high pressure plastic laminate, and interior surfaces must be melamine. All cabinets must have base/toe kicks that match the height of the wall base. Provide ABA compliant doors at casework as required throughout the facility. Provide filler panels as required where cabinets abut wall.

Design and provide cabinets to accommodate equipment such as refrigerator, sink, microwave, commercial coffee pot, and ice maker.

Provide finish choices for built-in cabinetry to include the manufacturer's standard complete color line for all materials.

All cabinets to have solid surface counters with eased leading edge, unless noted otherwise in RFP.

Provide base and/or wall cabinets in administrative break rooms and other rooms as indicated in Part 3, Chapter 5, Room Requirements section of this DB RFP.

C103010 CASEWORK

NOT USED

C103011 CLOSETS

NOT USED

C103012 FIRESTOPPING SYSTEMS

All firestopping systems shall be performed by one experienced firestop contractor. Experienced firestop contractor is defined as following:

1. FM Research approved in accordance with FM 4991, or
2. Operating as a UL Certified Firestop Contractor, or
3. A contractor completed the manufacturer accredited firestop specialty contractor program. Certified, licensed or otherwise qualified by the firestopping manufacturer as having the necessary staff, training, and a minimum of 3 years of experience in the installation of manufacturer’s products in accordance with specified requirements. Submit documentation of this experience. A manufacturer’s willingness to sell its firestopping products to the contractor or to an installer engaged by the Contractor does not in itself confer installer qualifications on the buyer. Individual building system subcontractor, such as Mechanical, Electrical, Plumbing, Gypsum wall, etc., is not permitted to install firestopping systems.

A single complete submittal including Shop Drawings, Product Data, UL details must be provided for all firestopping systems throughout entire project.

C103013 SPRAYED FIRE-RESISTIVE MATERIALS

The requirement for sprayed fire-resistive materials is determined by the building code analysis prepared by the design/build contractor's Qualified Fire Protection Engineer (QFPE). If required, provide sprayed fire-resistive materials to the building's framework.

C103014 ENTRANCE FLOOR GRILLES AND MATS

Provide recessed walk-off floor mats or surface mounted/loose lay floor mats at building entrances in sizes as indicated in RFP Part 3, Chapter 5 Room Requirements and RFP Part 6 drawings. Recessed walk-off floor mats are part of the construction contract. Surface mounted or loose lay floor mats are part of the FF&E package. Provide sealed concrete underneath recessed walk-off floor mats.

Provide recessed walk-off floor mats with a carpet insert (100% solution dyed) designed for high traffic areas. Recessed walk-off floor mats must have T5 aluminum alloy frame with anodized finish. Provide architectural surface pattern with combination of inserts, finish colors, aluminum slots, and aluminum framework. Inserts must include monofilament abrasive fibers and finish colors must be offered in a broad range of standard neutral and bright colors. Floor mat surfaces must comply with ASHRAE 90.1 and ASHRAE 189.1 requirements.

C103015 ORNAMENTAL METAL WORK

NOT USED

C103090 OTHER INTERIOR SPECIALTIES

NOT USED

--End of Section--

C20 STAIRS AND LADDERS – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

Provide ladders as required by the building code for access to platforms and mezzanines, and roof areas. Since this building is one story it is not anticipated that stairs will be needed, however the requirements of this section are included in the RFP in the case that a stair or ladder may be required for operations.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEMS REQUIREMENTS

Provide ladders conforming to UFC 1-200-01, *General Building Requirements*.

C2010 STAIR CONSTRUCTION

C201001 INTERIOR AND EXTERIOR STAIRS

Provide metal pan stair construction to access spaces that are regularly accessed.

C201002 FIRE ESCAPE STAIRS

NOT USED

C201090 HANDRAILS, GUARDRAILS, LADDERS AND ACCESSORIES

Provide painted, galvanized steel handrails, guardrails and ladders, as required by code. Exterior systems must be coated or galvanized to withstand extreme wear and weathering conditions. Provide handrails, guardrails and ladders with smooth, unbroken surfaces throughout the length of the stair or ladder as required by code.

Provide metal ladders and railings complying with OSHA requirements for access and protection to all mechanical mezzanines, lofts and similar spaces.

--End of Section--

C30 INTERIOR FINISHES – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

Interior finishes include wall finishes, floor finishes, wall base finishes, and ceiling finishes.

Provide aesthetically pleasing, functional, durable finishes appropriate to the building function. Acoustic properties of materials, as well as durability and ease of maintenance, must be considered during material selection. Maximize the use of sustainable materials.

All interior finish products must be from manufacturer's standard running line offerings. Manufacturer's submitted materials must be made available for purchase at NO MINIMUMS for not less than 7 years from the date of the original product order. Custom fabrications must not be allowed unless otherwise noted.

Finish selections for this project will require the use of wall, floor, and ceiling material accents to enhance the interior design and architecture of the building. Provide an interior finish design scheme that includes a minimum of two different accent colors, to be used throughout the facility. Refer to Part 3, Chapter 6, ESR E20 for Structural Interior Design (SID) requirements and Part 3, Chapter 5, Room Requirements for required locations. Submit floor pattern and accent wall location drawings, indicating proposed interior finish locations with the Structural Interior Design submittal.

GENERAL SYSTEMS REQUIREMENTS

See Part 3 Chapter 5 Room Requirements for specific requirements on Interior Finishes.

C30 SSPC QP 1 CERTIFICATION

The Project requires industrial coatings on exposed steel surfaces. All contractors and subcontractors that perform surface preparation or coating application must be certified by the Society for Protective Coatings (formerly Steel Structures Painting Council - SSPC) to the requirements of SSPC QP 91 prior to contract award and must remain certified while accomplishing any surface preparation or coating application.

C3010 WALL FINISHES

Provide architectural feature wall consisting of wood veneer panel and wood acoustical panel in key public locations to include the Lobby and main entrance areas. Acoustical fabric wall panels must be used in the Conference rooms.

C301001 CONCRETE WALL FINISHES

NOT USED

C301002 PLASTER WALL FINISHES

NOT USED

C301003 GYPSUM WALLBOARD FINISHES

All interior wall finish materials must be finished and painted gypsum wall board, as indicated in the Part 3 Chapter 5 Room Requirements.

In all locations, where concrete or concrete masonry walls exist in conjunction with GWB over metal stud construction within a space, all walls must be finished with GWB. Moisture-resistant

gypsum wall board must be used in all wet or humid areas including, but not limited to vestibules, toilet rooms and locker room areas. Gypsum walls, fascia, and soffits must receive latex primer and two coats of Architectural Latex in a satin or eggshell finish. See Part 4, PTS, C304001 GENERAL REQUIREMENTS for the MPI standards for more information.

Regular and mold/moisture-resistant gypsum wall board must be used in spaces indicated in the Part 3, Chapter 5, Room Requirements.

C301004 CERAMIC AND PORCELAIN TILE WALL FINISHES

Porcelain Tile

Provide through-body color, rectified porcelain unglazed wall tile, minimum size of 12-inch x 12-inch with manufacturer recommended minimum width grout joints. Tile must be minimum Grade B, per ANSI 137.1 (1988), with a wide range of accent colors available.

Provide coordinating designer decorative accent strips or coordinating accessory tile shapes, minimum Grade D, as an integral part of the wall tile system. Porcelain wall tile must be installed full-height on gypsum wall board substrates. Provide grouted-in edge stainless steel protection strips at all outside and inside corners, stainless steel transition strips where wall tile and floor tile meet, and transitions from tile to other wall finishes.

Backer Board: Cementitious, water-durable board surfaced with fiberglass reinforcing mesh on front and back, long edges wrapped, and complying with ANSI A118.9 and ASTM C 1325.

Provide coordinating epoxy grout for all tile finishes. Avoid light colored grout.

Aesthetic Classifications: Provide tile with an aesthetic classification of V2 Similarly colored with variations in texture and/or pattern.

Install tile to full height of the wall in a running bond pattern.

C301005 WALL COVERINGS

Corner Guards

For office and administrative areas, corner Guards must be placed on outside corners in all high-traffic interior exposed corners in corridors and room exposed with corners in open office areas, except on walls of CMU construction and must be 3-inch width. They must be surface-mounted in a through-color, recycled, extruded PETG finished aluminum material. Corner guards must extend from top of cove base and extend 8 feet high and be mechanically installed with a concealed continuous aluminum retainer. Double stick tape and adhesive mounted corner guard methods are not acceptable.

In vehicle training bays, storage areas, labs and mechanical rooms, corner guards of stainless steel and 3-inch width with brushed finish must be placed on outside corners at exposed corners of rooms or corridors. Corner guards must extend from floor to 60-inch above floor or be full height of wall if required and be mechanically fastened and adhered.

Wall Protection

Provide stainless-steel wall protectors at mop sinks in janitor rooms.

C301006 ACOUSTICAL PANELS ADHERED TO WALLS

Provide sound absorbing acoustical fabric wrapped wall panels reinforced edges as identified in Part 3 Chapter 5 Room Requirements for conference rooms. Wall panel system must have a field-replaceable fabric system.

Provide wood veneer acoustical wall panels that are factory-assembled, and factory finished. Panels must be perforated and backed with an acoustic textile product for optimum acoustical quality with limited textile visibility when installed. Veneer selection must be selected from an A grade range of stain grade veneer with minimal graining. Species and finish must coordinate with other wood finishes on interior finish schedule. Include all required corner, transition and base components for a quality installation. Refer to Part 4 Section C103009 for veneer quality and graining of wood finish materials.

C301090 OTHER WALL FINISHES

Solid Surfacing Wall Finishes

Provide 100% Acrylic Polymer in a solid color or with small size particulate solid surface material for shower surround and window stools.

Exterior windows will receive a window stool.

100 percent acrylic solid surface at Break Rooms: 1/2-inch solid surface wall panel will extend width of sink to top cabinetry from backsplash to underside of wall cabinets.

100 percent acrylic solid surface at Showers: 1/2-inch solid surface wall panels will extend vertically from top of shower pan. Solid surface material will overlap top of shower pan with an air gap, as required by manufacturer installation instructions. Wall panels in shower areas will extend horizontally beyond the “wet area” to the exterior line of the shower receptor threshold. A solid surface transition will be required where solid surface meets wall tile. Locate wall panel seams at corners only. No material seams will be acceptable, except at corners. All shower seams at corners will be lap joints with solid surface corner trim from floor to ceiling. Chemically fuse seams. Include a matching corner shower shelf in each shower compartment. Full-height solid surface transitions will be provided at adjacent wall surfaces. Substrate behind solid surface shower walls will be equal to cementitious ceramic tile backer board. Solid surface shower receptors will be installed prior to wall system. Shower pan receptors will be a minimum thickness of 1/2-inch thick, with a 3/4-inch thick area at least 12 inches in diameter at the drain. Receptors will be one-piece, factory formed shower pans with integral thresholds. Thresholds will have structural supports every 4 inches on center.

Modular Architectural Panels/Decorative Paneling System

Provide modular architectural paneling wall system consisting of wood veneer acoustical panel in key public locations.

System must utilize ¾ inch thick panels in a rail and spline fastening system with 1/4-inch-wide or 1/2-inch-wide channel reveals, rails, splines and edge trim.

All exposed hardware must be black satin factory finished, anodized aluminum. Panel sizes must be a minimum of 4 x 8 feet.

Wood Trim

Paint grade hardwood trim to include crown molding, wainscot and chair rail. Veneer must be selected from A grade of paint grade veneer with minimal graining. Species and stain must coordinate with interior color scheme and interior wood doors. Refer to Part 4 Section C103009 for veneer quality and graining of wood finish materials.

Water-based Epoxy Wall Coating

Water-based epoxy wall coating must be used in the Janitor's Closets as noted in Part 3 Chapter 5 Room Requirements. Wall coating system must be a 10 to 12 mil thick wall system over adequate wall patching compound/wall prep. Wall coating system must consist of one coat of water-based epoxy primer, a waterproofing membrane, two coats of water-based epoxy body/bonding coat, and gloss finish/seal coat from a single wall coating system manufacturer for a uniform, monolithic, slightly textured wall surface with rounded 1-inch radius inside corners, wall-to-ceiling and floor-to-wall transitions. All plumbing, floor-to-ceiling and wall-to-floor transition details must be a recommended by wall and floor coating manufacturer.

Plywood

Telecomm closets must receive floor-to-ceiling, 3/4-inch plywood, Class A fire-rated, sanded, face-grade plywood on side and back walls.

C3020 FLOOR FINISHES

Provide floor finish materials to meet the following requirements.

C302001 TILE FLOOR FINISHES

Porcelain Tile Floor Finishes

Provide through-body, rectified porcelain tile in a minimum size of 12 x 12 inches with matching 6-inch-high cove tile base with flat top and bottom edge, or with stainless steel coved transition between floor and wall tile. The cove base must have a flat top/bottom edge. Grout joints in a maximum width of 3/16 inch must be provided. Tile must be non-slip, with a light texture. Texture of tile must be analyzed with regard to maintenance and selected based on a minimal maintenance program. Provide grouted-in stainless steel metal transition strips at expansion joints, corners (inside and outside), and transition between floor and wall tile.

Provide coordinating epoxy grout for all tile finishes. Avoid light colored grout.

C302002 TERRAZZO FLOOR FINISHES – BID OPTION

Resinous (Epoxy) Flooring Requirements: Provide resinous (epoxy) flooring as identified in RFP Part 3, Chapter 5 Room Requirements, and as directed below. See Part 4 PTS for additional requirements.

Moisture Testing: Perform tests recommended by manufacturer and as follows:

a. Perform relative-humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.
b. If the relative humidity exceeds 75 percent, then manufacturer approved primer moisture mitigation system must be installed prior to resinous flooring installation. Slab-on-grade substrates without a vapor barrier require a moisture mitigation system.
c. Poured-Epoxy Terrazzo Floor System – A 3/8-inch thick (minimum) epoxy terrazzo floor system in accordance with the "NTMA Epoxy Thin Set Terrazzo Specification" and manufacturer specifications, whichever is more stringent. Terrazzo floor system must include (but not be limited to) moisture vapor primer system, crack isolation membrane, zinc divider strips, aggregates, and epoxy terrazzo topping. Aggregate mixture to include marble and/or granite chips, 15 percent minimum colored glass chips and 20 percent minimum recycled mirror chips. Incorporate a base color, three accent colors, and

divider strips in a pattern to create a design of interest. Provide an 800-grit level polished finish. Wall base must be separate, 6-inch-height, top set, precast epoxy terrazzo, flat tile base matching the floor field color. See Part 4, Section A103001 Standard Slab on Grade for additional requirements.

C302003 WOOD FLOORING

NOT USED

C302004 RESILIENT FLOOR FINISHES

Luxury Vinyl Tile Flooring

Provide resilient luxury vinyl tile, in lobby, corridors break rooms, Mother's Room and other high traffic areas for floors with high durability, low maintenance, high slip-resistance requirements. Luxury vinyl tile will be planks or square tiles as indicated in Part 3 Chapter 5 Room Requirements. Luxury vinyl tile must fall under Product Classification Class III, Type B per ASTM F1700 and use Class III printed film that conforms to ASTM F1700. Luxury Vinyl Tile must not contain ortho-phthalates. Luxury Vinyl Tile must have a minimum Coefficient of Friction of >0.5. All products must be from manufacturer's standard running line offering. Custom products or products with a minimum order quantity are prohibited.

20 mil and 30 mil wear layer products will be accepted if they have the following characteristics: factory applied UV-cured polyurethane finish containing anti-scratch particles and anti-scuff qualities, a test result of B1 or B2 on the Martindale Procedure B Test - BS EN 16094:2012 Procedures B (which assesses the scratch performance of the topical factory applied finish treatment that enhances clean ability and durability), passes ASTM F970 for Static Loads resulting in Pounds per Square Inch (PSI) minimum of 1000 PSI (to avoid materials that have the potential to severely indent and/or break with heavy static loads), and must carry a 20 year manufacturer's written warranty.

40 mil wear layer product with a 20-year manufacturer's written warranty is required.

C302005 CARPETING

NOT USED

C302006 MASONRY & STONE FLOORING

NOT USED

C302007 WALL BASE FINISHES

Resilient Wall Base

Provide rubber cove wall base, throughout areas with resilient flooring and straight rubber for carpeted areas.as indicated in Part 3 Chapter 5 Room Requirements.

Tile Base

In areas where wall tile is required, or otherwise specified, tiled floor must have matching 6-inch high cove base or stainless-steel cove transition strips between floor tile and wall tile. In areas where no wall tile is specified, tiled floor must have matching 6-inch-high cove base. When tile cove base is used, base must have flat top and bottom edges to join evenly with adjacent tiles. Resilient base must be 120’ coils. Rounded edges are not allowed. Tile cove wall base units must be pre-formed; cut tiles are not allowed.

Provide coordinating epoxy grout for all tile finishes. Avoid light colored grout.

C302008 STAIR FINISHES

NOT USED

C302009 FLOOR TOPPINGS AND TRAFFIC MEMBRANES

NOT USED

C302010 HARDENERS AND SEALERS

Concrete Floor Requirements

Finish concrete surfaces smooth enough to meet the minimum requirements of this RFP or the floor finish manufacturer's smoothness requirements, whichever is the most restrictive. Provide hardener in concrete mixture in accordance with the manufacture requirements. Exposed concrete floors that are not required to have an applied floor finish, must receive a minimum of three coats of the manufacturer's approved sealer.

Provide concrete flooring as identified in RFP Part 3, Chapter 5 Room Requirements, and as directed in the following.

Sealed Concrete: Finish concrete surface smooth enough to meet the minimum requirements of this RFP or the floor finish manufacturer’s smoothness requirements, whichever is the most restrictive. Apply both penetrating and topical sealers on exposed concrete floors that are not required to have an applied floor finish.

a. Water-based, clear, penetrating sealing compound blend of silane and siloxane for salt protection that penetrates into the pores of the concrete. Sealer must limit intrusion of moisture and chlorides into the concrete.
b. Water-based, topical, non-yellowing, clear, acrylic curing and sealing compound meeting the following requirements.
    I. ASTM C 309, Type 1, Class B
    II. ASSHTO M 148, Type 1, Class B
    III. ASTM C 1315, Class A, Section 6.4.1 – non-yellowing
    IV. ASTM C 1315, Section 6.6 – exceed 50 MPa (70 psi) adhesion.

C302011 RAISED ACCESS FLOORING

Provide concrete filled steel panel raised access floor system (24-inch X 24-inch panels) with steel pedestals and bolted stringers as indicated in Part 3, Chapter 5 – Room Requirements, of this RFP. All panels must be able to be interchangeable in the system.

Finish must be luxury vinyl tile - on module. Raised access flooring locations must be as indicated in Part 3 Chapter 5 Room Requirements. Raised flooring must accommodate data and electrical systems. Majority of Raised Flooring components must be available on GSA Schedule.

The total system height must be 6-inch. Provide in a flat or tiered arrangement with all accessories to provide stairs and guardrails as necessary, and provide vertical closure panels at ends of exposed steps and ramps.

Pedestals - Pedestals shall be capable of supporting a 5,000-pound axial load without permanent deformation. Bonding strength of pedestal adhesive - adhesive for anchoring pedestal bases - shall have a bonding strength capable of resisting an overturning moment of 1,000 lb/f-in when a force is applied to the top of the pedestal in any direction.

Bond strength of factory installed covering shall be sufficient to permit handling of the panels by use of the panel lifting device, and to withstand moving caster loads up to 1,000 pounds, without separation of the covering from the panel.
The raised access flooring shall be tested in accordance with ASM – CISCA Standards and Procedure and meet the following load requirements:

- Concentrated load of 1,250 pounds in classrooms and classroom/labs. Calculate concentrated load as load on one square inch, at any point on panel, without deflecting more than 0.08 inch, with a safety factor of 2 based on static design load, without permanent deformation in excess of 0.01 inch in any of the specified tests.
- Uniform live load of 400 psf for classrooms and classroom/labs without deflecting more than 0.04 inch.
- A rolling load of 800 pounds for classrooms and classroom/labs applied through hard rubber surfaced wheel 6 inches in diameter by 1 1/2-inch-wide for 10,000 cycles over the same path. Permanent set at conclusion of test shall not exceed 0.010 inch.
- A rolling load of 1,000 pounds for classrooms and classroom/labs applied through a 3-inch diameter by 1-13/16-inch-wide caster for 10 cycles over the same path, without deflecting more than 0.04 inch and without permanent deformation in excess of 0.02 inch. In accordance with CISCA Access Floors, the permanent deformation limit under rolling load shall be satisfied in all of the specified tests. In the specified tests, the permanent deformation shall be measured after 10 passes with Wheel 1 and after 10,000 passes with Wheel 2.
- An impact load of 150 pounds on one square inch from a height of 36 inches with permanent set not to exceed 0.060 inch.

C302090 OTHER FLOORING & FLOOR FINISHES

Provide fuel resistive resinous flooring finish system – 5 coat system as indicated in Chapter, Part 5, Room Requirements of this RFP. The system must provide an easily cleanable floor surface with a slip resistant top coat. Provide an integral wall base at height recommended by the manufacturer and metal termination bar.

Provide fuel resistive resinous flooring finish system – 3 coat system as indicated in Chapter, Part 5, Room Requirements of this RFP. The system must provide an easily cleanable floor surface with a slip resistant top coat. Provide an integral wall base at height recommended by the manufacturer and metal termination bar.

Provide Standard Resinous flooring finish system as indicated in Chapter, Part 5, Room Requirements of this RFP. The system must provide an easily cleanable floor surface with a slip resistant top coat

C3030 CEILING FINISHES

Finished surface of ceiling tiles must be selected to address acoustical, maintenance, moisture or impact resistance requirements of the room. Provide feature or accent ceiling of gypsum wall board in main entrance/lobby and administrative areas. Ceiling finishes must be as indicated in Part 3 Chapter 5 Room Requirements portion of this RFP and as defined in this ESR.

C303001 ACOUSTICAL CEILING TILES & PANELS

Acoustic Ceiling Panels

Suspended Acoustical Panel System: Primary ceiling finish will be 24-inch x 24-inch by 5/8-inch minimum thickness suspended acoustical panel ceiling system as indicated in Part 3, Chapter 5, Room Requirements port of this RFP, except provide a suspended gypsum board ceiling in entrance lobby. Acoustical panels will have a square edge, closed pore panel surface unless as noted. Select finished surface of ceiling tiles to address acoustical, maintenance, moisture or impact resistance requirements of the room. Provide sustainable panels.

C303002 GYPSUM WALLBOARD CEILING FINISHES

Gypsum Wallboard Ceiling Finishes

Provide Regular Gypsum Board and Moisture/Mold Resistant Gypsum Board as indicated in the Part 3 Chapter 5 Room Requirements and in ESR C10. Moisture/Mold Resistant gypsum wall board must be used in all wet or humid areas include, but not limited to vestibules, toilet rooms and locker rooms areas.

C303003 PLASTER CEILING FINISHES

NOT USED

C303004 WOOD CEILINGS

NOT USED

C303005 SUSPENSIONS SYSTEMS

Provide 24-inch by 24-inch aluminum or steel non-corroding intermediate-duty standard grid system for lay-in acoustical panels (ASTM C635). Finish must be factory applied white baked enamel. Provide manufacturer’s hold down clips for fire rated assemblies and wall or edge molding. Hang grid system as recommended by manufacturer but with no less than 0.106-inch diameter wires (ASTM A641A, A641M, Class 1), or with one by 3/16 inch galvanized steel

straps conforming to ASTM A653A, A653M (for light commercial zinc coating) or ASTM A366A, A366M (with an electrodeposited zinc coating, Type RS). Use ASTM A580/580M, composition 302 or 304, condition annealed stainless steel, 0.106 inches in diameter over high humidity areas such as commercial kitchens and pools. Install suspended grid system with acoustical sealant (ASTM C843, non-staining and ASTM C636). Recycled content must be a minimum of 25%.

C303006 METAL STRIP CEILINGS

NOT USED

C303009 OTHER CEILING & CEILING FINISHES

NOT USED

C3040 INTERIOR COATINGS AND SPECIAL FINISHES

C304001 GENERAL REQUIREMENTS

Spray paint all interior exposed surfaces including metal items, such as interior grilles, registers, diffusers, access panels, and panel boxes with a minimum of two coats in color to match adjacent surfaces, unless otherwise indicated. All primer and paint systems must be the manufacturer’s highest premium quality, professional grade. All materials must be moisture and mildew resistant and easily cleaned.

C304002 CONCRETE FINISHES

NOT USED

C304003 CONCRETE MASONRY FINISHES

Paint finish as required for concrete masonry in Part 3, Chapter 5, Room Requirements portion of this RFP. See Part 4, C3040 INTERIOR COATINGS AND SPECIAL FINISHES and provide paint systems in accordance with the MPI standards for the interior architectural surface being finished – Concrete Masonry Units. Finish coat must be a semi-gloss.

C304004 METAL FINISHES

NOT USED

C304005 INTERIOR WOOD FINISHES

NOT USED

C304006 GYPSUM WALLBOARD FINISHES

Gypsum walls, gypsum wall board ceilings, fascias and soffits must receive latex primer and two coats of Architectural Latex in a satin or eggshell finish. See Part 4, C3040 INTERIOR COATINGS AND SPECIAL FINISHES. Include a minimum of two paint selections for accent walls as indicated in Part 3 Chapter 5 Room Requirements.

C304007 SPECIAL COATINGS ON WALLS

High Performance Architectural Coating

Provide high performance architectural paint coatings in areas as indicated in Part 3 Chapter 5 Room Requirements portion of this RFP.

--End of Section--

D10 CONVEYING SYSTEMS – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

Provide Conveying System that include lifts and cranes.

GENERAL REQUIREMENTS

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

D1010 ELEVATORS

NOT USED

D101001 GENERAL CONSTRUCTION ITEMS

NOT USED

D101002 PASSENGER ELEVATORS

NOT USED

D101003 FREIGHT ELEVATORS

NOT USED

D101004 WHEELCHAIR LIFT

NOT USED

D101005 DUMBWAITERS

NOT USED

D101090 OTHER VERTICAL TRANSPORTATION EQUIPMENT

NOT USED

D1020 WEIGHT HANDLING EQUIPMENT

Ensure that the relocated crane satisfies the testing and certification requirements detailed in Part 4 of this RFP, to the satisfaction of the user activity designated weight handling certifying official. Coordinate witness testing with the user activity designated weight handling certifying official.

D20 PLUMBING – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

The plumbing system consists of all fixtures, potable cold and hot water piping and equipment, piping insulation, water heating equipment, sanitary waste and vent piping systems, and other specialty piping and equipment within 5 feet of the building.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Provide working space around all equipment. Provide concrete pads under all equipment. Provide all required fittings, connections and accessories required for a complete and usable system. Install all equipment per the criteria of PTS section D20 and the manufacturer's recommendations. Design and install plumbing systems in accordance with IPC and UFC 3-420-01, *Plumbing Systems*. Where the word "should" is used in the manufacturer's recommendations, substitute the word "must".

Include the hot and cold water systems to list of systems to be commissioned in accordance with UFGS 01 33 29.05 20 Sustainability Requirements for Design Build

Refer to RFP Part 3 – Project Program, Chapter 2 for commissioning requirements

D2010 PLUMBING FIXTURES

Provide quantity and type of plumbing fixtures required for the use and functions described for this facility. Obtain occupancy from the owner. Refer to Part 3 Chapter 5 Room Requirements Section for additional specific requirements for spaces with plumbing fixtures. Provide handicapped fixtures in accordance with the referenced criteria in the Project Program.

D201001 WATER CLOSETS

Provide floor mounted flush valve water closets with hard-wired automatic flush control with push button backup. Maximum flushing volume is 1.28 gallons.

D201002 URINALS

Provide flush valve urinals with hard-wired automatic flush control with push button backup. Maximum flushing volume is 0.125 gallons.

D201003 LAVATORIES

Provide solid surface lavatories with integral sinks with hard-wired sensing faucet with automatic control and battery backup.

Provide all stainless steel fixtures and counters for student restrooms that serve the training bays.

D201004 SINKS

Provide brushed stainless steel undermount sink in the pantry/break areas. Provide swivel faucet.

Provide semi-circular multi occupant wash fountain(s) with foot pedal supply in each instructional area.

Provide mop sink in janitor's closets.

D201005 SHOWERS

All showers are to be the low flow type, 2.0 gpm. The shower heads to be located at a stationary position pointed away from the shower entrance opening and to keep from spraying toward the shower entrance opening and causing water damage. The shower faucet and spray head is to be a surface mount unit complete with prefabricated stainless steel mount and enclosure panel, temperature compensating shower valve with metal stem handle and integral service stops, and a shower head with flow control on institutional bracket.

D201006 DRINKING FOUNTAINS AND COOLERS

Provide hi low drinking fountains. Each drinking fountain must have a bottle filler.

Provide wall recess or side walls to protect drinking fountains.

D201090 EMERGENCY FIXTURES

Provide emergency shower and eyewash in the with privacy curtain and rail.

Provide tepid water (60F to 100F) with water tempering valve assembly.

Provide alarms and appurtenances for service within NEMA type 4 enclosures.

D2020 DOMESTIC WATER DISTRIBUTION

Perform a flow test to determine the potable water pressure at the building and calculate piping system requirements.

D202001 PIPES AND FITTINGS

Provide Copper piping Type L for above ground and Type K for buried. Press fittings are not allowed.

D202002 VALVES & HYDRANTS

Provide isolation valves at supply to each floor. Provide hose bibbs in mechanical rooms and within 25 feet of all exterior equipment with coils. Provide hose bibbs every 20 feet in vehicle instruction labs. Provide wall hydrants along the building exterior such that all points along the perimeter can be reached with a 25-foot-long hose.

D202003 DOMESTIC WATER EQUIPMENT

Provide backflow preventers of types and at points within domestic water systems as specified by IPC. Locate inside the mechanical room on service entrance lines where not provided exterior to the building.

Perform calculations to determine the water heater capacity to supply hot water to the fixtures.

Provide electric or natural gas water heater for heating of domestic water.

Provide water tempering valve assembly.

Provide domestic hot water recirculation system with high efficiency recirculation pump and recirculation loop with all associated fixtures, equipment, and appurtenances. Provide inline

circulator for domestic hot water distribution system. Provide balance valves throughout system to allow for system balance to achieve required maximum wait times per International Energy Conservation Code. Provide domestic water balance per UFGS 23 05 93.00 22 *Testing, Adjusting, and Balancing for Mechanical Systems*.

If water flow test shows inadequate water pressure, provide domestic water booster system for domestic water distribution system.

Provide water meter on the building main. Water meters must be appropriately sized for the building load. The water meter register must display gallons and must be clearly visible for inspection. The register must be compatible with the Itron 100W encoded radio transmitter (ERT). Refer to Itron's documentation for a compatibility list.

Contact: United Systems & Software, Incorporated

Jody Cline

800.455.3293

jodyc@united-systems.com

The ERT must be an Itron 100W+ with encoded output. The ERT must be installed per Itron installation guidelines. The contractor must supply all necessary mounting material, cabling, etc.

For meters installed inside of facilities (e.g. Mechanical room), the ERT must be mounted on the outside wall of the room.

Meters installed in pits must utilize the appropriate "through the LID" antenna.

The ERT must be proven to be capable of communicating with Itron's Advanced Meter Reading (AMR) and/or Advanced Metering Infrastructure (AMI) technology. Camp Lejeune's current AMR technology includes Mobile Collector Lite (MC Lite). AMR technology consists of Choice Connect version 5, with Cell Collector Units (CCUs). Prior to acceptance, all installations must prove successful communication between the meter endpoint (ERT) and Camp Lejeune's endpoint AMR and/or AMI communication equipment (i.e. MCLite/FC300 handheld and/or CCU).

The contract must submit the following information for each location (meter) included in the project.

Meter: Make, Serial Number, Size, Compound (Y/N)

Register (aka Encoder): Make, Model, Dials, Multiplier, Unit of Measure (i.e. gallons)

ERT: Make, Model, ID, Latitude, Longitude.

D202004 INSULATION & IDENTIFICATION

Provide cellular glass insulation with vapor barrier on domestic hot water supply piping and on domestic cold water supply piping. Provide identification for piping and equipment.

D202005 SPECIALTIES

Provide ice maker connector box for refrigerators.

Provide overhead cold water hose reels for each vehicle.

D202090 OTHER DOMESTIC WATER SUPPLY

Provide piping supports in accordance with the IPC. Provide inspections, disinfection, and testing in accordance with the IPC.

Provide recessed water-outlet boxes for ice and coffee makers.

D2030 SANITARY WASTE

D203001 WASTE PIPE & FITTINGS

Above ground provide cast iron hubless pipe with rubber gasket and stainless-steel banding. Below ground provide hub and spigot. Line trenches with gravel for continuous slope and support prior to the 10’ column testing. Provide easy access for inspection of each joint on all sides during the test. Encase all direct buried sanitary lines in a minimum of 12” gravel on all sides after successful completion of the column test and prior to backfill and tampering. Provide slab anchored hangers for buildings with pile foundation systems.

Provide plastic PVC piping, fittings, and solvent cement for below ground installation.

D203002 VENT PIPE & FITTINGS

Provide cast iron hubless pipe and fittings, rubber compression gasket joints and stainless steel banding.

D203003 FLOOR DRAINS

Provide floor drains in mechanical rooms, restrooms, break rooms, in proximity to emergency eyewashes and showers, and plumbing chase areas.

Provide floor sinks to receive condensate from air handling units.

Provide trench drains with a manual control valve installed in-line to connect to Oil Water Separator in vehicle maintenance labs and other spaces that require Oil Water Separators.

Provide trench drains at overhead doors in Dyno Rooms.

D203004 SANITARY & VENT EQUIPMENT

Provide sump pump in building drains that cannot discharge to the sewer by gravity.

D2040 RAIN WATER DRAINAGE

D204001 PIPE & FITTING

Above ground provide cast iron hubless pipe with rubber gasket and stainless-steel banding. Below ground provide hub and spigot. Line trenches with gravel for continuous slope and support prior to the 10’ column testing. Provide easy access for inspection of each joint on all sides during the test. Encase all direct buried sanitary lines in a minimum of 12” gravel on all sides after successful completion of the column test and prior to backfill and tampering. Provide slab anchored hangers for buildings with pile foundation systems.

D204002 ROOF DRAINS

Provide roof drains that are compatible with the roofing system.

D204004 INSULATION & IDENTIFICATION

Domestic, Storm and Condensate piping.

D204090 OTHER RAIN WATER DRAINAGE SYSTEM

NOT USED

D2090 OTHER PLUMBING SYSTEMS

D209001 SPECIAL PIPING SYSTEMS

Obtain natural gas pressures from the local gas utility provider. Contractor must invite the utility provider to the design reviews. Contractor is responsible for any applications and permits, and must provide the complete natural gas system from the load side of the utility meter to the heating equipment. Provide steel natural gas piping system. Include gas distribution piping from the gas meter to points of usage. Follow Camp Lejeune design standards for piping pressures inside the building.

The Contractor must provide the projected loads to the gas utility provider 6 months prior to in-service date. The Contractor must have the local gas utility provider install piping and appurtenances up to the load side of the meter. Tie the gas meter into the Building Automation System (BAS) and the existing Advanced Metering Infrastructure (AMI) metering system.

Natural Gas Utility Provider Information:

Piedmont Natural Gas (PNG)

Invite the following to Design Reviews:

- Michael Lilly - PNG Commercial and Residential Sales Specialist - michael.lilly@duke-energy.com - 252-808-7292
- Bobby Gurganus - PNG Construction - bobby.gurganus@duke-energy.com - 252-670-9613

D209002 ACID WASTE SYSTEMS

NOT USED

D209003 INTERCEPTORS

Provide an oil/water separator for the vehicle labs and other spaces as required.

D209005 COMPRESSED AIR SYSTEM

Provide a central compressed air system with primary and standby compressors to serve the vehicle maintenance tools and equipment throughout the facility. Provide compressed air to the rooms as indicated in Section 3, Chapter 5, Room Requirements, and as requested by the building owner.

Provide air compressor, refrigerated air dryer, aftercooler, and receiver. Provide piping and compressed air drops with quick disconnects throughout the work areas to allow connection of equipment such as pneumatic tools and air guns. Provide hose reel with one compressed air drop per vehicle. Provide other compressed air outlets as directed by owner.

D209090 OTHER SPECIAL PLUMBING SYSTEMS

NOT USED

--End of Section--

D30 HVAC – P1512F LOG OPS SCHOOL

SYSTEM DESCRIPTION

Provide the following type of high performance system:

Provide a variable air volume (VAV) system with shut-off terminal units and hot water heating coils. The VAV AHU will feature a chilled water-cooling coil and a hot water preheating coil. Ventilation air will be provided via the VAV AHU(s). Provide a total enthalpy fixed plate heat exchanger energy recovery section in the VAV AHU. Chilled water will be generated by an air-cooled chiller, and hot water will be generated by condensing gas boiler[s]. Size the AHU coils, chillers, and boilers for full capacity, in the event of a heat recovery system failure.

The primary air from the VAV AHU will be ducted to the terminal units by medium-pressure galvanized metal ductwork. Supply air from the terminal unit to the zone and return air from the zone to the AHU will be ducted by low-pressure galvanized metal ductwork.

Provide dedicated outdoor air AHUs (DOAS) with fixed plate energy recovery to serve the vehicle maintenance labs.

Roof mounted equipment is not permitted.

MOST RELEVANT CODES AND STANDARDS

Refer to Part 3, Chapter 1.

GENERAL SYSTEM REQUIREMENTS

Provide working space around all equipment. Provide all required fittings, connections, and accessories required for a complete and usable system. Install all equipment in accordance with the criteria in Performance Technical Specification Section D30 and the manufacturer's recommendations. Where the word "should" or “must” is used in manufacturer’s instructions, substitute the word "must."

Economizer cycles must not be used.

The new facilities must not use rooftop heating, ventilation, and air conditioning (HVAC) equipment. All major HVAC equipment must be located in mechanical rooms. Consider attic and above-ceiling placement of AHU equipment only when absolutely necessary. Stairs are required for any above-ceiling or attic located air-handling equipment (excluding VAV terminals). Attic space may be used for mechanical equipment if there is a 6-foot-wide stairway with double doors for maintenance purposes. Equipment with cooling coils placed above ceilings must have secondary drain pans with approved gravity drainage piping.

Provide corrosion protection for ALL exterior HVAC equipment, including air-handling units (AHUs), heat exchanger coil surfaces, equipment casings, air-cooled water chiller coils, heat pumps, and air conditioning units that are exposed to the weather. Corrosion protection is also required on HVAC equipment within buildings that are subject to the outside weather conditions. Specifically, equipment requiring protection is defined as the first HVAC equipment (unit coils) met by the outside air in the supply air ductwork system. The corrosion protection must meet or exceed the requirements of a 3000-hour salt spray test in accordance with ASTM International (ASTM) B117. The specified capacities on the plans and specifications must be the capacities after the required corrosion protection coatings are applied. Specify manufacturer's standard off-

the-shelf anti-corrosion options for "coastal" or "sea coast" installations that meet or exceed the requirements stated above.

Provide radiant barriers in the exterior wall system. Optimize the building envelope and window requirements to exceed ASHRAE 90.1-2013.

Provide premium-efficiency motors, chillers, and boilers, and optimize the HVAC system.

Provide Seal Class A on all ducts to reduce duct losses. Increase thermal insulation on mechanical systems and use radiant barriers to reduce thermal losses.

Provide chemical shot feeders, air separators, and bladder type expansion tanks for hydronic systems. Provide inline centrifugal pumps with inlet suction diffusers, isolation valves, discharge check valves, balancing valves, drain valves, differential pressure gauges, and flexible pipe connectors and coupling guards.

Single-phase fractional horsepower alternating current motors must be high-efficiency types corresponding to the applications listed in National Electrical Manufacturers Association (NEMA) Motors and Generators (MG) 11. Select polyphase motors based on high-efficiency characteristics relative to the applications listed in NEMA MG 10. Additionally, all polyphase squirrel-cage medium-induction motors with continuous ratings must meet or exceed energy-efficient ratings per Table 2-10 of NEMA MG 1. Provide controllers for three-phase motors rated 1 horsepower (hp) and above with phase voltage monitors designed to protect motors from phase loss and over-/under-voltage. All motors 1 hp and larger must be premium efficiency. Provide the means to prevent automatic restart by a time-adjustable restart relay. For packaged equipment, the manufacturer must provide controllers including the required monitors and timed restart. Provide reduced-voltage starters for all motors 25 hp and larger.

Provide minimum 4-inch (100 mm) thick concrete housekeeping pads and vibration isolators under all floor-mounted equipment.

Provide factory painted finishes that are designed for 3000-hour duration test for outside equipment and for equipment bringing in outside air.

Provide a manufacturer approved coating system for coastal environments on mechanical equipment, cooling, heating, and condenser coils on units with more than 5 tons of cooling capacity. The submittals must indicate heat transfer rating of coated coils.

The facility must have a complete air and water balanced HVAC system. Calculations must be provided and show the air and water systems are balanced. Drawings must also show balanced air and water systems.

Provide air conditioning and heating for spaces as indicated and for the following Design conditions:

Outside Conditions

Summer	91	Degrees F dry bulb	Winter	26	Degrees F
	79	Degrees F wet bulb	Dehumidification	140	Grains/lb

Inside Conditions – Occupied Areas including vehicle maintenance labs

Summer	78	Degrees F dry	Winter	68	Degrees F

		bulb			
	50	%RH			

Heating and Ventilating Conditions – Electrical Rooms, Mech Rooms with Heat producing equipment (Boilers, Water Heaters, etc)

Summer	10	Degrees F dry bulb above ambient	Winter	55	Degrees F

Inside Conditions – Cold Mechanical Rooms (AHUs and pumps)

Summer	N/A	Degrees F dry bulb	Winter	55	Degrees F
	55	Degrees F Dew Point			

Inside Conditions – Communication and IT Rooms

Summer	78	Degrees F dry bulb	Winter	NA	Degrees F
	55	Degrees F Dew Point			

Provide Ventilation rates and systems per ASHRAE Standard 62.1-2010, *Ventilation for Acceptable Indoor Air Quality*. Provide carbon dioxide (CO_2) sensors to limit CO_2 concentration to 800 parts per million (ppm) in spaces with 25 or more occupants per 1,000 square feet (SF).

Provide carbon monoxide (CO) sensors with audible and visual alarms if CO concentration is greater than 25 ppm in areas where internal combustion engines will be operating.

Noise levels must comply with the requirements in the latest edition of the ASHRAE Applications Handbook. The design must provide noise level control by requiring maximum noise levels as well as noise separation areas for the Mechanical Rooms. The drawings must specify the maximum equipment noise level. Classrooms must not be adjacent to mechanical rooms

Mechanical room(s) and electrical room(s) with heat producing equipment must each be a separate zone, heated and ventilated only. Mechanical rooms with combustion units (boilers, water heaters, and similar) must be provided supply fans instead of exhaust fans as required in UFC 3-410-01

Cold mechanical rooms(s) (AHU’s, chilled water pumps) must each be a separate zone, heated and dehumidified.

Provide a separate zone for IT closets, telecom rooms and server rooms. These zones shall be served by dedicated DX split system equipment.

The HVAC system must provide each zone with the choice of heating or cooling year-round unless otherwise indicated. Provide each zone with its own thermostatic range of control.

Zone the HVAC system as follows:

Administrative spaces such administrative areas, offices, shops, maintenance control, quality assurance, ready rooms, conference rooms, flight equipment, training rooms, tool rooms, restrooms, lockers, elevator lobbies, break rooms, corridors, and project rooms must be zoned separately, such that each administrative space greater than 175 square feet (SF) is its own zone, and any spaces less than 175 SF must be grouped into a single zone.

- Corridors must not be on separate zones. Locate thermostats for corridors in separate occupied spaces.
- Provide a separate zone for the boiler room, heated and ventilated only. Mechanical rooms with combustion units (boilers, water heaters, and similar) must be provided supply fans instead of exhaust fans as required in UFC 3-410-01.
- Provide a separate zone for occupied spaces.
- Provide a separate zone for the boiler room, heated and ventilated only.
- Provide a separate zone for the chilled water pump/AHU room, heated and dehumidified only, no ventilation.
- Provide a separate zone for IT closets, telecom rooms and server rooms.
- Provide a separate zone for electrical rooms.
- Provide a separate zone for Vehicle Labs. Interlock DOAS with vehicle exhaust system.
- Provide a separate zone for Vehicle Dyno rooms.
- Provide a separate zone for Battery/Hazmat rooms.
- Provide a separate zone for the Fuel Lab.

For unoccupied mode, provide the following night setback temperatures:

- For winter, 10 degrees F lower than indoor heating design conditions, but no lower than 55 degrees F.
- For summer, 5 degrees F higher than indoor cooling design conditions, but no higher than 85 degrees F.
- Year round, 60 percent RH maximum.

Provide thermostats and temperature sensors with occupant adjustment control of +/- 3 degrees F.

Provide a manufacturer approved coating system for coastal environments on mechanical equipment, cooling, heating, and condenser coils on units with more than 5 tons of cooling capacity. The submittals must indicate heat transfer rating of coated coils.

D3010 ENERGY SUPPLY

D301001 OIL SUPPLY SYSTEM

NOT USED

D301002 GAS SUPPLY SYSTEM

Provide a natural gas supply system for the heating of the facility. Natural gas must be the energy source (at a supply pressure of 5 inches water column [w.c.] minimum to 7 inches w.c. maximum) for all building heating systems. Provide a complete natural gas supply system as detailed in the specification in accordance with National Fire Protection Association (NFPA) 54, the North Carolina Building Code, the North Carolina Mechanical Code, and natural gas supplier requirements. Size natural gas piping to carry 15% more flow than is required by heating loads. Obtain natural gas pressures from the local gas company, Piedmont Natural Gas (PNG). The Contractor is responsible for coordinating with PNG and the Contracting Officer regarding the natural gas requirements for each facility. Provide a complete natural gas system, including any applications and permits. PNG will provide the natural gas to within 5 feet of each facility.

D301003 STEAM SUPPLY SYSTEM (FROM CENTRAL PLANT)

NOT USED

D301004 HOT WATER SUPPLY SYSTEM

NOT USED

D301005 SOLAR ENERGY SUPPLY SYSTEMS

NOT USED

D3020 HEAT GENERATING SYSTEMS

Provide a heating system for this facility consisting of at least two boilers. Each boiler must be no greater than 399,000 Btu/hr. For loads less than 399,000 Btu/hr provide two boilers with 100% redundancy. For loads greater than 399,000 Btu/hr and two boilers are needed based on size limitations, each boiler must supply no less than 65% of the heating load. Where more than two boilers are required to meet size limitations, size each boiler for 1/N of the total load, where “N” is the total number of boilers. On multiple boiler installations with the largest boiler off line, the remaining boiler(s) must be capable of carrying not less than 65% of the maximum winter design load. The boiler fuel train must be compatible to match the available source at the project site. Use the building block load to size the heating plant.

Refer to Part 3, Chapter 2, Paragraph 2.3.9 Air Quality Management, for air emission permit information. Air Emission permit is required for each combustion device provided.

All combustion sources are subject to the NC Air Toxics Permitting requirements.

D302001 BOILERS

Provide packaged gas-fired condensing type boilers. Provide minimum 90% efficiency boilers with stainless steel heat exchangers. All heating equipment boilers must have the ENERGYSTAR label. Provide a stainless steel, multi-wall insulated boiler stack. The stack must be pre-engineered and pre-manufactured, Underwriters Laboratory (UL) listed, and must meet NFPA 211. Fuel for boilers must be natural gas. Provide boiler(s) with a condensate neutralization tank/kit.

All vents on gas control valves must be routed outdoors as required by NFPA 54. All gas lines serving gas-fired equipment must be fitted with UL or Factory Mutual approved gas trains suitable for the gas being provided.

D302002 FURNACES

NOT USED

D302003 FUEL-FIRED UNIT HEATERS

NOT USED

D302004 AUXILIARY EQUIPMENT

NOT USED

D302005 EQUIPMENT THERMAL INSULATION

Provide all hot water equipment with cellular glass insulation with vapor barrier jacket or molded fiberglass with vapor barrier jacket.

D3030 COOLING GENERATING SYSTEMS

D303001 CHILLED WATER SYSTEMS

HVAC refrigeration and air conditioning compressors must have full 5-year warranties including all parts and labor from the time of Beneficial Occupancy

Provide rotary screw or scroll air-cooled chillers. Provide high-efficiency air-cooled chillers. Provide constant primary/variable secondary pumping systems on single chiller systems greater than 60 tons and on multiple chiller systems. Primary pumping may be used only on single chiller systems less than 60 tons. Keep flow through the chiller constant; do not use variable primary flow. A buffer tank must be provided on all systems to provide thermal inertia. Provide multiple chillers for loads greater than 160 tons with each chiller sized for 50% of the total facility cooling load.

For unique facilities that exhibit widely variable occupant loading, multiple dissimilar sized chillers must be provided as appropriate for the low occupancy condition and fully occupied condition.

The chillers must be located in an exterior equipment yard area and properly spaced from each other and other equipment away from building perimeter. The air-cooled chiller(s) must be located outside on a 150 mm (6-inch) thick reinforced concrete housekeeping pad. Provide heat tape to ensure freeze protection as low as 10°F on chilled water piping and any other associated appurtenances. Refer to the MCB Camp Lejeune mechanical policy for the

requirements for phase and voltage protection requirements for chillers. Provide emergency chiller connections consisting of isolation valves and blind flanges.

Low ambient capability must be provided to allow chillers to operate in temperatures as low as 15°F (-9.4°C).

All coils must have the approved coatings that pass a salt-spray test conducted per ASTM B117 for duration of at least 3,000 hours and provide a minimum of loss of heat transfer due to the thickness of the coating.

Provide the approved quantity, size, spacing, material, and height of bollards around all yard equipment.

Provide blind flanges with butterfly isolation valves at the chiller location for emergency portable chiller connection. Coordinate site plan design to accommodate access needed for an 18-wheeler flat bed to park near the flange location.

Provide chiller controls with BACnet communication protocol.

Provide complete start-up and operational testing of chiller equipment.

Provide heat tracing of the chiller bundle and all above ground piping and valves, etc. that are subject to freezing.

Provide insulation and vapor barriers on all chilled water equipment.

Provide complete system flushing and start-up for the entire chilled water system including piping.

Provide air vents at all terminal equipment and system high points, drains at system low points, and provide chemical treatment equipment for chilled water piping system.

Startup must include operational testing of chiller equipment and full commissioning.

D303002 DIRECT EXPANSION SYSTEMS

Provide a dedicated air-cooled DX ductless split system cooling only unit for IT closets, telecom rooms, and server rooms and any other space requiring independent conditioning. If the unit does not have a BACnet system interface, provide a room temperature sensor and a current sensor, tied to the building DDC system, to determine the operating status of the system. Size DX cooling equipment at 120% of IT equipment load. Provide low ambient cooling.

D3040 DISTRIBUTION SYSTEMS

D304001 AIR DISTRIBUTION, HEATING & COOLING

Provide shutoff-type terminal units with hot water reheat coils to serve occupied spaces except vehicle maintenance labs. To maximize energy savings on this project: the shutoff-type terminal units must comply with ASHRAE 55 and sized to meet indoor design conditions (temperature, humidity, ventilation, etc.) that are used in the design; do not size shutoff-type terminal units to maintain a minimum of 4 AC/Hr in occupied mode.

Provide DOAS units for vehicle maintenance labs to maintain temperature comfort. Units must modulate the amount of DOAS exhaust fan when vehicle exhaust system is active to maintain

slightly negative pressure with respect to corridors and classrooms and neutral to slightly positive pressure with respect to the outdoor ambient pressure. If DOAS exhaust fan is turned off and the space is still negative with respect to outdoor, DOAS supply fan must modulate to maintain space pressurization requirements.

Provide insulated, galvanized steel ductwork in concealed locations constructed, braced, reinforced, installed, supported, and sealed in accordance with the IMC and Sheet Metal and Air Conditioning Contractors National Association (SMACNA) standards. For exposed ductwork, provide insulated, double walled, galvanized steel duct.

Provide medium-pressure duct from VAV AHU to shutoff-type terminal unit. Provide round or flat oval primary supply air duct. Size the medium pressure duct according to the static regain method. Provide low-pressure supply air duct from the terminal unit to the zone being served. Provide low-pressure return air duct from the zone to the VAV AHU. Provide a minimum of 6 diameters of rigid straight duct at the inlet to each VAV terminal to maintain a uniform velocity profile at the valve inlet for airflow measurement accuracy. Flexible duct connection to the primary air inlet of VAV terminal is not permitted.

Provide shutoff-type terminal units typically above lay-in ceilings. Provide terminal units above hard ceilings with lockable access panels.

Provide aluminum grilles, registers, and diffusers. Provide linear slot diffusers including manufacturer insulated plenum.

Provide manual balancing dampers for all main and branch ducts. Incorporate product requirements identified in the UFGS 23 00 00 Manual Balancing Damper Editing Guide, in RFP, Part 6, into project specifications.

Install all metal duct to Seal Class A standard. Insulated flexible duct may be installed in low-pressure supply duct but may not exceed 5 feet in length or provide more than a 45-degree change in direction. Flexible duct may not be installed in return or exhaust air duct.

Provide AMCA 540 and 550 rated louvers.

Size low pressure supply ductwork at 0.08"/100LF and negative pressure return/exhaust at 0.05"/100LF (max).

Provide rigid foil faced board insulation where ducts are exposed in mechanical spaces. Provide pre-manufactured double wall ductwork on building exterior or where ducts are exposed in occupied spaces. Insulate all ductwork.

Mineral fiber blanket wrap must meet the requirements of ASTM C1136, ASTM C1290, ASTM C1338, ASTM E84, UL 723, NFPA 90A, and NFPA 90B.

Rigid mineral fiber must meet the requirements of ASTM C553, ASTM C612, ASTM C1136, ASTM 1393, ASTM E84, and UL 723.

Make duct penetrations of all walls with sheet metal ducts. Flexible duct penetrations of walls are not acceptable.

Coordinate locations of all air devices with ceiling mounted equipment. Maintain minimum of 3'-0" from ceiling mounted smoke detectors.

Provide unvaned radius elbows with a radius equal to 1 ½ times the duct width. Provide all 90-degree mitered square elbows with turning vanes with a radius equal to 2 times the duct width. Provide access doors upstream of all elbows with turning vanes.

Do not hangs duct from other ducts.

Provide canvas duct connectors for all equipment ductwork connections containing fans. Provided grounding across flexible connections with flexible copper grounding straps. Grounding straps must be bolted or soldered to both the equipment and the duct.

Ductwork and air handling equipment must be sealed and protected from dirt and debris during the entire construction duration.

Provide separate chases for ductwork and piping. Do not install ductwork and piping in the same chase.

Route all ductwork perpendicular and parallel to the building structure.

Where sheet metal is visible through the face of air terminals, paint sheet metal with a flat black enamel finish.

Manual Balancing Dampers (Accessible): Round type is not acceptable. Provide pre-manufactured rectangular type with 16 gage galvanized steel channel frame with corner braces. Blades will be opposing type 16 gage with a maximum width of 8". Provide with a 20 gage blade stop on units 12" high and under. Provide with position lock, molded synthetic bearings, and square shaft.

Manual Balancing Dampers (Inaccessible): Provide cable operated remote controlled volume dampers in inaccessible branch ducts feeding diffusers. Dampers must be adjustable through the diffuser face with standard hand tools, providing positive balancing of multiple airflows to maintain design air throw and noise criteria. Radial damper must be direct actuated by a brass plated rotary cable which is fixed at the damper end in an integral support bracket. Rotary cable must have a minimum torque service factor of 200% when installed in accordance with manufacturer furnished instructions. The entire assembly must be furnished as one piece for installation with no linkage adjustment required or miscellaneous small parts. Each unit must be factory tested as a complete assembly prior to shipment (100% testing). Accessible cable end must be secured with a factory furnished nylon clamp, allowing maximum placement flexibility. Positive, direct, two-way damper control must be provided without sleeves, springs, or screw adjustments (that may loosen after ceiling closure).

Motorized dampers frame must be 16 gage (1.6) galvanized steel structural hat channel with tabbed corners for reinforcement for 11 gage (3.05) structural equivalence. Blades must be 14 gage (2.0) equivalent thickness galvanized steel, roll-formed airfoil type for low pressure drop and low noise generation. Blade edge seals must be suitable for -72°F to +275°F and mechanically locked into the blade edge. Adhesive or clip-on type seals are unacceptable. Jamb seals must be flexible metal, compression type to prevent leakage between blade end and damper frame. Blade end overlapping frame is unacceptable. Bearings must be corrosion resistant, permanently lubricated stainless steel sleeve type turning in an extruded hole in the damper frame. Axles must be hexagonal positively locked into the damper blade. Linkage must be concealed out of airstream, within the damper frame to reduce pressure drop and noise. Submittal must include leakage, maximum air flow and maximum pressure ratings based on AMCA Publication 500. Dampers must be equipped with factory installed damper position indication switch package. The switch package must include two position indication switches linked directly to the damper blade to provide full open and full closed damper blade position. The switch package must be capable of interfacing with the HVAC control system and provide remote damper blade position status. Factory mounted damper actuators with adjustable

memory stops must be furnished and mounted by the damper manufacturer in their factory. Each damper must be cycle tested at the factory prior to shipment.

D304002 STEAM DISTRIBUTION SYSTEMS

NOT USED

D304003 HOT WATER DISTRIBUTION SYSTEMS

For exterior buried Hot Water Distribution Systems see Section G30, *Site Civil/Mechanical Utilities*.

Provide a variable speed pumping system to serve the HVAC hot water equipment throughout the facility. Provide two pumps, each sized at 100 percent of building load. Provide insulated steel or copper hot water supply and return piping to serve the HVAC equipment throughout the facility.

Provide valves and related hot water system appurtenances. Provide a bladder type expansion tank and air/solids separator for the hot water system. Provide a shot type feeder for manual chemical feed to the hot water piping system.

Provide insulated steel or copper hot water supply and return piping to serve the HVAC equipment throughout the facility. Insulate piping with mineral fiber insulation.

Provide system flushing and startup for the hot water piping system.

Provide air vents at all terminal equipment and system high points, drains at system low points, and provide chemical treatment equipment for hot water piping system.

Provide complete startup and operational testing of all hot water systems.

Hot-water piping 4-inch and smaller must be ASTM B 88 Type K (below ground) or L (above ground) copper. Electric resistance welded or seamless Schedule 40 black steel pipe conforming to ASTM A 53/A 53M must be used for piping greater than 4-inch.

Provide insulation for piping exposed to outdoor ambient temperatures; provide heat tracing to ensure freeze protection down to 10°F. Heat trace must be UL listed and self-regulating cable construction consisting of two 16 AWG, stranded, nickel plated copper bus wires, between which a positive temperature coefficient conductive polymer heating element is placed. Cable must be provided with tinned copper metal braid for additional protection and path for ground fault currents, and a thermoplastic over jacket.

D304004 CHANGEOVER DISTRIBUTION SYSTEMS

NOT USED

D304005 GLYCOL DISTRIBUTION SYSTEMS

NOT USED

D304006 CHILLED WATER DISTRIBUTION SYSTEMS

Provide a variable speed pumping system to serve the HVAC chilled water equipment throughout the facility. Provide a primary and standby pump each sized at 100 percent of building load.

For buildings with less than 60 tons of cooling load, provide a constant primary pumping system to serve the HVAC chilled water equipment throughout the facility. For buildings with more than

60 tons of cooling load, provide a constant primary/variable secondary pumping arrangement with a single primary pump per chiller. For buildings with more than 160 tons of cooling load, provide a constant primary/variable secondary pumping arrangement with one primary pump per chiller. In all cases, keep flow through the chiller constant.

For building less than 160 tons, provide two primary pumps or two secondary pumps as appropriate with each pump sized for 100% flow. For buildings with more than 160 tons, provide three secondary pumps, each sized for 50% of maximum building flow. Two pumps must operate as duty pumps and the third must act as standby. Provide a control sequence to rotate pump duty/standby assignments monthly and equalize running hours.

Provide valves and related chilled water system appurtenances. Provide a bladder type expansion tank and air/solids separator in chilled water system. “Triple duty” or “multi-purpose” valves that combine a check valve, throttling valve, and shut-off valve must not be used for the chilled water system. Provide air vents at all terminal equipment and system high points for air control.

Provide steel and copper chilled water supply and return piping to serve the HVAC equipment throughout the facility. Insulate piping with cellular glass insulation on all above ground chilled water distribution piping.

Provide air vents at all terminal equipment and system high points for air control. Provide a shot type feeder for manual chemical feed for the chilled water piping system.

Provide thermal mass capability in the chilled water system to insure proper control and longevity of chillers by using inertia tanks. Provide inertia tanks, sized per chiller manufacturer recommendation to ensure stability of operation and temperature setpoint control. Total chilled water system volume must be a minimum of 7 gallons per ton of cooling. Provide an insulated storage tank within the mechanical room in order to meet this requirement.

Provide insulation, vapor barrier, and aluminum jacketing on piping exposed to outdoors. Install heat tracing on piping to ensure freeze protection to 10°F.

Provide system flushing and startup for the chilled water piping system.

Provide complete startup and operational testing of all chilled water systems.

Provide insulation for piping exposed to outdoor ambient temperatures; provide heat tracing to ensure freeze protection down to 10°F. Heat trace must be UL listed and self-regulating cable construction consisting of two 16 AWG, stranded, nickel plated copper bus wires, between which a positive temperature coefficient conductive polymer heating element is placed. Cable must be provided with tinned copper metal braid for additional protection and path for ground fault currents, and a thermoplastic over jacket.

Provide threaded joints for steel pipe 2" or less and welded or bolted flange for sizes greater.

Provide flanged connections with flexible braided stainless steel connectors at all equipment connections.

Provide pre-manufactured dual containment system consisting of carrier pipe, cellular glass carrier insulation, air space, steel conduit, polyurethane outer insulation, and seamless extruded HDPE casing for direct buried piping. The carrier pipe must be ASTM A53 steel schedule 40 or 80 as scheduled. The product must be rated for corrosion resistance without the need for cathodic protection. Provide with leak detection system.

Chilled water piping 4 inches and smaller must be ASTM B 88 Type K (below ground) or L (above ground) copper. Electric resistance welded or seamless Schedule 40 black steel pipe conforming to ASTM A 53/A 53M must be used for piping greater than 4 inches.

D304007 EXHAUST SYSTEMS

Provide ductwork constructed, braced, reinforced, installed, supported, and sealed per the IMC and SMACNA standards. Install exhaust duct according to Seal Class A.

Provide ducted exhaust ventilation rate according to ASHRAE 62.1.

Provide stainless-steel fume hoods that are rated for heat and vapor removal with associated ducts and fans.

Provide battery charging area with dedicated exhaust according to IMC 2018 and UFC 3-520-05 requirements.

D304008 AIR HANDLING UNITS

Provide central station VAV AHUs to provide constant temperature primary supply air to all terminal units. Provide hot water preheating coils, chilled water-cooling coils, variable-speed fan sections, ultraviolet coil disinfection systems, and energy recovery sections. Units must include additional sections as necessary to facilitate ready access to all maintainable components.

Provide central station DOASs to provide temperature comfort and differential pressure control. Provide hot water preheating coils, chilled water-cooling coils, hot water reheat coil variable-speed exhaust and supply fan sections, ultraviolet coil disinfection systems, and energy recovery sections. Units must include additional sections as necessary to facilitate ready access to all maintainable components.

The energy recovery section must be a fixed plate total enthalpy heat exchanger with MERV 8 prefilters and MERV 13 filters upstream of the unit in both the outside air and exhaust air streams. If AHU manufacturers are unable to provide these filters in the central station unit, provide ducted filter boxes outside the unit in a location accessible for filter replacement.

Provide the means to measure filtered outdoor airflow to verify proper ventilation.

Provide modular, central station, air handlers with the following:

Unit panels must be 2-inch solid. Exterior surfaces of the unit casing must be factory painted to withstand ASTM B117 90 3000-hour salt spray requirements.

All interior casing panels must be made of stainless steel.

Casing air leakage must not exceed leak class 9 (CL = 9) per ASHRAE 111.

Panel insulation must provide a minimum thermal resistance (R) value of 13 $ft^2 \cdot h \cdot {}^oF/Btu$ throughout the entire unit.

Access doors must be 2-inch double-wall construction with latching door handles.

Provide factory-mounted, weather-resistant, light emitting diode (LED) fixtures in sections of the unit for maintenance and service visibility.

Provide a fan array for the supply and return. The fans must be direct drive, single-width, single-inlet plenum. The fan blades must be aluminum backward-inclined airfoil. Fan array fans must be controlled using a common control signal, such as the duct static control signal, to modulate the fan speed.

The fan and motor assembly must be internally isolated from the unit casing, furnished and installed by the unit manufacturer.

Provide with factory mounted VFD for control of fan speed to modulate the airflow.

Provide 24-inch-long (min.) modular inspection sections with removable doors on both sides of the chilled water coil module.

The coil must have a factory applied flexible epoxy polymer coating (1 mil min. thickness) uniformly applied to all coil surface areas without material bridging between fins.

Provide two sets of spare filters for each AHU.

Provide a factory-installed dial type differential pressure gauge piped to both sides of the filter to indicate status.

A mixing section module must be provided to support the damper assembly for outdoor, return, and/or exhaust air. Dampers must modulate the volume of outdoor, return, or exhaust air. The dampers must be of double-skin airfoil design with metal, compressible jamb seals and extruded-vinyl blade-edge seals on all blades. The blades must rotate on stainless-steel sleeve bearings. Airfoil dampers must be rated for a maximum leakage complying with ASHRAE 90.1.

Provide an air blender section to mix outside and return air, minimize stratification, and reduce the risk of frozen coils.

Fully modulating 2-way hydronic coils. If the AHU is at the end of the water loop, a 3-way valve arrangement at the final coil connection is acceptable in lieu of a bypass.

Provide a factory installed combination VFD/disconnect for each fan motor. Each VFD/disconnect must be properly sized, factory mounted in a full metal enclosure, wired to the fan motor (s), and commissioned. VFD/disconnects must include a circuit breaker disconnect with a through-the-door interlocking handle designed to rest only in the full ON or OFF state and must be lockable in these states. A concealed defeater mechanism must allow entry into the enclosure when the handle is in the ON position. The VFD package must also include:

- Electronic manual speed control
- Current limited stall prevention
- Auto restart after momentary power loss
- Speed search for starting into rotating motor
- Anti-windmill with DC injection before start
- Phase-to-phase short circuit protection
- Ground fault protection

D304090 OTHER DISTRIBUTION SYSTEMS

Provide inline pumps with variable frequency drives.

Hangers, Clamps, Rollers, and Supports must comply with MSS SP-58 unless otherwise noted. Steel channel strut and angle iron are acceptable materials for field constructed trapeze hanger assemblies where the rated load limit is not exceeded. Provide with MSS type carbon-steel hanger rods, nuts, saddles, and U-bolts.

Run all horizontal piping above ceiling unless otherwise noted.

Provide full line size valves except control and balancing valves. Provide extended plugs and labels where piping is insulated. Provide removable insulation over plugs.

Provide manual air vents at all high spots and the ends of all piping loops. Do not use automatic air vents in any place other than mechanical rooms where floor drains are already provided for. Provide 1/2" drain valves at low points in piping. Provide minimum pitch sufficient to insure adequate venting and draining.

Provide permanent flushing isolation valves and tees at both sides of all hydronic equipment. Provide tees with ¾” hose end connection and removable brass cap.

Do not hang pipe from other pipe.

Do not use flexible braided pipe to change direction at equipment connections regardless of manufacturer documentation.

Do not bend pipe or pipe hangers to correct poor alignment.

Route all piping perpendicular and parallel to the building structure.

Maintain a minimum of 3'-6" of ground cover over all underground HVAC piping.

Install piping so that all valves, strainers, unions, traps, flanges, and other appurtenances requiring access are accessible from below.

Install valves so that the valves will remain in service when equipment or piping on the equipment side of the valve are removed.

Provide balancing valves with position indicators and maximum adjustable stops (memory stops).

Provide chain wheel operators for all valves in equipment rooms mounted greater than 7'-0" above floor level; chain must extend to 7'-0" above floor level.

Install unions and/or flanges at each piece of equipment, in bypasses, and in long piping runs (100 feet or more) to permit disassembly for alteration and repairs.

Install all piping without forcing, springing, or bending.

Tap all branch lines from top of piping mains (45 degrees preferred, 90 degrees acceptable).

All valves must be set up and adjusted for smooth and easy operation.

All piping work must be coordinated with all trades involved. Offsets in piping around obstructions must be provided at no additional cost to the government.

Provide stainless steel flexible connections in all piping systems connected to pumps, chillers, cooling towers, and other equipment which require vibration isolation. Flexible connections must be provided as close to the equipment as possible.

Unless otherwise noted, all chilled water and hot water piping must be no less than ¾".

All piping must clear doors and windows.

Provide dielectric fittings at all pipe connections of dissimilar metals.

All piping must be free of dirt, debris, and moisture prior to installation of insulation. Chilled water systems must be disabled, brought to room temperature, and free of external moisture prior to insulation installation.

Install piping in accordance with the latest editions of MSS SP-58 and ASME B31.9. Use MSS type hangers and supports. Provide saddles and base supports. All-thread rod is acceptable for tension support applications only, not compression.

Select thermometers and pressure gages where the operating condition falls within the middle third of the range.

Provide chrome plated escutcheon plates for exposed pipe penetrations in occupied spaces.

Do not route pipe risers in duct shafts. Do not penetrate fire rated shafts with pipe unless the shaft is specifically allocated for that service.

Size all hydronic piping between 1 feet and 4 feet total dynamic head pressure drop per 100' length.

Grooved piping and press fittings are prohibited in all applications.

D3050 TERMINAL & PACKAGE UNITS

D305002 UNIT HEATERS

Provide gas fired or hot water unit heaters to serve the heating requirements of mechanical and air handler rooms of the facility.

D305003 FAN COIL UNITS

NOT USED

D305004 FIN TUBE RADIATORS

NOT USED

D305005 ELECTRIC HEATING

NOT USED

D305006 PACKAGE UNITS

NOT USED

D305007 COMPUTER ROOM AIR CONDITIONING (CRAC)

NOT USED

D3060 CONTROLS AND INSTRUMENTATION

D306001 HVAC CONTROLS

D306001 1.1 DIRECT DIGITAL CONTROL SYSTEM (DDCS)

Provide a complete Direct Digital Control (DDC) system to comply with UFGS 23 09 00.00 22 Instrumentations and Control for HVAC, UFGS 23 09 13.00 22 Instrumentation and Control Devices for HVAC, and UFGS 23 09 23.02 22 BACnet Direct Digital Control Systems for HVAC and Other Building Control Systems for the facility. All Camp Lejeune specific standards and requirements in Division 23 sections in Part 5 of this RFP must be incorporated into the design where applicable.

The DDCS must utilize intelligent distributed controllers, which communicate over a controller network in accordance with ASHRAE Standard 135-2016, BACnet – A Data Communication Protocol for Building and Control Networks. Provide all necessary hardware, software and control devices to perform the optimal operation of the entire HVAC system and other building systems.

The Energy Management Control System (EMCS) has an existing front-end system managed by DPW. The government is responsible for integration of the building onto the base-wide network and integration of new buildings into the front-end. Contractor point of demarcation is the field point of contact (FPOC) and will be designed using BACnet protocol for future integration. The EMCS building level system must be designed and commissioned to match the existing ATO level of L-M-M. Contractor must use DDC equipment and Meters selected from base ATO approved equipment listing or must provide forty (40) hours testing time and support for DPW cybersecurity testing and hardening at the base's test environment. Only equipment capable of meeting cybersecurity hardening requirements will be accepted for use.

Provide two (2) CAT6 cables from the Supervisory Panel to the telecommunications closet. Incorporate requirements identified in the UFGS 23 09 00.00 22 provided in RFP, Part 5, into project specifications.

Provide meters, monitored by DDC, on the following incoming utilities of the building: Domestic water, natural gas, electricity. Tie the gas meter into the existing Advanced Metering Infrastructure (AMI) metering system. For electrical energy monitoring refer to Section D50, *Electrical,* paragraph entitled, *Service Entrance Equipment.* For potable water meter refer to Section G30, *Site Civil/Mechanical Utilities,* paragraph entitled, *Potable Water Distribution.*

Preferred location for water meter is in the mechanical room.

Provide meters, monitored by DDC, on the following subsystems for steam, gas and water: HVAC and processes.

Provide ASHRAE Standard 135 building controller as the main interface for the building control system.

Provide notebook computer(s) and complete application software with all licenses.

Provide patch panel in the mechanical equipment room for ease of connection and disconnection of equipment.

Provide panels with locks and alarms. The alarms must include both a flashing light and an audible alarm inside the mechanical room. The alarms must also be a networked alarm (e.g. switch connected to controller DI) with alarm events recorded remotely for a period not less than one year.

Provide flow rate meters, monitored by the DDC system, for central, chilled, and hot water flow.

Provide air handlers and all terminal units, including VAV boxes, with discharge/supply temperature sensors.

Provide air handler unit outside air flow monitoring stations.

Provide a DDC option for automatic operation of building circulating pumps whenever outdoor air temperature is below 35 degrees F or when there is a high potential for freeze damage.

Provide control to automatically start back-up pumps (or other HVAC equipment) if the primary device fails. Primary and back-up equipment starter circuits must be wired to prevent both pieces of equipment from operating at the same time. Rotate primary and back-up HVAC equipment monthly (adjustable) with a lead/lag control routine.

Provide the following phase monitors for all 3 phase equipment:

1. Phase loss protection
2. Phase reversal protection
3. Phase unbalance protection

Provide the following phase monitors for all 3 phase chillers:

1. Phase unbalance protection
2. Over/under voltage protection
3. Phase loss protection
4. Delay of break timer to delay automatic restarts
5. Non critical fault delay
6. Programmable auto/manual restart
7. Load and line side monitoring
8. Phase reversal
9. Phase unbalance

Provide new DDCS front-end notebook computer(s) loaded with all necessary application software displaying graphic floor plan, equipment graphics, control diagrams, and complete sequence of operations graphic pages. Provide all alarming, trend services, and schedules and other BACnet services and configurations as described in the UFGS 23 09 23.02 22. Provide and incorporate all new control points and sequences by creating new graphics, alarms, trends, schedules, and system reports. In addition, provide each graphic screen of mechanical equipment with links to the applicable as-built written sequence of operation that fully describes every operating routine and as-built DDC wiring diagram.

Non-BACnet compliant or proprietary equipment or systems, including gateways/protocol convertors, are not desired and are to be avoided unless a conflict dictates, at which time Government review and approval will be required.

The Contractor must be responsible for developing construction documents in accordance with United Facilities Criteria (UFC) for the design of standard HVAC control systems including:

1. UFC 3-410-02, Direct Digital Control for HVAC and Other Building Control Systems, dated 18 July 2018

2. UFC 4-010-01, DoD Minimum Antiterrorism Standards for Buildings, with Change 1; 1 October 2013 – Standard 18, Emergency Air Distribution Shutoff

DDC System Design: Submit all design documents to be reviewed and approved by Government. Control system design must include the following:

1. EMCS Control Diagrams showing the configuration of each system and equipment with applicable schematic flow diagram, control/field devices, device tags, input/output designations, and applicable field/interlock wiring in accordance with UFC 3-410-02.

2. EMCS Network Riser Diagram showing the layout of DDC system network, all network hardware, controllers, and notebook computer(s) in the building. The diagram must show the locations of notebook computer(s), network hardware, switches/router/hubs and network routing, distinguishing between different forms of media (i.e. Fiber, Category 5/6, shielded twisted pair, coaxial cable, etc.). Various types of LANs must be identified and distinguished from each other.

3. The Sequence of Operation describing all control processes and operation that are controlled by the control system must be included. The sequence of operation must be clearly shown in a text narrative form in order to demonstrate a clear understanding of how the system is to operate and be specific to the control system equipment used.

4. The DDC System Point Schedules indicating, at a minimum, the control point name, input/output designation, device code/tag, fail mode/position, software functions, alarms and alarm limits in accordance with UFC 3-410-02.

5. Provide control system specification to ensure that all of the components, which are expected to be used in the DDC system installation, are properly specified. In addition, the control system specifications must also specify detailed requirements for testing and commissioning of the DDC system. The control system specifications must also include all training requirements.

6. Provide graphic screens including mechanical floor plan indicating control locations and front-end graphic screens of mechanical equipment controls. The graphics must be submitted during construction stages for review and approval by Government.

DDC System Network Architecture:

1. The primary DDC system network, including DDC system network hardware, supervisory/building controllers (BC), Advanced Application Controllers (AAC) for major mechanical equipment, and DDC system notebook computer(s), must communicate via a dedicated DDC system network backbone using BACnet over IP (BACnet/IP). Using the Government Local Area Network (LAN) for DDC system communication is strictly prohibited.

2. The field controllers such as Advanced Application Controllers (AAC) and Application Specific Controllers (ASC) for small mechanical equipment, terminal units and miscellaneous/unitary equipment must be connected to the associated DDC system network hardware and supervisory/building (BC) controllers, and communicate via secondary DDC system network using BACnet MS/TP.

3. Network controllers, switches and/or routers must be provided to extend DDC system network throughout the facility, where necessary.

4. Non-BACnet-compliant or proprietary equipment or systems including gateways using a proprietary communication protocol are not acceptable and are strictly prohibited. For the existing equipment communicating with the existing control system using a proprietary or non-BACnet communication protocol, provide necessary gateway or network interface directly connected to the new DDC system network using a BACnet communication protocol.

Critical Systems:

1. For the DDC system associated with the critical equipment, provide separate controllers for primary and back-up HVAC units, which provide redundant HVAC service to critical spaces, to ensure that failure of any one controller will not cause the loss of the entire service to the critical space. The equipment must be distributed across multiple controllers in such a manner that no more than one unit must be powered, controlled and monitored using a single controller.

2. Each BC, AAC and network hardware such as Ethernet switch and router must be provided with an Uninterruptible Power Supply (UPS) that can supply electrical power for at least four hours to the attached load. This load must include the power required for HVAC equipment or field/control devices such as damper and control valves, etc.

3. For the HVAC equipment serving critical spaces or configured for redundant operation, a controls scheme for manual operation, which will bypass the automatic control through the DDC system, must be incorporated. Provide a HOA switch, if not provided as part of electrical equipment, so the equipment can be manually started and operated in Hand mode. The control valves and dampers associated with chilled water system and air handling units must be configured with necessary fail position so the equipment can operate manually and provide temporary cooling and/or ventilation if there is a failure in the control system.

4. When switching the redundant units during the rotation, the unit in the next sequence must be enabled or started before the previously enabled or started unit is disabled or stopped. If enabled unit should fail, an alarm must be generated at the DDC system and it must automatically enable the stand-by unit to replace the failed unit. Once the newly started unit is in operation, the failed unit must be disabled.

DDC System Software: Provide new DDCS and OWS with new front-end software and other utilities and tools as necessary. All software necessary for the configuration, operation, and maintenance of the installed DDC system must be provided, with licenses residing with the Government. Where new software, including application and tools, is provided, the latest tested, compatible and reliable version of the software available at the time must be installed prior to system testing and personnel training. In general, the front-end software must allow each authorized operator to execute the following functions as a minimum:

1. Security: Provide security function that prevents unauthorized use unless operator is logged on. Access must be limited to operator's assigned functions when user is logged on. Each operator's terminal must provide security for 10 users as a minimum. Each user must have an individual User ID/Name and Password. System user must be allowed individual assignment of only those control functions and menu items to which that user requires access. Each user must also have a set security level, which defines access to displays and individual objects the user may control. System must include minimum of 5 separate and distinct security levels for assignment to operators. Software must be initially configured to allow government personnel responsible for system administration full, unrestricted access. All default access passwords and user authentication identification must be documented and provided to the Government.

2. Schedule: Operators must be able to view scheduled operating hours of each schedulable piece of equipment on a weekly or monthly calendar-based graphical

schedule display; to select and adjust each schedule and time period; and to simultaneously schedule related equipment. Operators must be able to schedule holidays and special events directly from the calendar.

3. Alarm: The notebook computer(s) must provide audible, visual, and printed means of alarm indication. System input and status objects must be configurable to alarm on departing from and on returning to normal state. Operator must be able to enable or disable each alarm and to configure alarm limits, alarm limit differentials, alarm states, and alarm reactions for each system object. Alarms must be BACnet alarm objects and must use BACnet alarm services.

4. Trend Log: Operator must be able to configure trend sample or change of value (COV) interval, start time, and stop time for each system data object and must be able to retrieve data for use in spreadsheets and standard database programs. Controller must sample and store trend data and must be able to archive data to the hard disk. Coordinate items to be trended and trend configurations with the facility maintenance personnel. Trends must be BACnet trend objects.

5. Graphical Displays: The notebook computer(s) must display all data associated with project as required. The notebook computer(s) must display all data using two and/or three-dimensional graphic representations of all mechanical equipment. System must be capable of displaying graphic file, text, and dynamic object data together on each display. Information must be labeled with descriptors and must be shown with the appropriate engineering units. All information on any display must be dynamically updated without any action by the user.

Control Damper and Actuators:

1. Control Dampers: Motorized control dampers must have opposed blade dampers for modulating service and parallel blade dampers for 2-position service. Frames must be of five inch by one inch extruded aluminum hat channel with a minimum of 0.125-inch wall thickness. Blades must not exceed six inches wide and must be of heavy gage extruded aluminum airfoil shape to minimize pressure loss across the damper. Damper blades must be injected with CFC free, two part high density polyurethane foam. Each blade must include a thermal isolation gap. Dampers must be rated for minimum 2000 fpm air velocity at 2.5 inches static pressure and damper leakage must not exceeding 0.5 percent of total CFM (4.00 CFM/sq. ft.) based on 2000 fpm and one-inch static pressure when tested per AMCA Publication 500. Damper must be rated for a temperature range of minus 70 to 200°F

2. Provide electric type, direct shaft mount damper actuators with bracket arrangement for location outside of the air stream. Actuators must provide at least 125 percent of the required torque to effectively operate the damper. Actuator drive time for 90 degree rotation must be 150 seconds maximum. Actuators must be normally open, normally closed, or fail in position as required to obtain the operation as required by the application. Normally open and normally closed dampers must return to their normal position in the event of a power failure to the actuator. Provide auxiliary switches or damper position switches, rated as required, to provide specific operation. Provide transformers and accessories as required. Actuators requiring linkages, crank arms, connecting rods, or ball joints are not acceptable.

Control Valves and Actuators:

1. Characterized Control Ball Valves (up to and including 3 Inches): Nickel-plated forged brass body, valve trim must utilize stainless steel ball and stem, fiberglass reinforced Teflon PTFE seats with O-rings, 2 EPDM O-rings packing. A flow characterizing disc, made of Tefzel Teflon must be installed in the inlet of 2-way characterized control ball valves. 3-way valves must utilize flow characterizing discs at both input ports. Standard ball valves without this feature are not acceptable. 2-way valves must have equal port percentage characteristics; 3-way valves must have linear characteristics. Operators must close valves against pump shutoff head. Control valves must be selected for the pressure drop calculated to ensure proper control valve authority for the application.

2. Globe Pattern Control Valves (over 3 inches): Iron body, bronze trim, 316 stainless steel rising stem, bronze plug-type disc, flanged ends, renewable bronze seat and disc, TFE V-ring packing. It must have replaceable plugs and seats of stainless steel or bronze. 2-way valves must have equal percentage characteristics; 3-way valves must have linear characteristics. Operators must close valves against pump shutoff head. Control valves must be selected for the pressure drop calculated to ensure proper control valve authority for the application.

3. Valve Actuator: Provide electric valve actuators, which are two-position or modulating as required by application. Actuators must be of ample capacity to handle the required load under all conditions and as a minimum must close valves against pump shutoff head pressure of 55 psi. Unless otherwise indicated, valves must be arranged to return to the normal (fail-safe) position in the event of a power failure to the actuator.

Air Flow Measuring Stations (AFMS): For all air handling units with outdoor air intake, provide AFMS to continuously monitor the outdoor ventilation air in CFM values.

1. Provide high performance, thermal dispersion type AFMS. Pitot tubes, arrays, Piezo rings and other differential pressure based devices are not acceptable. AFMSs must contain an airflow straightener if required by the AFMS manufacturer's published installation instructions. The straightener must be contained inside a flanged sheet metal casing, with the AFMS located as specified according to the published recommendation of the AFMS manufacturer. In the absence of published documentation, airflow straighteners must be provided if there is any duct obstruction within 5 duct diameters upstream of the AFMS. Air-flow straighteners, where required, must be constructed of 0.125 inch aluminum honeycomb and the depth of the straightener must not be less than 1.5 inches. Sensing probe must be constructed of extruded aluminum or of stainless steel tubes. The operating humidity range must be 0 to 99% RH and direct exposure to water must not damage the sensing elements. AFMSs must have an accuracy of +/- 2% of reading with air velocity range of 0 to 5,000 fpm. The transmitter must have local LCD display, continuously displaying airflow and temperature and be calibrated for the appropriate operating range based on the required operating range.
