   DIFFUSER OR NECK SIZE: 8x4 0" / A / 75 — VERTICAL BLADE SPREAD (WHERE APPLICABLE); DIFFUSER TYPE AS NOTED ABOVE; AIR QUANTITY
2. FINISH TO MATCH / BE ABLE MATCH CEILING OR WALL OR DOOR.
3. FACTORY INSULATION BACKING ON GRILLES EXPOSED TO NON-CONDITIONED AREAS. ALTERNATELY, FIELD SUPPLY AND IN

RTU-13, RTU-17 SEQUENCE OF OPERATION

- UNIT TO BE CONSTANT VOLUME WITH 24/7 SUPPLY FAN.
- SUPPLY AIR TEMPERATURE AND HUMIDITY TO BE MODULATED TO SATISFY INTERIOR SPACE TEMPERATURE AND HUMIDITY SET POINTS BY MODULATION OF AC COMPRESSOR, REHEAT AND HEATING SYSTEM.
- UNIT TO PROVIDE 10% OUTSIDE AIR DURING UNOCCUPIED HOURS
- UNIT TO PROVIDE 100% OUTSIDE AIR DURING OCCUPIED HOURS
- COOLING LEAVING AIR TEMPERATURE MUST BE SELECTED TO BE EQUAL TO OR LESS THAN SPACE DEW POINT DESIGN OR RELATIVE HUMIDITY WILL NOT BE ABLE TO BE PROPERLY CONTROLLED.

RTU-1, RTU-12 SEQUENCE OF OPERATION

- VAV SYSTEM CONTROLLER TO RECEIVE INPUT FROM ZONE THERMOSTATS AND MODULATE BYPASS DAMPER ACTUATOR AND RTU HEAT/COOL STAGES TO MAINTAIN DUCT SUPPLY AIR TEMPERATURE AND STATIC PRESSURE SET POINTS.
- CONTROLLER TO POLL ZONE THERMOSTAT SET POINTS AND READINGS TO DETERMINE WHETHER SYSTEM IS TO BE OPERATED IN HEATING OR COOLING. ALL ZONE THERMOSTATS ARE TO HAVE EQUAL VOTING WEIGHT.
- AFTER (3) MINUTES IN COOLING, IF SUPPLY AIR TEMPERATURE IS 57° F OR ABOVE, STAGE 2 OF COOLING IS TO ACTIVATE UNTIL SPACE SET POINTS ARE REACHED. LIKEWISE, AFTER (3) MINUTES IN HEATING IF SUPPLY AIR TEMPERATURE IS 94° F OR LESS, STAGE 2 OF HEATING IS TO ACTIVATE UNTIL SPACE SET POINTS ARE REACHED (RTU-12 DOES NOT HAVE 2 STAGES OF HEAT). ONCE SUPPLY AIR TEMPERATURE DROPS ONE DEGREE BELOW/ABOVE THE SET POINT (DEPENDING ON COOLING/HEATING), THE RTU WILL DE-ENERGIZE FOR (4) MINUTES.
- M.C. TO WORK WITH OWNER TO PROGRAM HOURS/DAYS OF OPERATION AND OCCUPIED/UNOCCUPIED SETTING BY DEFAULT AND SWITCH TO OCCUPIED SETTINGS WHEN MANUAL OVERRIDES ARE ACTIVATED AT CONTROLLER OR ZONE THERMOSTATS.
- ZONE DAMPERS ARE TO MODULATE PRIMARY AIR VALVE TO MAINTAIN ZONE TEMPERATURE.
- ZONE DAMPERS PAIRED WITH OCCUPANCY SENSORS ARE TO CLOSE TO MINIMUMS WHEN NO MOTION IS DETECTED BY SENSOR.
- RTU COMPRESSORS / HEATERS TO SHUT OFF IF NO CALLS FOR HEATING OR COOLING ARE DETECTED.
- RTU SUPPLY FAN TO RUN CONTINUOUSLY DURING OCCUPIED MODE. ON/OFF AS REQUIRED DURING UNOCCUPIED MODE.

SPECIFICATION: CAPTRATE® GREASE-STOP® SOLO FILTER

THE CAPTRATE GREASE-STOP SOLO FILTER IS A SINGLE-STAGE FILTER FEATURING A UNIQUE S-BAFFLE DESIGN IN CONJUNCTION WITH A SLOTTED REAR BAFFLE DESIGN, TO DELIVER EXCEPTIONAL FILTRATION EFFICIENCY.

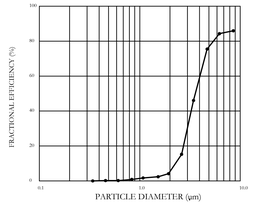
FILTER IS STAINLESS STEEL CONSTRUCTION, AND SIZED TO FIT INTO STANDARD 2-INCH DEEP HOOD CHANNEL(S).

UNITS SHALL INCLUDE STAINLESS STEEL HANDLES AND A FASTENING DEVICE TO SECURE THE TWO COMPONENTS WHEN ASSEMBLED.

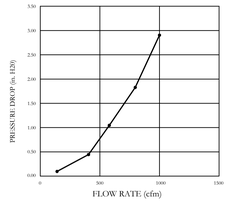
GREASE EXTRACTION EFFICIENCY PERFORMANCE SHALL REMOVE AT LEAST 75% OF GREASE PARTICLES FIVE MICRONS IN SIZE, AND 85% GREASE PARTICLES SEVEN MICRONS IN SIZE AND LARGER, WITH A CORRESPONDING PRESSURE DROP NOT TO EXCEED 1.0 INCHES OF WATER GAUGE.

THE CAPTRATE GREASE-STOP SOLO WAS TESTED TO ASTM STANDARD ASTM F2519-05.

EFFICIENCY VS. PARTICLE DIAMETER



PRESSURE DROP VS. FLOW RATE



CAPTRATE FILTERS ARE BUILT IN COMPLIANCE WITH:
NFPA #96
NSF STANDARD #2
UL STANDARD #1046
INT. MECH. CODE (IMC)

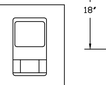
DUCT TEMPERATURE SENSOR

Provides exhaust air temperature for proper hood control operation. For all installations excluding a single hood with factory risers and a hood mounted panel, duct mounted temperature sensors will need to be field wired. 2-wire 18 AWG plenum rated thermistor cable must be used.

ROOM TEMPERATURE SENSOR



Provides room override based on temperature differential between the room and duct. Installed by electrician on a wall, 5'-6' off the finished floor, in the space but not directly under the hood or close to an appliance (including the electrical control box) so the reading is accurate for space.

HOOD CONTROL INTERFACE

The LCD interface provides user control and hood status. The faceplate is connected to the hood control panel through CAT-5 cable. A faceplate has 2 RJ-45 connectors. One connects to port J4 or J5 in the hood control panel and the other will typically be occupied by a RJ-45 end-of-line terminator.

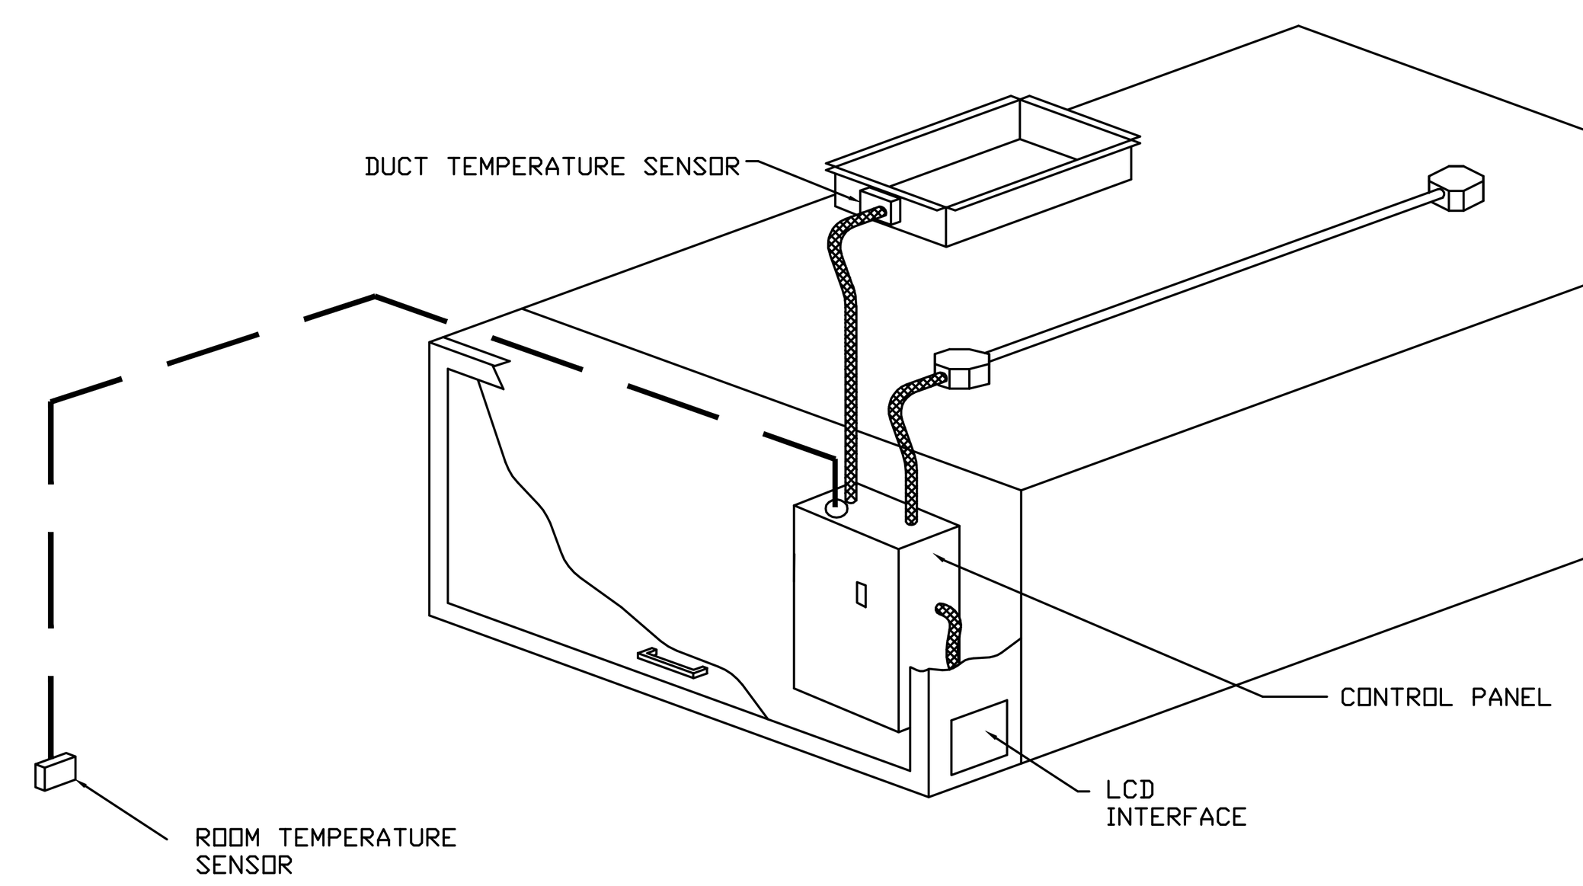
Demand Control Ventilation Hood Control Panel Specifications:

- Controls shall be listed by ETL (UL 508A) and shall comply with demand ventilation system turndown requirements outlined in IECC 403.2.8 (2015).
- The control enclosure shall be NEMA 1 rated and listed for installation inside of the exhaust hood utility cabinet. The control enclosure may be constructed of stainless steel or painted steel.
- Temperature probe(s) located in the exhaust duct riser(s) shall be constructed of stainless steel.
- A digital controller shall be provided to activate the hood exhaust fans dynamically based on a fixed differential between the ambient and duct temperatures sensors. This function shall meet the requirements of IMC 507.1.1.
- A digital controller shall provide adjustable hysteresis settings to prevent cycling of the fans after the cooking appliances have been turned off and/or the heat in the exhaust system is reduced.
- A digital controller shall provide an adjustable minimum fan run-time setting to prevent fan cycling.
- Variable Frequency Drives (VFDs) shall be provided for fans as required. The digital controller shall modulate the VFDs between a minimum setpoint and a maximum setpoint on demand. The duct temperature sensor input(s) to the digital controller shall be used to calculate the speed reference signal.
- The VFD speed range of operation shall be from 0% to 100% for the system, with the actual minimum speed set as required to meet minimum ventilation requirements.
- An internal algorithm to the digital controller shall modulate supply fan VFD speed proportional to all exhaust fans that are located in the same fan group as the supply fan.
- The system shall operate in PREP MODE during light cooking load or COOL DOWN MODE when sufficient heat remains underneath the hood system after cooking operations have completed. Operation during either of these periods will disable the supply fans and provide an exhaust fan speed that is equal to the minimum ventilation requirement.
- A digital controller shall disable the supply fan(s), activate the exhaust fan(s), activate the appliance shunt trip, and disable an electric gas valve automatically when fire condition is detected on a covered hood.
- A digital controller shall allow for external BMS fan control via Dry Contact (external control shall not override fan operation logic as required by code).
- An LCD interface shall be provided with the following features:
  a. On/Off push button fan & light switch activation
  b. Integrated gas valve reset for electronic gas valves (no reset relay required)
  c. VFD Fault display with audible & visual alarm notification
  d. Duct temperature sensor failure detection with audible & visual alarm notification
  e. Mis-wired duct temperature sensor detection with audible & visual alarm notification
  f. A single low voltage Cat-5 RJ45 wiring connection
  g. An energy savings indicator that utilizes measured kWh from the VFDs



TYPICAL HOOD CONTROL PANEL INSTALLATION

Sequence of Operations:

The hood control panel is capable of operating in one or more of the following states at any given time:

- Automatic: The system operates based on the differential between room temperature and the temperature at the hood cavity or exhaust duct collar. Fans activate at a configurable temperature differential threshold. Depending on the job configuration each fan zone can be configured as static or dynamic. These terms refer to whether a variable motor (such as EC Motors or VFD driven motors) modulate with temperature. If the panel is equipped with variable speed fans and the zone is defined as "dynamic", these will modulate within a user-defined range based on the temperature differential. Panels equipped with variable speed fans and a fan zone defined as "static", fans will run at a set speed calculated for the drive. Demand control ventilation systems are capable of modulating exhaust and make up air fan speeds per the requirements outlined in IECC 403.2.8.
- Manual: The system operates based on human input from an HMI.
- Schedule: A weekly schedule can be set to run fans for a specified period throughout the day. There are three occupied times per day to allow for the user to set up a time that is suitable to their needs. Any time that is within the defined occupied time, the system will run at modulation mode and follow the fan procedure algorithm based on temperature during this time. During unoccupied time, the system will have an extra offset to prevent unintended activation of the system during a time where the system is not being occupied.
- Other: The system operates based on the input from an external source (DDC, BMS or hard-wired interlock)
