CONSTRUCTION DOCUMENT SPECIFICATION

FORT FISHER AQUARIUM RENOVATION & EXPANSION

SCO # 17-18042-02A

Kure Beach, North Carolina

8 AUGUST 2025

Szostak Design, Inc.
Chapel Hill, NC

DESIGN DEVELOPMENT SPECIFICATIONS FOR:

Fort Fisher Aquarium Renovation & Expansion

900 Loggerhead Rd
Kure Beach, NC 28449

Owner

NC Dept of Natural & Cultural Resources
3125 Poplarwood Ct, Suite 160
Raleigh, NC 27604

Contact Person:
James Mancari, Division Project Manager
NC Aquariums
919.877.5500

000005	CMR General Conditions 2013 Rev 1	38
000006	Supplementary General Conditions	4
000007	Geotechnical (Subsurface) Investigation Report	54

DIVISION 1 GENERAL REQUIREMENTS

011000	Summary	4
012100	Allowances	4
012200	Unit Prices	4
012300	Alternates	4
012600	Contract Modification Procedures	4
012900	Payment Procedures	4
013100	Project Management and Coordination	6
013200	Construction Progress Documentation	6
013233	Photographic Documentation	2
013300	Submittal Procedures	10
014110	Statement of Special Inspections	2
015000	Temporary Facilities and Controls	6
015639	Temporary Tree and Plant Protection	8
017300	Execution	6
017700	Closeout Procedures	6
017823	Operations and Maintenance Data	2
017839	Project Record Documents	2
017900	Demonstration and Training	4

DIVISION 2 DEMOLITION

024119	Selective Demolition	8

DIVISION 3 CONCRETE

031000	Concrete Forming and Accessories	6
032000	Concrete Reinforcing	4
033000	Cast in Place Concrete	20
033300	Landscape Architectural Concrete	12

DIVISION 4 MASONRY

042000	Unit Masonry	8

DIVISION 5 METALS

051200	Structural Steel Framing	6
052100	Steel Joists	4
053100	Steel Decking	4
054000	Cold-formed Metal Framing	8
055000	Metal Fabrications	4
055100	Metal Stairs, Metal Pipe and Tube Railings	8
055213	Exterior Pipe and Tube Railings	8
055300	Metal Gratings	8

DIVISION 6 WOOD, PLASTICS, AND COMPOSITES

061053	Miscellaneous Rough Carpentry	4
061600	Sheathing	2
062700	Fiberglass Sculpture	2
064023	Interior Architectural Woodwork	6
066010	Pultruded Fiberglass Gratings	4
066050	Molded Fiberglass (FRP) Stair Treads	4
066100	Pultruded Structural Fiberglass Construction	4
068113	Pultruded Handrails and Guard Rails	4

DIVISION 7 THERMAL AND MOISTURE PROTECTION

071326	Self Adhered Sheet Waterproofing	4
072100	Thermal Insulation	4
072419	Water-Drainage Exterior Insulation and Finish System (EIFS)	14
075423	Thermoplastic Polyolefin (TPO) Roofing	6
076200	Sheet Metal Flashing and Trim	6
079200	Joint Sealants	6

DIVISION 8 OPENINGS

081416	Flush Wood Doors	4
081716	Fiberglass Fire-Rated Doors and Frames	8
082550	Aluminum FRP Flush Doors and Frames	8
083160	Flood Panel System	6
083323	Insulated Rolling Service Doors	6
083919	Watertight Doors	6
084113	Aluminum-Framed Entrances and Storefronts	6
084123	Aluminum-Framed Sliding Mall Front Doors	6
084456	Aluminum Flush Framed Concealed Doors	4
085800	Transaction Windows	2
087100	Door Hardware	54
088000	Glazing	4
088400	Exhibit Tank Glazing	12
089000	Louvers and Vents	4

DIVISION 9 FINISHES

092216	Non-Structural Metal Framing	4
092713	Castworks GFRG Architectural Columns	4
092900	Gypsum Board	4
093000	Tiling	6
095113	Acoustical Panel Ceilings	4
096513	Resilient Base and Accessories	4
096816	Tile Carpeting	4
097720	Fiber-Reinforced Polyester (FRP) Wall Panels	6
099123	Interior Painting	6
099600	High Performance Coatings	6
099800	Exhibit Tank Coating	8

DIVISION 10 SPECIALTIES

100000 Miscellaneous Specialties 14

1. Fire Extinguisher Cabinets (FEC).
2. Toilet Accessories.
3. Roller Shades.
4. Toilet Compartments.
5. Interior Signage.
6. Metal Access Door.
7. Marker Boards and Tack Boards.
8. Expansion Joint Covers.
9. Entrance Floor Mats and Frames (RCM).
10. Dock Bumpers.
11. Folding Partitions.
12. Suspended Curtain Track
13. Composite Manhole Covers
14. Coiled Wire Fabric Curtain System

DIVISION 11 EXHIBIT + EQUIPMENT

111600	Hoist and Crane Equipment	4
111795	Lift floor for Shark Tank	4
115901	General Requirements for Exhibit Fabrications	4

115910 Fiberglass Tanks 6
115920 Replicated Habitats 24
115930 Interpretive Graphics 10
115940 Media Software 8
115950 Media Hardware 12
115970 Exhibit Casework and Furniture 8

DIVISION 13 SPECIAL CONSTRUCTION

133423 Fabricated Structures 4

DIVISION 14 CONVEYING SYSTEMS – NOT USED

DIVISION 17 LIFE SUPPORT SYSTEMS

170010 General Provisions 26
170024 FRP Filters 8
170028 Modular Drum Filters 8
170032 Bag Filters 2
170035 Cartridge Filters 2
170062 Sand and Gravel Media 6
170063 Glass Media 2
170072 Carbon Media 2
170088 Aeration Tower Packing Media 4

END OF TABLE OF CONTENTS

GENERAL CONDITIONS OF THE CONTRACT

STANDARD FORM FOR CONSTRUCTION MANAGER-AT-RISK PROJECTS

NORTH CAROLINA

DEPARTMENT OF ADMINISTRATION

STATE CONSTRUCTION OFFICE

Form OC-15CM

This document is intended for use on State capital construction projects and shall not be used on any project that is not reviewed and approved by the State Construction Office. Extensive modification to the General Conditions by means of "Supplementary General Conditions" is strongly discouraged. State agencies and institutions may include special requirements in "Division 1 – General Requirements" of the specifications, where they do not conflict with the General Conditions.

Second Edition January 2013
Revision 1 – May 2024: Article 23.b

GENERAL CONDITIONS OF THE CONTRACT

The use or reproduction of this document or any part thereof is authorized for and limited to use on projects of the State of North Carolina, and is distributed by, through and at the discretion of the State Construction Office, Raleigh, North Carolina, for that distinct and sole purpose.

ARTICLE 1 - DEFINITIONS

a. The **contract documents** consist of the Request for Proposal (RFP); Construction Manager's formal response to the RFP; General Conditions of the Contract; special conditions if applicable; Supplementary General Conditions; the drawing and specifications, including all bulletins, addenda or other modifications of the drawings and specifications incorporated into the documents prior to their execution; the contract; the performance bond; the payment bond; insurance certificates; the approval of the attorney general; and the certificate of the Office of State Budget and Management. All of these items together form the contract.

b. The **Owner** is the State of North Carolina by and through the agency or institution named in the contract.

c. The **designer** or **project designer** means the firm or firms of architects or engineers or both (and their consultants) which have undertaken to design the project pursuant to a contract with the Owner, (hereinafter, the "design contract").

d. The **Construction Manager-at-Risk (CM) accepts a relationship of trust and confidence between himself and the Owner and undertakes to act as the Owner's fiduciary in the handling and opening of bids in accordance with the provisions of North Carolina General Statute (N.C.G.S.) 143-128.1.** The CM agrees to furnish his best skills and his best judgment to cooperate with the Owner and Designer for undertaking all necessary action contemplated under the contract documents to (a) establish during the design phase a Guaranteed Maximum Price (GMP) to construct the project and (b) ensure timely and quality completion of the project at a cost within the GMP. Construction Manager or CM as used in the contract documents means Construction Manager-at-Risk (CM at Risk).

e. A **subcontractor**, as the term is used herein, shall be in the case of a principal trade contractor, a general, mechanical, electrical or plumbing contractor or in the case of a specialty contractor, a trade contractor who is not a principal trade contractor, who has entered into a direct contract with a CM, and includes one who furnishes materials worked to a special design in accordance with plans and specifications covered by the contract, but does not include one who only sells or furnishes materials not requiring work so described or detailed.

f. **Written notice** shall be defined as notice in writing delivered in person to the contractor, or to a partner of the firm in the case of a partnership, or to a member of the contracting organization, or to an officer of the organization in the case of a corporation, or sent to the last known business address of the contracting organization by registered mail.

g. **Work**, as used herein as a noun, is intended to include materials, labor, and workmanship of the appropriate contractor as supervised by the CM.

h. The **project** is the total construction work to be performed under the contract documents.

i. **Construction Management Fee** shall be an all-inclusive lump sum management fee which will include all Construction Manager-at-Risk home office, project site and project related costs including all Construction Manager-at-Risk overhead costs and profit.

j. **Change order**, as used herein, shall mean a written order to the CM subsequent to the signing of the contract authorizing a change in the GMP contract. The change order shall be signed by the CM, designer and the Owner, and approved by the State Construction Office, in that order (Article 19).

k. **Field Order,** as used herein, shall mean a written approval for the CM to proceed with the work requested by Owner prior to issuance of a formal Change Order. The field order shall be signed by the CM, designer, Owner, and State Construction Office (SCO).

l. **Field Change,** as used herein shall mean a written approval from the Owner for the CM to proceed with work requested by the Owner to be paid for from the CM Contingency or Owner's Project Reserve within the GMP.

m. **Time of Completion**, as stated in the contract documents, is to be interpreted as consecutive calendar days measured from the date established in the written Notice to Proceed, or such other date as may be established herein (Article 23).

n. **Liquidated damages,** as stated in the contract documents, is an amount reasonably estimated in advance to cover the consequential damages associated with the Owner's economic loss in not being able to use the Project for its intended purposes at the end of the contract's completion date as amended by change order, if any, by reason of failure of the CM to complete the work within the time specified. Liquidated damages does not include the Owner's extended contract administration costs (including but not limited to additional fees for architectural and engineering services, testing services, inspection services, commissioning services, etc.), such other damages directly resulting from delays caused solely by the CM, or consequential damages that the Owner identified in the bid documents that may be impacted by any delay caused solely by the CM (e.g., if a multi-phased project-subsequent phases, delays in start of other projects that are dependent on the completion of this Project, extension of leases and/or maintenance agreements for other facilities).

o. **Surety**, as used herein, shall mean the bonding company or corporate body which is bound with and for the CM, and which engages to be responsible for the CM and his acceptable performance of the work.

p. **Routine written communications between the Designer and the Construction Manager** are any communication other than a "request for information" provided in letter, memo, or transmittal format, sent by mail, courier, electronic mail, or facsimile. Such communications cannot be identified as "request for information".

q. **Clarification or Request for information (RFI)** is a request from the CM seeking an interpretation or clarification by the Designer relative to the contract documents. The RFI, which shall be labeled (RFI), shall clearly and concisely set forth the issue or item requiring clarification or interpretation and why the response is needed. The RFI must set forth the CM's interpretation or understanding of the contract documents requirements in question, along with reasons for such an understanding.

r. **Approval** means written or imprinted acknowledgement that materials, equipment or methods of construction are acceptable for use in the work**.**

s. **Inspection** shall mean examination or observation of work completed or in progress to determine its compliance with contract documents.

t. **"Equal to" or "approved equal"** shall mean materials, products, equipment, assemblies, or installation methods considered equal by the bidder in all characteristics (physical, functional, and aesthetic) to those specified in the contract documents. Acceptance of equal is subject to approval of the designer and owner.

u. **"Substitution" or "substitute"** shall mean materials, products, equipment, assemblies, or installation methods deviating in at least one characteristic (physical, functional, or aesthetic) from those specified, but which in the opinion of the bidder would improve competition and/or enhance the finished installation. Acceptance of substitution is subject to the approval of the designer and owner.

v. **Provide** shall mean furnish and install complete in place, new, clean, operational, and ready for use.

w. **Indicated and shown** shall mean provide as detailed, or called for, and reasonably implied in the contract documents.

x. **Special inspector** is one who inspects materials, installation, fabrication, erection or placement of components and connections requiring special expertise to ensure compliance with the approved construction documents and referenced standards.

y. **Commissioning** is a quality assurance process that verifies and documents that building components and systems operate in accordance to the owner's project requirements and the project design documents.

z. **Designer Final Inspection** is the inspection performed by the design team to determine the completeness of the project in accordance with approved plans and specifications. This inspection occurs prior to SCO final inspection.

aa. **SCO Final Inspection** is the inspection performed by the State Construction Office to determine the completeness of the project in accordance with NC Building Codes and approved plans and specifications.

bb. **Beneficial Occupancy** is requested by the owner and is occupancy or partial occupancy of the building after all life safety items have been completed as determined by the State Construction Office. Life safety items include but not limited to fire alarm, sprinkler, egress and exit lighting, fire rated walls, egress paths and security.

cc. **Final Acceptance** is the date in which the State Construction Office accepts the construction as totally complete. This includes the SCO Final Inspection and certification by the designer that all punch lists are completed.

ARTICLE 2 - INTENT AND EXECUTION OF DOCUMENTS

a. The drawings and specifications are complementary, one to the other. That which is shown on the drawings or called for in the specifications shall be as binding as if it were both called for and shown. The intent of the drawings and specifications is to establish the scope of all labor, materials, transportation, equipment, and any and all other things necessary to provide a complete job. In case of discrepancy or disagreement in the contract documents, the order of precedence shall be: Form of Contract, specifications, large-scale detail drawings, small-scale drawings.

b. The wording of the specifications shall be interpreted in accordance with common usage of the language except that words having a commonly used technical or trade meaning shall be so interpreted in preference to other meanings.

c. The CM shall execute each copy of the response to RFP, contract, performance bond and payment bond as follows:

1. If the documents are executed by a sole Owner, that fact shall be evidenced by the word "Owner" appearing after the name of the person executing them.

2. If the documents are executed by a partnership, that fact shall be evidenced by the word "Co-Partner" appearing after the name of the partner executing them.

3. If the documents are executed on the part of a corporation, they shall be executed by either the president or the vice president and attested by the secretary or assistant secretary in either case, and the title of the office of such persons shall appear after their signatures. The seal of the corporation shall be impressed on each signature page of the documents.

4. If the documents are made by a joint venture, they shall be executed by each member of the joint venture in the above form for sole Owner, partnership or corporation, whichever form is applicable to each particular member.

5. All signatures shall be properly witnessed.

6. If the construction manager's license is held by a person other than an Owner, partner or officer of a firm, then the licensee shall also sign and be a party to the contract. The title "Licensee" shall appear under his/her signature.

7. The bonds shall be executed by an attorney-in-fact. There shall be attached to each copy of the bond a certified copy of power of attorney properly executed and dated.

8. Each copy of the bonds shall be countersigned by an authorized individual agent of the bonding company licensed to do business in North Carolina. The title "Licensed Resident Agent" shall appear after the signature.

9. The seal of the bonding company shall be impressed on each signature page of the bonds.

10. The CM's signature on the performance bond and the payment bond shall correspond with that on the contract.

ARTICLE 3 - CLARIFICATIONS AND DETAIL DRAWINGS

a. In such cases where the nature of the work requires clarification by the designer, such clarification shall be furnished by the designer with reasonable promptness by means of written instructions or detail drawings, or both. Clarifications and drawings shall be consistent with the intent of contract documents, and shall become a part thereof.

b. The CM and the Designer shall prepare, if deemed necessary, a schedule fixing dates upon which foreseeable clarifications will be required. The schedule will be subject to addition or change in accordance with progress of the work. The Designer shall furnish drawings or clarifications in accordance with that schedule. The CM shall not proceed with the work without such detail drawings and/or written clarifications.

ARTICLE 4 - COPIES OF DRAWINGS AND SPECIFICATIONS

The Designer or owner shall furnish free of charge to the CM electronic copies of plans and specifications. If requested by the CM, up to 30 paper copies of plans and specifications will be

provide free of charge, plus a clean set of black line prints on white paper of all appropriate drawings, upon which the CM shall clearly and legibly record all work-in-place that is at variance with the contract documents. Additional sets shall be furnished at cost, including mailing, to the CM at the request of the CM.

ARTICLE 5 - SHOP DRAWINGS, SUBMITTALS, SAMPLES, DATA

a. Within fifteen (15) consecutive calendar days of the notice to proceed, a schedule for anticipated submission of all shop drawings, product data, samples, and similar submittals shall be prepared by the CM and provided to the designer. This schedule shall indicate the items, relevant specification sections, other related submittal data, and the date when these items will be furnished to the designer.

b. The CM shall review, approve and submit to the Designer all Shop Drawings, Coordination Drawings, Product Data, Samples, Color Charts, and similar submittal data required or reasonably implied by the Contract Documents. Required Submittals shall bear the CM's stamp of approval, any exceptions to the Contract Documents shall be noted on the submittals, and copies of all submittals shall be of sufficient quantity for the Designer to retain up to three (3) copies of each submittal for his own use plus additional copies as may be required by the CM. Submittals shall be presented to the Designer in accordance with the schedule submitted in paragraph (a). so as to cause no delay in the activities of the Owner.

c. The Designer shall review required submittals promptly, noting desired corrections if any, and retaining three (3) copies (1 for the Designer, 1 for the owner and 1 for SCO) for his use. The remaining copies of each submittal shall be returned to the CM not later than twenty (20) days from the date of receipt by the Designer, for the CM's use or for corrections and resubmittal as noted by the Designer. When resubmittals are required, the submittal procedure shall be the same as for the original submittal***s.***

d. Approval of shop drawings by the designer shall not be construed as relieving the CM from responsibility for compliance with the design or terms of the contract documents nor from responsibility of errors of any sort in the shop drawings, unless such error has been called to the attention of the designer in writing by the CM.

ARTICLE 6 - WORKING DRAWINGS AND SPECIFICATIONS AT THE JOB SITE

a. The CM shall maintain, in readable condition at his job office, one complete set of working drawings and specifications for his work including all shop drawings. Such drawings and specifications shall be available for use by the Designer or his authorized representative, owner or State Construction Office.

b. The CM shall maintain at the job office, a day-to-day record of work-in-place that is at variance with the contract documents. Such variations shall be fully noted on project drawings by the CM and submitted to the designer upon project completion and no later than thirty (30) days after acceptance of the project.

c. The contractor shall maintain at the job office a record of all required tests that have been performed, clearly indicating the scope of work inspected and the date of approval or rejection.

ARTICLE 7 - OWNERSHIP OF DRAWINGS AND SPECIFICATIONS

All drawings and specifications are instruments of service and remain the property of the Owner. The use of these instruments on work other than this contract without permission of the Owner is prohibited. All copies of drawings and specifications other than contract copies shall be returned to the Owner upon request after completion of the work.

ARTICLE 8 - MATERIALS, EQUIPMENT, EMPLOYEES

a. The CM shall, unless otherwise specified, supply & pay for all lighting, power, heat, sanitary facilities & water and shall require the Principal Trade and Specialty Contractors to, supply and pay for all labor, transportation, materials, tools, apparatus, scaffolding and incidentals necessary for the completion of his work, and to install, maintain and remove all equipment of the construction, other utensils or things, and be responsible for the safe, proper and lawful construction, maintenance and use of same. The CM shall construct in the best and most workmanlike manner, a complete job and everything incidental thereto, as shown on the plans, stated in the specifications, or reasonably implied there from, all in accordance with the contract documents.

b. All materials shall be new and of quality specified, except where reclaimed material is authorized herein and approved for use. Workmanship shall at all times be of a grade accepted as the best practice of the particular trade involved, and as stipulated in written standards of recognized organizations or institutes of the respective trades except as exceeded or qualified by the specifications.

c. Upon notice, the CM shall furnish evidence from the Principal Trade and Specialty Contractors as to quality of materials.

d. Products are generally specified by ASTM or other reference standard and/or by manufacturer's name and model number or trade name. When specified only by reference standard, the CM through the Principal Trade or Specialty Contractor may select any product meeting this standard, by any manufacturer. When several products or manufacturers are specified as being equally acceptable, the CM through the Principal Trade or Specialty Contractor has the option of using any product and manufacturer combination listed. However, the CM through the Principal Trade or Specialty Contractor shall be aware that the cited examples are used only to denote the quality standard of product desired and that they do not restrict bidders to a specific brand, make, manufacturer or specific name; that they are used only to set forth and convey to bidders the general style, type, character and quality of product desired; and that equivalent products will be acceptable. The CM shall be responsible for reviewing all substitution requests from Principal Trade or Specialty Contractors prior to submission to the Project Designer and Owner and shall track & monitor all such requests. Requests for substitution of materials, items, or equipment shall be submitted to the Project Designer for approval or disapproval; such approval or disapproval shall be made by the designer prior to the opening of bids. Alternate materials may be requested after award if it can clearly be demonstrated that it is an added benefit to the owner and the designer and the owner approves.

e. The CM shall obtain written approval from the designer for the use of products, materials**,** equipment**,** assemblies or installation methods claimed as equal to those specified. Such approvals must be obtained as soon after contract awards as possible and before any materials are ordered.

f. The Designer is the judge of equality for proposed substitution of products, materials or equipment.

g. If at any time during the construction and completion of the work covered by these contract documents, the conduct of any workman of the various crafts be adjudged a nuisance to the Owner or Designer, or if any workman be considered detrimental to the work, the CM shall order such parties removed immediately from grounds.

ARTICLE 9 - ROYALTIES, LICENSES AND PATENTS

It is the intention of the contract documents that the work covered herein will not constitute in any way infringement of any patent whatsoever unless the fact of such patent is clearly evidenced herein. The CM shall protect and save harmless the Owner against suit on account of alleged or actual infringement. The CM shall pay all royalties and/or license fees required on account of patented articles or processes, whether the patent rights are evidenced hereinafter.

ARTICLE 10 - PERMITS, INSPECTIONS, FEES, REGULATIONS

a. The CM shall give all notices and comply with all laws, ordinances, codes, rules and regulations bearing on the conduct of the work under this contract. If the CM observes that the drawings and specifications are at variance therewith, he shall promptly notify the Designer in writing. Any necessary changes required after contract award shall be made by change order in accordance with Article 19. If the CM performs any work or authorizes any work to be performed knowing it to be contrary to such laws, ordinances, codes, rules and regulations, and without such notice to the designer, he shall bear all cost arising there from. Additional requirements implemented after bidding will be subject to equitable negotiations.

b. All work under this contract shall conform to the North Carolina State Building Code and other State, local and national codes as are applicable. The cost of all required inspections and permits shall be the responsibility of the CM unless otherwise specified.

c. Projects constructed by the State of North Carolina or by any agency or institution of the State are not subject to inspection by any county or municipal authorities and are not subject to county or municipal building codes. The CM shall, however, cooperate with the county or municipal authorities by obtaining building permits. Permits shall be obtained at no cost.

d. Projects involving local funding (Community Colleges) are also subject to county and municipal building codes and inspection by local authorities. The CM shall pay the cost of these permits and inspections unless otherwise specified.

ARTICLE 11 - PROTECTION OF WORK, PROPERTY AND THE PUBLIC

a. The CM shall be responsible for the entire site and the building or construction of the same and provide all the necessary protections, as required by the Owner or designer, and by laws or ordinances governing such conditions. The CM shall be responsible for any damage to the Owner's property or of that of others on the job, by them, their personnel, or their subcontractors, and shall make good such damages. The CM shall be responsible for and pay for any damages caused to the Owner. The CM shall have access to the project at all times.

b. The CM shall be responsible to cover and protect all portions of the structure when the work is not in progress, provide and set all temporary roofs, covers for doorways, sash and windows, and all other materials necessary to protect all the work on the building. Any work damaged through the lack of proper protection or from any other cause, shall be repaired or replaced without extra cost to the Owner.

c. No fires of any kind will be allowed inside or around the operations during the course of construction without special permission from the Designer.

d. The CM shall ensure that all trees and shrubs designated to remain in the vicinity of the construction operations are protected in accordance with the requirements of the plans and specifications. All walks, roads, etc., shall be barricaded as directed by the designer to keep the public away from the construction. All trenches, excavations or other hazards in the vicinity of the work shall be well barricaded and properly lighted at night.

e. The CM shall develop and implement a project safety plan that provides all necessary safety measures for the protection of all persons on the job, including the requirements of the A.G.C. *Accident Prevention Manual in Construction*, as amended, and shall fully comply with all state laws or regulations and North Carolina State Building Code requirements to prevent accident or injury to persons on or about the location of the work. The CM shall clearly mark or post signs warning of hazards existing, and shall barricade excavations, elevator shafts, stairwells and similar hazards. The CM shall insure that protection is provided against damage or injury resulting from falling materials and that all protective devices and signs be maintained throughout the progress of the work.

f. The CM shall adhere to the rules, regulations and interpretations of the North Carolina Department of Labor relating to Occupational Safety and Health Standards for the Construction Industry (Title 29, Code of Federal Regulations, Part 1926, published in Volume 39, Number 122, Part II, June 24, 1974, *Federal Register*), and revisions thereto as adopted by N.C.G.S. 95-126 through 155.

g. The CM shall. designate a responsible person of his organization as safety officer/inspector to inspect the project site for unsafe health and safety hazards, to report these hazards to the contractor for correction, and whose duties also include accident prevention on the project, and to provide other safety and health measures on the project site as required by the terms and conditions of the contract. The name of the safety inspector shall be made known to the designer and owner at the time of the preconstruction conference and in all cases prior to any work starting on the project.

h. In the event of an emergency affecting the safety of life, the protection of work, or the safety of adjoining properties, the CM is hereby authorized to act at his own discretion, without further authorization from anyone, to prevent such threatened injury or damage. Any compensation claimed by the CM on account of such action shall be determined as provided for under Article 19(b).

i. Any and all costs associated with correcting damage caused to adjacent properties of the construction site or staging area shall be borne by the contractor. These costs shall include but not be limited to flooding, mud, sand, stone, debris, and discharging of waste products.

ARTICLE 12 - SEDIMENTATION POLLUTION CONTROL ACT OF 1973

a. Any land-disturbing activity performed by the CM or any Principal Trade or Specialty Contractor in connection with the project shall comply with all erosion control measures set

forth in the contract documents and any additional measures which may be required in order to ensure that the project is in full compliance with the Sedimentation Pollution Control Act of 1973, as implemented by Title 15, North Carolina Administrative Code, Chapter 4, Sedimentation Control, Subchapters 4A, 4B and 4C, as amended (15 N.C.A.C. 4A, 4B and 4C).

b. Upon receipt of notice that a land-disturbing activity is in violation of said act, the CM shall be responsible for ensuring that all steps or actions necessary to bring the project in compliance with said act are promptly taken.

c. The CM shall be responsible for defending any legal actions instituted pursuant to N.C.G.S. 113A-64 against any party or persons described in this article.

d. To the fullest extent permitted by law, the CM shall indemnify and hold harmless the Owner, the designer and the agents, consultants and employees of the Owner and designer, from and against all claims, damages, civil penalties, losses and expenses, including, but not limited to, attorneys' fees, arising out of or resulting from the performance of work or failure of performance of work, provided that any such claim, damage, civil penalty, loss or expense is attributable to a violation of the Sedimentation Pollution Control Act. Such obligation shall not be construed to negate, abridge or otherwise reduced any other right or obligation of indemnity which would otherwise exist as to any party or persons described in this article.

ARTICLE 13 - INSPECTION OF THE WORK

a. It is a condition of this contract that the work shall be subject to inspection during normal working hours by the designer, designated official representatives of the Owner, State Construction Office and those persons required by state law to test special work for official approval. The CM shall therefore provide safe access to the work at all times for such inspections.

b. All instructions to the CM will be made only by or through the designer or his designated project representative. Observations made by official representatives of the Owner shall be conveyed to the designer for review and coordination prior to issuance to the CM.

c. The CM shall perform quality control inspections on the work of Principal Trade and Specialty Contractors to guard the Owner against defects and deficiencies in the work and shall coordinate this activity with the on-site duties of the Project Designer. The CM shall advise the Project Designer of any apparent variation and/or deviation from the intent of the Contract Documents and shall take the necessary action to correct such variations and deviations.

d. All work shall be inspected by designer, special inspector and/or State Construction Office prior to being covered by the contractor. The CM shall give a minimum two weeks' notice unless otherwise agreed to by all parties. If inspection fails, after the first re-inspection all costs associated with additional re-inspections shall be borne by the CM.

e. Where special inspection or testing is required by virtue of any state laws, instructions of the designer, specifications or codes, the CM shall give adequate notice to the Project Designer of the time set for such inspection or test, if the inspection or test will be conducted by a party other than the Project Designer. Such special tests or inspections will be made in the presence of the Project Designer, or his authorized representative, and it shall be the CM's responsibility to serve ample notice of such tests.

f. All laboratory tests shall be paid by the Owner unless provided otherwise in the contract documents except the CM shall pay for laboratory tests to establish design mix for concrete and for additional tests to prove compliance with contract documents where materials have tested deficient except when the testing laboratory did not follow the appropriate ASTM testing procedures.

g. Should any work be covered up or concealed prior to inspection and approval by the Project Designer and/or (SCO) such work shall be uncovered or exposed for inspection, if so requested by the Project Designer or SCO in writing. Inspection of the work will be made promptly upon notice from the CM. All cost involved in uncovering, repairing, replacing, recovering and restoring to design condition, the work that has been covered or concealed will be paid by the CM.

ARTICLE 14 - CONSTRUCTION SUPERVISION AND SCHEDULE

a. On-site representatives of the CM shall manage the work of the Principal Trade and Specialty Contractors and coordinate the work with the activities of the Owner and Project Designer to complete the project with the Owner's objectives of cost, time and quality. Throughout the progress of the work, the CM shall maintain a competent and adequate full-time staff approved by the Owner and Project Designer. It is understood that the designated and approved on-site representative of the CM will remain on the job and in responsible charge as long as those persons remain employed by the CM unless otherwise requested or agreed to by the Owner. The CM shall establish an on-site organization with appropriate lines of authority to act on behalf of the CM. Instructions, directions or notices given to the designated on-site authority shall be as binding as if given to the CM. However, directions, instructions, and notices shall be confirmed in writing.

b. The CM shall examine and study the drawings and specifications and fully understand the project design, and shall provide constant and efficient supervision to the work. Should he discover any discrepancies of any sort in the drawings or specifications, he shall report them to the designer without delay. He will not be held responsible for discrepancies in the drawings and/or specifications, but shall be held responsible to report them should they become known to him.

c. The CM shall call and preside over monthly job site progress conferences. All Principal Trade and Specialty Contractors shall be represented at these job progress conferences by both home office and project personnel. The CM shall require attendance from other subcontractors and material suppliers who can contribute toward maintaining required job progress. It shall be the principal purpose of these meetings, or conferences, to effect coordination, cooperation and assistance in every practical way toward the end of maintaining progress of the project on schedule and to complete the project within the specified contract time. The CM shall be prepared to assess progress of the work and to recommend remedial measures for correction of progress as may be appropriate. The CM with assistance from the Designer shall be the coordinator of the conferences and shall preside as chairman. The CM shall turn over a copy of his daily reports to the Designer and Owner at the job site progress conference. Owner will determine daily report format.

d. The CM shall employ an engineer or a land surveyor licensed in the State of North Carolina to lay out the work and to establish a bench mark nearby in a location where same will not be disturbed and where direct instruments sights may be taken.

e. Prior to bidding, it shall be the responsibility of the CM to prepare an electronic and paper copy of a preliminary critical path method (CPM) schedule and submit such schedule to the Project Designer for his review and comment in sufficient time to allow revisions prior to inserting said schedule into the Principal Trade and Specialty Contractors' bid packages. After contract award but prior to thirty (30) days from the date of the notice to proceed, the CM shall obtain from the Principal Trade and Specialty Contractors their respective work activities and integrate them into a project construction schedule in CPM form. The resulting CPM schedule shall show all salient features of the work required for construction of the project from start to finish within the time allotted by the contract. The time in days between the CM's early completion date and the contractual completion date is project float time and shall be used as such by the CM unless amended by change order. The CM shall submit to the Project Designer an electronic and paper copy of the final CPM schedule after contracts are executed but within fifteen (15) days prior to the written notice to proceed. The Project Designer after reviewing and commenting on the project CPM schedule shall submit it to the Owner for approval. No application for payment will be processed until the project CPM schedule is approved by the Owner. No monthly application for payment will be processed without the submission of an electronic and paper copy of the CPM schedule attached.

f. The CPM schedule shall be a complete computer-generated network analysis showing the complete sequence of construction activities, identifying the work of separate stages and other logically grouped activities, indicating early and late start and early and late finish dates, float duration and a complete logic. Monthly updates will show the estimated completion of each activity.

g. The CM shall distribute to the principal trade and specialty contractors the approved project CPM schedule and shall display same at the job site.

h. The CM shall maintain the project CPM schedule, making monthly adjustments, updates, corrections, etc., which are necessary to finish the project within the time allotted by the contract. In doing so, the CM shall keep the designer as well as all Principal Trade and Specialty Contractors fully informed as to all changes and updates to the schedule. The CM shall submit to the Project Designer a monthly report of the status of all work activities. The monthly status report shall show the actual work completed to date in comparison with the original amount of work scheduled. If the work is behind schedule, the CM must indicate in writing what measures are being taken to bring the work back on schedule and ensure that the contract completion date is not exceeded. If the work is greater than thirty (30) days behind schedule and no legitimate requests for time extensions are in process, then the CM shall prepare and submit to the Project Designer a recovery schedule for review and approval. Failure of the CM to abide by the directives in this paragraph will give the Owner cause to exercise the remedies set forth in Article 29 of the General Conditions and pursue any other legal remedies allowed it by law.

ARTICLE 15 – {NOT USED}

ARTICLE 16 - PRINCIPAL TRADE AND SPECIALTY CONTRACTS AND CONTRACTORS

a. Principal Trade and Specialty Contractors shall be pre-qualified by the CM. The prequalification criteria shall be determined by the Owner and CM to address quality, performance, the time specified in the bids for performance of the contract, the cost of construction oversight, time for completion, capacity to perform, and any other factors deemed appropriate by the Owner and/or CM. Basic qualification information from Principal Trade and Specialty Contractors shall be requested on the standard State of North Carolina

Prequalification Form approved by the State Building Commission. Only pre-qualified contractors are allowed to bid to and contract with the CM on a project.

b. All bids for Principal Trade and Specialty Contracts shall be publicly advertised and shall be opened publicly in a public venue, and once opened, shall be public records under N.C.G.S. 132. The CM shall award the contract to the lowest responsible, responsive bidder, taking into consideration quality, performance, the time specified in the bids for performance of the contract, the time for completion, compliance with N.C.G.S. 143-128.2, and other factors deemed appropriate by the Owner and advertised as part of the bid solicitation. When contracts are awarded pursuant to this section, the Owner shall provide for a dispute resolution procedure as provided by N.C.G.S. 143-128(f1). Once Principal Trade and Specialty Contractors are in place, the CM shall provide copies of the contracts to the Project Designer and also provide a list of equipment and material suppliers.

c. A CM may perform a portion of the work only if (a) bidding produces no responsible, responsive bidder for that portion of the work, or (b) the lowest responsible, responsive bidder will not execute a contract for the bid portion of the work, or the Principal Trade or Specialty Contractor defaults and a prequalified replacement cannot be obtained in a timely manner, and (c) the Owner approves performance of the work by the CM.

d. The Designer will furnish to any Principal Trade or Specialty Contractor, upon request, evidence regarding amounts of money paid to the CM on account of the work of the Principal Trade or Specialty Contractor.

e. The CM is and remains fully responsible for his own acts or omissions as well as those of any Principal Trade or Specialty Contractor or of any employee of either. The CM agrees that no contractual relationship exists between the Principal Trade and Specialty Contractors and the Owner in regard to the contract, and that the Principal Trade and Specialty Contractors act on this work as an agent or employee of the CM.

ARTICLE 17 - CONSTRUCTION MANAGER AND SUBCONTRACTOR RELATIONSHIPS

The CM agrees that the terms of these contract documents shall apply equally to each Principal Trade and Specialty Contractor as to the CM, and the CM agrees to take such action as may be necessary to bind each Principal Trade and Specialty Contractor to these terms. The CM further agrees to conform to the Code of Ethical Conduct as adopted by the Associated General Contractors of America, Inc., with respect to CM-subcontractor relationships, and that payments to Principal Trade and Specialty Contractors shall be made in accordance with the provisions of N.C.G.S. 143-134.1 titled “Interest on final payments due to prime contractors: payments to subcontractors”.

a. On all public construction contracts which are let by a board or governing body of the state government or any political subdivision thereof, except contracts let by the Department of Transportation pursuant to N.C. G.S. 136-28.1, the balance due the CM shall be paid in full within 45 days after respective prime contracts of the project have been accepted by the Owner, certified by the architect, engineer or designer to be completed in accordance with terms of the plans and specifications, or occupied by the Owner and used for the purpose for which the project was constructed, whichever occurs first. Provided, however, that whenever the architect or consulting engineer in charge of the project determines that delay in completion of the project in accordance with terms of the plans and specifications is the fault of the CM, the project may be occupied and used for the purposes for which it was constructed without payment of any interest on amounts withheld past the 45 day limit. Should final

payment to the CM beyond the date such contracts have been certified to be completed by the Project Designer, accepted by the Owner, or occupied by the Owner and used for the purposes for which the project was constructed, be delayed by more than 45 days, said CM shall be paid interest, beginning on the 46th day, at the rate of one percent (1%) per month or fraction thereof unless a lower rate is agreed upon on such unpaid balance as may be due. In addition to the above final payment provisions, periodic payments due the CM during construction shall be paid in accordance with the payment provisions of the contract documents or said CM shall be paid interest on any such unpaid amount at the rate stipulated above for delayed final payments. Such interest shall begin on the date the payment is due and continue until the date on which payment is made. Such due date may be established by the terms of the contract. Funds for payment of such interest on state-owned projects shall be obtained from the current budget of the owning department, institution or agency. Where a conditional acceptance of a contract exists, and where the Owner is retaining a reasonable sum pending correction of such conditions, interest on such reasonable sum shall not apply.

b. Within seven days of receipt by the CM of each periodic or final payment, the CM shall pay the Principal Trade and Specialty Contractors based on work completed or service provided under their contract with the CM. Should any periodic or final payment to a Principal Trade or Specialty Contractor be delayed by more than seven days after receipt of periodic or final payment by the CM, the CM shall pay the Principal Trade or Specialty Contractor interest, beginning on the eighth day, at the rate of one percent (1%) per month or fraction thereof on such unpaid balance as may be due.

c. The percentage of retainage on payments made by the CM to the Principal Trade and Specialty Contractors shall not exceed the percentage of retainage on payments made by the Owner to the CM. Any percentage of retainage on payments made by the CM to the Principal Trade or Specialty Contractors that exceeds the percentage of retainage on payments made by the Owner to the CM shall be subject to interest to be paid by the CM to the Principal Trade or Specialty Contractor at the rate of one percent (1%) per month or fraction thereof.

d. Nothing in this section shall prevent the CM at the time of application and certification to the Owner from withholding application and certification to the Owner for payment to a Principal Trade or Specialty Contractor for unsatisfactory job progress; defective construction not remedied; disputed work; third-party claims filed or reasonable evidence that claim will be filed; failure of the Principal Trade or Specialty Contractor to make timely payments for labor, equipment and materials; damage to CM or another subcontractor; reasonable evidence that a Principal Trade or Specialty Contract cannot be completed for the unpaid balance of the subcontract sum; or a reasonable amount for retainage not to exceed the initial percentage retained by Owner.

ARTICLE 18 - DESIGNER'S STATUS

a. The Project Designer shall provide liaison and necessary inspection of the work to ensure compliance with plans and specifications. He is the agent of the Owner only for the purpose of constructing this work and to the extent stipulated in the contract documents. He has authority to stop work or to order work removed, or to order corrections of faulty work where such action may be necessary to assure successful completion of the work.

b. The Project Designer is the impartial interpreter of the contract documents, and, as such, he shall exercise his powers under the contract to enforce faithful performance by both the Owner and the CM, taking sides with neither.

c. Should the Project Designer cease to be employed on the work for any reason whatsoever, then the Owner shall employ a competent replacement who shall assume the status of the former Project Designer.

d. The Project Designer will make periodic inspections of the project at intervals appropriate to the stage of construction. He will inspect the progress, the quality and the quantity of the work.

e. The Project Designer and the Owner shall have access to the work whenever it is in preparation and progress during normal working hours. The CM shall provide facilities for such access so the Designer may perform his functions under the contract documents.

f. Based on the Project Designer's inspections and evaluations of the project, the Project Designer shall issue interpretations, directives and decisions as may be necessary to assist the CM in the administration of the project. His decisions relating to artistic effect and technical matters shall be final, provided such decisions are within the limitations of the contract. The CM's decisions, however, relating to means and methods, and administration of the contracts the CM holds are final.

ARTICLE 19 - CHANGES IN THE WORK

a. The Owner may have changes made in the work covered by the contract. These changes will not invalidate and will not relieve or release the CM from any guarantee given by him pertinent to the contract provisions. These changes will not affect the validity of the guarantee bond and will not relieve the surety or sureties of said bond. All extra work shall be executed under conditions of the original contract.

b. Except in an emergency endangering life or property, no change shall be made by the contractor except upon receipt of approved change order or written field order from the designer, countersigned by the owner and the state construction office authorizing such change. No claim for adjustments of the contract price shall be valid unless this procedure is followed.

A field order, transmitted by fax or hand- delivered, may be used where the change involved impacts the critical path of the work. A formal change order shall be issued as expeditiously as possible.

The CM may be requested to make a change to the work by the Project Designer and Owner where such work is to be funded by the CM Contingency or Project Reserve that is part of the GMP contract. Such a change must be documented in the same manner as a Change Order and must be authorized in writing by the Project Designer and Owner by a Field Change document.

In the event of emergency endangering life or property, the CM may be directed to proceed on a time and material basis whereupon the CM shall proceed and keep accurately on such form as may be required, a correct account of costs together with all proper invoices, payrolls and supporting data. Upon completion of the work the change order will be prepared as outlined under either Method "c(1)" or Method "c(2)" or both.

c. In determining the values of changes, either additive or deductive, the CM and Principal Trade and Specialty Contractors are restricted to the use of the following methods:

1. Where the extra work involved is covered by unit prices quoted in the proposal, the value of the change shall be computed by application of unit prices based on quantities,

estimated or actual as agreed of the items involved, except is such cases where a quantity exceeds the estimated quantity allowance in the contract by one hundred percent (100%) or more. In such cases, either party may elect to proceed under subparagraph c2 herein. If neither party elects to proceed under c2, then unit prices shall apply.

2. The contracting parties shall negotiate and agree upon the equitable value of the change prior to issuance of the change order, and the change order shall stipulate the corresponding lump sum adjustment to the contract price.

d. Under Paragraph “b” and Methods "c(2)" above, the allowances for overhead and profit combined for a Principal Trade or Specialty Contractor and all multi-tier subcontractors shall not exceed fifteen percent (15%) of **net cost** of the work. No allowance for overhead and profit will be allowed for the CM until the change orders aggregate to a sum in excess of five percent (5%) of the Cost of the Work portion of the GMP. Once this threshold is met the CM may add an overhead & profit allowance not to exceed four percent (4%) of the net cost of the change order. Change orders to the GMP which authorize additional phases of a project without a change in scope of the originally intended project will not be considered in establishing the threshold for additional CM overhead & profit. Under Method "c (1)", no additional allowances shall be made for overhead and profit. In the case of deductible change orders, under Method "c(2)" and Paragraph (b) above, the contractor shall include no less than five percent (5%***)*** profit, but no allowances for overhead.

e. The term "net cost" as used herein shall mean the difference between all proper cost additions and deductions. The "cost" as used herein shall be limited to the following:

1. The actual costs of materials and supplies incorporated or consumed as part of the project;

2. The actual costs of labor expended on the project site;

3. The actual costs of labor burden, limited to the costs of social security (FICA) and Medicare/Medicaid taxes; unemployment insurance costs; health/dental/vision insurance premiums; paid employee leave for holidays, vacation, sick leave, and/or petty leave, not to exceed a total of 30 days per year; retirement contributions; worker’s compensation insurance premiums; and the costs of general liability insurance when premiums are computed based on payroll amounts; the total of which shall not exceed thirty percent (30%) of the actual costs of labor;

4. The actual costs of rental for tools, excluding hand tools; equipment; machinery; and temporary facilities required for the project;

5. The actual costs of premiums for bonds, insurance, permit fees and sales or use taxes related to the project.

Overtime and extra pay for holidays and weekends may be a cost item only to the extent approved by the Owner.

f. Should concealed conditions be encountered in the performance of the work below grade, or should concealed or unknown conditions in an existing structure be at variance with the conditions indicated by the contract documents, the contract sum and time for completion may be equitably adjusted by change order upon claim by either party made within thirty (30) days after the condition has been identified. The cost of such change shall be arrived at by one of the foregoing methods.

All change orders shall be supported by a breakdown showing method of arriving at net cost as defined above.

g. In all change orders, the procedure will be for the Project Designer to request proposals for the change order work in writing. The CM will require the Principal Trade and Specialty Contractors to provide such proposals and supporting data in suitable format and will review and approve such change orders prior to submission to the designer. The Project Designer shall verify correctness. Within fourteen (14) days after receipt of the CM's proposal**,** the Project Designer shall prepare the change order and forward to the CM for his signature or otherwise respond, in writing, to the CM's proposal. Within seven (7) days after receipt of the change order executed by the CM, the Project Designer shall, certify the change order by his signature, and forward the change order and all supporting data to the Owner for the Owner's signature. The Owner shall execute the change order and forward to the State Construction Office for final approval**,** within seven (7) days of receipt. The State Construction Office shall act on the change order within seven (7) days. Upon approval by the State Construction Office, one copy remains with the State Construction Office, and the remaining copies are sent to the Project Designer for distribution to the Owner(s)**,** CM and the surety. In case of emergency or extenuating circumstances, approval of changes may be obtained verbally by telephone or field orders approved by all parties, then shall be substantiated in writing as outlined under normal procedure.

h. At the time of signing a change order, the CM shall be required to certify as follows:

"I certify that my bonding company will be notified forthwith that my contract has been changed by the amount of this change order, and that a copy of the approved change order will be mailed upon receipt by me to my surety."

i. A change order, when issued, shall be full compensation, or credit, for the work included, omitted or substituted. It shall show on its face the adjustment in time for completion of the project as a result of the change in the work.

j. If, during the progress of the work, the Owner requests a change order and the CM's terms are unacceptable, the Owner**,** with the approval of the State Construction Office, may require the CM to perform such work on a time and material basis in accordance with paragraph "b" above. Without prejudice, nothing in this paragraph shall preclude the Owner from performing or to have performed that portion of the work requested in the change order.

ARTICLE 20 - CLAIMS FOR EXTRA COST

a. Should the CM consider that as a result of any instructions given in any form by the designer, he is entitled to extra cost above that stated in the contract, he shall give written notice thereof to the designer within seven (7) days without delay. The written notice shall clearly state that a claim for extra cost is being made and shall provide a detailed justification for the extra cost. The CM shall not proceed with the work affected until further advised, except in emergency involving the safety of life or property, which condition is covered in Article 19(b) and Article 11(h). No claims for extra compensation will be considered unless the claim is so made. The Designer shall render a written decision within seven (7) days of receipt of claim.

b. The CM shall not act on instructions received by him from persons other than the Project Designer, and any claims for extra compensation or extension of time on account of such instruction will not be honored. The Project Designer will not be responsible for misunderstandings claimed by the CM of verbal instructions which have not been confirmed in writing, and in no case shall instructions be interpreted as permitting a departure from the

contract documents unless such instruction is confirmed in writing and supported by a properly authorized change order.

c. Should a claim for extra compensation that complies with the requirements of (a) above by the CM be denied by the Project Designer or Owner, and cannot be resolved by a representative of the State Construction Office, the CM may request a mediation in connection with N.C.G.S. 143-128(f1) in the dispute resolution rules adopted by the State Building Commission (1 N.C.A.C. 30H .0101 through .1001). If the CM is unable to resolve its claims as a result of mediation, then the CM may pursue his claim in accordance with the provisions of N.C.G.S. 143-135.3, or G.S. 143-135.6 where Community Colleges are the owner, and the following:

1. A CM who has not completed a contract with a state agency or institution for construction or repair work and who has not received the amount he claims is due under the contract may submit a verified written claim to the Director of the State Construction Office of the Department of Administration for the amount the CM claims is due. The Director may deny, allow or compromise the claim, in whole or in part. A claim under this subsection is not a contested case under N.C.G.S. Chapter 150B.

2. (a) A CM who has completed a contract with a State agency or institution for construction or repair work and who has not received the amount he claims is due under the contract may submit a verified written claim to the Director of the State Construction Office of the Department of Administration for the amount the CM claims is due. The claim shall be submitted within sixty (60) days after the CM receives a final statement of the board's disposition of his claim and shall state the factual basis for the claim.

(b) The Director shall investigate a submitted claim within ninety (90) days of receiving the claim, or within any longer time period upon which the Director and the CM agree. The CM may appear before the Director, either in person or through counsel, to present facts and arguments in support of his claim. The Director may allow, deny or compromise the claim, in whole or in part. The Director shall give the CM a written statement of the Director's decision on the CM’s claim.

(c) A CM who is dissatisfied with the Director's decision on a claim submitted under this subsection may commence a contested case on the claim under Chapter 150B of the General Statutes. The contested case shall be commenced within sixty (60) days of receiving the Director's written statement of the decision.

(d) As to any portion of a claim that is denied by the Director, the CM may, in lieu of the procedures set forth in the preceding subsection of this section, within six (6) months of receipt of the Director's final decision, institute a civil action for the sum he claims to be entitled to under the contract by filing a verified complaint and the issuance of a summons in the Superior Court of Wake County or in the superior court of any county where the work under the contract was performed. The procedure shall be the same as in all civil actions except that all issues shall be tried by the judge, without a jury.

ARTICLE 21 - MINOR CHANGES IN THE WORK

The Project Designer will have the authority to order minor changes in the work not involving an adjustment in the contract sum or time for completion, and not inconsistent with the intent of the contract documents. Such changes shall be affected by written order, copied to the State Construction Office, and shall be binding on the Owner and the CM.

ARTICLE 22 - UNCORRECTED FAULTY WORK

Should the correction of faulty or damaged work be considered inadvisable or inexpedient by the Owner and the Project Designer, the Owner shall be reimbursed by the CM. A change order will be issued to reflect a reduction in the contract sum.

ARTICLE 23 - TIME OF COMPLETION, DELAYS, EXTENSION OF TIME

a. The final completion date will be as determined by the Owner, Designer and CM during the pre-construction phase of the project and will be incorporated into the contract for construction services between the Owner and the CM.

b. The CM shall commence work to be performed under this agreement on a date to be specified in a written Notice to Proceed from the Project Designer and shall fully complete all work hereunder within the time of completion specified. For each day in excess of the above number of days, the CM shall pay the Owner the sum stated as liquidated damages reasonably estimated in advance to cover the loses to be incurred by the Owner by reason of failure of the CM to complete the work within the time specified, such time being in the essence of this contract and a material consideration thereof. Should the work be delayed by both the owner and contractor, liquidated damages shall be apportioned to reflect the delays of each party. In the case of concurrent delays, contractor caused delays shall be accounted for before owner and designer caused delays.

c. If the CM is delayed at any time in the progress of his work by any act or negligence of the Owner or the Project Designer, or by any employee of either; by changes ordered in the work; by labor disputes at the project site; by abnormal weather conditions not reasonably anticipated for the locality where the work is performed; by unavoidable casualties; by any causes beyond the contractor's control; or by any other causes which the designer and Owner determine may justify the delay, then the contract time may be extended by change order for the time which the designer and Owner may determine is reasonable.

   Time extensions will not be granted for rain, wind, snow or other natural phenomena of normal intensity for the locality where work is performed. For purpose of determining extent of delay attributable to unusual weather phenomena, a determination shall be made by comparing the weather for the contract period involved with the average of the preceding five (5) year climatic range during the same time interval based on the National Oceanic and Atmospheric Administration National Weather Service statistics for the locality where work is performed and on daily weather logs kept on the job site by the CM reflecting the effect of the weather on progress of the work and initialed by the designer's representative. No weather delays shall be considered after the building is dried in unless work claimed to be delayed is on the critical path of the baseline schedule or approved updated schedule. Time extensions for weather delays, acts of God, labor disputes, fire, delays in transportation, unavoidable casualties or other delays which are beyond the control of the Owner do not entitle the Contractor to compensable damages for delays. Any contractor claim for compensable damages for delays is limited to delays caused solely by the owner or its agents. Contractor caused delays shall be accounted for before owner or designer caused delays in the case of concurrent delays.

d. Request for extension of time shall be made in writing to the designer, copies to the owner and SCO, within twenty (20) days following cause of delay. In case of continuing cause for delay, the CM shall notify the designer copies to the owner and SCO, of the delay within twenty (20) days of the beginning of the delay and only one claim is necessary.

e. The CM shall notify his surety in writing of extension of time granted.

f. No claim shall be allowed on account of failure of the Project Designer to furnish drawings or instructions until twenty (20) days after demand for such drawings and/or instructions. See Article 5c. Demand must be in written form clearly stating the potential for delay unless the drawings or instructions are provided. Any delay granted will begin after the twenty (20) day demand period is concluded.

ARTICLE 24 - PARTIAL UTILIZATION/BENEFICIAL OCCUPANCY

a. The Owner may desire to occupy or utilize all or a portion of the project when the work is substantially complete.

b. Should the owner request a utilization of a building or portion thereof, the designer shall perform a designer final inspection of area after being notified by the contractor that the area is ready for such. After the contractor has completed designer final inspection punch list and the designer has verified, then the designer shall schedule a beneficial occupancy inspection at a time and date acceptable to the owner, contractor(s) and State Construction Office. If beneficial occupancy is granted by the State Construction Office, in such areas the following will be established:

1. The beginning of guarantees and warranties period for the equipment necessary to support. in the area.

2. The owner assumes all responsibilities for utility costs for entire building.

3. Contractor will obtain consent of surety.

4. Contractor will obtain endorsement from insurance company permitting beneficial occupancy.

c. The Owner shall have the right to exclude the CM from any part of the project which the Project Designer has so certified to be substantially complete, but the Owner will allow the CM reasonable access to complete or correct work to bring it into compliance with the contract.

d. Occupancy by the Owner under this article will in no way relieve the CM from his contractual requirement to complete the project within the specified time. The contractor will not be relieved of liquidated damages because of beneficial occupancy. The designer may prorate liquidated damages based on the percentage of project occupied.

ARTICLE 25 - FINAL INSPECTION, ACCEPTANCE, AND PROJECT CLOSEOUT

a. Upon notification from the CM that the project is complete and ready for inspection, the Project Designer shall make a designer final inspection to verify that the project is complete and ready for SCO final inspection. Prior to SCO final inspection, the CM shall ensure that all items requiring corrective measures noted at the designer final inspection are complete.

The Project Designer shall schedule an SCO final inspection at a time and date acceptable to the Owner, the CM and the State Construction Office.

b. At the SCO final inspection, the designer and his consultants shall, if job conditions warrant, record a list of items that are found to be incomplete or not in accordance with the contract documents. At the conclusion of the SCO final inspection, the designer and State Construction Office representative shall make the following determinations:

   1. That the project is completed and accepted.

   2. That the project is accepted subject to the correction of the list of discrepancies (punch list). All punch list items must be completed within thirty (30) days of SCo final inspection or the Owner may invoke Article 28, Owner's Right to Do Work.

   3. That the project is not complete and another date for a final inspection will be established.

c. Within fourteen (14) days of acceptance per Paragraph c1 or within fourteen (14) days after completion of punch list per Paragraph c2 above, the Project Designer shall certify the work and issue applicable certificate(s) of compliance.

d. Any discrepancies listed or discovered after the date of SCO final inspection and acceptance under Paragraphs c1 or c2 above shall be handled in accordance with Article 42.

e. The date of acceptance will establish the following:

   1. The beginning of guarantees and warranties period.

   2. The date on which the CM's insurance coverage for public liability, property damage and builder's risk may be terminated.

   3. That no liquidated damages (if applicable) shall be assessed after this date.

   4. The termination date of utility cost to the CM (if applicable).

f. **Prior to issuance of final acceptance date, the contractor shall have his authorized representatives visit the project and give full instructions to the designated personnel regarding operating, maintenance, care, and adjustment of all equipment and special construction elements. In addition, the contractor shall provide to the owner a complete instructional video (media format acceptable to the owner) on the operation, maintenance, care and adjustment of all equipment and special construction elements.**

ARTICLE 26 - CORRECTION OF WORK BEFORE FINAL PAYMENT

a. Any work, materials, fabricated items or other parts of the work which have been condemned or declared not in accordance with the contract by the designer shall be promptly removed from the work site by the CM, and shall be immediately replaced by new work in accordance with the contract at no additional cost to the Owner. Work or property of the Owner, damaged or destroyed by virtue of such faulty work, shall be made good at the expense of the CM.

b. Correction of condemned work described above shall commence within twenty-four (24) hours after receipt of notice from the Project Designer, and shall make satisfactory progress until completed.

c. Should the CM fail to proceed with the required corrections, then the Owner may complete the work in accordance with the provisions of Article 28.

ARTICLE 27 - CORRECTION OF WORK AFTER FINAL PAYMENT

See Article 35, Performance Bond and Payment Bond, and Article 42, Guarantee**.** Neither the final certificate, final payment, occupancy of the premises by the Owner, nor any provision of the contract, nor any other act or instrument of the Owner, nor the Project Designer, shall relieve the CM from responsibility for negligence, or faulty material or workmanship, or failure to comply with the drawings and specifications. The CM shall correct or make good any defects due thereto and repair any damage resulting therefrom, which may appear during the guarantee period following final acceptance of the work except as stated otherwise under Article 42, Guarantee. The Owner will report any defects as they may appear to the CM and establish a time limit for completion of corrections by the CM. The Owner will be the judge as to the responsibility for correction of defects.

ARTICLE 28 - OWNER'S RIGHT TO DO WORK

If, during the progress of the work or during the period of guarantee, the CM fails to prosecute the work properly or to perform any provision of the contract, the Owner, after seven (7) days written notice sent by certified mail, return receipt requested, to the CM from the designer, may perform or have performed that portion of the work. The cost of the work may be deducted from any amounts due or to become due to the CM, such action and cost of same having been first approved by the Project Designer. Should the cost of such action of the Owner exceed the amount due or to become due the CM, then the CM or his surety, or both, shall be liable for and shall pay to the Owner the amount of said excess.

ARTICLE 29 - ANNULMENT OF CONTRACT

If the CM fails to begin the work under the contract within the time specified or fails to establish a GMP or obtain bids from or enter into contracts with qualified Principal Trade or Specialty Contractors within the GMP, or the progress of the work is not maintained on schedule, or the work is not completed within the time above specified, or fails to perform the work with sufficient workmen and equipment or with sufficient materials to ensure the prompt completion of said work, or shall perform the work unsuitably or shall discontinue the prosecution of the work, or if the CM shall become insolvent or be declared bankrupt or commit any act of bankruptcy or insolvency, or allow any final judgment to stand against him unsatisfied for a period of forty-eight (48) hours, or shall make an assignment for the benefit of creditors, or for any other cause whatsoever shall not carry on the work in an acceptable manner, the Owner may give notice in writing, sent by certified mail, return receipt requested, to the CM and his surety of such delay, neglect or default, specifying the same, and if the CM within a period of seven(7) days after such notice shall not proceed in accordance therewith, then the Owner shall, declare this contract in default, and, thereupon, the surety shall promptly take over the work and complete the performance of this contract in the manner and within the time frame specified. In the event the surety shall fail to take over the work to be done under this contract within seven(7) days after being so notified and notify the Owner in writing, sent by certified mail, return receipt requested, that he is taking the same over and stating that he will diligently pursue and complete the same, the Owner shall have full power and authority, without violating the contract, to take the prosecution of the work out of the hands of said CM, to appropriate or use any or all contract materials and equipment on the grounds as may be suitable and acceptable and may enter into an agreement, either by public letting or negotiation, for the completion of said contract according to the terms and provisions thereof or use such other methods as in his opinion shall be required for the completion of said contract in an acceptable manner. All costs and charges incurred by the Owner, together with the costs of completing the

work under contract, shall be deducted from any monies due or which may become due said CM and surety. In case the expense so incurred by the Owner shall be less than the sum which would have been payable under the contract, if it had been completed by said CM, then the said CM and surety shall be entitled to receive the difference, but in case such expense shall exceed the sum which would have been payable under the contract, then the CM and the surety shall be liable and shall pay to the Owner the amount of said excess.

ARTICLE 30 – CONSTRUCTION MANAGER'S RIGHT TO STOP WORK OR TERMINATE THE CONTRACT

a. Should the work be stopped by order of a court having jurisdiction, or by order of any other public authority for a period of three months, due to cause beyond the fault or control of the CM, or if the Owner should fail or refuse to make payment on account of a certificate issued by the designer within forty-five (45) days after receipt of same, then the CM, after fifteen (15) days' written notice sent by certified mail, return receipt requested, to the Owner and the designer, may suspend operations on the work or terminate the contract.

b. The Owner shall be liable to the CM for the cost of all materials delivered and work performed on this contract plus ten (10) percent overhead and profit and shall make such payment. The designer shall be the judge as to the correctness of such payment.

ARTICLE 31 - REQUEST FOR PAYMENT

a. Not later than the fifth day of the month, the CM shall submit to the designer a request for payment for work done during the previous month. The request shall be in the form agreed upon between the CM and the designer, but shall show substantially the value of work done and materials delivered to the site during the period since the last payment, and shall sum up the financial status of the contract with the following information:

1. Total of contract including change orders.

2. Value of work completed to date.

3. Less five percent (5%) retainage, provided however, that after fifty percent (50%) of the CM's work has been satisfactorily completed on schedule, with approval of the owner and the State Construction Office and written consent of the surety, further requirements for retainage will be waived only so long as work continues to be completed satisfactorily and on schedule.

4. Less previous payments.

5. Current amount due.

b. Prior to submitting the first payment request, the CM shall prepare a schedule showing a breakdown of the contract price into values of the various parts of the GMP contract. The Cost of the Work breakdown will be arranged so as to facilitate payments to the Principal Trade and Specialty Contractors in accordance with Article 17. The combined CM Construction Management Fee, Bonds & Insurance, CM Contingency, and Project Reserve (if any) will be shown on the Schedule of values as separate lines. The values for the CM Contingency and Project Reserve (if any) will move to appropriate lines within the Cost of the Work as those funds are committed and expended. This schedule of values will be submitted to & approved by the designer and Owner within 30 days of the Notice to Proceed.

The schedule of values shall be prepared in such form and supported by such data to substantiate its accuracy as the designer and Owner may require.

.

c. Applications for payment shall be in a form agreed upon by the CM, designer and Owner and shall prepared and supported by such data to substantiate the accuracy of the request as the designer may require.

d. Subject to other provisions of the contract documents, the amount of each progress payment shall be computed as follows:

1. Take that portion of the GMP properly allocable to completed work as determined by multiplying the percentage completion of each portion Cost of the Work by the share of the GMP allocated to that portion of the work in the schedule of values.

2. Add that portion of the GMP properly allocable to materials and equipment delivered and suitably stored at the site for subsequent incorporation in the work or if approved in advance by the Owner, suitably stored off site at a location agreed upon in writing.

3. Subtract the aggregate of previous payments made by the Owner.

4. Subtract the amount, in any, by which the CM has been previously overpaid, as evidenced by the Owner's review of the CM's documentation.

5. Subtract amounts, if any, for which the Project Designer has withheld or nullified a certificate of payment.

6. Subtract retainage as per paragraph (h) below.

7. Add the amount due for the CM Construction Management Fee calculated on the basis the percentage completion of the project or on a schedule of payment negotiated with the Owner less fifteen percent (15%) and less previous payments for CM Construction Management Fee.

e. Payment allocated to Principal Trade and Specialty Contractors shall be subject to five percent (5%) retainage, provided, however that after fifty percent (50%) of the Cost of the Work has been satisfactorily completed on schedule, with the approval of the Owner and the State Construction Office and with written consent of the surety, further requirements for retainage will be waived only so long as work continues to be completed satisfactorily and on schedule. The balance of the CM Construction Management Fee shall be held by the Owner until satisfactory completion and close out of the project. Satisfactory completion and close out of the project is understood to mean that the Owner and Project Designer are satisfied that the project has been completed in accordance with the plans and specifications and within the GMP, all general conditions of the contract pertaining to close out have been satisfied, and all Principal Trade and Specialty Contractors have satisfactorily completed their respective contracts. No retainage will be held for the cost of Bonds and Insurance

f. When payment is made on account of stored materials and equipment, such materials must be stored on the owner's property, and the requests for payments shall be accompanied by invoices or bills of sale or other evidence to establish the owner's title to such materials and equipment. Such payments will be made only for materials that have been customized or fabricated specifically for this project. Raw materials or commodity products including but not limited to piping, conduit, CMU, metal studs and gypsum board may not be submitted. Responsibility for such stored materials and equipment shall remain with the CM regardless

of ownership title. Such stored materials and equipment shall not be removed from the owner's property. Should the space for storage on-site be limited, the CM, at his option, shall be permitted to store such materials and/or equipment in a suitable space off-site. Should the CM desire to include any such materials or equipment in his application for payment, they must be stored in the name of the owner in an independent, licensed, bonded warehouse approved by the designer, owner and the State Construction Office and located as close to the site as possible. The warehouse selected must be approved by the CM's bonding and insurance companies; the material to be paid for shall be assigned to the owner and shall be inspected by the designer. Upon approval by the designer, owner and SCO of the storage facilities and materials and equipment, payment therefore will be certified. Responsibility for such stored materials and equipment shall remain with the CM. Such stored materials and equipment shall not be moved except for transportation to the project site. Under certain conditions, the designer may approve storage of materials at the point of manufacture, which conditions shall be approved by the designer, the owner and the State Construction Office prior to approval for the storage and shall include an agreement by the storing party which unconditionally gives the State absolute right to possession of the materials at any time. Bond, security and insurance protection shall continue to be the responsibility of the CM.

g. In the event of beneficial occupancy, retainage of funds due the CM may be reduced with the approval of the State Construction Office to an equitable amount to cover the list of items to be completed or corrected. Retainage may not be reduced to less than two and one-half (2 1/2) times the estimated value of the work to be completed or corrected. Reduction of retainage must be with the consent and approval of the CM's bonding company.

ARTICLE 32 - CERTIFICATES OF PAYMENT AND FINAL PAYMENT

a. Within five (5) days from receipt of request for payment from the CM, the designer shall issue and forward to the Owner a certificate for payment. This certificate shall indicate the amount requested or as approved by the designer. If the certificate is not approved by the designer, he shall state in writing to the CM and the Owner his reasons for withholding payment.

b. No certificate issued or payment made shall constitute an acceptance of the work or any part thereof. The making and acceptance of final payment shall constitute a waiver of all claims by the Owner except:

1. Claims arising from unsettled liens or claims against the CM.

2. Faulty work or materials appearing after final payment.

3. Failure of the contractor to perform the work in accordance with drawings and specifications, such failure appearing after payment.

4. As conditioned in the performance bond and payment bond.

c. The making and acceptance of final payment shall constitute a waiver of all claims by the CM except those claims previously made and remaining unsettled (Article 20(c)).

d. Prior to submitting request for final payment to the designer for approval, the CM shall fully comply with all requirements specified in the “project closeout” section of the specifications. These requirements include but not limited to the following:

1. Submittal of Product and Operating Manuals, Warranties and Bonds, Guarantees, Maintenance Agreements, As-Built Drawings, Certificates of Inspection or Approval

from agencies having jurisdiction. (The designer must approve the Manuals prior to delivery to the Owner).

2. Transfer of required attic stock material and all keys in an organized manner.

3. Record of Owner's training.

4. Resolution of any final inspection discrepancies.

5. Granting access to Contractor's records, if Owner's internal auditors have made a request for such access pursuant to Article 52.

e. The CM shall forward to the designer, the final application for payment along with the following documents:

1. List of minority business subcontractors and material suppliers showing breakdown of contracts amounts and total actual payments to subcontractors and material suppliers.

2. Affidavit of Release of Liens.

3. Affidavit from CM of payment to material suppliers and subcontractors. (See Article 36).

4. Consent of Surety to Final Payment**.**

5. Certificates of state agencies required by state law.

f. The designer will not authorize final payment until the work under contract has been certified by Project Designer, certificates of compliance issued, and the CM has complied with the closeout requirements. The designer shall forward the CM's final application for payment to the Owner along with respective certificate(s) of compliance required by law.

ARTICLE 33 - PAYMENTS WITHHELD

a. The designer with the approval of the State Construction Office may withhold payment for the following reasons:

1. Faulty work not corrected.

2. The unpaid balance on the contract is insufficient to complete the work in the judgment of the designer.

3. To provide for sufficient contract balance to cover liquidated damages that will be assessed against the CM.

b. The Secretary of the Department of Administration may authorize the withholding of payment for the following reasons:

1. Claims filed against the CM or evidence that a claim will be filed.

2. Evidence that Principal Trade or Specialty Contractors have not been paid.

c. The Owner may withhold all or a portion of CM's Project Management Fee costs set forth in the approved schedule of values, if CM has failed to comply with: (1) a request to access its records by Owner's internal auditors pursuant to Article 52; (2) a request for a plan of action and/or recovery schedule under Article 14.j or provide The Owner; (3) a request to provide an electronic copies of Contractor's baseline schedule, updates with all logic used to create the schedules in the original format of the scheduling software; and (4) Contractor's failure to have its Superintendent on the Project full-time.

d. When grounds for withholding payments have been removed, payment will be released. Delay of payment due the CM without cause will make owner liable for payment of interest to the CM in accordance with G.S. 143-134.1. As provided in G.S.143-134.1(e) the owner shall not be liable for interest on payments withheld by the owner for unsatisfactory job progress, defective construction not remedied, disputed work, or third-party claims filed against the owner or reasonable evidence that a third-party claim will be filed.

ARTICLE 34 - MINIMUM INSURANCE REQUIREMENTS

The work under this contract shall not commence until the CM has verified to the Owner that all required insurance and verifying certificates of insurance have been obtained and approved in writing by the Owner. These certificates shall contain a provision that coverages afforded under the policies will not be cancelled, reduced in amount or coverages eliminated until at least thirty (30) days after mailing written notice, by certified mail, return receipt requested, to the insured and the Owner of such alteration or cancellation.

a. **Worker's Compensation and Employer's Liability**

The CM shall ensure that it and all Principal Trade and Specialty Contractors shall provide and maintain, during the life of the contract, workmen's compensation insurance, as required by law, as well as employer's liability coverage with minimum limits of $100,000.

b. **Public Liability and Property Damage**

The CM shall ensure that it and all Principal Trade and Specialty Contractors shall provide and maintain, during the life of the contract, comprehensive general liability insurance, including coverage for premises operations, independent contractors, completed operations, products and contractual exposures, as shall protect such contractors from claims arising out of any bodily injury, including accidental death, as well as from claims for property damages which may arise from operations under this contract, whether such operations be by the contractor or by any subcontractor, or by anyone directly or indirectly employed by either of them and the minimum limits of such insurance shall be as follows:

Bodily Injury:	$500,000 per occurrence
Property Damage:	$100,000 per occurrence / $300,000 aggregate

In lieu of limits listed above, a $500,000 combined single limit shall satisfy both conditions.

Such coverage for completed operations must be maintained for at least two (2) years following final acceptance of the work performed under the contract.

c. **Property Insurance (Builder's Risk/Installation Floater)**

The CM shall ensure that it and all Principal Trade and Specialty Contractors shall purchase and maintain property insurance during the life of this contract, upon the entire work at the

site to the full insurable value thereof. This insurance shall include the interests of the Owner, the CM, and subcontractors in the work and shall insure against the perils of fire, extended coverage, and vandalism and malicious mischief. If the Owner is damaged by failure of the CM to purchase or maintain such insurance, then the CM shall bear all reasonable costs properly attributable thereto; the CM shall affect and maintain similar property insurance on portions of the work stored off the site when request for payment per articles so includes such portions.

d. **Deductible**

Any deductible, if applicable to loss covered by insurance provided, is to be borne by the CM and/or the Principal Trade or Specialty Contractor as applicable.

e. **Other Insurance**

The CM shall ensure that it and all Principal Trade and Specialty Contractors shall obtain such additional insurance as may be required by the Owner or by the General Statutes of North Carolina including motor vehicle insurance, in amounts not less than the statutory limits.

f. **Proof of Carriage**

The CM shall ensure that it and all Principal Trade and Specialty Contractors shall furnish the Owner with satisfactory proof of carriage of the insurance required before written approval is granted by the Owner.

.

ARTICLE 35 - PERFORMANCE BOND AND PAYMENT BOND

a. The CM shall furnish a performance bond and payment bond executed by a surety company authorized to do business in North Carolina. The bonds shall be in the full contract amount, which shall be in the amount of the GMP for the entire project. Bonds shall be executed in the form bound with the specifications

b. All bonds shall be countersigned by an authorized agent of the bonding company who is licensed to do business in North Carolina.

ARTICLE 36 - CONTRACTOR'S AFFIDAVIT

The final payment of retained amount due the CM on account of the contract shall not become due until the CM has furnished to the Owner through the designer an affidavit signed, sworn and notarized to the effect that all payments for materials, services or subcontracted work to Principal Trade and Specialty Contractors in connection with his contract have been satisfied, and that no claims or liens exist against the CM in connection with this contract. In the event that the CM cannot obtain similar affidavits from the Principal Trade and Specialty Contractors to protect the CM and the Owner from possible liens or claims against the subcontractor, the CM shall state in his affidavit that no claims or liens exist against any subcontractor to the best of his (the CM's) knowledge, and if any appear afterward, the CM shall save the Owner harmless.

ARTICLE 37 - ASSIGNMENTS

The CM shall not assign any portion of this contract nor subcontract in its entirety. Except as may be required under terms of the performance bond or payment bond, no funds or sums of money due or become due the CM under the contract may be assigned.

ARTICLE 38 - USE OF PREMISES

a. The CM shall confine his apparatus, the storage of materials and the operations of his workmen to limits indicated by law, ordinances, permits or directions of the designer and shall not exceed those established limits in his operations.

b. The CM shall not load or permit any part of the structure to be loaded with a weight that will endanger its safety.

c. The CM shall enforce the designer's and owner's instructions regarding signs, advertisements, fires and smoking.

d. No firearms, any type of alcoholic beverages or drugs (other than those prescribed by a physician) will be permitted at the job site.

ARTICLE 39 - CUTTING, PATCHING AND DIGGING

a. The CM shall ensure that all cutting, fitting or patching that may be required to make the work come together properly and fit it to receive or be received by work of other contractors shown upon or reasonably implied by the drawings and specifications for the completed structure, as the designer may direct.

b. Any cost brought about by defective or ill-timed work shall be borne by the party responsible therefor.

c. No Principal Trade or Specialty Contractor shall endanger any work of another such contractor by cutting, digging or other means, nor shall he cut or alter the work of any other such contractor without the consent of the designer and the affected contractor(s).

ARTICLE 40 - UTILITIES, STRUCTURES, SIGNS

a. The CM shall provide necessary and adequate facilities for water, electricity, gas, oil, sewer, and other utility services, which may be necessary and required for completion of the project. If the Owner specifies that the CM is to pay all utilities, any permanent meters installed shall be listed in the CM's name until his work is fully accepted by the Owner. As stipulated in the Supplementary General Conditions, the Owner may: (1) pay utilities cost directly, (2) require the CM to pay all utilities cost, (3) or reimburse the CM for the actual cost of utilities. The Owner or CM, as applicable, may recover actual costs of metered utilities from the responsible party should delays occur in project completion. Coordination of the work of the utility companies during construction is the sole responsibility of the CM.

b. If applicable Meters shall be relisted in the Owner's name on the day following completion and acceptance of the CM's work, and the Owner shall pay for services used after that date.

c. Prior to the operation of permanent systems, the CM will provide temporary power, lighting, water, and heat to maintain space temperature above freezing, as required for construction operations.

d. The CM shall ensure that the permanent building systems are in sufficient readiness for furnishing temporary climatic control at the time a building is enclosed and secured. The HVAC systems shall maintain climatic control throughout the enclosed portion of the building sufficient to allow completion of the interior finishes of the building. A building shall be considered enclosed and secured when windows**,** doorways (exterior, mechanical, and

electrical equipment rooms), and hardware are installed*;* and other openings have protection, which will provide reasonable climatic control. The appropriate time to start the mechanical systems and climatic condition shall be jointly determined by the CM and the designer. Use of the equipment in this manner shall in no way affect the warranty requirements of the CM.

e. The CM shall coordinate the work so that the building's permanent power wiring distribution system shall be in sufficient readiness to provide power as required by the HVAC contractor for temporary climatic control.

f. The CM shall coordinate the work so that the building's permanent lighting system shall be ready at the time interior painting and finishing begins and shall provide adequate lighting in those areas where interior painting and finishing is being performed.

g. The CM shall be responsible for his permanently fixed service facilities and systems in use during progress of the work. The following procedures shall be strictly adhered to:

    1. Prior to acceptance of work by the State Construction Office, the CM shall coordinate the removal and replacement of any parts of the permanent building systems damaged through use during construction.

    2. Temporary filters as recommended by the equipment manufacturer in order to keep the equipment and ductwork clean and free of dust and debris shall be installed in each of the heating and air conditioning units and at each return grille during construction. New filters shall be installed in each unit prior to the Owner's acceptance of the work.

    3. Extra effort shall be maintained to keep the building and the site adjacent to the building clean and under no circumstances shall air systems be operated if finishing and site work operations are creating dust in excess of what would be considered normal if the building were occupied.

    4. It shall be understood that any warranty on equipment presented to the Owner shall extend from the day of final acceptance by the Owner. The cost of warranting the equipment during operation in the finishing stages of construction shall be borne by the contractor whose system is utilized.

    5. The CM shall ensure that all lamps are in proper working condition at the time of final project acceptance.

h. The CM shall provide, if required and where directed, a shed for toilet facilities and shall furnish and install in this shed all water closets required for a complete and adequate sanitary arrangement. These facilities will be available to other contractors on the job and shall be kept in a neat and sanitary condition at all times. Chemical toilets are acceptable.

i. The CM shall, if required by the Supplementary General Conditions and where directed, erect a temporary field office, complete with lights, telephone, heat and air conditioning. A portion of this office shall be partitioned off, of sufficient size, for the use of a resident inspector, should the designer so direct.

j. On multi-story construction projects, the CM shall either provide or ensure that temporary elevators, lifts, or other necessary special equipment is available for the general use of all contractors. The cost for such elevators, lifts or other special equipment and the operation thereof shall either be included in the CM Construction Management Fee or specified as part of the work of a Principal Trade or Specialty Contractor and paid for as a part of the Cost of the Work.

k. The CM will erect one sign on the project if required. The sign shall be of sound construction, and shall be neatly lettered with black letters on white background. The sign shall bear the name of the project, and the CM's name, and the name of the designer and consultants. Directional signs may be erected on the Owner's property subject to approval of the Owner with respect to size, style and location of such directional signs. Such signs may bear the name of the contractor and a directional symbol. No other signs will be permitted except by permission of the Owner.

ARTICLE 41 - CLEANING UP

a. The CM shall ensure that the building and surrounding area is reasonably free from rubbish at all times, and shall remove debris from the site on a timely basis or when directed to do so by the designer. The CM shall provide an on-site refuse container(s) for the use of all Principal Trade and Specialty Contractors. The CM shall ensure that each Principal Trade and Specialty Contractor removes their rubbish and debris from the building on a daily basis. The CM shall ensure that the building is broom cleaned as required to minimize dust and dirt accumulation.

b. The CM shall provide and maintain suitable all-weather access to the building.

c. Before final inspection and acceptance of the building, the CM shall ensure that all portions of the work are clean, including glass, hardware, fixtures, masonry, tile and marble (using no acid), clean and wax all floors as specified, and completely prepare the building for use by the Owner, with no cleaning required by the Owner.

ARTICLE 42 - GUARANTEE

a. The CM shall unconditionally guarantee materials and workmanship against patent defects arising from faulty materials, faulty workmanship or negligence for a period of twelve (12) months following the date of final acceptance of the work or beneficial occupancy and shall replace such defective materials or workmanship without cost to the Owner.

b. Where items of equipment or material carry a manufacturer's warranty for any period in excess of twelve (12) months, then the manufacturer's warranty shall apply for that particular piece of equipment or material. The CM shall replace such defective equipment or materials, without cost to the Owner, within the manufacturer's warranty period.

c. Additionally, the Owner may bring an action for latent defects caused by the negligence of the CM, which is hidden or not readily apparent to the Owner at the time of beneficial occupancy or final acceptance, whichever occurred first, in accordance with applicable law.

d. Guarantees for roof, equipment, materials, and supplies shall be stipulated in the specification sections governing such roof, equipment, materials, or supplies.

ARTICLE 43 - CODES AND STANDARDS

Wherever reference is given to codes, standard specifications or other data published by regulating agencies including, but not limited to, national electrical codes, North Carolina State Building Codes, federal specifications, ASTM specifications, various institute specifications, etc., it shall be understood that such reference is to the latest edition including addenda published prior to the date of the contract documents.

ARTICLE 44 - INDEMNIFICATION

To the fullest extent permitted by law, the CM shall indemnify and hold harmless the Owner, the designer and the agents, consultants and employees of the Owner and designer, from and against all claims, damages, losses and expenses, including, but not limited to, attorneys' fees, arising out of or resulting from the performance or failure of performance of the work, provided that any such claim, damage, loss or expense (1) is attributable to bodily injury, sickness, disease or death, or to injury to or destruction of tangible property (other than the work itself) including the loss of use resulting therefrom, and (2) is caused in whole or in part by any negligent act or omission of the CM, the CM's subcontractor, or the agents of either the CM or the CM's subcontractor. Such obligation shall not be construed to negate, abridge or otherwise reduce any other right or obligation of indemnity which would otherwise exist as to any party or person described in this article.

ARTICLE 45 - TAXES

a. Federal excise taxes do not apply to materials entering into state work (Internal Revenue Code, Section 3442(3)).

b. Federal transportation taxes do not apply to materials entering into state work (Internal Revenue Code, Section 3475(b) as amended).

c. North Carolina sales tax and use tax, as required by law, do apply to materials entering into state work and such costs shall be included in the bid proposal and contract sum.

d. Local option sales and use taxes, as required by law, do apply to materials entering into state work as applicable and such costs shall be included in the bid proposal from Principal Trade and specialty Contractors and contract sum.

e. Accounting Procedures for Refund of County Sales & Use Tax

   Amount of county sales and use tax paid per CM's statements:

   CM's performing contracts for state agencies shall ensure that the Principal Trade and Specialty Contractors provide information to allow the CM to give the state agency for whose project the materials, supplies, fixtures and/or equipment was purchased a signed statement containing the information listed in N.C.G.S. 105-164.14(e).

   The Department of Revenue has agreed that in lieu of obtaining copies of sales receipts from contractors, an agency may obtain a certified statement from the contractors setting forth the date, the type of property and the cost of the property purchased from each vendor, the county in which the vendor made the sale and the amount of local sales and use taxes paid thereon. If the property was purchased out-of-state, the county in which the property was delivered should be listed. The contractor should also be notified that the certified statement may be subject to audit.

   In the event the contractors make several purchases from the same vendor, such certified statement must indicate the invoice numbers, the inclusive dates of the invoices, the total amount of the invoices, the counties, and the county sales and use taxes paid thereon.

   Name of taxing county: The position of a sale is the retailer's place of business located within a taxing county where the vendor becomes contractually obligated to make the sale. Therefore, it is important that the county tax be reported for the county of sale rather than the county of use.

When property is purchased from out-of-state vendors and the county tax is charged, the county should be identified where delivery is made when reporting the county tax.

Such statement must also include the cost of any tangible personal property withdrawn from the contractor's warehouse stock and the amount of county sales or use tax paid thereon by the CM.

Contractors are not to include any tax paid on supplies, tools and equipment which they use to perform their contracts and should include only those building materials, supplies, fixtures and equipment which actually become a part of or annexed to the building or structure.

ARTICLE 46 - EQUAL OPPORTUNITY CLAUSE

The non-discrimination clause contained in Section 202 (Federal) Executive Order 11246, as amended by Executive Order 11375, relative to equal employment opportunity for all persons without regard to race, color, religion, sex or national origin, and the implementing rules and regulations prescribed by the Secretary of Labor, are incorporated herein.

ARTICLE 47 - EMPLOYMENT OF INDIVIDUALS WITH DISABILITIES

The CM agrees not to discriminate against any employee or applicant for employment because of physical or mental handicap in regard to any position for which the employee or applicant is qualified. The CM agrees to take affirmative action to employ, advance in employment and otherwise treat qualified handicapped individuals without discrimination based upon their physical or mental handicap in all employment practices.

ARTICLE 48 - ASBESTOS-CONTAINING MATERIALS (ACM)

The State of North Carolina has attempted to address all asbestos-containing materials that are to be disturbed in the project. However, there may be other asbestos-containing materials in the work areas that are not to be disturbed and do not create an exposure hazard. Construction Managers are reminded of the requirements of instructions under General Conditions of the Contract, titled Examination of Conditions. Statute 130A, Article 19, amended August 3, 1989, established the Asbestos Hazard Management Program that controls asbestos abatement in North Carolina. The latest edition of *Guideline Criteria for Asbestos Abatement* from the State Construction Office is to be incorporated in all asbestos abatement projects for the Capital Improvement Program.

ARTICLE 49 - MINORITY BUSINESS PARTICIPATION

N.C.G.S. 143-128.2 establishes a ten percent (10%) goal for participation by minority businesses in total value of work for each State building project and requires documentation of good faith efforts for meeting that goal. The document, *Guidelines for Recruitment and Selection of Minority Businesses for Participation in State Construction Contracts* including Affidavits and Appendix F are hereby incorporated into and made a part of this contract.

The CM shall identify and define contract packages (the value of which shall total to at least ten percent (10%) of the GMP) that remove barriers to participation commonly experienced by Historically Underutilized Businesses and Minority Business Enterprises as those terms are defined in North Carolina General Statute 143-128.2, hereinafter referred to as Reduced Barrier Packages (RBP). Such contract packages will be submitted to the Owner for review. As an example, RBP's may require no performance or payment bond, or may offer the participation of the CM as a guarantor or surety in the financing of material purchases by the Principal Trade and/or Specialty Contractors, provided that the CM may condition such financing participation upon the

issuance of joint checks or other similar arrangements to allow the CM to verify that timely payments are made to suppliers furnishing credit. The CM may propose other and/or additional provisions for reducing barriers to participation.

The Owner shall require the CM to submit a plan for compliance with N.C.G.S.143-128.2 by approval by the Owner prior to soliciting bids for the Principal Trade and Specialty Contracts. The CM and Principal Trade and Specialty Contractors shall make a good faith effort to recruit and select minority businesses for participation in contracts pursuant to N.C.G.S. 143-128.2.

ARTICLE 50 – CONTRACTOR EVALUATION

The CM's overall work performance on the project shall be fairly evaluated in accordance with the State Building Commission policy and procedures, for determining qualifications to compete for future capital improvement projects for institutions and agencies of the State of North Carolina. In addition to final evaluation, interim evaluation may be prepared during the progress of project. The document, Construction Manager Evaluation Procedures, is hereby incorporated and made a part of this contract. The Owner may request the CM's comments to evaluate the designer.

ARTICLE 51 – GIFTS

Pursuant to N.C. Gen. Stat. § 133-32, it is unlawful for any vendor or contractor (i.e. architect, bidder, contractor, construction manager, design professional, engineer, subcontractor, supplier, vendor, etc.), to make gifts or to give favors to any State employee. This prohibition covers those vendors and contractors who: (1) have a contract with a governmental agency; or (2) have performed under such a contract within the past year; or (3) anticipate bidding on such a contract in the future. For additional information regarding the specific requirements and exemptions, vendors and contractors are encouraged to review G.S. Sec. 133-32.

During the construction of the Project, the Contractor is prohibited from making gifts to any of the Owner's employees, Owner's project representatives (architect, engineers, construction manager and their employees), employees of the State Construction Office and/or any other State employee that may have any involvement, influence, responsibilities, oversight, management and/or duties that pertain to and/or relate to the contract administration, financial administration and/or disposition of claims arising from and/or relating to the Contract and/or Project.

ARTICLE 52 – AUDITING-ACCESS TO PERSONS AND RECORDS

In accordance with N.C. General Statute 147-64.7, the State Auditor shall have access to Contractor's officers, employees, agents and/or other persons in control of and/or responsible for the Contractor's records that relate to this Contracts for purposes of conducting audits under the referenced statute. The Owner's internal auditors shall also have the right to access and copy the Contractor's records relating to the Contract and Project during the term of the Contract and within two years following the completion of the Project/close-out of the Contract to verify accounts, accuracy, information, calculations and/or data affecting and/or relating to Contractor's requests for payment, requests for change orders, change orders, claims for extra work, requests for time extensions and related claims for delay/extended general conditions costs, claims for lost productivity, claims for loss efficiency, claims for idle equipment or labor, claims for price/cost

escalation, pass-through claims of subcontractors and/or suppliers, and/or any other type of claim for payment or damages from Owner and/or its project representatives.

ARTICLE 53 – NORTH CAROLINA FALSE CLAIMS ACT

The North Carolina False Claims Act ("NCFCA"), N.C Gen. Stat. § 1-605 through 1-618, applies to this Contract. The Contractor should familiarize itself with the entire NCFCA and should seek the assistance of an attorney if it has any questions regarding the NCFCA and its applicability to any requests, demands and/or claims for payment its submits to the State through the contracting state agency, institution, university or community college.

The purpose of the NCFCA "is to deter persons from knowingly causing or assisting in causing the State to pay claims that are false or fraudulent and to provide remedies in the form of treble damages and civil penalties when money is obtained from the State by reason of a false or fraudulent claim." (Section 1-605(b).) A contractor's liability under the NCFCA may arise from, but is not limited to: requests for payment, invoices, billing, claims for extra work, requests for change orders, requests for time extensions, claims for delay damages/extended general conditions costs, claims for loss productivity, claims for loss efficiency, claims for idle equipment or labor, claims for price/cost escalation, pass-through claims of subcontractors and/or suppliers, documentation used to support any of the foregoing requests or claims, and/or any other request for payment from the State through the contracting state agency, institution, university or community college. The parts of the NCFCA that are most likely to be enforced with respect to this type of contract are as follows:

- A "claim" is "[a]ny request or demand, whether under a contract or otherwise, for money or property and whether or not the State has title to the money or property that (i) is presented to an officer, employee, or agent of the State or (ii) is made to a contractor … if the money or property is to be spent or used on the State's behalf or to advance a State program or interest and if the State government: (a) provides or has provided any portion of the money or property that is requested or demanded; or (b) will reimburse such contractor … for any portion of the money or property which is requested or demanded." (Section 1-606(2).)

- "Knowing" and "knowingly." – Whenever a person, with respect to information, does any of the following: (a) Has actual knowledge of the information; (b) Acts in deliberate ignorance of the truth or falsity of the information; and/or (c) Acts in reckless disregard of the truth or falsity of the information. (Section 1-606(4).) Proof of specific intent to defraud is not required. (Section 1-606(4).)

- "Material" means having a natural tendency to influence, or be capable of influencing, the payment or receipt of money or property. (Section 1-606(4).)

- Liability. – "Any person who commits any of the following acts shall be liable to the State for three times the amount of damages that the State sustains because of the act of that person[:] … (1) Knowingly presents or causes to be presented a false or fraudulent claim for payment or

approval. (2) Knowingly makes, uses, or causes to be made or used, a false record or statement material to a false or fraudulent claim. (3) Conspires to commit a violation of subdivision (1), (2) …" (Section 1-607(a)(1), (2).)

- The NCFCA shall be interpreted and construed so as to be consistent with the federal False Claims Act, 31 U.S.C. § 3729, et seq., and any subsequent amendments to that act. (Section 1-616(c).)

Finally, the contracting state agency, institution, university or community college may refer any suspected violation of the NCFCA by the Contractor to the Attorney General's Office for investigation. Under Section 1-608(a), the Attorney General is responsible for investigating any violation of NCFCA, and may bring a civil action against the Contractor under the NCFCA. The Attorney General's investigation and any civil action relating thereto are independent and not subject to any dispute resolution provision set forth in this Contract. (See Section 1-608(a).)

ARTICLE 54 – TERMINATION FOR CONVENIENCE

a. Owner may at any time and for any reason terminate CM's services and work at Owner's convenience. Upon receipt of such notice, CM shall, unless the notice directs otherwise, immediately discontinue the work and placing of orders for materials, facilities and supplies in connection with the performance of this Agreement.

b. Upon such termination, CM shall be entitled to payment only as follows: (1) the actual cost of the work completed in conformity with this Agreement; plus, (2) such other costs actually incurred by CM as are permitted by the prime contract and approved by Owner; (3) plus ten percent (10%) of the cost of the work referred to in subparagraph (1) above for overhead and profit. There shall be deducted from such sums as provided in this subparagraph the amount of any payments made to CM prior to the date of the termination of this Agreement. CM shall not be entitled to any claim or claim of lien against Owner for any additional compensation or damages in the event of such termination and payment.

000006 – SUPPLEMENTARY GENERAL CONDITIONS

PART 1 - GENERAL

1.1 SUMMARY

The following modifies the January 2013 rev 1 edition of the General Conditions of the Contract, State of North Carolina Form OC-15 CMR, and supersedes them only as modified per this document. CM and CMR will hereinafter refer to the Construction Manager at Risk.

A. ARTICLE I - Definitions:

1. Paragraph “b” Add the following to the end of the paragraph:

   Owner's representative: North Carolina Department of Cultural and Natural Resources (NCDCNR) represents the Owner in all matters pertaining to construction contracts. NCDCNR will designate a Project Manager, James Mancari, for the project. All official contacts, decisions, directions, problem resolution, and coordination required with NCDCNR and Ft. Fisher Aquarium will be through the Project Manager. This requirement does not modify the responsibilities of the Designer as stated in the General Conditions. The term Owner, NCDCNR Project Manager and Ft. Fisher Aquarium Representative shall be synonymous.

2. Paragraph “c” Add the following second sentence:

   The Designer or Project Designer as referred to herein shall mean Architect or Engineer and throughout the documents the word designer or project designer shall mean Designer.

3. Paragraph “d” Add the following second sentence:

   The CM, CMa or CMR as referred to herein shall mean the Construction Manager at Risk.

4. Paragraph “l” Add the following sentence:

   Refer to Section 013200 “Construction Progress Documentation” for the definition of “Schedule” as it relates to “Time of Completion”.

5. Paragraph “t” Delete this paragraph and replace with the following:

   “Or approved equal”, “equivalent”, and “equal to” shall mean a product or products by manufacturers other than those listed in the specifications that may be incorporated into the work, subject to compliance with the requirements of the section, and after review and concurrence by the Designer and the Owner.

6. Paragraph “u” “Substitute” or “substitution" shall mean a product or products by manufacturers not listed in the specifications and are not an “or approved equal”, “equivalent” or an “equal to.”

7. Paragraph “v” Delete this paragraph and replace with the following:

   “Provide" shall mean furnish and install complete, in place, new, clean, fully tested, operational, and ready for use.

8. Paragraph “cc” Add the following after “Final Acceptance”:

   Or “Acceptance by Owner”.

9. Paragraph “dd” Add the following new paragraph:

   “Latest edition" shall mean the current printed version of the referenced document issued up to 30 calendar days prior to date of receipt of bids, unless specified otherwise

10. Paragraph “ee” Add the following new paragraph:

    “Drawings" or "plans" shall mean the drawings enumerated in the contract documents, as well as all the information in the detail manual when applicable, addenda, and designer prepared field drawings, bulletin and clarification drawings.

11. Paragraph “ff” Add the following new paragraph:

    "Specifications" mean this project manual and addenda thereto.

B. ARTICLE 4 is appended as follows:

1. Cost for additional complete sets of Plans and Specifications will be $1,600.00.

2. Construction Documents are available to Bidders on the Designers “Cloud” site and access to that site will be provided free of charge when requested by a Bidder.

C. ARTICLE 5; Replace paragraphs b. and c with the contents of Section 013300, Submittal Procedures.

D. ARTICLE 6; Refer to Section 017839 for supplemental information regarding Record Drawings and Specifications.

E. ARTICLE 14; Add the following new Paragraph “i”: “Refer to Section 013200 for additional specific requirements regarding Construction Progress Documentation”.

F. ARTICLE 14; Add the following new Paragraph “j”: “Refer to Section 013100 for additional specific requirements regarding Construction Progress Meetings”.

G. ARTICLE 14; Add the following new Paragraph “k”: “Refer to Section 017300 for additional specific requirements regarding Project Layout Documentation”.

H. ARTICLE 15 is hereby deleted for this Project.

H. ARTICLE 19; Add the following new Paragraph “k”: “Refer to Section 012600 for additional specific instructions regarding Changes in the Work”.

I. ARTICLE 23;

1. Add to Paragraph “a”: Time for Completion:

1. The Work of this portion of the Project will be completed within XXX calendar days.

2. Unless stated otherwise, Notice to Proceed will be determined in the Pre-Construction Conference.

3. The CMR’s Schedule is to be used for the tracking of the progress of the work and has no other demonstrable purpose.

4. If the Work is not completed by the Time for Acceptance by the Owner then the Owner will assess the General Contractor an amount of $XXX per day.

J. ARTICLE 31; Refer to Section 012900 (except for 1.3, G, H, and I) for specific instructions regarding Requests for Payment.

K. ARTICLE 32; Refer to Section 012900, 3.1, G, H, and I for more specific information regarding Final Payment Requirements.

L. ARTICLE 38; add the following:

e. General: CMR shall have limited use of Project site for construction operations as indicated on Drawings by the Contract limits and as indicated by requirements of this Section.

f. Limit use of Project site to work in areas designated for each phase and areas within the Contract limits indicated. Do not disturb portions of Project site beyond areas in which the Work is indicated.

g. The Owner will designate space for laydown, dumpster, and worker parking.

h. Keep driveways, loading areas, and entrances serving premises clear and available to Owner, Owner's employees, and emergency vehicles at all times. Do not use these areas for parking or storage of materials.

1. Schedule deliveries to minimize use of driveways and entrances by construction operations.
2. Schedule deliveries to minimize space and time requirements for storage of materials and equipment on-site.

M. ARTICLE 41; append to the end of this article the information in Section 017300, paragraph 3.6, for additional cleaning requirements as paragraph “d”.

1.2 WORK UNDER SEPARATE CONTRACTS

A. General: Cooperate fully with separate contractors so work on those contracts may be carried out smoothly, without interfering with or delaying work under this Contract or other contracts. Coordinate the Work of this Contract with work performed under separate contracts.

S&ME Project No. 23060119
NC PE Firm License No. F-0176

Dear Mr. Mancari:

S&ME, Inc. (S&ME) has completed the geotechnical exploration for the referenced project located in Kure Beach, North Carolina. Our services were performed in general accordance with S&ME Proposal No. 23060119, dated September 27, 2023, and the Agreement, dated December 21, 2023, fully executed on January 10, 2024.

The purpose of this exploration was to obtain subsurface information to allow characterization of the subsurface conditions at the site and to develop recommendations concerning earthwork and foundations, as they relate to design and construction of the proposed structures at the site.

This report describes our understanding of the project, presents the results of the field exploration, laboratory testing, and engineering analysis, and discusses our geotechnical conclusions and recommendations based on these considerations.

S&ME appreciates this opportunity to be of service to you. Please contact us if you have questions concerning this report or any of our services.

Sincerely,

S&ME, Inc.

Nathan Buffum, P.E.

Report at a Glance

Key geotechnical findings based on our current understanding of the proposed project are presented below. These findings are presented as an overview and should not be used in place of the more detailed recommendations presented in the remainder of this report.

Category	Key Geotechnical Finding
Subsurface Conditions	• Previously placed fill and very loose to loose near-surface sands to depths of 3 feet. • Beneath near-surface soils, medium dense to very dense sands to exploration termination depths. • Soft to stiff clay layers, varying in thickness from about 1 to 10 feet, encountered within the sands at depths ranging from about 24 to 34 feet. • At depths below about 40 feet, recovered samples from borings included cemented fragments. • Varying subsurface water levels approximately 0.1 to 5 feet below the ground surface.
Site Development	• Drainage should be established early, so water levels are maintained at least 2 feet or more below working surfaces. • Densification of existing loose near-surface soils after stripping, prior to fill placement. • Soils encountered in the upper subsurface profile area generally suitable for re-use as fill but will likely require moisture conditioning to obtain specified compaction and stability.
Excavation Conditions	• Difficult to excavate materials not anticipated. • The contractor should be prepared to dewater where utility or foundation excavations extend beneath subsurface water levels and control any water that collects in excavations. • Excavations below groundwater may encounter loose, unstable excavation bottoms that require stabilization.
Seismic Considerations	• Seismic Design Category C for Risk Category classification of I, II, or III (ASCE 7-10). • Seismic Site Class D. • Liquefaction risk is low, and liquefaction-induced damage is not expected.
Foundation Type	• Auger Cast-in-place (ACIP) piles. Evaluations included 14-inch and 16-inch diameters. • Shallow Spread Foundations (single-story generator and electrical building, single-story elevated mechanical) • Preliminary evaluation of 8-inch diameter micropiles for potential support of the Touch Tank.
Slab Support	• On-grade for thin (non-structural) grade slabs.

1.0 Project Information

The purpose of this exploration was to obtain subsurface information to allow characterization of the subsurface conditions at the site and to develop recommendations concerning earthwork and foundations, as they relate to design and construction of the proposed structure at the site. This report describes our understanding of the project, presents the results of the field exploration, laboratory testing, and engineering analysis, and discusses our geotechnical conclusions and recommendations based on these considerations.

1.1 Site and Project Description

Project information was provided during email correspondence in August and September of 2023, between Mr. Mancari and team members from Szostak Design, Bennett & Pless, and S&ME. In an email on August 21, 2023, Mr. Mancari provided the following documents:

1. Memorandum outlining geotechnical requirements for the project, prepared by Klaus Perkins (Bennett & Pless), dated August 21, 2023.
2. A site plan depicting existing site features and the proposed new building footprint, undated.
3. Existing building layout drawings, each for levels 1 through 3, related to the hazardous materials survey proposal request.

An online meeting occurred on September 6, 2023, to further discuss aspects of the project and proposed services to be provided by S&ME. On September 7, 2023, Mr. Phil Nelson (Szostak Design) provided a link to access 90% Schematic Design drawings and original drawings for the previous buildings constructed in 1973 and 1999. On January 11, 2024, Mr. Dan Armento (Clancy & Theys) provided a link to access 100% Schematic Design drawings.

Additional project discussions occurred during a site meeting on January 19, 2024, and subsequent online calls in February, March, and April, 2024.

1.1.1 Site Description

The project site is located at the existing Ft. Fisher Aquarium, on Loggerhead Road, in Kure Beach, North Carolina. The site area for the proposed building additions is located on the northeast, east, and southeast sides of the existing building. Existing conditions in these areas include wooded and low-lying areas, grassed and gravel-covered surfaces, utilities and fencing, and asphalt and concrete pavements.

1.1.2 Project Description

The project will include building additions totaling approximately 20,000 square feet in plan area. The Shark Tank building addition will be up to five stories in height. Structural components will include reinforced concrete slabs, columns, beams, and walls, and potentially structural steel framing.

Based on conversations with the design team, the foundation support for the Shark Tank building addition will be provided by augered cast-in-place (ACIP) piles incorporated into pile caps and grade beams, similar to portions of the existing building. We understand that soil-supported grade slabs may be utilized in some areas of the new building while some areas will require the use of pile-supported reinforced structural slabs or mat foundations.

Based on the provided information, typical building interior and exterior column loads will be 700 kips and 400 kips, respectively, or less. A Shark Tank will be constructed in the new addition and impose an additional floor slab area load of 1,152 psf to 1,344 psf due to water weight. Tank foundations may consist of reinforced structural slabs, 12 inches or more in thickness. Slabs-on-grade to be constructed in the building addition are planned to be 4 inches in thickness and we have assumed floor slab loads in these areas will be 150 psf or less (including slab self-weight).

A new Touch Tank will be constructed in the northeast corner of the existing building and impose an additional floor slab area load of about 192 psf due to water weight. Due to height restrictions within the existing building, foundation support for the Touch Tank may include micropiles.

A new single-story generator and electrical building will be constructed on the south side of the existing building, having approximately 1,300 square feet in plan area. An elevated single-story mechanical building will be constructed southeast of the existing building, having approximately 3,000 square feet in plan area. Although structural loads for these structures were not provided, we understand that shallow foundations are planned, and assume column and wall loads will be 50 kips and 3 kips per foot, respectively, or less.

Based on the information available, it appears that existing grades within the proposed Shark Tank building addition range from about 3 feet to 9 feet above MSL. Finished floor elevations within the building will vary from about 2 to 11 feet, such that minor cuts and up to about 6 feet of fill placement may be required during site grading. Within the generator and electrical building, up to 4 feet of fill placement may be required.

2.0 Methods of Exploration

2.1 Field Exploration

Before visiting the site, NC 811 was contacted for clearance to drill at the site. We also subcontracted a private utility locate service to help identify potential buried utilities near proposed test locations. We then proceeded to perform the following tasks using the information provided:

1. We performed a site walkover, observing general features of topography, existing structures, ground cover, and surface soils at the project site.
2. We established the locations of four standard penetration test (SPT) boring locations across the proposed building location, labeled B-1 through B-4, and four cone penetration test (CPT) soundings, labeled S-1 through S-4. Relative to the initially proposed scope, one of the planned SPT borings was replaced with one CPT sounding after the CPT rig was successful in advancing to target depths.
3. We advanced the SPT borings to depths ranging from 45 feet to 60 feet. Each SPT boring was advanced by mud rotary slurry drilling methods.
4. In conjunction with the standard penetration testing, split-spoon disturbed soil samples were recovered at regular depth intervals within the borings and transported to our laboratory for further evaluation.
5. CPT soundings were advanced to target depths of 60 to 67 beneath the existing ground surface.
6. In conjunction with soundings S-1 and S-3, downhole shear wave velocity measurements were obtained at approximate 1-meter depth intervals.

7. At each CPT test location, we advanced one hand auger boring without penetration testing to a target depth of 4 feet, to observe topsoil thicknesses and near-surface soil types. Near sounding S-4, two hand auger borings were performed (S-4A and S-4B).
8. Subsurface water levels at each sounding and boring were measured in the field at the end of the drilling day. Water levels within SPT borings were also measured at least 24 hours after drilling. The borings were backfilled with soil cuttings following water level measurements.

The approximate test locations are shown on the Test Location Sketch included as Figure 1 in Appendix I. A brief description of the field exploration procedures performed, soil classification legends, the sounding logs, and the boring logs are attached in Appendix II.

2.2 Laboratory Testing

Representative soil samples encountered within the soil test borings were collected and transported to our laboratory. The recovered soil samples were classified in general accordance with the visual-manual method described in ASTM D 2488, "Standard Practice for Description and Identification of Soils (Visual-Manual Method)". At the discretion of the geotechnical engineer, no further laboratory testing was performed for this exploration.

3.0 Site And Surface Conditions

3.1 Site Conditions

Based on the topographic map provided and site observations, the ground surfaces within the building addition area generally slope down from an elevation of about 8 feet MSL near the existing building to about 3 feet in the low-lying areas to the northeast, east, and south. Ground surface elevations at the test locations were not surveyed.

In general, no surficial topsoil layer of appreciable thickness was encountered at our test locations, although several test locations were located in areas of wetland vegetation and others in areas of sparse grasses.

3.2 Local Geology

The site is located in the Coastal Plain Physiographic Region of North Carolina. The Coastal Plain Province is typically characterized by marine, alluvial, and aeolian sediments that were deposited during periods of fluctuating sea levels and moving shorelines. The soils and basal formations in the North Carolina Coastal Plain Physiographic Province are typical of those laid down in a shallow sloping sea bottom; interbedded sands and clays with irregular deposits of shells and layers of limestone and cemented sands. Alluvial sands, silts, and clays are typically present near rivers and creeks. Deposits of peat, organic silt, and organic clay are also typically present in or near current or former tidal marsh areas in the outer portion of the Coastal Plain.

According to the 1985 Geologic Map of North Carolina, the site is underlain by undivided surficial deposits of Quaternary age. These deposits consist of sand, clay, gravel, and peat deposited in marine, fluvial, eolian, and lacustrine environments.

4.0 Subsurface Conditions

The generalized subsurface conditions at the site are described below. For more detailed descriptions and stratifications at test locations, the respective sounding and boring logs should be reviewed in Appendix II. These logs represent our interpretation of the subsurface conditions based upon the field data. Stratification lines on the logs represent approximate boundaries between soil types and soil behavior types; however, the actual transition may be gradual.

4.1 Interpreted Subsurface Profile

An interpreted subsurface cross-sectional profile of the site soils is attached in Appendix I as Figure 2. The cross-section orientation in plan view is shown on Figure 1 in Appendix I. Profile A-A' is oriented generally south to north across the site and depicts soil conditions penetrated by our soundings and borings looking in a westerly direction.

The profile is provided to illustrate a general representation of the subsurface conditions within the proposed construction area. Note that the profile is not to scale. The subsurface profiles were prepared for illustrative purposes only. Subsurface stratifications may be more gradual than indicated, and conditions may vary between test locations.

4.2 Description of Subsurface Soils

4.2.1 Fill Material

Previously placed fill material was encountered within hand auger borings S-1 through S-4A to depths ranging from approximately 0.5 to 3 feet and consisted of poorly graded sands (USCS Classification "SP"). Varying amounts of gravel were observed mixed within the fill material.

Within the corresponding CPT soundings, near-surface soils within the upper 1 to 2 feet exhibited tip resistances of about 20 to 40 tons per square foot (tsf), indicating a loose relative density.

4.2.2 Coastal Plain Soils

Beneath the fill, and extending from the ground surface at other locations, Coastal Plain soils were encountered to termination depths of hand auger borings, SPT borings, and soundings. Samples recovered from the borings consisted of poorly graded sands (SP) and poorly graded sands with silt (SP-SM). Some shell materials were encountered in several borings between depths of about 5 to 10 feet. At depths below about 40 feet, recovered samples included some cemented fragments.

Soils within the upper 3 feet of SPT borings exhibited N-values ranging from 3 to 8 blows per foot (bpf), indicative of very loose to loose relative density. Beneath the loose upper sands, N-values typically ranged from about 9 to 35 bpf and indicated generally medium dense to dense relative density with some loose and very dense layers.

A layer of sandy clay (CL) was encountered within boring B-3, from depths of about 24 to 29 feet, and within boring B-4, from depths of about 24 to 34 feet. N-values within these clays varied from 4 to 6 bpf, indicating a soft to firm consistency.

CPT soundings encountered predominantly sandy Soil Behavior Types (SBT) exhibiting tip resistances typically ranging from about 120 to 360 tsf, indicating dense to very dense relative density. A relatively thin clay layer, ranging from less than one foot to about three feet in thickness, was encountered at depths ranging from about 25 to 28 feet. Tip resistances of 5 to 20 tsf indicate soft to stiff consistency within the cohesive layers.

Within soundings S-2 through S-4, below depths of about 43 to 48 feet, interbedded layers of sands, sand mixtures, and thin clay lenses were encountered to sounding termination depths of about 60 feet. The interbedded layers exhibited tip resistances widely varying from about 30 to 300 tsf, indicating interbedded lenses of loose to very dense relative density.

4.2.3 Groundwater

Water levels were measured upon completion of the CPT soundings and hand auger borings. Subsurface water at the time of the exploration was encountered at depths ranging from about 2 to 5 feet below existing ground surface in our CPT soundings. Water was not encountered within hand auger borings S-2 and S-3. Water was encountered in hand auger borings S-1, S-4A, and S-4B at respective depths of 1.5, 2.6, and 2.3 feet.

Water was measured within SPT borings after a waiting period of over 24 hours after drilling and ranged from 0.1 to 5.6 feet.

Subsurface water levels can be expected to fluctuate due to seasonal variations in rainfall, evaporation, tidal effects, and other factors. Additionally, perched water conditions may exist during the typically wetter winter months above less permeable dense sands encountered within the upper soil profile. Thus, shallower water levels may be encountered during wet weather grading.

5.0 Conclusions and Recommendations

The following conclusions and recommendations are based on our field exploration, our understanding of the proposed construction, our engineering analyses, experience with similar projects and subsurface conditions, and our correspondence with you. If structural loads and/or proposed site grades are different from those indicated, we should be provided the opportunity to review and comment upon the recommendations of this report so that they may be confirmed, extended, or modified as necessary. If subsurface conditions adverse to those indicated by this report are encountered during construction, those differences should be reported to us for review and comment.

Based on our review of the provided project information and geotechnical analyses of field testing data, this site appears generally adaptable for the proposed development. The following sections present our geotechnical conclusions and recommendations regarding design and construction.

5.1 Seismic Considerations

5.1.1 Seismic Site Class

Seismic site classification is based on the top 100 feet of a site's subsurface profile. Shear wave velocity profiles were developed from measurements recorded in seismic CPT soundings S-1 and S-3 to respective depths of about 67 and 60 feet. Using the collected data and S&ME's knowledge of the local geology, when extrapolated to a depth of 100 feet, average shear wave velocities of 904 and 1,157 ft/sec were estimated, which is greater than the 600 ft/sec that is required for consideration of Site Class D design parameters. Figures 3A and 3B in Appendix I present the Shear Wave Velocity Profiles developed from measurements recorded in soundings S-1 and S-3. Based on Section 1613.3.2 of the 2018 North Carolina Building Code (NCBC), the site is designated as **Seismic Site Class D**.

5.1.2 Liquefaction Triggering Evaluation and Liquefaction Potential

A liquefaction triggering evaluation was performed using the methods presented by Youd et. al. (2001), Boulanger and Idriss (2014), and recent research concerning the liquefaction resistance of aged sands (Hayati and Andrus, 2009). Following the method developed by Andrus, the shear wave velocity profiles have been used to determine measured-to estimated-velocity-ratio (MEVR) which in turn is related to age correction factors (K_{DR}) utilized in the liquefaction triggering evaluation.

Based on provisions of the NCBC, the design earthquake has a hazard equal to a 2 percent probability of exceedance in a 50-year period (2,475-year return period). Our liquefaction evaluation was based on an earthquake with a magnitude of 7.3. For Seismic Site Class D at the project site, the site modified peak ground acceleration is 0.184g (ASCE 7-10). The seismic hazard information was obtained from the United States Geologic Survey (USGS).

Based on the results of our analyses, we conclude that liquefaction is unlikely to occur under the design earthquake, and no further consideration of liquefaction is necessary for the design of the project.

5.1.3 Seismic Spectral Design Values for Site Class D

The current NCBC references the 2015 International Building Code and ASCE 7-10 for determining the design spectral accelerations and liquefaction potential; however, Seismic Ground Motion Maps were updated in 2014 and are incorporated into ASCE 7-16, which is referenced by the 2018 version of the International Building Code (IBC). The updated seismic maps, which result in lower spectral accelerations, represent updated understanding of the seismic hazards, and will presumably eventually be incorporated into the next edition of the NCBC, which is based on the IBC. Listed in the table below are the ground motion parameters from both resources, ASCE 7-10 and ASCE 7-16. Use of the newer, more up to date seismic parameters may require the authorization of the local Building Official.

Table 5-1: Ground Motion Parameters

Method	Site Class	S_S	S_1	S_{DS}	S_{D1}	PGA_M
2018 North Carolina Building Code (ASCE 7-10)	D	0.229g	0.094g	0.245g	0.151g	0.184g
2018 International Building Code (ASCE 7-16)	D	0.164g	0.071g	0.175g	0.114g	0.133g

5.1.4 *Seismic Design Category*

For a structure having a Risk Category classification of I, II, or III, the S_{DS} and S_{D1} values obtained are consistent with "Seismic Design Category C" as defined by the 2018 North Carolina Building Code and ASCE 7-10. For Risk Category IV, the values are consistent with "Seismic Design Category D".

For a structure having a Risk Category classification of I, II, or III, the S_{DS} and S_{D1} values obtained are consistent with "Seismic Design Category B" as defined by the 2018 International Building Code and ASCE 7-16. For Risk Category IV, the values are consistent with "Seismic Design Category C".

5.2 Augered Cast-in-Place (ACIP) Reinforced Concrete Piles

ACIP piles have the advantage of being relatively economical to install and have a comparatively high axial capacity regarding the soil conditions observed at this site versus other types of piles. ACIP piles appear to be a feasible deep foundation option to install at this site.

ACIP piles, or continuous flight auger (CFA) piles, are installed by drilling down to the desired penetration depth in a continuous operation. Once the desired penetration depth is reached, the pile is grouted as the auger is slowly extracted. This pile installation method does not densify the ground as it drills, because the drilled soils are removed from the ground as spoils. This method generates spoils that should be planned for handling during construction.

We do not recommend drilled displacement piles for this site based on the interpreted subsurface profile.

5.2.1 *Axial Pile Resistance*

Axial resistances versus depth were estimated for individual 16-inch and 18-inch diameter ACIP piles based upon the subsurface conditions encountered in the soundings and borings. Figure 4A of Appendix I presents a plot of the estimated single-pile allowable axial resistances for each foundation type.

The elevations indicated on the right vertical axis in Figure 4A are referenced to the existing ground surface elevation near soundings S-1 and S-2 (i.e., approximately +5 feet). The elevations were not directly surveyed and were interpolated based on the provided topographic map. Pile lengths should be determined based on the design axial load and pile tip elevation relationship provided in Figure 4A, and the actual pile-top cut off elevations.

An ASD safety factor of 2.0 was applied to the estimated ultimate pile bearing resistances to determine the allowable compressive load and a safety factor of 3.0 was applied to determine allowable tension loads from a geotechnical resistance standpoint. Load testing must be implemented to use the safety factor of 2.0 assumed in our analysis.

The piles should be installed to a minimum pile tip elevation of -25 feet, (i.e., approximately 30 feet below the existing grade elevation of +5 feet), to penetrate soft to stiff clay layers encountered at some test locations. An efficiency factor accounting for capacity reductions caused by group effects of 1.0 should be used for center-to-center pile spacing of three pile diameters or more. Three pile diameters is the minimum recommended spacing for piles.

As illustrated in Figure 4A, a 14-inch diameter ACIP pile properly installed to a tip elevation of -25 feet is estimated to provide an allowable axial compressive resistance of 106 kips (53 tons), based on a safety factor of 2.0, and confirmation by load testing. An allowable axial tension resistance of 52 kips (26 tons) is estimated based on a safety factor of 3.0.

Similarly, a 16-inch diameter ACIP pile properly installed to a tip elevation of -25 feet is estimated to provide an allowable axial compressive resistance of 134 kips (67 tons), based on a safety factor of 2.0, and confirmation by load testing. An allowable axial tension resistance of 60 kips (30 tons) is estimated based on a safety factor of 3.0.

The structural capacity of the piles has not been considered in our analysis and is the responsibility of the Structural Engineer.

5.2.2 *Geotechnical Lateral Pile Response*

The NCBC requires the allowable lateral load on a pile be determined by an approved method of analysis (or lateral load test) and the allowable load should be limited to one-half of the lateral load that produces a gross lateral movement of 1 inch at the lower of: 1) the top of the foundation element or 2) the ground surface. The code allows for higher deflections or loads to be used if the Structural Engineer can show that the predicted lateral movement and resulting load will cause neither harmful distortion or instability in the structure, nor cause any element to be loaded beyond its capacity.

Lateral loads and foundation details are not available at this time, so design-level lateral pile analyses cannot be performed. More specifically and as explained below, because lateral pile response depends on pile spacing and pile group geometries, it cannot be fully evaluated until these details are better defined. As a preliminary step, we used LPILE[1] to analyze the response of an individual pile, 30 feet in length, without consideration of any group effects. The lateral load that produces 1 inch of lateral movement at the pile head was computed, and the allowable lateral load was then defined as half of this value. The analysis was repeated with this allowable lateral load to compute the estimated lateral deflection, shear, and moment distributed along the length of the pile.

The single pile analysis modeled fixed head restraint conditions. Axial loads of 106 and 135, respectively, were applied to the top of the foundations as summarized in Table 5-2. Piles were modeled with a non-linear bending

1 Reese, Lymon C., Wang, Shin-Tower, LPILE 2022.12.10, Ensoft, Inc., 2022.

stiffness for 14-inch and 16-inch diameter piles, using a concrete strength of 4,000 psi and typical steel reinforcement patterns with steel to concrete ratios of approximately 1 ½ percent. A change in pile-top geometry relative to the ground surface, as well as the remaining modelling aspects can have a significant effect on pile response.

A summary of the lateral analyses is presented in Table 5-2, and plots of the deflection, shear, and moment versus depth for each pile type are included in the Appendix.

Table 5-2: Summary of Single Pile Lateral Response

Pile Type	Pile Top Conditions	Load Case	Applied Axial Load (kips)	Pile Head Lateral Deflection (in.)	Lateral Shear Load (kips)	Maximum Bending Moment (in.-kips)
14-inch Diameter ACIP	Fixed Head	1 in. Lateral Deflection	106	1.0	26.8	898
		Allowable Lateral Load		0.16	13.4	509
16-inch Diameter ACIP	Fixed Head	1 in. Lateral Deflection	135	1.0	36.7	1387
		Allowable Lateral Load		0.18	18.4	774

* Lateral response is for a single pile and does not consider softened response due to group effects.

The information presented in Table 5-2 represents the geotechnical lateral response of a single pile and does not consider the softened response due to group effects. The response of a pile in a group will vary from the response of a single, stand-alone pile, and this response is affected by a number of factors including number of piles in a group, the center-to-center pile spacing, and the arrangement of the piles within the group. These group effects must be considered when evaluating the lateral response of piles.

Although structural properties have been assumed, the structural capacity of a pile has not been considered in our lateral soil-structure analyses. As such, the shear and moments calculated with depth may exceed structural limits and must be evaluated by the Structural Engineer. The Structural Engineer should review boundary conditions to confirm the assumptions are compatible with foundation design. The Structural Engineer should also review pile interaction diagrams to confirm the load case (i.e., compression or tension) that controls the structural pile design and capacity. Design of the pile structure is the responsibility of the Structural Engineer.

5.2.3 *Embedment, Difficult Drilling Conditions, and Auger Refusal*

Based on the soils encountered during our exploration, we do not anticipate that auger refusal will be routinely encountered above the specified pile tip termination depth if the proper rig and drill are used; however, it is possible that isolated, very hard lenses could cause difficult drilling or auger refusal above the desired bearing depths at some locations.

It is important that the pile installer does not stop trying to advance the pile at the first encounter of dense materials. Therefore, the auger refusal criterion is recommended to be defined as an auger advancement rate of

less than 1 foot per minute for at least 10 minutes at the full down-crowd pressure of the drill tooling. These refusal criteria may need to be exceeded if the minimum embedment depth is not achieved on a particular pile.

In order to advance the piles through potential very dense soils to reach the desired termination depths, a strong rotary turntable will be required, as well as sharp reinforced cutting bits. We anticipate that a drilled pile that is advanced using reinforced cutting teeth should be able to advance to the desired penetration depth, since our drill rig (using a tri-cone roller bit) was able to advance through these dense materials. However, slow augering should be expected to occur within the bearing stratum, and the contractor should be prepared to spend extra time advancing the piles by grinding into these materials if necessary.

5.2.4 *ACIP Pile Construction Considerations*

ACIP pile elements do not allow for down-hole observation prior to casting. Therefore, strict quality control is required to verify adequate grout volumes, and to confirm theoretical diameters meet the specified requirements. Piles should be constructed in accordance with Publication No. FHWA-HIF-07-03 (Geotechnical Engineering Circular No. 8: Design and Construction of Continuous Flight Auger Piles) dated April 2007. A pile installation plan should be submitted by the contractor that addresses all aspects of construction including sequencing, tooling and excavation, grouting, and finishing.

The contractor should use electronic monitoring equipment to continuously record penetration depth and torque throughout installation. During extraction and grouting, the contractor should record the volume of grout placed as a function of depth, as well as the total volume per pile. The Geotechnical Engineer or their representative should monitor installation of production piles. During pile installation, the representative should record (as a minimum) pile tip elevations, pile locations, and grout volumes, ideally at 5-foot increments as well as total volume. The representative should also cast grout cubes for compressive strength testing (ASTM C109).

Grout should be installed using a positive displacement pump. The pump discharge capacity should be calibrated in order to adequately determine the quantity of grout installed. Grout should be pumped with sufficient pressure to prevent suction as the augers are withdrawn and avoid necking or collapse of the auger hole. We recommend that a pressure head of at least 10 feet of grout be maintained above the injection point. Auger hoisting equipment should be capable of removing the augers slowly while turning in a clockwise direction. The grout should be discharged at the tip of the auger and at a constant rate. To confirm that the grout is in good contact with the sidewalls of the auger hole and there has been no hole collapse, we recommend that the injected grout volume per linear foot be no less than 120 percent of the theoretical grout volume (volume of auger hole).

To establish production pile lengths and confirm the estimated capacities, we recommend at least one sacrificial ACIP pile be statically loaded to geotechnical failure using the ASTM D1143 quick loading procedure. The test pile should be installed using the same construction techniques (i.e., the same grout volume, tooling, etc.) planned for the production piles. The pile should be loaded to geotechnical failure or three times the design load, whichever occurs first. Load testing is considered part of the geotechnical design, and S&ME must provide technical oversight, observation, and evaluation of the static load test program.

If it is determined by the design team that it is desired to consider a higher tension resistance per pile, then it may also be appropriate to perform tension testing of one or more test piles in accordance with the quick loading procedure of ASTM D 3689 - "Standard Test Methods for Deep Foundations under Static Axial Tensile Load." In

this case, we would recommend that at least one static tension test be performed by the contractor on one pile that is constructed to the design dimensions and loaded to at least twice the design working tension single pile capacity to confirm that the assumed ultimate design strength is available. This test is typically setup and performed by the pile contractor using their equipment, and is observed by the Geotechnical Engineer

The installation of strain gages to determine the load distribution along the length of the test pile may be of benefit in evaluating the load test results and optimizing the required production pile length. S&ME can assist with determining appropriate strain gage locations if desired. If load testing has confirmed the pile achieved the required resistance, subsequent piles should be installed to similar bearing depths with similar techniques. Load testing may indicate that adjustments to lengths are necessary.

All ACIP pile installation should be observed by S&ME to confirm that the conditions encountered during excavation are consistent with the results of our geotechnical exploration and the assumptions of our geotechnical analysis. If the actual conditions at specific pile locations vary significantly from the conditions used in our geotechnical analysis, then adjustments to the pile length may be necessary.

5.3 Micropiles

We understand that micropiles may be considered for foundation support of the new Touch Tank to be constructed in the existing building due to height restrictions within the existing building or other factors. The preliminary recommendations presented herein are for conceptual purposes, in part since our exploration did not include a test location within the Touch Tank footprint.

Micropiles are small diameter piles (i.e., generally less than 12 inches) that are typically drilled and grouted in place with neat cement. They can be installed with small, relatively low-impact equipment and are commonly used in underpinning and/or remediation applications where they are installed immediately adjacent to, or drilled through, existing foundations. They can efficiently support relatively large axial loads and can also support modest lateral loads. The top of the pile is often cased to improve lateral performance.

Micropiles are installed by specialty contractors using a relatively wide variety of means and methods. A commonly used system in the Wilmington area is a "hollow bar" micropile. As the name implies, these foundation elements are constructed using a hollow steel bar attached to a sacrificial drill bit. The bars are drilled into the ground using a mud-rotary method with lean grout serving as the drilling mud. At the target depth, drilling stops, and the lean grout is flushed and replaced with the design-strength grout. The hollow bar serves as the structural member and is incorporated into a cap at the surface, typically by means of a bearing plate and nuts at the top of the hollow bar.

A variety of other micropile systems are also used, each with certain advantages. For example, as compared to the hollow bar system, some alternate methods are better suited for higher capacity elements, difficult drilling conditions, or a reduced volume of spoils. The primary differences are the materials that are used (e.g., hollow bars, solid bars, casing, etc.), the capabilities of the drilling equipment (e.g., rotary, rotary-percussion, duplex, etc.), and the grouting methodology (e.g., gravity, pressure, post-grouted, etc.).

5.3.1 *Procurement*

Micropiles are often proprietary and provided on a design-build basis by specialty contractors. As such, we recommend micropiles be procured using a performance specification. In general, the performance specification should include the following:

- The allowable axial loads that the piles will support with the required factor of safety (typically 2 when the recommended static load testing is performed).
- The allowable lateral loads that the piles will support (if any).
- The static load testing requirements – for this project, we recommend a minimum of 1 static load test be performed.
- Minimum pile length of 20-ft below pile cap.
- A pile design and installation plan submittal – the submittal should include the design calculations, the proposed means and methods, and the contractor's QC plan. The submittal should also address how the contractor will make sure that existing foundations are not undermined or heaved during pile installation.

A copy of our geotechnical report should be submitted to the design-build contractor to provide the necessary subsurface data for the design. We should also be provided with the opportunity to review the contractor's submittal.

5.3.2 *Axial Pile Resistance*

We have not been provided service loads anticipated to be required for micropiles. For preliminary conceptual purposes, we have evaluated axial resistances versus depth for individual 8-inch diameter micropiles based on the subsurface conditions encountered in our CPT soundings. Figure 4B of Appendix I presents a plot of the estimated single-pile allowable axial resistances.

An ASD safety factor of 2.0 was applied to the predicted ultimate soil resistances to determine the allowable geotechnical resistance. Load testing must be implemented to use the safety factor of 2.0 assumed in our analyses. The allowable tension resistance for the micropiles was estimated using a safety factor of 3.0.

As previously noted for ACIP piles, based on the sounding data, we recommend piles be installed to a minimum pile tip elevation of -25 feet, (i.e., approximately 30 feet below the existing grade elevation of +5 feet), to penetrate soft to stiff clay layers encountered at some test locations.

As illustrated in Figure 4B, an 8-inch diameter micropile properly installed to a tip elevation of -25 feet is estimated to provide an allowable axial compressive resistance of 54 kips (27 tons), based on a safety factor of 2.0, and confirmation by load testing. An allowable axial tension resistance of 30 kips (15 tons) is estimated based on a safety factor of 3.0.

Because the performance of micropiles is dependent on installation methods, our estimates are provided for conceptual planning only. The foundation contractor should be responsible for determining what penetration and diameter is required for their design and specific means and methods.

5.4 Shallow Foundations

The following section provides shallow foundation recommendations for the new single-story generator and electrical building and elevated single-story mechanical structure planned for construction on the south and southeast sides of the existing building.

Provided that the recommendations which follow in this report for site preparation and fill placement and compaction are implemented, the structure can be supported on shallow spread footings bearing in compacted structural fill or suitable natural soils and designed for a net allowable bearing pressure of up to 3,000 pounds per square foot (psf). Based on encountered subsurface conditions, assumed structural loads, and assuming the subgrades are properly prepared as discussed herein, we estimate that total settlement of building foundations will be 1 inch or less with differential settlements of about ½ inch or less.

Footings should bear at least 18 inches below exterior grade so they will not be adversely affected by frost penetration and to develop the design bearing capacity. Continuous wall footings should be at least 18 inches wide, and isolated column footings should be at least 24 inches wide. This recommendation is made to prevent a localized or "punching" shear failure condition which can occur with very narrow footings.

The bottom of all footing excavations for the structure should be evaluated by the S&ME geotechnical engineer or their representative using a hand auger and dynamic cone penetrometer (DCP). In cases where the DCP testing indicates insufficient available bearing pressure for the applied bearing pressure, the foundation bearing soils may need to be repaired. Repairs may include undercutting and replacing with washed stone (#57) prior to foundation construction, subject to the recommendations of the geotechnical engineer.

It should be anticipated that where footings bear directly on fill, or within loose native soils, the soils exposed in the bottom of the footings may need to be tamped to increase their density prior to the placement of foundation concrete.

5.5 Floor Slabs

The following recommendations are provided regarding thin grade slabs subjected to relatively light area loads of 150 psf, or less, and structurally separated from column and wall loads. These recommendations are not intended to be applicable to structural slabs.

A slab-on-grade floor system can be adequately supported on newly placed and compacted structural fill or approved natural soils, provided the site preparation and fill placement procedures outlined in this report are implemented.

We recommend that at least 6 inches of compacted select granular material be placed beneath all ground floor slabs to provide a capillary break, provide more uniform slab support, and reduce damage to subgrade soils during construction. The select granular fill should classify as SP, SP-SM, SW, or SW-SM in accordance with the Unified Soil Classification System, which requires that these soils have less than 12 percent passing the No. 200 sieve. Manufactured materials such as aggregate base course (ABC) or processed fill (i.e., screenings) meeting this specification can be used. A modulus of subgrade reaction value of 175 psi/in may be used to design floor slab

on subgrades consisting of these soils compacted to at least 98 percent of the soil's standard Proctor maximum dry density.

Exposure to the environment and construction activities will weaken the floor slab subgrade soils. Therefore, we recommend that subgrade soils in slab areas be evaluated prior to placement of the select granular fill. If near surface deterioration of the soils has occurred, undercutting or reworking of the fill may be necessary.

Water vapor transmission through the slab is a design consideration. Evaluating the need for and design of a vapor retarder or vapor barrier for moisture control is outside our scope of services and should be determined by the project architect/structural engineer based on the planned floor coverings and the corresponding design constraints, as outlined in ACI 302.1R-04 Guide for Concrete Floor and Slab Construction. Further, health and environmental considerations with respect to any potentially harmful vapor transmission are also outside of our scope.

5.6 Lateral Earth Pressure Coefficients

The lateral earth pressure coefficients given below in Table 5-3 may be used to design below-grade earth retaining structures, such as pile caps, cast neat into native soil excavations or properly backfilled. The values given in the following table assume that any backfill that is placed around and behind these structures is placed and compacted in accordance with the requirements of Section 5.7.5 of this report. These values assume backfill generally classified as SP or SM, soils according to the Unified Soil Classification system.

Table 5-3: Lateral Earth Pressure Coefficients

Support Condition	Angle of Internal Friction (φ')	Cohesion (lbs./sq.ft.)	Moist Unit Weight (γ)	Drained Static Earth Pressure Coefficient (K)
Active (K_a)	30	0	120	0.33
At-Rest (K_o)	30	0	120	0.50
Passive (K_p)	30	0	120	3.0

A. The above values represent a fully-drained soil condition at or near the optimum moisture content. Where backfill soils are not fully drained, the lateral soil pressure must consider hydrostatic forces below the water level, and submerged soil unit weight.
B. A coefficient of sliding friction (tan δ) of 0.36 may be used in computation of the lateral sliding resistance.

We have not been provided details regarding the location or height of any earth retaining walls. Note that any basement or loading dock wall which is backfilled prior to being braced internally by framing must, in addition to being designed as a fully braced wall using the at-rest earth pressure, also be designed to resist the lateral earth pressure for the active case as a fully cantilevered wall.

Organic soils (OL or OH), inorganic silts (ML or MH), or inorganic plastic clays (CL or CH) soils should not be used as retaining wall backfill.

Compact the backfill directly behind walls with light, hand-held compactors. Heavy compactors and grading equipment should not be allowed to operate within 5 feet of the walls during backfilling to avoid developing excessive temporary or long-term lateral soil pressures. We caution that operating compaction equipment directly behind the retaining structures can create lateral earth pressures far in excess of those recommended for design. Therefore, bracing of the walls may be needed during backfilling operations.

Provide positive gravity drainage of the backfill using a permanent toe drain to limit buildup of hydrostatic pressures in the backfill. Gravity drainage may consist of a minimum two-foot-wide blanket of clean crushed stone or washed sand, separated from the backfill by a properly graded filter or approved non-woven geotextile filter fabric, or equivalent. Vertical drains should be tied into a permanent "toe" drain installed at the base of the wall. Where gravity drainage of retaining walls is not feasible, design walls to resist hydrostatic forces in addition to the lateral earth pressure.

5.7 Earthwork

To reduce potential earthwork problems, site preparation and grading should be scheduled during the typically drier months of May through November, if possible. If late fall or winter grading is attempted, repair of near-surface soils and possible use of select off-site borrow will be necessary to adequately prepare subgrades for new construction. Heavy rubber-tired construction equipment should not be allowed to operate on exposed subgrades during wet conditions. Even during drier periods of the year, we recommend that exposed subgrades be sloped and sealed at the end of each day to promote runoff and reduce infiltration from rainfall. Water should not be allowed to pond on exposed subgrades. To further reduce potential deterioration of exposed subgrades, construction traffic patterns should be managed to limit equipment passes across the site.

The following sections present our geotechnical recommendations regarding earthwork.

5.7.1 Demolition of Previous Construction

The following general recommendations are provided for the demolition of any underground utilities, old foundations, and/or previous construction remnants where encountered:

1. Demolish existing pavements and existing structures within the footprint of proposed new structures.
2. Following demolition of the existing pavements and structures, remove or plug existing utilities that are to be permanently abandoned. If not removed or plugged, pipes may serve as conduits for subsurface erosion resulting in formation of voids below foundations or grade slabs.
3. Reroute existing utilities that will remain in use around the proposed building footprints.
4. Areas excavated to remove any buried structures should be backfilled in accordance with Section 5.7.5 of this report.
5. As with any demolition project, there may be unexpected or unforeseen conditions encountered in the subsurface. In such cases, the Geotechnical Engineer should be consulted.

5.7.2 Site Preparation

Prior to construction, site drainage improvements should be implemented for existing drainage features and new drainage ditching established to lower shallow water levels or perched water and divert water away from the

construction area. Drainage should be maintained throughout construction. Surface and subsurface water conditions that occur during construction will determine the need for and extent of drainage measures. Water levels should be lowered and/or maintained 2 feet or more beneath existing grades within the construction area.

After site drainage is established, site preparation should be initiated by clearing vegetation and stripping and grubbing of organics and topsoil, and any other deleterious materials for a lateral distance of at least 5 feet beyond the limits of new construction. Although appreciable surficial topsoil was not encountered within the hand auger borings, stripping of surficial vegetation and organic materials will be necessary and may be deeper in the wooded and low-lying areas. The site should be stripped with light, tracked equipment to avoid mixing the topsoil into the loose near surface silty sands and creating thicker stripping depths.

Very loose to loose near-surface sands were encountered at most of the test locations. After the stripping operation is complete and temporary site drainage has been installed, for areas to receive fill or near final grades, the exposed soil surface should be thoroughly densified in place by making several passes with a heavy vibratory roller prior to placement of new fill or beginning the next stage of construction. Moisture conditioning of the subgrade by the addition of water or drying of soils may be required prior to densification, depending upon conditions at the time of construction. Soils may need to be plowed or disced and dried (or in some cases wetted) to adjust the moisture content to suitable levels for compaction.

Following densification, but prior to fill placement, the exposed surfaces of areas to receive fill and areas near final grades should be evaluated by an S&ME geotechnical engineer or their representative. This evaluation should include proofrolling with a fully-loaded tandem-axle dump truck or similar rubber-tired construction equipment. Any areas that deflect excessively and cannot be densified by rolling should be repaired by undercutting to suitable soils and replacing with compacted structural fill or aggregate base course (ABC) stone. Densification or undercutting existing near-surface soils may be required depending on weather conditions at the time of construction.

5.7.3 *Subgrade Repair and Improvement Methods*

The exposed subgrade of both cut and fill areas can deteriorate and lose support when exposed to construction traffic and adverse weather conditions. Deterioration can occur in the form of rutting, pumping, freezing, or erosion. We recommend that, during construction, exposed subgrade surfaces be sealed at the end of each day or when wet weather is forecast. Water should not be allowed to pond in fill or cut areas. Immediately prior to foundation or floor slab construction, exposed subgrade soils should be evaluated. Evaluation by proofrolling should be conducted where practical to determine their stability. Soils which rut, pump, or deflect under proofrolling should be repaired prior to granular soil or ABC stone placement. Repair measures may include scarifying/drying/recompacting, undercutting, placement of geotextiles, or some combination of these. Actual repair measures will be influenced by project schedule and weather conditions and can only be determined in the field.

5.7.4 *Excavations*

Based on subsurface conditions encountered and assumed site grading, medium dense to dense silty sands will be encountered within anticipated shallow excavation depths at the site. Local excavations within these materials

for shallow utility trenches and foundations can be accomplished by a conventional backhoe or track-mounted backhoe.

Soils encountered during our exploration within the anticipated excavation depths for the project appear suitable for re-use as structural fill. Sandy soils borrowed from below water levels or in areas of perched water may be significantly wet of the optimum moisture content for compaction and may need to be stockpiled and allowed to drain, and/or rigorously worked.

The contractor should be prepared to dewater where utility or foundation excavations extend beneath subsurface water levels and control any water that collects in excavations. Temporary ditches or the use of French drains may be needed to assist in dewatering the site for construction. The contractor should be responsible for determining water control measures.

Excavations should be sloped or shored in accordance with local, state, and federal regulations, including OSHA (29 CFR Part 1926) excavation trench safety standards. The contractor is usually responsible for site safety. This information is provided only as a service and under no circumstances should we be assumed responsible for construction site safety.

5.7.5 *Structural Fill Placement and Compaction*

Soils used as structural fill should meet the following requirements:

- USCS classification of SM, SC, SP, SW, or some combination of these.
- Plasticity index of 10 percent or less.
- Contain less than 3 percent organics.
- Be free of trash or other deleterious materials.
- Have a maximum particle size of 2 inches or less.
- Have a minimum standard Proctor maximum dry density of 100 pounds per cubic foot.

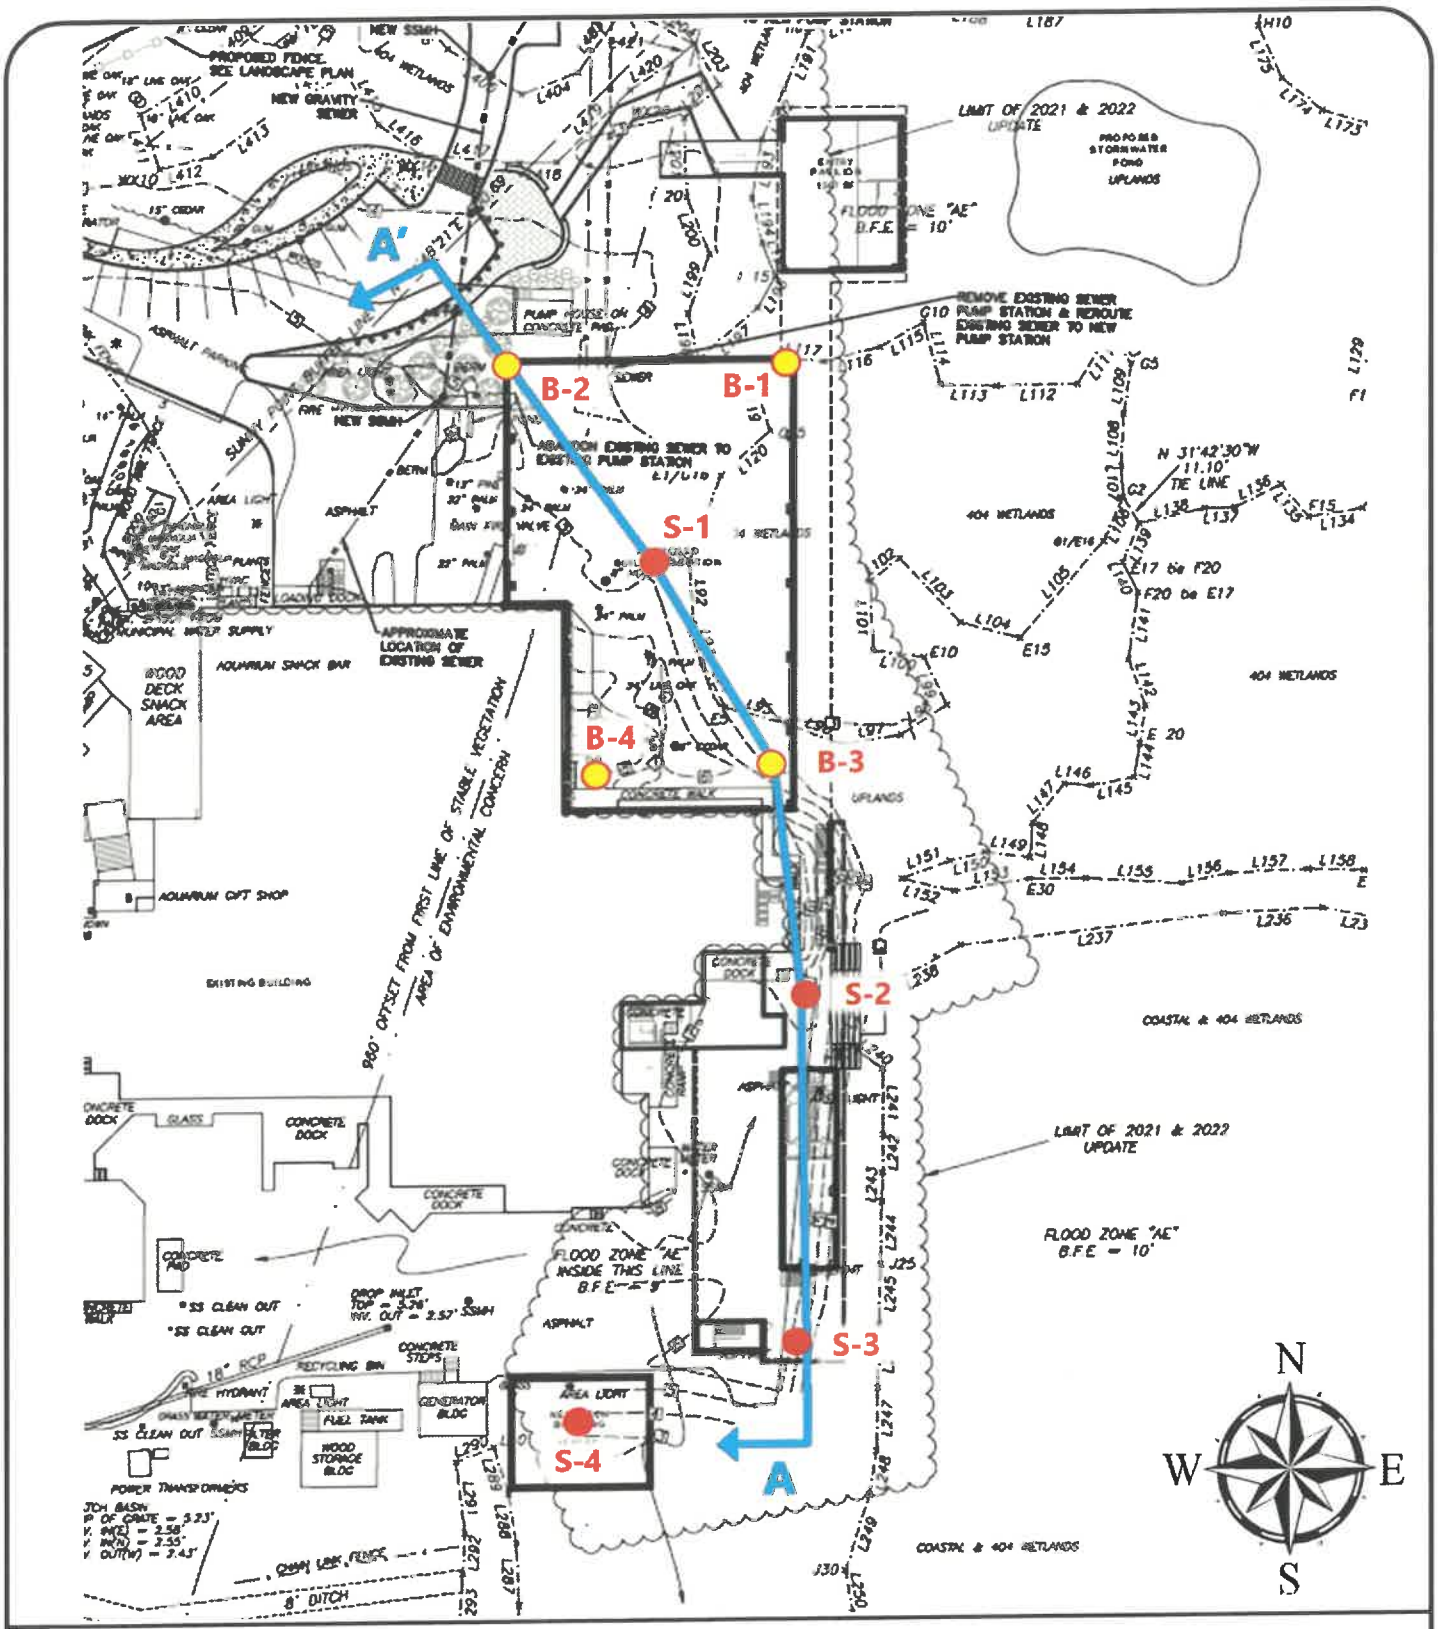
All new structural fill soil should be placed in 8 to 10-inch loose lifts and compacted to at least 95 percent of the standard Proctor maximum dry density (MDD) (ASTM D698). The top 12 inches should be compacted to at least 98 percent of the materials standard Proctor MDD. The moisture content of structural fill should be maintained at +/- 3% of optimum moisture during compaction. S&ME construction services personnel, working under the supervision of the geotechnical engineer, should observe fill placement and compaction. An appropriate number of soil density tests should be conducted to confirm that adequate fill compaction is achieved.

Where present, water levels should be maintained at least 2 feet below any surface to be densified prior to beginning compaction. This is to prevent the compaction operation from drawing water up to the surface and degrading it. Compacted soils should not exhibit pumping or rutting under equipment traffic.

6.0 Limitations Of Report

This report has been prepared in accordance with generally accepted geotechnical engineering practice for specific application to this project. The conclusions and recommendations in this report are based on the

applicable standards of our practice in this geographic area at the time this report was prepared. No other warranty, express or implied, is made.



The analyses and recommendations submitted herein are based, in part, upon the data obtained from the subsurface exploration. The nature and extent of variations of the soils at the site to those encountered at our boring locations may not become evident until construction. If variations appear evident, then we should be provided the opportunity to re-evaluate the recommendations of this report. In the event that any changes in the nature, design, or location of the structure are planned, the conclusions and recommendations contained in this report will not be considered valid unless the changes are reviewed and conclusions modified or verified in writing by the submitting engineers.

Assessment of site environmental conditions; sampling of soils, ground water or other materials for environmental contaminants; identification of jurisdictional wetlands, rare or endangered species, geological hazards or potential air quality and noise impacts were beyond the scope of this geotechnical exploration.

S&ME should be provided the opportunity to review the final plans and specifications to confirm that our recommendations are properly interpreted and implemented. The recommendations in this report are contingent on S&ME's review of final plans and specifications followed by observation and monitoring during construction.

Appendix II – Exploration Procedures, Legends, and Logs

Summary of Exploration Procedures

The American Society for Testing and Materials (ASTM) publishes standard methods to explore soil, rock and ground water conditions in Practice D 420-18, *"Standard Guide for Site Characterization for Engineering Design and Construction Purposes."* The boring and sampling plan must consider the geologic or topographic setting. It must consider the proposed construction. It must also allow for the background, training, and experience of the geotechnical engineer. While the scope and extent of the exploration may vary with the objectives of the client, each exploration includes the following key tasks:

- Reconnaissance of the Project Area
- Preparation of Exploration Plan
- Layout and Access to Field Sampling Locations
- Field Sampling and Testing of Earth Materials
- Laboratory Evaluation of Recovered Field Samples
- Evaluation of Subsurface Conditions

The standard methods do not apply to all conditions or to every site. Nor do they replace education and experience, which together make up engineering judgment. Finally, ASTM D 420 does not apply to environmental investigations.

Reconnaissance of the Project Area

We walked over the site to note land use, topography, ground cover, and surface drainage. We observed general access to proposed sampling points and noted any existing structures.

Checks for Hazardous Conditions - State law requires that we notify North Carolina 811 (NC 811) before we drill or excavate at any site. NC 811 is operated by the major water, sewer, electrical, telephone, CATV, and natural gas suppliers of North Carolina. NC 811 forwarded our location request to the participating utilities. Location crews then marked buried lines with paint or colored flags within 72 hours. They did not mark utility lines beyond junction boxes or meters. We checked proposed sampling points for conflicts with marked utilities, overhead power lines, tree limbs, or man-made structures during the site walkover.

Additionally, we engaged a private utility locator subconsultant to locate and mark private utilities in the work area. Typically, the locator utilizes a combination of ground penetrating radar (GPR) and radio-frequency electromagnetic (EM) pipe and cable locators to scan the vicinity of test locations.

Field Sampling and Testing

Electronic Cone Penetrometer (CPT) Soundings

CPT soundings consist of a conical pointed penetrometer which is hydraulically pushed into the soil at a slow, measured rate. Procedures for measurement of the tip resistance and side friction resistance to push generally follow those described by ASTM D-5778, *"Standard Test Method for Performing Electronic Friction Cone and Piezocone Penetration Testing of Soils."*

A penetrometer with a conical tip having a 60-degree apex angle and a cone base area of 10 cm^2 was advanced into the soil at a constant rate of 20 mm/s. The force on the conical point required to penetrate the soil was measured electronically every 50 mm penetration to obtain the *cone resistance* q_c. A friction sleeve is present on the penetrometer immediately behind the cone tip. The force exerted on the sleeve was measured electronically at a minimum of every 50 mm penetration and divided by the surface area of the sleeve to obtain the *friction sleeve resistance value,* f_s. A pore pressure element mounted immediately behind the cone tip was used to measure the pore pressure induced during advancement of the cone into the soil.

CPT Soil Stratification

Using ASTM D-5778 soil samples are not obtained. Soil classification was made on the basis of comparison of the tip resistance, sleeve resistance and pore pressure values to values measured at other locations in known soil types, using experience with similar soils and exercising engineering judgment.

Plots of normalized tip resistance versus friction ratio and normalized tip resistance versus penetration pore pressure were used to determine soil classification (Soil Behavior Type, SBT) as a function of depth using empirical charts developed by P.K. Robertson (1990). The friction ratio soil classification is determined from the chart in the appendix using the normalized corrected tip stress and the normalized corrected tip stress and the normalized friction ratio.

At some depths, the CPT data fell outside of the range of the classification chart. When this occurred, no data was plotted, and a break was shown in the classification profile. This occasionally occurred at the top of a penetration as the effective vertical stress is very small and commonly produced normalized tip resistances greater than 1000.

To provide a simplified soil stratigraphy for general interpretation and for comparison to standard boring logs, a statistical layering and classification system was applied to the field classification values. Layer thicknesses were determined based on the variability of the soil classification profile, based upon changes in the standard deviation of the SBT classification number with depth. The average SBT number was determined for each successive 6-inch layer, beginning at the surface. Whenever an additional 6-inch increment deviated from the previous increment, a new layer was started, otherwise, this material was added to the layer above and the next 6-inch section evaluated. The soil behavior type for the layer was determined by the mean value for the complete layer.

Downhole Shear Wave Velocity Test

Shear wave velocity measurements were performed using a cone penetrometer equipped with geophones, or a seismic cone penetrometer (SCPT). The seismic cone penetrometer measures the travel times of surface generated vibrations to geophones mounted on the penetrometer at various incremental depths in the sounding. At a given depth, the travel time of the first arrival is measured and corrected for the horizontal offset of the source at the surface from the sounding. Interval velocities are calculated by dividing the difference in travel times by the vertical distance between successive measurement depths. Measurements were made at 1-meter intervals – the length of commonly available CPT extension rods – unless otherwise noted.

Soil Test Boring with Mud Rotary Drilling

Soil sampling and penetration testing were performed in general accordance with ASTM D1586, "Standard Test Method for Penetration Test and Split Barrel Sampling of Soils". Rotary drilling processes were used to advance

the hole and a heavy drilling fluid was circulated in the bore holes to stabilize the sides and flush the cuttings. At regular intervals, drilling tools were removed, and soil samples were obtained with a standard 1.4 inch I. D., two-inch O. D., split barrel sampler. The sampler was first seated six inches to penetrate any loose cuttings, then driven an additional 12 inches with blows of a 140-pound hammer falling 30 inches. The number of hammer blows required to drive the sampler through the two final six-inch increments was recorded as the penetration resistance (SPT) N-value. The N-value, when properly interpreted by qualified professional staff, is an index of the soil strength and foundation support capability.

Hand Auger Borings without Dynamic Cone Penetrometer

Auger borings were advanced using hand operated augers. The soils encountered were identified in the field by cuttings brought to the surface. Representative samples of the cuttings were placed in glass jars or plastic bags and later transported to the laboratory. Soil consistency was qualitatively estimated by the relative difficulty of advancing the augers.

Water Level Measurement

Subsurface water levels in each sounding were measured via pore water pressure readings and corresponding depths from the existing grade. Subsurface water was measured from existing ground surface in the hand auger borings using a tape measure, where encountered.

CPT Soil Classification Legend

Zone	Q_t/N	Description
1	2	Sensitive, Fine Grained
2	1	Organic Soils-Peats

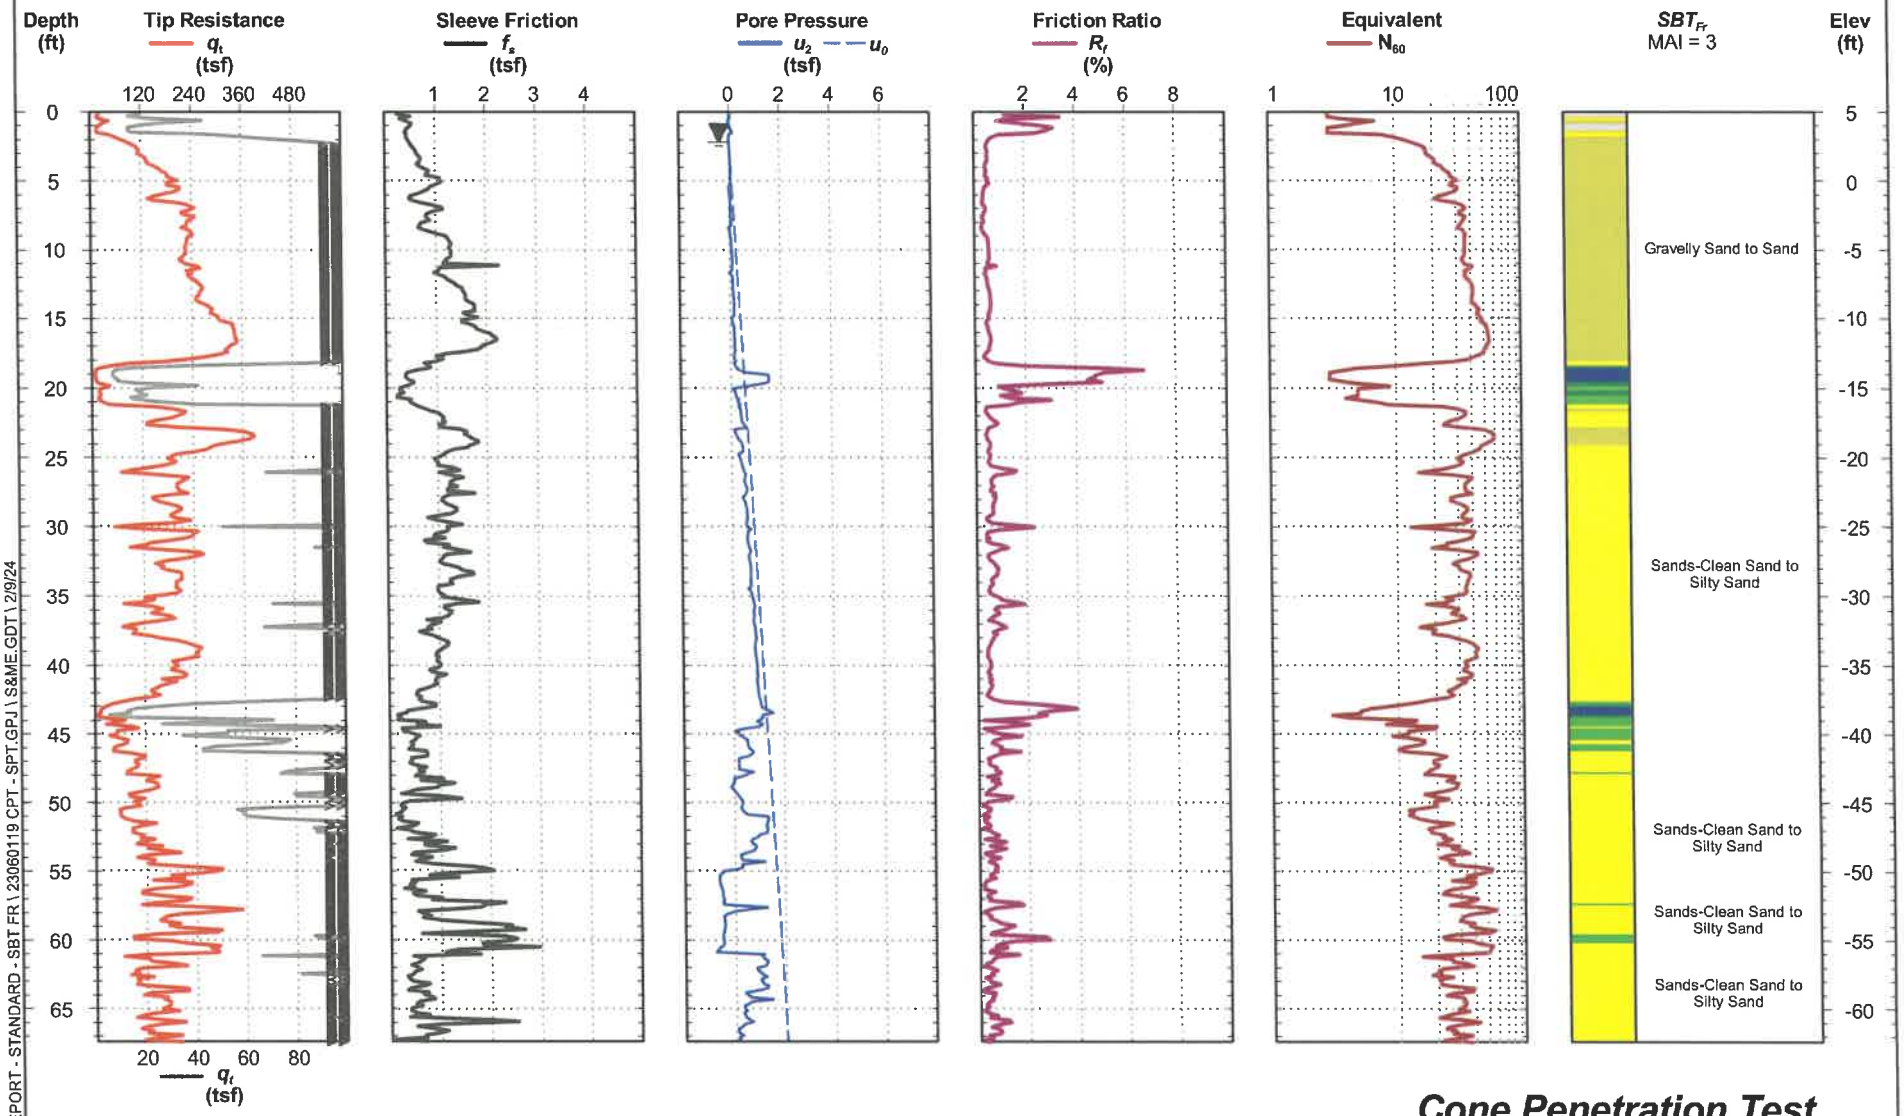
9	2	Very Stiff, Fine Grained*

(*) Heavily Overconsolidated or Cemented

Robertson's Soil Behavior Type (SBT), 1990			
Group #	Description	Ic	
		Min	Max
1	Sensitive, fine grained	N/A	
2	Organic soils - peats	3.60	N/A
3	Clays - silty clay to clay	2.95	3.60
4	Silt mixtures - clayey silt to silty clay	2.60	2.95
5	Sand mixtures - silty sand to sandy silt	2.05	2.60
6	Sands - clean sand to silty sand	1.31	2.05
7	Gravelly sand to dense sand	N/A	1.31
8	Very stiff sand to clayey sand (High OCR or cemented)	N/A	
9	Very stiff, fine grained (High OCR or cemented)	N/A	

Soil behavior type is based on empirical data and may not be representative of soil classification based on plasticity and grain size distribution.



Relative Density and Consistency Table			
SANDS		SILTS and CLAYS	
Cone Tip Stress, qt (tsf)	Relative Density	Cone Tip Stress, qt (tsf)	Consistency
Less than 20	Very Loose	Less than 5	Very Soft
20 - 40	Loose	5 - 15	Soft to Firm
40 - 120	Medium Dense	15 - 30	Stiff
120 - 200	Dense	30 - 60	Very Stiff
Greater than 200	Very Dense	Greater than 60	Hard

Appendix III – LPILE Deflection Model Results

LPILE Deflection Model Results: 14-inch ACIP Pile, 30-foot Length, Fixed Head

LPILE Deflection Model Results: 16-inch ACIP Pile, 30-foot Length, Fixed Head

SECTION 011000 – SUMMARY

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Project information.
2. Work covered by Contract Documents.
3. Phased construction and Contract Time.
4. Work under separate contracts.
5. Access to site.
6. Coordination with occupants.
7. Work restrictions.
8. Specification and drawing conventions.
9. Miscellaneous provisions.

B. Related Requirements:

1. Section 015000 "Temporary Facilities and Controls" for limitations and procedures governing temporary use of Owner's facilities.

2. Refer to Section “Instructions to Bidders and General Conditions of the Contract; NC State Form OC-15, Twenty Fourth Edition, January 2013”.

1.2 PROJECT INFORMATION

A. Project Identification: NC Aquarium at Fort Fisher – Renovations + Additions

B. Project Locations: Ft Fisher Aquarium
900 Loggerhead Road
Kure Beach, NC 28449

C. Owner: State of North Carolina through Department of Natural & Cultural Resources

D. Owner's Representative: James Mancari, Project Manager.

E. Architect: Szostak Design Inc. Phil Nelson, Principal-in-Charge.

1.3 WORK COVERED BY CONTRACT DOCUMENTS

A. The Work of Project is defined by the Contract Documents and consists of the following items:

1. Addition 1 (Shark Tank Building): Construct complete 3-Story addition to house the new shark tank exhibit on deep micro pile foundations and grade beams with a superstructure of cast in place concrete columns and beams. Floors and roof slabs will be cast in place concrete. Exterior

walls will have continuous insulation with an EIFS finish. Roofing will be a fully adhered TPO membrane.

Renovation to the existing aquarium building will include replacement of finishes and new exhibits including a large cast in place concrete “touch tank”. Plumbing fixtures, mechanical equipment and electrical gear will be replaced. Also included are new powerhouse and physical plant structures to house electrical and mechanical equipment. .

B. Information Conflicts in the Contract Documents.

1. The Construction Manager at Risk (CMR) and his Agents will notify the Designer when conflicts are discovered in the Contract Documents.
2. Where conflicts occur in the Contract Documents and the Designer has not provided a resolution to them in written form the Construction Manager at Risk (herein after referred to as CMR) will presume the higher quality of the methods, means or products involved is the intent of the Designer.

C. Payment to the Designer for additional Inspections and Submittal reviews.

1. If the CMR notifies the Designer that he is ready for an Inspection that is required by the contract Documents and it is determined, upon viewing the condition of the Work that this is not the case then the CMR will be charged the cost of the Designer’s time and expenses to come to the jobsite at the Architect’s Standard Hourly Rates, and the IRS Standard Mileage Rate.
2. Submittals that are not satisfactory after one Re-submittal may be subject to a charge for the time required by the designer to review it again. That charge will be for the actual cost of the work, per the Designers’ standard hourly rates.

1.4 WORK UNDER SEPARATE CONTRACTS

A. General: Cooperate fully with separate contractors so work on those contracts may be carried out smoothly, without interfering with or delaying work under this Contract or other contracts. Coordinate the Work of this Contract with work performed under separate contracts.

1.5 PHASING OF THE WORK AND OWNER OCCUPANCY OF ADJACENT STRUCTURE

A. The Owner will continuously occupy the aquarium, along with the animals in all of the remaining exhibits. The facility will be closed to the public, for periods that will be negotiated with the CMR, to allow for construction work. The intent is to keep the Aquarium open to visitors during construction when feasible.

B. There will be an early phase of work to upgrade the existing electrical power, power distribution facilities, reconfigure power feeds to the administration areas and upgrade the fire alarm system in advance of the main addition/renovation project.

1.6 SPECIFICATION AND DRAWING CONVENTIONS

A. Specification Content: The Specifications use certain conventions for the style of language and the intended meaning of certain terms, words, and phrases when used in particular situations. These conventions are as follows:

1. Imperative mood and streamlined language are generally used in the Specifications. The words "shall," "shall be," or "shall comply with," depending on the context, are implied where a colon (:) is used within a sentence or phrase.
2. Specification requirements are to be performed by Contractor unless specifically stated otherwise.

B. Requirements of Sections in Division 01 apply to the Work of all Sections in the Specifications.

C. Drawing Coordination: Requirements for materials and products identified on Drawings are described in detail in the Specifications. One or more of the following are used on Drawings to identify materials and products:

1. Terminology: Materials and products are identified by the typical generic terms used in the individual Specifications Sections.
2. Abbreviations: Materials and products are identified by abbreviations published as part of the U.S. National CAD Standard and scheduled on Drawings.
3. Keynoting: Materials and products are identified by reference keynotes referencing Specification Section numbers found in this Project Manual.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION (Not Used)

1 END OF SECTION 011000

SECTION 012100 - ALLOWANCES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements governing allowances.

B. Types of allowances include the following:

1. Lump-sum allowances.
2. Unit-cost allowances.
3. Quantity allowances.
4. Contingency allowances.

C. Related Requirements:

1. Section 012200 "Unit Prices" for procedures for using unit prices.

1.2 SELECTION AND PURCHASE

A. At the earliest practical date after award of the Contract, advise Architect of the date when final selection and purchase of each product or system described by an allowance must be completed to avoid delaying the Work.

B. At Architect's request, obtain proposals for each allowance for use in making final selections. Include recommendations that are relevant to performing the Work.

C. Purchase products and systems selected by Architect from the designated supplier.

1.3 ACTION SUBMITTALS

A. Submit proposals for purchase of products or systems included in allowances, in the form specified for Change Orders.

1.4 INFORMATIONAL SUBMITTALS

A. Submit invoices or delivery slips to show actual quantities of materials delivered to the site for use in fulfillment of each allowance.

B. Submit time sheets and other documentation to show labor time and cost for installation of allowance items that include installation as part of the allowance.

C. Coordinate and process submittals for allowance items in same manner as for other portions of the Work.

1.5 COORDINATION

A. Coordinate allowance items with other portions of the Work. Furnish templates as required to coordinate installation.

1.6 LUMP-SUM, UNIT-COST, AND QUANTITY ALLOWANCES

A. Allowance shall include cost to Contractor of specific products and materials ordered by Owner or selected by Architect under allowance and shall include taxes, freight**,** and delivery to Project site.

B. Unless otherwise indicated, Contractor's costs for receiving and handling at Project site, labor, installation, overhead and profit, and similar costs related to products and materials under allowance shall be included as part of the Contract Sum and not part of the allowance.

C. Unused Materials: Return unused materials purchased under an allowance to manufacturer or supplier for credit to Owner, after installation has been completed and accepted.

1. If requested by Architect, retain and prepare unused material for storage by Owner. Deliver unused material to Owner's storage space as directed.

1.7 CONTINGENCY ALLOWANCES

A. Use the contingency allowance only as directed by Architect for Owner's purposes and only by Change Orders that indicate amounts to be charged to the allowance.

B. Contractor's **overhead, profit, and** related costs for products and equipment ordered by Owner under the contingency allowance are included in the allowance and are not part of the Contract Sum. These costs include delivery, installation**, taxes**, insurance, equipment rental, and similar costs.

C. Change Orders authorizing use of funds from the contingency allowance will include Contractor's related costs and reasonable overhead and profit margins.

D. At Project closeout, credit unused amounts remaining in the contingency allowance to Owner by Change Order.

1.8 ADJUSTMENT OF ALLOWANCES

A. Allowance Adjustment: To adjust allowance amounts, prepare a Change Proposal based on the difference between purchase amount and the allowance, multiplied by final measurement of work-in-place where applicable. If applicable, include reasonable allowances for cutting losses, tolerances, mixing wastes, normal product imperfections, and similar margins.

1. Include installation costs in purchase amount only where indicated as part of the allowance.

2. If requested, prepare explanation and documentation to substantiate distribution of overhead costs and other margins claimed.

3. Submit substantiation of a change in scope of work, if any, claimed in Change Orders related to unit-cost allowances.

4. Owner reserves the right to establish the quantity of work-in-place by independent quantity survey, measure, or count.

B. Submit claims for increased costs because of a change in scope or nature of the allowance described in the Contract Documents, whether for the purchase order amount or Contractor's handling, labor, installation, overhead, and profit.

1. Do not include Contractor's or subcontractor's indirect expense in the Change Proposal cost amount unless it is clearly shown that the nature or extent of work has changed from what could have been foreseen from information in the Contract Documents.

2. No change to Contractor's indirect expense is permitted for selection of higher- or lower-priced materials or systems of the same scope and nature as originally indicated.

C. The Architect will create a Change Directive on a monthly basis, based on the sum of the Allowances and the allowance sum used to date, for acceptance by the Contractor and the Owner. The amount of this Change Directive may be drawn for the following Application for Payment.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine products covered by an allowance promptly on delivery for damage or defects. Return damaged or defective products to manufacturer for replacement.

3.2 PREPARATION

A. Coordinate materials and their installation for each allowance with related materials and installations to ensure that each allowance item is completely integrated and interfaced with related work.

3.3 SCHEDULE OF ALLOWANCES

A. Allowance No. 1: Quantity Allowance: **Unsuitable Soil removal and disposal on-site: 250 cy**.

B. Allowance No. 2: **Quantity Allowance: Unsuitable Soil or existing loose fill soil re-placement with on-site suitable soil in place: 250cy.**

C. Allowance No. 3: **Quantity Allowance: Unsuitable Soil removal and disposal off-site: 250 cy.**

D. Allowance No. 4: **Quantity Allowance: Replacement of removed unsuitable soils with on-site suitable soil in-place: 250 cy.**

E. Allowance No. 5: **Quantity Allowance: Replacement of removed unsuitable soils with Select Granular Material in-place: 250 cy.**

F. Allowance No. 6: **Quantity Allowance: Replacement of unsuitable soils with Aggregate Base Course NCDOT (ABC STONE) in-place: 100cy.**

G. Allowance No. 7: **Quantity Allowance: Replacement of unsuitable or wet soils with No.57 washed stone in-place: 100cy.**

H. Allowance No. 8: **Quantity Allowance: Woven Geo-Textile Fabric in place: 200sy**

I. Allowance No. 9: **Quantity Allowance: Biaxial Geo-Grid in place: 200sy**

END OF SECTION 012100,0

SECTION 012200 - UNIT PRICES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for unit prices.

B. Related Requirements:

1. Section 012600 "Contract Modification Procedures" for procedures for submitting and handling Change Orders.

1.2 DEFINITIONS

A. Unit price is an amount incorporated in the Agreement, applicable during the duration of the Work as a price per unit of measurement for materials, equipment, or services, or a portion of the Work, added to or deducted from the Contract Sum by appropriate modification, if the scope of Work or estimated quantities of Work required by the Contract Documents are increased or decreased.

1.3 PROCEDURES

A. Unit prices include all necessary material, plus cost for delivery, installation, insurance, applicable taxes, overhead, and profit.

B. Measurement and Payment: See individual Specification Sections for work that requires establishment of unit prices. Methods of measurement and payment for unit prices are specified in those Sections.

C. Owner reserves the right to reject Contractor's measurement of work-in-place that involves use of established unit prices and to have this work measured, at Owner's expense, by an independent surveyor acceptable to Contractor.

D. List of Unit Prices: A schedule of unit prices is included in Part 3. Specification Sections referenced in the schedule contain requirements for materials described under each unit price.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 SCHEDULE OF UNIT PRICES

A. Unit Price No. 1: **Unsuitable Soil removal and disposal on-site.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: cubic yard measured before removal.
3. Include the following in the unit price:

    a. Excavation, loading, transport, and legal disposal of all materials.
    b. All disposal fees.
    c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on volume of excavation.
6. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section “Allowances.”

B. Unit Price No. 2: **Replacement of unsuitable soils or existing loose fill soil with on-site suitable soil in-place.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: cubic yard of void to be filled.
3. Include the following in the unit price:

    a. Excavation, loading, transport, of suitable soil materials from on-site borrow area.
    b. Placement and compaction of soil into void remaining from removed rock or unsuitable soil.
    c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Do not include removal of unsuitable soil. Include costs related to removal of unsuitable soil in other Unit Prices.
6. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on volume of void to be filled.
7. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section “Allowances.”

C. Unit Price No. 3: **Unsuitable Soil or existing loose fill soil removal and disposal off-site.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: cubic yard measured before removal.
3. Include the following in the unit price:

    a. Excavation from below subgrade elevations.
    b. Loading and on-site transport of all materials.
    c. Placement, compaction and moisture conditioning of materials in on-site fill area.
    d. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on measured volume of excavation.
6. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section “Allowances.”

D. Unit Price No. 4: **Replacement of removed unsuitable soils with on-site suitable soil in-place.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: cubic yard of void to be filled.
3. Include the following in the unit price:

    a. Suitable soil materials from contractor’s off-site source.
    b. Excavation, loading, transport, placement and compaction of soil into void remaining from removed rock or unsuitable soil.
    c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Do not include removal of unsuitable soil. Include costs related to removal of unsuitable soil in other Unit Prices.
6. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on volume of void to be filled.
7. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section “Allowances.”

E. Unit Price No. 5: **Replacement of removed unsuitable soils with Select Granular Material in-place**.

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: cubic yard of void to be filled.
3. Include the following in the unit price:

    a. Select Granular Material from contractor’s off-site source.
    b. Excavation, loading, transport, placement and compaction of soil into void remaining from removed rock or unsuitable soil.
    c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Do not include removal of unsuitable soil. Include costs related to removal of unsuitable soil in other Unit Prices.
6. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on volume of void to be filled.
7. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section “Allowances.”

F. Unit Price No. 6: **Replacement of unsuitable soils with Aggregate Base Course in-place.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: cubic yard of void to be filled.
3. Include the following in the unit price:

    a. Certified ABC materials from contractor's off-site source.
    b. Excavation, loading, transport, placement and compaction of ABC into void remaining from removed rock or unsuitable soil.
    c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Do not include removal of unsuitable soil. Include costs related to removal of unsuitable soil in other Unit Prices.
6. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on volume of void to be filled.
7. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section "Allowances."

G. Unit Price No. 7**: Replacement of unsuitable soils with No.57 washed stone in-place.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: cubic yard of void to be filled.
3. Include the following in the unit price:

    a. Certified #57 washed stone from contractor's off-site source.
    b. Excavation, loading, transport, placement and compaction of #57 washed stone into void remaining from removed rock or unsuitable soil.
    c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Do not include removal of unsuitable soil. Include costs related to removal of unsuitable soil in other Unit Prices.
6. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on volume of void to be filled.
7. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section "Allowances."

H. Unit Price No. 8: **Woven Geo-Textile Fabric in place.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: square yard of surface to be covered.
3. Include the following in the unit price:

a. Materials and transport to site.
b. Unloading, handling, and placement.
c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on the area of ground covered by the fabric. Excess and/or overlap shall not be included in the measurement.
6. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section “Allowances.”

I. Unit Price No. 9: **Biaxial Geo-Grid in place.**

1. Purpose: To adjust the contract sum in case a quantity different from that indicated in the allowance is required.
2. Unit of measurement: square yard of surface to be covered.
3. Include the following in the unit price:

a. Materials and transport to site.
b. Unloading, handling, and placement.
c. Overhead and profit.

4. Include all other related costs in the contract sum.
5. Method of measurement: Quantities will be verified by a soils and materials engineer employed by the Owner based on the area of ground covered by the fabric. Excess and/or overlap shall not be included in the measurement.
6. Quantity Allowance: Coordinate unit price with allowance adjustment requirements of Division 01 Section “Allowances.”

PAGE INTENTIONALY LEFT BLANK

END OF SECTION 012200

SECTION 012300 – ALTERNATES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for alternates.

1.2 DEFINITIONS

A. Alternate: An amount proposed by bidders and stated on the Bid Form for certain work defined in the bidding requirements that may be added to or deducted from the base bid amount if Owner decides to accept a corresponding change either in the amount of construction to be completed or in the products, materials, equipment, systems, or installation methods described in the Contract Documents.

1. Alternates described in this Section are part of the Work only if enumerated in the Agreement.
2. The cost or credit for each alternate is the net addition to or deduction from the Contract Sum to incorporate alternate into the Work. No other adjustments are made to the Contract Sum.

1.3 PROCEDURES

A. Coordination: Revise or adjust affected adjacent work as necessary to completely integrate work of the alternate into Project.

1. Include as part of each alternate, miscellaneous devices, accessory objects, and similar items incidental to or required for a complete installation whether or not indicated as part of alternate.

B. Notification: Immediately following award of the Contract, notify each party involved, in writing, of the status of each alternate. Indicate if alternates have been accepted, rejected, or deferred for later consideration. Include a complete description of negotiated revisions to alternates.

C. Execute accepted alternates under the same conditions as other work of the Contract.

D. Schedule: A schedule of alternates is included at the end of this Section. Specification Sections referenced in schedule contain requirements for materials necessary to achieve the work described under each alternate.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 SCHEDULE OF ALTERNATES FOR **PHASE ONE SCOPE**

A. Alternate No. **1** – **Not Used**

B. Alternate No. **2** – **Entry Lobby & Restroom Renovations**: Renovate main Entry Lobby area with expanded restroom space.

1. Base Bid: No changes to Entry Lobby or adjacent restrooms.
2. Alternate: Demolish interior areas in Entry Lobby #R123 and adjacent rooms per 1/AD-1.21B, and renovate per 1/A-2.21D, 1/A-3.21D and associated MEP+FP sheets.

C. Alternate No. **3** – **Exotic Aquatics Modifications & Additions**: Provide changes and additional exhibits in the Exotic Aquatics #R130 area in the existing aquarium space.

1. Base Bid: No changes to Exotic Aquatics #R130.
2. Alternate: Reconfigure circulation through Exotic Aquatics exhibits per A-2.21A and install exhibits per sheets X-209, X-210, X-211, X-212 along with associated life support systems and lighting.

D. Alternate No. **4** – **Level 2 Staff Bathroom Renovation**: Renovate existing staff bathrooms/showers in back of house area on level 2.

1. Base Bid: No changes to staff bathroom & shower rooms in this area.
2. Alternate: Demolish existing interior spaces per AD-1.22A and renovate per A-2.22A, A-3.22-A and associated MEP+FP sheets.

E. Alternate No. **5A** – **Renovate Level 1 Restroom #s R113 & R114**: Renovate existing men's and women's gang toilets R113 & R114.

1. Base Bid: No changes to these restrooms.
2. Alternate: Remove existing fixtures and partitions in R113 & R114 per 2/AD-1.21B and renovate per 5/A-4.11 and associated plumbing sheets.

F. Alternate No. **5B** – **Renovate Level 2 Restroom #s R215 & R216**: Renovate existing men's and women's gang toilets R215 & R216.

1. Base Bid: No changes to these restrooms.
2. Alternate: Remove existing fixtures and partitions in R215 & R216 per 2/AD-1.22B and renovate per 6/A-4.11 and associated plumbing sheets

G. Alternate No. **6** – **Main Parking Lot & Bus Lot**: Reconfigure main parking lot and satellite lot.

1. Base Bid: No work in either area.
2. Alternate: Reconfigure main and satellite parking areas per Civil sheets C-0, C-1, C-2.0, C-2.1, C-3, C-4 & C-5 and Landscape Sheets L-1.20 & L-1.30, including associated stormwater structures.

H. Alternate No. **7** – **Lighting & Controls in Existing Exhibits/Areas**: Provide new light fixtures and control system in existing exhibit spaces.

1. Base Bid: No change to lighting or controls in current exhibit areas.
2. Alternate: Provide new lighting fixtures and control systems per LT series drawings.

I. Alternate No. **8** – **Outdoor Classroom Roof**: Provide roof structure above outdoor classroom.

1. Base Bid: No roof covering in outdoor classroom area.
2. Alternate: Provide roof structure, roof covering, finish materials, lighting, sprinklers, and associated items in outdoor classroom area.

J. Alternate No. **9** – **Emergency Power Supply System (EPSS)**: Provide emergency generators and new fuel tank.

1. Base Bid: Engine-Generator sets, exhaust system and silencers, generators remote annunciators, day tanks DT01 and DT02, ATS-LS, ATS-LSS, ATS-OP, 20,000 gallon above ground fuel tank and concrete base, fuel piping, fuel tank control panel, fuel as specified, gen sets paralleling controls, feeders from gen sets to Switchboard EPS, grounding, engine -generators controls as shown in Detail 5/E-5.6, emergency power off switches, all installed, tested, commissioned and maintained by Duke Energy One. Contractor must provide supporting branch power circuits to each gen set and intake and exhaust louvers and power circuits.

2. Alternate: Provide and install EPSS as described above and per the Divisions 23 and 26 drawings and specifications.

K. Alternate No. **10**– **Epoxy coated Concrete**: Provide epoxy coating on concrete floors in select areas.

1. Base Bid: Provide sealed concrete floors per the Finish Schedule on A-9.1.

2. Alternate: Provide epoxy coating to floor areas as called out on Finish Schedule A-9.1 in the “Comments” column.

Preferred Alternates

L. Preferred Alternate No**. PA-1**– Provide **Kessil W500 Aquascape Series** light fixtures for exhibits as specified in section 265100.

M. Preferred Alternate No**. PA-2**– Provide either **Kessil W2K Aquascape Series** or **Maxspect commercial LED Floodlight Series** light fixtures as specified in section 265100 for the Live Coral exhibit.
.

PAGE INTENTIONALLY LEFT BLANK

END OF SECTION 012300

SECTION 012600 - CONTRACT MODIFICATION PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for handling and processing Contract modifications.

1.2 CHANGES IN THE WORK - GENERAL

A. Architect will issue written instructions authorizing minor changes in the Work, not involving adjustment to the Contract Sum or the Contract Time.

B. No changes in the work will be considered authorized unless the CMR receives written instructions from the Architect, in advance, approving such changes.

1.3 PROPOSAL REQUESTS

A. Owner-Initiated Proposal Requests: Architect will issue a detailed description of proposed changes in the Work that may require adjustment to the Contract Sum or the Contract Time. If necessary, the description will include supplemental or revised Drawings and Specifications.

1. Work Change Proposal Requests issued by Architect are not instructions either to stop work in progress or to execute the proposed change.
2. Within time specified in Proposal Request or 14 days, when not otherwise specified, after receipt of Proposal Request, submit a quotation estimating cost adjustments to the Contract Sum and the Contract Time necessary to execute the change.

    a. Include a list of quantities of products required or eliminated and unit costs, with total amount of purchases and credits to be made. If requested, furnish survey data to substantiate quantities.
    b. Indicate applicable taxes, delivery charges, equipment rental, and amounts of trade discounts.
    c. Include costs of labor and supervision directly attributable to the change.
    d. Include an updated CMR's construction schedule that indicates the effect of the change, including, but not limited to, changes in activity duration, start and finish times, and activity relationship. Use available total float before requesting an extension of the Contract Time.
    e. Quotation Form: Use forms included in Project Manual.

B. CMR-Initiated Work Change Proposals: If latent or changed conditions require modifications to the Contract, Contractor may initiate a claim by submitting a request for a change to Architect.

1. Include a statement outlining reasons for the change and the effect of the change on the Work. Provide a complete description of the proposed change. Indicate the effect of the proposed change on the Contract Sum and the Contract Time.
2. Include a list of quantities of products required or eliminated and unit costs, with total amount of purchases and credits to be made. If requested, furnish survey data to substantiate quantities.

3. Indicate applicable taxes, delivery charges, equipment rental, and amounts of trade discounts.
4. Include costs of labor and supervision directly attributable to the change.
5. Include an updated CMR's construction schedule that indicates the effect of the change, including, but not limited to, changes in activity duration, start and finish times, and activity relationship. Use available total float before requesting an extension of the Contract Time.
6. Comply with requirements in Division 01 Section "Substitution Procedures" if the proposed change requires substitution of one product or system for product or system specified.
7. Work Change Proposal Request Form: Use form included in Project Manual.

1.4 ADMINISTRATIVE CHANGE ORDERS

A. Unit-Price Adjustment: See Division 01 Section "Unit Prices" for administrative procedures for preparation of Change Order Proposal for adjusting the Contract Sum to reflect measured scope of unit-price work.

1.5 CONSTRUCTION CHANGE DIRECTIVE

A. Construction Change Directive: Architect may issue a Construction Change Directive on Information Transmission Status part of the Construction Observation Report. Construction Change Directive instructs Contractor to proceed with a change in the Work, for subsequent inclusion in a Change Order.

1. Construction Change Directive contains a complete description of change in the Work. It also designates method to be followed to determine change in the Contract Sum or the Contract Time.

B. Documentation: Maintain detailed records on a time and material basis of work required by the Construction Change Directive.

1. After completion of change, submit an itemized account and supporting data necessary to substantiate cost and time adjustments to the Contract, if an alternative lump sum has not previously been agreed upon.

PART 2 - PRODUCTS (Not Used)

1 PART 3 - EXECUTION

COST BREAKDOWN SUMMARY SHEET

Project:

Architect's Project Designation: Brief Description:

1 .	Products (itemized breakdown attached):		1
2 .	Rent of Equipment (listed separately):*	$ -	2
	TOTAL of 1 + 2	$ -	**A**
3 .	Labor (itemized breakdown attached):	$ -	3
4 .	Insurance (workman's compensation, social security, or as otherwise required or specified): %	$ -	4
	TOTAL (A) + 3 + 4	$ -	**B**
5 .	Overhead and Profit {15% of Total (B)}:**	$ -	5
	TOTAL of (B) + 5	$ -	**C**
6 .	Sales Taxes on Total (A):	$ -	6
	TOTAL of (C) + 6:	$ -	**D**
7 .	Subcontract work (if applicable in a similar breakdown through total (D). (Profit and Overhead Allowance 15%):	$ -	7
8 .	CMR's overhead and profit on 7 sub-bids (5%)***	$ -	8
	TOTAL of 7 + 8	$ -	**E**
	TOTAL of (D) + (E)	$ -	**F**
9 .	Performance-Payment Bond on total (F): %		
TOTAL QUOTATION (F) + 9		$ -	

Extension of time requested:_____ calendar days.

* Include current schedules with each request if equipment is involved.
** In case of deductible changes, this figure to be ten percent (10%).
*** In case of deductible changes, this figure to be zero percent (0%).

1

2 END OF SECTION 012600

SECTION 012900 - PAYMENT PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements necessary to prepare and process Applications for Payment.

B. Related Requirements:

1. Division 01 Section "Contract Modification Procedures" for administrative procedures for handling changes to the Contract.
2. Division 01 Section "Construction Progress Documentation" for administrative requirements governing the preparation and submittal of the CMR's construction schedule.

1.2 SCHEDULE OF VALUES

A. Coordination: Coordinate preparation of the schedule of values with preparation of CMR's construction schedule.

1. Coordinate line items in the schedule of values with other required administrative forms and schedules, including the following:

    a. Application for Payment forms with continuation sheets.
    b. Submittal schedule.
    c. Items required to be indicated as separate activities in CMR's construction schedule.

2. Submit the schedule of values to Architect at earliest possible date but no later than seven days before the date scheduled for submittal of initial Applications for Payment.
3. Sub-schedules for Phased Work: Where the Work is separated into phases requiring separately phased payments, provide sub-schedules showing values coordinated with each phase of payment.

B. Format and Content: Use Project Manual table of contents as a guide to establish line items for the schedule of values. Provide at least one line item for each Specification Section.

1. Identification: Include the following Project identification on the schedule of values:

    a. Project name and location.
    b. Name of Architect.
    c. Architect's project number.
    d. CMR's name and address.
    e. Date of submittal.

2. Arrange schedule of values consistent with format of AIA Document G703.

3. Provide a breakdown of the Contract Sum in enough detail to facilitate continued evaluation of Applications for Payment and progress reports. Coordinate with Project Manual table of contents.
4. Round amounts to nearest whole dollar; total shall equal the Contract Sum.
5. Provide a separate line item in the schedule of values for each part of the Work where Applications for Payment may include materials or equipment purchased or fabricated and stored, but not yet installed.
6. Provide separate line items in the schedule of values for initial cost of materials, for each subsequent stage of completion, and for total installed value of that part of the Work.
7. Allowances: Provide a separate line item in the schedule of values for each allowance. Show line-item value of unit-cost allowances, as a product of the unit cost, multiplied by measured quantity. Use information indicated in the Contract Documents to determine quantities.
8. Each item in the schedule of values and Applications for Payment shall be complete. Include total cost and proportionate share of general overhead and profit for each item.

    a. Temporary facilities and other major cost items that are not direct cost of actual work-in-place may be shown either as separate line items in the schedule of values or distributed as general overhead expense, at CMR's option.

1.3 APPLICATIONS FOR PAYMENT

A. Each Application for Payment shall be consistent with previous applications and payments as certified by Architect and paid for by Owner.

1. Initial Application for Payment, Application for Payment at time of Beneficial Occupancy, and final Application for Payment involve additional requirements.

B. Payment Application Times: Submit Application for Payment to Architect by the 20th of the month. The period covered by each Application for Payment is one month, ending on the last day of the month. Modifications to this time period will be subject to the Owner's Approval.

C. Application for Payment Forms: Use AIA Document G702 and AIA Document G703 as form for Applications for Payment.

1. Provide Sale Tax Summary for the period of activity covered by the Pay Application.

D. Application Preparation: Complete every entry on form. Notarize and execute by a person authorized to sign legal documents on behalf of Contractor. Architect will return incomplete applications without action.

1. Entries shall match data on the schedule of values and CMR's construction schedule. Use updated schedules if revisions were made.
2. Include amounts of Change Orders and Construction Change Directives issued before last day of construction period covered by application.

E. Transmittal: Submit four signed and notarized original copies of each Application for Payment to Architect by a method ensuring receipt within 24 hours. One copy shall include waivers of lien and similar attachments if required.

1. Transmit each copy with a transmittal form listing attachments and recording appropriate information about application.

F. Waivers of Mechanic's Lien: With each Application for Payment, submit waivers of mechanic's lien from entities lawfully entitled to file a mechanic's lien arising out of the Contract and related to the Work covered by the payment.

1. Submit partial waivers on each item for amount requested in previous application, after deduction for retainage, on each item.
2. When an application shows completion of an item, submit conditional final or full waivers.
3. Owner reserves the right to designate which entities involved in the Work must submit waivers.
4. Waiver Forms: Submit executed waivers of lien on forms acceptable to Owner.

G. Initial Application for Payment: Administrative actions and submittals that must precede or coincide with submittal of first Application for Payment include the following:

1. List of subcontractors.
2. Schedule of values.
3. CMR's construction schedule (preliminary, if not final).
4. Schedule of unit prices.
5. Submittal schedule (preliminary if not final).
6. List of CMR's staff assignments.
7. Copies of demolition and/or building permits (if required).
8. Copies of authorizations and licenses from authorities having jurisdiction for performance of the Work.
9. Certificates of insurance and insurance policies.

H. Application for Payment at Beneficial Occupancy: After Architect issues the Certificate of Final Acceptance, submit an Application for Payment showing 100 percent completion for portion of the Work claimed as complete.

1. Include documentation supporting claim that the Work is substantially complete and a statement showing an accounting of changes to the Contract Sum.

I. Final Payment Application: After completing Project Closeout requirements, submit final Application for Payment with releases and supporting documentation not previously submitted and accepted, including, but not limited, to the following:

1. Evidence of completion of Project closeout requirements.
2. Insurance certificates for products and completed operations where required and proof that taxes, fees, and similar obligations were paid.
3. Updated final statement, accounting for final changes to the Contract Sum.
4. Certificates of Release: From authorities having jurisdiction.
5. Certificate of Insurance: For continuing coverage.
6. Project Approval Authorization; Partial Utilization (Beneficial Occupancy)
7. Project Approval Authorization; Final Inspection for Owner Occupancy.
8. Certificate of Compliance.
9. Certificate of Completion.
10. Evidence that claims have been settled.
11. Final meter readings for utilities, a measured record of stored fuel, and similar data as of date of Beneficial Occupancy or when Owner took possession of and assumed responsibility for corresponding elements of the Work.
12. Final liquidated damages settlement statement.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION (Not Used)

END OF SECTION 012900

SECTION 013100 - PROJECT MANAGEMENT AND COORDINATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative provisions for coordinating construction operations on Project including, but not limited to, the following:

1. Coordination drawings.
2. Requests for Information (RFIs).
3. Project meetings.

B. Related Requirements:

1. Section 017300 "Execution" for procedures for coordinating general installation and field-engineering services, including establishment of benchmarks and control points.

1.2 DEFINITIONS

A. RFI: Request from Owner, Architect, or CMR seeking information required by or clarifications of the Contract Documents.

1.3 INFORMATIONAL SUBMITTALS

A. Subcontract List: Prepare a written summary identifying individuals or firms proposed for each portion of the Work, including those who are to furnish products or equipment fabricated to a special design. Include the following information in tabular form:

1. Name, address, and telephone number of entity performing subcontract or supplying products.
2. Number and title of related Specification Section(s) covered by subcontract.
3. Drawing number and detail references, as appropriate, covered by subcontract.

1.4 GENERAL COORDINATION PROCEDURES

A. Coordination: Coordinate construction operations included in different Sections of the Specifications to ensure efficient and orderly installation of each part of the Work. Coordinate construction operations, included in different Sections that depend on each other for proper installation, connection, and operation.

1. Schedule construction operations in sequence required to obtain the best results where installation of one part of the Work depends on installation of other components, before or after its own installation.
2. Coordinate installation of different components to ensure maximum performance and accessibility for required maintenance, service, and repair.
3. Make adequate provisions to accommodate items scheduled for later installation.

B. Prepare memoranda for distribution to each party involved, outlining special procedures required for coordination. Include such items as required notices, reports, and list of attendees at meetings.

1. Prepare similar memoranda for Owner and separate contractors if coordination of their Work is required.

C. Administrative Procedures: Coordinate scheduling and timing of required administrative procedures with other construction activities to avoid conflicts and to ensure orderly progress of the Work. Such administrative activities include, but are not limited to, the following:

1. Preparation of CMR's construction schedule.
2. Preparation of the schedule of values.
3. Installation and removal of temporary facilities and controls.
4. Delivery and processing of submittals.
5. Progress meetings.
6. Project closeout activities.
7. Startup and adjustment of systems.

1.5 COORDINATION DRAWINGS

A. Coordination Drawings, General: Prepare coordination drawings according to requirements in individual Sections, where installation is not completely shown on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one entity.

1. Content: Project-specific information, drawn accurately to a scale large enough to indicate and resolve conflicts. Do not base coordination drawings on standard printed data. Include the following information, as applicable:

   a. Indicate functional and spatial relationships of components of architectural, structural, civil, mechanical, and electrical systems.
   b. Indicate dimensions shown on the Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternate sketches to Architect indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.

B. Coordination Drawing Organization: Organize coordination drawings as follows:

1. Floor Plans and Reflected Ceiling Plans: Show architectural and structural elements, and mechanical, plumbing, fire-protection, fire-alarm, and electrical Work. Show locations of visible ceiling-mounted devices relative to acoustical ceiling grid.
2. Plenum Space: Indicate subframing for support of ceiling and wall systems, mechanical and electrical equipment, and related Work. Locate components within ceiling plenum to accommodate layout of light fixtures indicated on Drawings.
3. Mechanical Rooms: Provide coordination drawings for mechanical rooms showing plans and elevations of mechanical, plumbing, fire-protection, fire-alarm, and electrical equipment.
4. Structural Penetrations: Indicate penetrations and openings required for all disciplines.
5. Slab Edge and Embedded Items: Indicate slab edge locations and sizes and locations of embedded items for metal fabrications, sleeves, anchor bolts, bearing plates, angles, door floor closers, slab depressions for floor finishes, curbs and housekeeping pads, and similar items.

6. Review: Architect will review coordination drawings to confirm that the Work is being coordinated, but not for the details of the coordination, which are CMR's responsibility.

1.6 REQUESTS FOR INFORMATION (RFIs)

A. General: Immediately on discovery of the need for additional information or interpretation of the Contract Documents, CMR shall prepare and submit an RFI in the form specified.

1. Architect will return RFIs submitted to Architect by other entities controlled by CMR with no response.
2. Coordinate and submit RFIs in a prompt manner so as to avoid delays in CMR's work or work of subcontractors.

B. Content of the RFI: Include a detailed, legible description of item needing information or interpretation and the following:

1. Project name.
2. Project number.
3. Date.
4. Name of CMR.
5. Name of Architect.
6. RFI number, numbered sequentially.
7. RFI subject.
8. Specification Section number and title and related paragraphs, as appropriate.
9. Drawing number and detail references, as appropriate.
10. Field dimensions and conditions, as appropriate.
11. Contractor's suggested resolution. If CMR's solution(s) impacts the Contract Time or the Contract Sum, CMR shall state impact in the RFI.
12. Contractor's signature.
13. Attachments: Include sketches, descriptions, measurements, photos, Product Data, Shop Drawings, coordination drawings, and other information necessary to fully describe items needing interpretation.

C. RFI Forms: AIA Document G716.

D. Architect's Action: Architect will review each RFI, determine action required, and respond. Allow seven working days for Architect's response for each RFI. RFIs received by Architect after 1:00 p.m. will be considered as received the following working day.

1. The following RFIs will be returned without action:

    a. Requests for approval of submittals.
    b. Requests for approval of substitutions.
    c. Requests for coordination information already indicated in the Contract Documents.
    d. Requests for adjustments in the Contract Time or the Contract Sum.
    e. Requests for interpretation of Architect's actions on submittals.
    f. Incomplete RFIs or inaccurately prepared RFIs.

2. Architect's action may include a request for additional information, in which case Architect's time for response will date from time of receipt of additional information.
3. Architect's action on RFIs that may result in a change to the Contract Time or the Contract Sum may be eligible for Contractor to submit Change Proposal according to Section 012600 "Contract Modification Procedures."

a. If Contractor believes the RFI response warrants change in the Contract Time or the Contract Sum, notify Architect in writing within 10 days of receipt of the RFI response.

E. RFI Log: Prepare, maintain, and submit a tabular log of RFIs organized by the RFI number. Submit log 3 working days prior to the Monthly Project Meeting. Include the following:

1. Project name.
2. Name and address of CMR.
3. Name and address of Architect.
4. RFI number including RFIs that were dropped and not submitted.
5. RFI description.
6. Date the RFI was submitted.
7. Date Architect's response was received.

F. On receipt of Architect's action, update the RFI log and immediately distribute the RFI response to affected parties. Review response and notify Architect within seven days if CMR disagrees with response.

1. Identification of related Minor Change in the Work, Construction Change Directive, and Proposal Request, as appropriate.
2. Identification of related Field Order, Work Change Directive, and Proposal Request, as appropriate.

1.7 PROJECT MEETINGS

A. General: Architect will schedule and conduct Monthly Project Meetings and conferences at Project site unless otherwise indicated.

B. Preconstruction Conference: Architect will schedule and conduct a preconstruction conference before starting construction, at a time convenient to Owner and Architect, but no later than 15 days after execution of the Agreement. The Architect will prepare and distribute Meeting Minutes to Attendees.

1. Attendees: Authorized representatives of Owner, Architect, and their consultants; CMR and its superintendent; major subcontractors; suppliers; and other concerned parties shall attend the conference. Participants at the conference shall be familiar with Project and authorized to conclude matters relating to the Work.
2. Agenda: Discuss items of significance that could affect progress, including the following:

a. Tentative construction schedule.
b. Phasing.
c. Critical work sequencing and long-lead items.
d. Designation of key personnel and their duties.
e. Procedures for processing field decisions and Change Orders.
f. Procedures for RFIs.
g. Procedures for testing and inspecting.
h. Procedures for processing Applications for Payment.
i. Distribution of the Contract Documents.
j. Submittal procedures.
k. Preparation of record documents.
l. Use of the premises and existing buildings.
m. Work restrictions.
n. Working hours.

o. Owner's occupancy requirements.
p. Responsibility for temporary facilities and controls.
q. Procedures for moisture and mold control.
r. Procedures for disruptions and shutdowns.
s. Construction waste management and recycling.
t. Parking availability.
u. Office, work, and storage areas.
v. Equipment deliveries and priorities.
w. First aid.
x. Security.
y. Progress cleaning.

C. Pre-installation Conferences: Conduct a pre-installation conference at Project site before each construction activity that requires coordination with other construction.

1. Attendees: Installer and representatives of manufacturers and fabricators involved in or affected by the installation and its coordination or integration with other materials and installations that have preceded or will follow, shall attend the meeting. Advise Architect of scheduled meeting dates.
2. Agenda: Review progress of other construction activities and preparations for the particular activity under consideration, including requirements for the following:

a. Contract Documents.
b. Options.
c. Related RFIs.
d. Related Change Orders.
e. Purchases.
f. Deliveries.
g. Submittals.
h. Possible conflicts.
i. Compatibility problems.
j. Time schedules.
k. Manufacturer's written instructions.
l. Warranty requirements.
m. Compatibility of materials.
n. Acceptability of substrates.
o. Temporary facilities and controls.
p. Space and access limitations.
q. Regulations of authorities having jurisdiction.
r. Testing and inspecting requirements.
s. Installation procedures.
t. Coordination with other work.
u. Required performance results.
v. Protection of adjacent work.
w. Protection of construction and personnel.

3. Record significant conference discussions, agreements, and disagreements, including required corrective measures and actions.
4. Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
5. Do not proceed with installation if the conference cannot be successfully concluded. Initiate whatever actions are necessary to resolve impediments to performance of the Work and reconvene the conference at earliest feasible date.

A. Progress Meetings: Architect will conduct progress meetings at monthly intervals. The Architect will prepare and distribute Meeting Minutes to Attendees.

1. Attendees: In addition to representatives of Owner and Architect, each contractor, subcontractor, supplier, and other entity concerned with current progress or involved in planning, coordination, or performance of future activities shall be represented at these meetings. All participants at the meeting shall be familiar with Project and authorized to conclude matters relating to the Work.
2. Agenda: Review and correct or approve minutes of previous progress meeting. Review other items of significance that could affect progress. Include topics for discussion as appropriate to status of Project.

    a. CMR's Construction Schedule: Review progress since the last meeting. Determine whether each activity is on time, ahead of schedule, or behind schedule, in relation to CMR's construction schedule. Determine how construction behind schedule will be expedited; secure commitments from parties involved to do so. Discuss whether schedule revisions are required to ensure that current and subsequent activities will be completed within the Contract Time.

        1) Review schedule for next period.

    b. Review present and future needs of each entity present, including the following:

        1) Interface requirements.
        2) Sequence of operations.
        3) Status of submittals.
        4) Deliveries.
        5) Off-site fabrication.
        6) Access.
        7) Site utilization.
        8) Temporary facilities and controls.
        9) Progress cleaning.
        10) Quality and work standards.
        11) Status of correction of deficient items.
        12) Field observations.
        13) Status of RFIs.
        14) Status of proposal requests.
        15) Pending changes.
        16) Status of Change Orders.
        17) Pending claims and disputes.
        18) Documentation of information for payment requests.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION (Not Used)

END OF SECTION 013100

SECTION 013200 - CONSTRUCTION PROGRESS DOCUMENTATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for documenting the progress of construction during performance of the Work, including the following:

1. CMR's construction schedule.
2. Construction schedule updating reports.
3. Daily construction reports.

1.2 DEFINITIONS

A. Schedule: The time required to complete the work of this Contract. This is not to be construed as the same as the Contract Time, which is established by the Designer, and is intended to allow for normal weather delays, unforeseen conditions, inspections delays, et cetera, and does not represent the time it should take to complete the work.

B. Activity: A discrete part of a project that can be identified for planning, scheduling, monitoring, and controlling the construction project. Activities included in a construction schedule consume time and resources.

1. Critical Activity: An activity on the critical path that must start and finish on the planned early start and finish times.
2. Predecessor Activity: An activity that precedes another activity in the network.
3. Successor Activity: An activity that follows another activity in the network.

C. CPM: Critical path method, which is a method of planning and scheduling a construction project where activities are arranged based on activity relationships. Network calculations determine when activities can be performed and the critical path of Project.

D. Critical Path: The longest connected chain of interdependent activities through the network schedule that establishes the minimum overall Project duration and contains no float.

E. Float: The measure of leeway in starting and completing an activity.

1. Float time is not for the exclusive use or benefit of either Owner or CMR, but is a jointly owned, expiring Project resource available to both parties as needed to meet schedule milestones, Beneficial Occupancy and Contract Completion date. No time extensions will be allowed if it can be demonstrated that the Work can reasonably be completed within the scheduled time.

1.3 INFORMATIONAL SUBMITTALS

A. Format for Submittals: Submit required submittals in the following format:

1. PDF electronic file.

B. CMR's Construction Schedule: Initial schedule, of size required to display entire schedule for entire construction period.

C. CPM Reports: Concurrent with CPM schedule, submit each of the following reports. Format for each activity in reports shall contain activity number, activity description, original duration, remaining duration, early start date, early finish date, late start date, late finish date, and total float in calendar days.

1. Activity Report: List of all activities sorted by activity number and then early start date, or actual start date if known.

D. Construction Schedule Updating Reports: Submit at Monthly progress Meeting.

E. Daily Construction Reports: Maintain log on Project Site.

PART 2 - PRODUCTS

2.1 CMR'S CONSTRUCTION SCHEDULE, GENERAL

A. Time Frame: Extend schedule from date established for the Notice of Award to date of final completion.

1. Contract completion date shall not be changed by submission of a schedule that shows an early completion date, unless specifically authorized by Change Order.

B. Activities: Treat each story or separate area as a separate numbered activity for each main element of the Work. Comply with the following:

1. Activity Duration: Define activities so no activity is longer than 10 days, unless specifically allowed by Architect.
2. Procurement Activities: Include procurement process activities for the following long lead items and major items, requiring a cycle of more than 60 days, as separate activities in schedule. Procurement cycle activities include, but are not limited to, submittals, approvals, purchasing, fabrication, and delivery.
3. Submittal Review Time: Include review and resubmittal times indicated in Section 013300 "Submittal Procedures" in schedule. Coordinate submittal review times in CMR's construction schedule with submittal schedule.
4. Startup and Testing Time: Include no fewer than 5 days for startup and testing.
5. Beneficial Occupancy: Indicate completion in advance of date established for Beneficial Occupancy, and allow time for Architect's administrative procedures necessary for certification of Beneficial Occupancy.
6. Punch List and Final Completion: Include not more than 10 days for completion of punch list items and final completion.

C. Constraints: Include constraints and work restrictions indicated in the Contract Documents and as follows in schedule, and show how the sequence of the Work is affected.

1. Phasing: Arrange list of activities on schedule by phase.
2. Work by Owner: Include a separate activity for each portion of the Work performed by Owner.
3. Work Restrictions: Show the effect of the following items on the schedule:

a. Coordination with existing construction.

b. Limitations of continued occupancies.
c. Uninterruptible services.
d. Partial occupancy before Final Completion.
e. Use of premises restrictions.
f. Environmental control.

4. Work Stages: Indicate important stages of construction for each major portion of the Work.

D. Milestones: Include milestones indicated in the Contract Documents in schedule, including, but not limited to, the Notice to Proceed, Beneficial Occupancy for each Phase, and final completion.

E. Upcoming Work Summary: Prepare summary report indicating activities scheduled to occur or commence prior to submittal of next schedule update. Summarize the following issues:

1. Unresolved issues.
2. Unanswered Requests for Information.
3. Rejected or unreturned submittals.
4. Notations on returned submittals.
5. Pending modifications affecting the Work and Contract Time.

F. Recovery Schedule: When periodic update indicates the Work is 14 or more calendar days behind the current approved schedule, submit a separate recovery schedule indicating means by which Contractor intends to regain compliance with the schedule.

G. Computer Scheduling Software: Prepare schedules using current version of a program that has been developed specifically to manage construction schedules.

2.2 CMR'S CONSTRUCTION SCHEDULE (GANTT CHART)

A. Gantt-Chart Schedule: Submit a comprehensive, fully developed, horizontal, Gantt-chart-type, Contractor's construction schedule within 21 days of date established for the Notice of Award.

B. Preparation: Indicate each significant construction activity separately. Identify first workday of each week with a continuous vertical line.

1. For construction activities that require three months or longer completing, indicate an estimated completion percentage in 20 percent increments within time bar.

2.3 CMR'S CONSTRUCTION SCHEDULE (CPM SCHEDULE)

A. General: Prepare network diagrams using AON (activity-on-node) format.

B. CPM Schedule: Prepare CMR's construction schedule using a time-scaled CPM network analysis diagram for the Work.

1. Develop network diagram in sufficient time to submit CPM schedule so it can be accepted for use no later than 14 days after date established for the Notice of Award.

a. Failure to include any work item required for performance of this Contract shall not excuse CMR from completing all work within applicable completion dates, regardless of Architect's approval of the schedule.

2. Establish procedures for monitoring and updating CPM schedule and for reporting progress. Coordinate procedures with progress meeting and payment request dates.
3. Use "one workday" as the unit of time for individual activities. Indicate nonworking days and holidays incorporated into the schedule in order to coordinate with the Contract Time.

C. CPM Schedule Preparation: Prepare a list of all activities required to complete the Work. Using the startup network diagram, prepare a skeleton network to identify probable critical paths.

1. Activities: Indicate the estimated time duration, sequence requirements, and relationship of each activity in relation to other activities. Include estimated time frames for the following activities:

    a. Preparation and processing of submittals.
    b. Mobilization and demobilization.
    c. Purchase of materials.
    d. Delivery.
    e. Fabrication.
    f. Utility interruptions.
    g. Installation.
    h. Work by Owner that may affect or be affected by CMR's activities.
    i. Testing.
    j. Punch list, Beneficial Occupancy and final completion.
    k. Activities occurring following final completion.

2. Critical Path Activities: Identify critical path activities, including those for interim completion dates. Scheduled start and completion dates shall be consistent with Contract milestone dates.
3. Processing: Process data to produce output data on a computer-drawn, time-scaled network. Revise data, reorganize activity sequences, and reproduce as often as necessary to produce the CPM schedule within the limitations of the Contract Time.
4. Format: Mark the critical path. Locate the critical path near center of network; locate paths with most float near the edges.

D. Contract Modifications: For each proposed contract modification and concurrent with its submission, prepare a time-impact analysis using a network fragment to demonstrate the effect of the proposed change on the overall project schedule.

E. Initial Issue of Schedule: Prepare initial network diagram from a sorted activity list indicating straight "early start-total float." Identify critical activities. Prepare tabulated reports showing the following:

1. CMR or subcontractor and the Work or activity.
2. Description of activity.
3. Main events of activity.
4. Immediately preceding and succeeding activities.
5. Early and late start dates.
6. Early and late finish dates.
7. Activity duration in workdays.
8. Total float or slack time.
9. Average size of workforce.
10. Dollar value of activity (coordinated with the schedule of values).

F. Schedule Updating: Concurrent with making revisions to schedule, prepare tabulated reports showing the following:

1. Identification of activities that have changed.
2. Changes in early and late start dates.
3. Changes in early and late finish dates.
4. Changes in activity durations in workdays.
5. Changes in the critical path.
6. Changes in total float or slack time.
7. Changes in the Contract Time.

2.4 REPORTS

A. Daily Construction Reports: Prepare a daily construction report recording the following information concerning events at Project site:

1. List of subcontractors at Project site.
2. List of separate subcontractors at Project site.
3. Approximate count of personnel at Project site.
4. Equipment at Project site.
5. Material deliveries.
6. Accidents.
7. Meetings and significant decisions.
8. Unusual events.
9. Stoppages, delays, shortages, and losses.
10. Orders and requests of authorities having jurisdiction.
11. Change Orders received and implemented.
12. Change Directives received and implemented.
13. Services connected and disconnected.
14. Equipment or system tests and startups.
15. Partial completions and occupancies.
16. Beneficial Occupancy authorized.

PART 3 - EXECUTION

3.1 CMR'S CONSTRUCTION SCHEDULE

A. CMR's Construction Schedule Updating: At monthly intervals, update schedule to reflect actual construction progress and activities. Issue schedule at each regularly scheduled progress meeting.

1. Revise schedule immediately after each meeting or other activity where revisions have been recognized or made. Issue updated schedule concurrently with the report of each such meeting.
2. Include a report with updated schedule that indicates every change, including, but not limited to, changes in logic, durations, actual starts and finishes, and activity durations.
3. As the Work progresses, indicate final completion percentage for each activity.

B. Distribution: Distribute copies of approved schedule to Architect, Owner, testing and inspecting agencies, and other parties identified by CMR with a need-to-know schedule responsibility.

1. Post copies in Project meeting rooms and temporary field offices.
2. When revisions are made, distribute updated schedules to the same parties and post in the same locations. Delete parties from distribution when they have completed their

assigned portion of the Work and are no longer involved in performance of construction activities.

END OF SECTION 013200

SECTION 013233 - PHOTOGRAPHIC DOCUMENTATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for the following:

1. Preconstruction photographs and/or video.

1.2 INFORMATIONAL SUBMITTALS

A. Key Plan: Submit key plan of Project site and building with notation of vantage points marked for location and direction of each **photograph** or **video recording**. Indicate elevation or story of construction. Include same information as corresponding photographic documentation.

B. Digital Photographs: Submit unaltered, original, full-size image files within seven (7) days of taking photographs.

1. Digital Camera: Minimum sensor resolution of twelve (12) megapixels.
2. Identification: Provide the following information with each image description in file metadata tag:

a. Name of Project.
b. Name and contact information for photographer.
c. Date photograph was taken.
d. Description of vantage point, indicating location, direction (by compass point), and elevation or story of construction.

PART 2 - PRODUCTS

2.1 PHOTOGRAPHIC MEDIA

A. Digital Images: Provide images in JPG format, with minimum size of five (5) megapixels.

PART 3 - EXECUTION

3.1 CONSTRUCTION PHOTOGRAPHS

A. General: Take photographs using the maximum range of depth of field, and that are in focus, to clearly show the Work. Photographs with blurry or out-of-focus areas will not be accepted.

1. Maintain key plan with each set of construction photographs that identifies each photographic location.

B. Digital Images: Submit digital images exactly as originally recorded in the digital camera, without alteration, manipulation, editing, or modifications using image-editing software.

1. Date and Time: Include date and time in file name for each image.
2. Field Office Images: Maintain one set of images accessible in the field office at Project site, available at all times for reference.

C. Preconstruction Photographs: Before **commencement of demolition**, take photographs of Project site and surrounding properties, including existing items to remain during construction, from different vantage points.

1. Flag **construction limits** before taking construction photographs.
2. Take 30 photographs to show existing conditions adjacent to **construction limits** before starting the Work.
3. Take 30 photographs of existing buildings to accurately record physical conditions at start of construction.

END OF SECTION 013233

SECTION 013300 - SUBMITTAL PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for the submittal schedule and administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals.

B. Related Requirements:

1. Section 013200 "Construction Progress Documentation" for submitting schedules and reports, including CMR's construction schedule.
2. Section 017839 "Project Record Documents" for submitting record Drawings, record Specifications, and record Product Data.

1.2 DEFINITIONS

A. Action Submittals: Written and graphic information and physical samples that require Architect's responsive action.

B. Informational Submittals: Written and graphic information and physical samples that do not require Architect's responsive action. Submittals may be rejected for not complying with requirements.

1.3 ACTION SUBMITTALS

A. Submittal Schedule: Submit a schedule of submittals, arranged in chronological order by dates required by construction schedule. Include time required for review, ordering, manufacturing, fabrication, and delivery when establishing dates. Include additional time required for making corrections or revisions to submittals noted by Architect and additional time for handling and reviewing submittals required by those corrections. This information should be incorporated into the Construction Schedule.

B. All Product Submittals must be scheduled for Designer review within 30 days of Notice to Proceed.

1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Architect's Digital Data Files: If requested, electronic copies of digital data files of the Contract Drawings will be provided by Architect for CMR's use in preparing submittals.

1. Architect will furnish CMR one set of digital data drawing files of the Contract Drawings for use in preparing Shop Drawings and Project record drawings.

    a. Architect makes no representations as to the accuracy or completeness of digital data drawing files as they relate to the Contract Drawings.

B. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.

1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
2. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.

    a. Architect reserves the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.
    b. Submit the entire building system as one submittal: i.e.: for masonry, provide submittals for accessories, mortar, flashings, masonry materials, etc.; for roofing, provide submittals for roof covering, underlayments, flashing materials, rain drainage, etc.

C. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.

1. Initial Review: Allow 7 days for initial review of each submittal. Allow additional time if coordination with subsequent submittals is required or if Architect's consultants must also review the submittal. Architect will advise CMR when a submittal being processed must be delayed for coordination.
2. Intermediate Review: If intermediate submittal is necessary, process it in same manner as initial submittal.
3. Resubmittal Review: Allow 5 days for review of each resubmittal.

D. Paper Submittals: ***(Do not use this format unless the Subcontractor or vendor does not have the capability to use electronic format).***

General: Place a permanent label or title block on each submittal item for identification.

1. Indicate name of firm or entity that prepared each submittal on label or title block.
2. Architect will place his Action Taken Stamp on the Transmittal Letter for returning the Submittal.
3. Include the following information for processing and recording action taken:

    a. Project name.
    b. Date.
    c. Name of Architect.
    d. Name of Construction Manager at Risk (CMR).
    e. Name of subcontractor.
    f. Name of supplier.
    g. Name of manufacturer.
    h. Submittal number or other unique identifier, including revision identifier.

        1) Submittal number shall use Specification Section number followed by a decimal point and then a sequential number (e.g., 061000.01). Resubmittals shall include an alphabetic suffix after another decimal point (e.g., 061000.01.A).

    i. Number and title of appropriate Specification Section.
    j. Drawing number and detail references, as appropriate.
    k. Location(s) where product is to be installed, as appropriate.
    l. Other necessary identification.

4. Additional Paper Copies: Unless additional copies are required for final submittal, and unless Architect observes noncompliance with provisions in the Contract Documents, initial submittal may serve as final submittal.

   a. Submit one copy of submittal to concurrent reviewer in addition to specified number of copies to Architect.

5. Transmittal for Paper Submittals: Assemble each submittal individually and appropriately for transmittal and handling. Transmit each submittal using a transmittal form. Architect will discard submittals received from sources other than CMR.

   a. Transmittal Form for Paper Submittals: Use facsimile of sample form included at the end of this Section.
   b. Transmittal Form for Paper Submittals: Provide locations on form for the following information:

      1) Project name.
      2) Date.
      3) Destination (To:).
      4) Source (From:).
      5) Name and address of Architect.
      6) Name of CMR.
      7) Name of Sub-Contractor.
      8) Name of firm or entity that prepared submittal.
      9) Names of subcontractor, manufacturer, and supplier.
      10) Category and type of submittal.
      11) Submittal purpose and description.
      12) Specification Section number and title.
      13) Specification paragraph number or drawing designation and generic name for each of multiple items.
      14) Drawing number and detail references, as appropriate.
      15) Indication of full or partial submittal.
      16) Transmittal number, numbered consecutively.
      17) Submittal and transmittal distribution record.
      18) Remarks.
      19) Signature of transmitter.

E. Electronic Submittals: ***Preferred form of Submittal.***

General: Identify and incorporate information in each electronic submittal file as follows:

1. All Electronic Submittals to the Design Team shall be in PDF format. Contractor's Management Software does not apply to the communications with the Design Team. Items requiring primary review by professional license holders on the Design Team ***other than the Architect*** must be emailed directly to that professional and an email copy shall be sent to the Architect. The professional will return the submittals with marking and copy the Architect.
2. Assemble complete submittal package into a single indexed file incorporating submittal requirements of a single Specification Section and transmittal form with links enabling navigation to each item.
3. Name file with submittal number or other unique identifier, including revision identifier.

   a. File name shall use project identifier and Specification Section number followed by a decimal point and then a sequential number (e.g., LNHS-061000.01). Resubmittals shall include an alphabetic suffix after another decimal point (e.g., LNHS-061000.01.A).

4. Provide means for insertion to permanently record CMR's review and approval markings and action taken by Architect.
5. Transmittal Form for Electronic Submittals: Use form at the end of this Section.

F. Options: Identify options requiring selection by Architect.

G. Deviations: Identify deviations from the Contract Documents on submittals.

H. Resubmittals: Make resubmittals in same form and number of copies as initial submittal.

1. Note date and content of previous submittal.
2. Note date and content of revision in label or title block and clearly indicate extent of revision.
3. Resubmit submittals until they are marked with approval notation from Architect's action stamp.

I. Distribution: Furnish copies of final submittals to manufacturers, subcontractors, suppliers, fabricators, installers, authorities having jurisdiction, and others as necessary for performance of construction activities. Show distribution on transmittal forms.

J. Use for Construction: Retain complete copies of submittals on Project site. Use only final action submittals that are marked with approval notation from Architect's action stamp.

PART 2 - PRODUCTS

2.1 SUBMITTAL PROCEDURES

A. **Submittal Procedures simplified:** PART 1 of each Specification Section includes a subparagraph “SUBMITTALS”. Provide all of the information required in that subparagraph at one time. PART 2 of each Specification Section is labeled “PRODUCTS”. Highlight or underline in your submittal each product you intend to use. *Do not send extraneous information pertaining to products not specified.*

B. General Submittal Procedure Requirements:

1. ***Submit complete package for each building system at one time. Preference is for electronic submittal only (exception: provide one set of samples, listed on the electronic submittal and parcel posted the same day).***
2. ***Submit electronic submittals via email as PDF electronic files.***

    a. Architect will return annotated file. Annotate and retain one copy of file as an electronic Project record document file.

3. ***Submit to the Consultant who is responsible for the Division of Work covered by the Submittal and provide the Architect with a Copy of that submittal.***
4. Action Submittals: Submit 2 paper copies (plus 1, for Architect Consultant Review) of each submittal unless otherwise indicated. Architect will return 1 copy.
5. Informational Submittals: Submit 1 paper copy (plus 1, for Architect Consultant Review) of each submittal unless otherwise indicated. Architect will not return copies.
6. Certificates and Certifications Submittals: Provide a statement that includes signature of entity responsible for preparing certification. Certificates and certifications shall be signed by an officer or other individual authorized to sign documents on behalf of that entity.

a. Provide a digital signature with digital certificate on electronically-submitted certificates and certifications where indicated.
b. Provide a notarized statement on original paper copy certificates and certifications where indicated.

C. Product Data: Collect information into a single submittal for each element of construction and type of product or equipment.

1. If information must be specially prepared for submittal because standard published data are not suitable for use, submit as Shop Drawings, not as Product Data.
2. Mark each copy of each submittal to show which products and options are applicable.
3. Include the following information, as applicable:

a. Manufacturer's catalog cuts.
b. Manufacturer's product specifications.
c. Standard color charts.
d. Statement of compliance with specified referenced standards.
e. Testing by recognized testing agency.
f. Application of testing agency labels and seals.
g. Notation of coordination requirements.
h. Availability and delivery time information.

4. For equipment, include the following in addition to the above, as applicable:

a. Wiring diagrams showing factory-installed wiring.
b. Printed performance curves.
c. Operational range diagrams.
d. Clearances required to other construction, if not indicated on accompanying Shop Drawings.

5. Submit Product Data in the following format:

a. PDF electronic file, preferred, or:
b. 1 paper copy (plus 1, for Architect Consultant Review) of Product Data unless otherwise indicated. Architect will not return any copies, but will comment via electronic transmittal.

D. Shop Drawings: Prepare Project-specific information, drawn accurately to scale. Do not base Shop Drawings on reproductions of the Contract Documents or standard printed data, unless submittal based on Architect's digital data drawing files is otherwise permitted.

1. Preparation: Fully illustrate requirements in the Contract Documents. Include the following information, as applicable:

a. Identification of products.
b. Schedules.
c. Compliance with specified standards.
d. Notation of coordination requirements.
e. Notation of dimensions established by field measurement.
f. Relationship and attachment to adjoining construction clearly indicated.
g. Seal and signature of professional engineer if specified.

2. Sheet Size: Except for templates, patterns, and similar full-size drawings, submit Shop Drawings on sheets at least 8-1/2 by 11 inches (215 by 280 mm), but no larger than 30 by 42 inches (750 by 1067 mm).

3. Submit Shop Drawings in the following format:

    a. PDF electronic file (preferred) or:
    b. Two opaque (bond) copies (plus 1, for Architect Consultant Review) of each submittal. Architect will return one copy.

E. Samples: Submit Samples for review of kind, color, pattern, and texture for a check of these characteristics with other elements and for a comparison of these characteristics between submittal and actual component as delivered and installed. ***When providing samples that match the Designer's selection deliver them to the Project Site and not to the Designer.***

1. Transmit Samples that contain multiple, related components such as accessories together in one submittal package.
2. Identification: Attach label on unexposed side of Samples that includes the following:

    a. Generic description of Sample.
    b. Product name and name of manufacturer.
    c. Sample source.
    d. Number and title of applicable Specification Section.

3. For projects where electronic submittals are required, provide corresponding electronic submittal of Sample transmittal, digital image file illustrating Sample characteristics, and identification information for record.
4. Disposition: Maintain sets of approved Samples at Project site, available for quality-control comparisons throughout the course of construction activity. Sample sets may be used to determine final acceptance of construction associated with each set.

    a. Samples that may be incorporated into the Work are indicated in individual Specification Sections. Such Samples must be in an undamaged condition at time of use.
    b. Samples not incorporated into the Work, or otherwise designated as Owner's property, are the property of CMR

5. Samples for Initial Selection: Submit manufacturer's color charts consisting of units or sections of units showing the full range of colors, textures, and patterns available.

    a. Number of Samples: Submit one full set(s) of available choices where color, pattern, texture, or similar characteristics are required to be selected from manufacturer's product line. Architect will not return submittal, but will designate options selected via email.

6. Samples for Verification: Submit full-size units or Samples of size indicated, prepared from same material to be used for the Work, cured and finished in manner specified, and physically identical with material or product proposed for use, and that show full range of color and texture variations expected. Samples include, but are not limited to, the following: partial sections of manufactured or fabricated components; small cuts or containers of materials; complete units of repetitively used materials; swatches showing color, texture, and pattern; color range sets; and components used for independent testing and inspection.

    a. Number of Samples: Retain samples at the Project Site.

        1) If variation in color, pattern, texture, or other characteristic is inherent in material or product represented by a Sample, provide at least 3 sets of paired units that show approximate limits of variations.

F. Product Schedule: As required in individual Specification Sections, prepare a written summary indicating types of products required for the Work and their intended location. Include the following information in tabular form:

1. Submit product schedule in the following format:

a. PDF electronic file (preferred), or:
b. 2 paper copies (plus 1, for Architect Consultant Review) of product schedule or list unless otherwise indicated. Architect will scan and return an electronic copy.

G. Coordination Drawings Submittals: Comply with requirements specified in Section 013100 "Project Management and Coordination."

H. CMR's Construction Schedule: Comply with requirements specified in Section 013200 "Construction Progress Documentation."

I. Application for Payment and Schedule of Values: Comply with requirements specified in Section 012900 "Payment Procedures.

J. Closeout Submittals and Maintenance Material Submittals: Comply with requirements specified in Section 017700 "Closeout Procedures."

K. Maintenance Data: Comply with requirements specified in Section 017823 "Operation and Maintenance Data."

L. Qualification Data: Prepare written information that demonstrates capabilities and experience of firm or person. Include lists of completed projects with project names and addresses, contact information of architects and owners, and other information specified.

M. Welding Certificates: Prepare written certification that welding procedures and personnel comply with requirements in the Contract Documents. Submit record of Welding Procedure Specification and Procedure Qualification Record on AWS forms. Include names of firms and personnel certified.

N. Installer Certificates: Submit written statements on manufacturer's letterhead certifying that Installer complies with requirements in the Contract Documents and, where required, is authorized by manufacturer for this specific Project.

O. Manufacturer Certificates: Submit written statements on manufacturer's letterhead certifying that manufacturer complies with requirements in the Contract Documents. Include evidence of manufacturing experience where required.

P. Product Certificates: Submit written statements on manufacturer's letterhead certifying that product complies with requirements in the Contract Documents.

Q. Material Certificates: Submit written statements on manufacturer's letterhead certifying that material complies with requirements in the Contract Documents.

R. Material Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting test results of material for compliance with requirements in the Contract Documents.

S. Product Test Reports: Submit written reports indicating that current product produced by manufacturer complies with requirements in the Contract Documents. Base reports on evaluation

of tests performed by manufacturer and witnessed by a qualified testing agency, or on comprehensive tests performed by a qualified testing agency.

T. Research Reports: Submit written evidence, from a model code organization acceptable to authorities having jurisdiction, that product complies with building code in effect for Project.

U. Schedule of Tests and Inspections: Comply with requirements specified in Section 014000 "Quality Requirements."

V. Preconstruction Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting results of tests performed before installation of product, for compliance with performance requirements in the Contract Documents.

W. Compatibility Test Reports: Submit reports written by a qualified testing agency, on testing agency's standard form, indicating and interpreting results of compatibility tests performed before installation of product. Include written recommendations for primers and substrate preparation needed for adhesion.

X. Field Test Reports: Submit written reports indicating and interpreting results of field tests performed either during installation of product or after product is installed in its final location, for compliance with requirements in the Contract Documents.

Y. Design Data: Prepare and submit written and graphic information, including, but not limited to, performance and design criteria, list of applicable codes and regulations, and calculations. Include list of assumptions and other performance and design criteria and a summary of loads. Include load diagrams if applicable. Provide name and version of software, if any, used for calculations. Include page numbers.

2.2 DELEGATED-DESIGN SERVICES

A. Performance and Design Criteria: Where professional design services or certifications by a design professional are specifically required of CMR by the Contract Documents, provide products and systems complying with specific performance and design criteria indicated.

1. If criteria indicated are not sufficient to perform services or certification required, submit a written request for additional information to Architect.

B. Delegated-Design Services Certification: In addition to Shop Drawings, Product Data, and other required submittals, submit digitally signed PDF electronic file of certificate, signed and sealed by the responsible design professional, for each product and system specifically assigned to Contractor to be designed or certified by a design professional.

1. Indicate that products and systems comply with performance and design criteria in the Contract Documents. Include list of codes, loads, and other factors used in performing these services.

PART 3 - EXECUTION

3.1 CONTRACTOR'S REVIEW

A. Action and Informational Submittals: ***Review each submittal and check for coordination with other Work of the Contract and for compliance with the Contract Documents. Note***

corrections and field dimensions. Mark and date with approval stamp before submitting to Architect.

B. Project Closeout and Maintenance Material Submittals: See requirements in Section 017700 "Closeout Procedures."

C. Approval Stamp: Stamp each submittal with a uniform, approval stamp. Include Project name and location, submittal number, Specification Section title and number, name of reviewer, date of CMR's approval, and statement certifying that submittal has been reviewed, checked, and approved for compliance with the Contract Documents.

3.2 ARCHITECT'S ACTION

A. General: Architect will not review submittals that do not bear CMR's approval stamp and will return them without action.

B. Action Submittals: Architect will review each submittal, make marks to indicate corrections or revisions required, and return it. Architect will stamp each submittal with an action stamp and will mark stamp appropriately to indicate action.

C. Informational Submittals: Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

D. Incomplete submittals are unacceptable, will be considered nonresponsive, and will not be returned.

E. Submittals not required by the Contract Documents may not be reviewed and may be discarded.

F. Submittals that are not satisfactory after one Re-submittal may be subject to a charge for the time required by the designer to review it again. That charge will be for actual cost of the work, per the Designers' standard hourly rates.

3.3 DOCUMENTS REQUIRED TO BE AVAILABLE ON SITE

A. The CMR must provide a complete full size paper set of each approved submittal in the Project Office, to assure the Designers' instructions have been transmitted to the Superintendent and the installers.

SECTION 014110 – special Inspections

Statement of Special Inspections

Project: Fort Fisher Aquarium Renovation & Expansion – Phase 1
Location: 900 Loggerhead Rd, Kure Beach, NC 28449
Owner's Representative: James Mancari
Owner's Address: 3125 Poplarwood Ct, Suite 160, Raleigh, NC 27604

This Statement of Special Inspections is submitted as a condition for permit issuance in accordance with the Special Inspection requirements of the 2018 North Carolina State Building Code. It includes a Schedule of Special Inspection Services applicable to this project (refer to S-010 and G-1.24), the name of the Special Inspector, the identity of other approved agencies retained for conducting Special Inspections, and the required inspector qualifications. This Statement of Special Inspections was prepared by the following Designers of Record:

Structural	Klaus Perkins		
	(Type or print name)	(Signature)	(Date)
Architectural	Phil Szostak		
	(Type or print name)	(Signature)	(Date)
Mechanical			
	(Type or print name)	(Signature)	(Date)
Other			
	(Type or print name)	(Signature)	(Date)

The Special Inspector shall keep records of all special inspections and tests and shall furnish reports to the State Construction Office and the Designers of Record. Reports shall indicate if the work inspected or tested was or was not completed in conformance with the approved construction documents. Discovered discrepancies shall be brought to the immediate attention of the Contractor for correction. If such discrepancies are not corrected, the discrepancies shall be brought to the attention of the State Construction Office and the Designers of Record. The Special Inspections program does not relieve the Contractor of his or her responsibilities.

Interim reports shall be submitted to the State Construction Office, Owner, and the Designers of Record.

Interim Report Frequency: Monthly

A Final Report of Special Inspections documenting completion of all required Special Inspections, testing, and correction of any discrepancies should be submitted prior to issuance of a Certificate of Use and Occupancy.

Job Site safety and means and methods of construction are solely the responsibility of the Contractor.

END OF SECTION

SECTION 015000 - TEMPORARY FACILITIES AND CONTROLS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for temporary utilities, support facilities, and security and protection facilities.

B. Related Requirements:

1. Section 011000 "Summary" for work restrictions and limitations on utility interruptions.

1.2 USE CHARGES

A. General: Installation and removal of and use charges for temporary facilities shall be included in the Contract Sum unless otherwise indicated. Allow other entities to use temporary services and facilities without cost, including, but not limited to testing agencies and authorities having jurisdiction.

B. Water Service: Water will become available as part of this project. Until it is available for use provide water as required for construction operations.

1.3 INFORMATIONAL SUBMITTALS

A. Site Plan: When facilities are known, show temporary facilities, utility hookups, staging areas, and parking areas for construction personnel. Distribute copies of this to all personnel and subcontractors.

B. Fire-Safety Program: Show compliance with requirements of NFPA 241 and authorities having jurisdiction. Indicate CMR personnel responsible for management of fire prevention program.

1.4 QUALITY ASSURANCE

A. Electric Service: Comply with NECA, NEMA, and UL standards and regulations for temporary electric service. Install service to comply with NFPA 70.

B. Tests and Inspections: Arrange for authorities having jurisdiction to test and inspect each temporary utility before use. Obtain required certifications and permits.

C. Accessible Temporary Egress: Comply with applicable provisions in ICC/ANSI A117.1.

1.5 PROJECT CONDITIONS

A. Temporary Use of Permanent Facilities: Engage Installer of each permanent service to assume responsibility for operation, maintenance, and protection of each permanent service during its use as a construction facility before Owner's acceptance, regardless of previously assigned responsibilities.

PART 2 - PRODUCTS

2.1 TEMPORARY FACILITIES

A. Field Offices, General: Prefabricated or mobile units with serviceable finishes, temperature controls, and foundations adequate for normal loading.

B. Common-Use Field Office: Of sufficient size to accommodate needs of Owner, Architect, and construction personnel office activities and to accommodate Project meetings specified in other Division 01 Sections. Keep office clean and orderly.

C. Sanitary Facilities: Provide temporary toilets, wash facilities, and drinking water for use of construction personnel. Comply with requirements of authorities having jurisdiction for type, number, location, operation, and maintenance of fixtures and facilities.

2.2 EQUIPMENT

A. Fire Extinguishers: Portable, UL rated; with class and extinguishing agent as required by locations and classes of fire exposures.

B. HVAC Equipment: Unless Owner authorizes use of permanent HVAC system (where it may be available), provide vented, self-contained, liquid-propane-gas or fuel-oil heaters with individual space thermostatic control.

1. Use of gasoline-burning space heaters, open-flame heaters, or salamander-type heating units is prohibited.
2. Heating Units: Listed and labeled for type of fuel being consumed, by a qualified testing agency acceptable to authorities having jurisdiction, and marked for intended location and application.
3. Permanent HVAC System: Use permanent HVAC system for temporary use during construction when it becomes available, provide filter with MERV of 8 at each return-air grille in system and remove at end of construction and clean HVAC system as required in Section 017700 "Closeout Procedures".

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Locate facilities where they will serve Project adequately and result in minimum interference with performance of the Work. Relocate and modify facilities as required by progress of the Work.

B. Provide each facility ready for use when needed to avoid delay. Do not remove until facilities are no longer needed or are replaced by authorized use of completed permanent facilities.

3.2 TEMPORARY UTILITY INSTALLATION

A. General: Install temporary service.

1. Arrange to make connections for temporary services at the earliest time required to provide service to all subcontractors.

B. Water Service: Make arrangements for use of existing water service on site for all subcontractors.

C. Sanitary Facilities: Provide temporary toilets, for use of construction personnel. Comply with requirements of authorities having jurisdiction for type, number, location, operation, and maintenance of fixtures and facilities.

D. Electric Power Service: Make arrangements for use of Owner's existing electric power service. Verify that it is of sufficient size, capacity, and power characteristics required for construction operations.

E. Lighting: Provide temporary lighting with local switching that provides adequate illumination for construction operations, observations, inspections, and traffic conditions.

1. Install and operate temporary lighting that fulfills security and protection requirements without operating entire system.

F. Telephone Service: Provide the CMR Superintendent with a cellular phone the can receive emails and text messages as well as voice mail.

G. Electronic Communication Service: Provide a desktop computer or laptop computer in the primary field office adequate for use by Architect and Owner to access project electronic documents and maintain electronic communications. Equip computer with not less than the following:

Processors: AMD Ryzen 5000 or Intel 11th Gen (for onboard video, no GPU, Ryzen 7000 or specifically 5000 G series)
GPU: if not using onboard video or in need of more graphics power use RTX A2000 or newer
Memory: 16-gigabyte.
Disk Storage: 1TB SSD.
Display: 24-inch
Network Connectivity: 1000 BaseT Ethernet.
Software: Windows 11 Pro, Adobe Acrobat DC or Pro, Microsoft Office 2021 or M365
Printer: "All-in-one" unit combining color printing, photocopying, scanning, and faxing
Internet Service: Cable or Fiber
Internet Security: Built-In Windows Defender or Bitdefender

3.3 SUPPORT FACILITIES INSTALLATION

A. General: Comply with the following:

1. Maintain support facilities until Architect schedules Beneficial Occupancy inspection. Remove before Beneficial Occupancy. Personnel remaining after Beneficial Occupancy will be permitted to use permanent facilities, under conditions acceptable to Owner.

B. Parking: Temporary parking areas for construction personnel will be elsewhere on the Aquarium Property as directed by the Owner.

C. Waste Disposal Facilities: Provide waste-collection containers in sizes adequate to handle waste from construction operations. Comply with requirements of authorities having jurisdiction. Comply with progress cleaning requirements in Section 017300 "Execution."

D. Lifts and Hoists: Provide facilities necessary for hoisting materials and personnel.

1. Truck cranes and similar devices used for hoisting materials are considered "tools and equipment" and not temporary facilities.

3.4 SECURITY AND PROTECTION FACILITIES INSTALLATION

A. Protection of Existing Facilities: Protect existing vegetation, equipment, structures, utilities, and other improvements at Project site and on adjacent properties, except those indicated to be removed or altered. Repair damage to existing facilities.

B. Barricades, Warning Signs, and Lights: Comply with requirements of authorities having jurisdiction for erecting structurally adequate barricades, including warning signs and lighting. Use high visibility warning tape and wood or metal stakes to separate construction area from remainder of campus.

C. Temporary Egress: Maintain temporary egress from existing occupied facilities as required by authorities having jurisdiction.

D. Temporary Partitions: Provide floor-to-ceiling dustproof partitions to limit dust and dirt migration and to separate demolition area from area occupied by Owner from fumes and noise.

E. Temporary Fire Protection: Install and maintain temporary fire-protection facilities of types needed to protect against reasonably predictable and controllable fire losses. Comply with NFPA 241; manage fire prevention program.

1. Supervise welding operations, combustion-type temporary heating units, and similar sources of fire ignition according to requirements of authorities having jurisdiction.
2. Develop and supervise an overall fire-prevention and -protection program for personnel at Project site. If using fire-suppression sprinkler systems or other permanent fire-protection systems, insert specific requirements.

3.5 MOISTURE AND MOLD CONTROL

A. Contractor's Moisture Protection Plan: Avoid trapping water in finished work. Document visible signs of mold that may appear during construction.

3.6 OPERATION, TERMINATION, AND REMOVAL

A. Supervision: Enforce strict discipline in use of temporary facilities. To minimize waste and abuse, limit availability of temporary facilities to essential and intended uses.

B. Maintenance: Maintain facilities in good operating condition until removal.

1. Maintain operation of temporary enclosures, heating, cooling, humidity control, ventilation, and similar facilities on a 24-hour basis where required to achieve indicated results and to avoid possibility of damage.

C. Temporary Facility Changeover: Do not change over from using temporary security and protection facilities to permanent facilities until Beneficial Occupancy.

D. Termination and Removal: Remove each temporary facility when need for its service has ended, when it has been replaced by authorized use of a permanent facility, or no later than Beneficial Occupancy. Complete or, if necessary, restore permanent construction that may have been delayed because of interference with temporary facility. Repair damaged Work, clean exposed surfaces, and replace construction that cannot be satisfactorily repaired.

1. Materials and facilities that constitute temporary facilities are property of Contractor.
2. At Beneficial Occupancy, repair, renovate, and clean permanent facilities used during construction period. Comply with final cleaning requirements specified in Section 017700 "Closeout Procedures."

1

2 END OF SECTION 015000

SECTION 015639 - TEMPORARY TREE AND PLANT PROTECTION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes general protection and pruning of existing trees and plants that are affected by execution of the Work, whether temporary or permanent construction.

B. Related Requirements:

1. Section 015000 "Temporary Facilities and Controls" for temporary site fencing.
2. Section 311000 "Site Clearing" for removing existing trees and shrubs.

1.3 DEFINITIONS

A. Caliper: Diameter of a trunk measured by a diameter tape at a height 6 inches (150 mm) above the ground for trees up to and including 4-inch (100-mm) size at this height and as measured at a height of 12 inches (300 mm) above the ground for trees larger than 4-inch (100-mm) size.

B. Caliper (DBH): Diameter breast height; diameter of a trunk as measured by a diameter tape at a height 54 inches (1372 mm) above the ground line for trees with caliper of 8 inches (200 mm) or greater as measured at a height of 12 inches (300 mm) above the ground.

C. Plant-Protection Zone: Area surrounding individual trees, groups of trees, shrubs, or other vegetation to be protected during construction and indicated on Drawings.

D. Tree-Protection Zone: Area surrounding individual trees or groups of trees to be protected during construction and indicated on Drawings.

E. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Review methods and procedures related to temporary tree and plant protection including, but not limited to, the following:

    a. Tree-service firm's personnel, and equipment needed to make progress and avoid delays.
    b. Arborist's responsibilities.
    c. Quality-control program.

d. Coordination of Work and equipment movement with the locations of protection zones.
e. Trenching by hand or with air spade within protection zones.
f. Field quality control.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings:

1. Include plans, elevations, sections, and locations of protection-zone fencing and signage, showing relation of equipment-movement routes and material storage locations with protection zones.
2. Detail fabrication and assembly of protection-zone fencing and signage.
3. Indicate extent of trenching by hand or with air spade within protection zones.

C. Samples: For each type of the following:

1. Organic Mulch: 1-quart (1-L) volume of organic mulch; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch.
2. Protection-Zone Fencing: Assembled Samples of manufacturer's standard size made from full-size components.
3. Protection-Zone Signage: Full-size Samples of each size and text, ready for installation.

D. Tree Pruning Schedule: Written schedule detailing scope and extent of pruning of trees to remain that interfere with or are affected by construction.

1. Species and size of tree.
2. Location on site plan. Include unique identifier for each.
3. Reason for pruning.
4. Description of pruning to be performed.
5. Description of maintenance following pruning.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For arborist and tree service firm.

B. Certification: From arborist, certifying that trees indicated to remain have been protected during construction according to recognized standards and that trees were promptly and properly treated and repaired when damaged.

C. Maintenance Recommendations: From arborist, for care and protection of trees affected by construction during and after completing the Work.

D. Existing Conditions: Documentation of existing trees and plantings indicated to remain, which establishes preconstruction conditions that might be misconstrued as damage caused by construction activities.

1. Use sufficiently detailed photographs or video recordings.
2. Include plans and notations to indicate specific wounds and damage conditions of each tree or other plants designated to remain.

E. Quality-control program.

1.7 QUALITY ASSURANCE

A. Arborist Qualifications: Certified Arborist as certified by ISA and licensed arborist in jurisdiction where Project is located.

B. Tree Service Firm Qualifications: An experienced tree service firm that has successfully completed temporary tree and plant protection work similar to that required for this Project and that will assign an experienced, qualified arborist to Project site during execution of the Work.

C. Quality-Control Program: Prepare a written program to systematically demonstrate the ability of personnel to properly follow procedures and handle materials and equipment during the Work without damaging trees and plantings. Inc

D. lude dimensioned diagrams for placement of protection zone fencing and signage, the arborist's and tree-service firm's responsibilities, instructions given to workers on the use and care of protection zones, and enforcement of requirements for protection zones.

1.8 FIELD CONDITIONS

A. The following practices are prohibited within protection zones:

1. Storage of construction materials, debris, or excavated material.
2. Moving or parking vehicles or equipment.
3. Foot traffic.
4. Erection of sheds or structures.
5. Impoundment of water.
6. Excavation or other digging unless otherwise indicated.
7. Attachment of signs to or wrapping materials around trees or plants unless otherwise indicated.

B. Do not direct vehicle or equipment exhaust toward protection zones.

C. Prohibit heat sources, flames, ignition sources, and smoking within or near protection zones and organic mulch.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Backfill Soil: Planting soil of suitable moisture content and granular texture for placing around tree; free of stones, roots, plants, sod, clods, clay lumps, pockets of coarse sand, concrete slurry, concrete layers or chunks, cement, plaster, building debris, and other extraneous materials harmful to plant growth.
1. Planting Soil: Planting soil as specified in Section 329300 "Plants".

B. Organic Mulch: Free from deleterious materials and suitable as a top dressing for trees and shrubs, consisting of one of the following:

1. Mulch: Mulch as specified in Section 329300 “Plants”.

C. Plastic Protection-Zone Fencing: Fencing fixed in position and meeting the following requirements:

1. Plastic Protection-Zone Fencing: Plastic construction fencing constructed of high-density extruded and stretched polyethylene fabric with 2-inch (50-mm) maximum opening in pattern and weighing a minimum of 0.4 lb/ft. (0.6 kg/m); remaining flexible from minus 60 to plus 200 deg F (minus 16 to plus 93 deg C); inert to most chemicals and acids; minimum tensile yield strength of 2000 psi (13.8 MPa) and ultimate tensile strength of 2680 psi (18.5 MPa); secured with plastic bands or galvanized-steel or stainless-steel wire ties; and supported by tubular or T-shape galvanized-steel posts spaced not more than 96 inches (2400 mm) apart.

a. Height: 48 inches (1800 mm).

2. Gates: Single swing access gates matching material and appearance of fencing, to allow for maintenance activities within protection zones; leaf width minimum 36 inches (914 mm).

D. Protection-Zone Signage: Shop-fabricated, rigid plastic or metal sheet with attachment holes pre-punched and reinforced; legibly printed with nonfading lettering and as follows:

1. Size and Text: As shown on Drawings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Erosion and Sedimentation Control: Examine the site to verify that temporary erosion- and sedimentation-control measures are in place. Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross protection zones.

B. Prepare written report, endorsed by arborist, listing conditions detrimental to tree and plant protection.

3.2 PREPARATION

A. Locate and clearly identify trees, shrubs, and other vegetation to remain. Tie a 1-inch (25-mm) blue vinyl tape around each tree trunk at 54 inches (1372 mm) above the ground.

B. Protect tree root systems from damage caused by runoff or spillage of noxious materials while mixing, placing, or storing construction materials. Protect root systems from ponding, eroding, or excessive wetting caused by dewatering operations.

C. Tree-Protection Zones: Mulch areas inside tree-protection zones and other areas indicated. Do not exceed indicated thickness of mulch.

1. Apply 4-inch (100-mm) uniform thickness of organic mulch unless otherwise indicated. Do not place mulch within 6 inches (150 mm) of tree trunks.

3.3 PROTECTION ZONES

A. Protection-Zone Fencing: Install protection-zone fencing along edges of protection zones before materials or equipment are brought on the site and construction operations begin in a manner that will prevent people and animals from easily entering protected areas except by entrance gates. Construct fencing so as not to obstruct safe passage or visibility at vehicle intersections where fencing is located adjacent to pedestrian walkways or in close proximity to street intersections, drives, or other vehicular circulation.

1. Chain-Link Fencing: Install to comply with ASTM F 567 and with manufacturer's written instructions.
2. Posts: Set or drive posts into ground one-third the total height of the fence without concrete footings. Where a post is located on existing paving or concrete to remain, provide appropriate means of post support acceptable to Architect.
3. Access Gates: Install where indicated adjust to operate smoothly, easily, and quietly; free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

B. Protection-Zone Signage: Install protection-zone signage in visibly prominent locations in a manner approved by Architect. Install one sign spaced approximately every 50 feet (15 m) on protection-zone fencing, but no fewer than four signs with each facing a different direction.

C. Maintain protection zones free of weeds and trash.

D. Maintain protection-zone fencing and signage in good condition as acceptable to Architect and remove when construction operations are complete and equipment has been removed from the site.

1. Do not remove protection-zone fencing, even temporarily, to allow deliveries or equipment access through the protection zone.
2. Temporary access is permitted subject to preapproval in writing by arborist if a root buffer effective against soil compaction is constructed as directed by arborist. Maintain root buffer so long as access is permitted.

3.4 EXCAVATION

A. General: Excavate at edge of protection zones and for trenches indicated within protection zones according to requirements in Section 312000 "Earth Moving" unless otherwise indicated.

B. Trenching within Protection Zones: Where utility trenches are required within protection zones, excavate under or around tree roots by hand or with air spade, or tunnel under the roots by drilling, auger boring, or pipe jacking. Do not cut main lateral tree roots or taproots; cut only smaller roots that interfere with installation of utilities. Cut roots as required for root pruning. If excavating by hand, use na

C. rrow-tine spading forks to comb soil and expose roots.

D. Redirect roots in backfill areas where possible. If encountering large, main lateral roots, expose roots beyond excavation limits as required to bend and redirect them without breaking. If encountered immediately adjacent to location of new construction and redirection is not practical, cut roots approximately 3 inches (75 mm) back from new construction and as required for root pruning.

E. Do not allow exposed roots to dry out before placing permanent backfill. Provide temporary earth cover or pack with peat moss and wrap with burlap. Water and maintain in a moist condition. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.

3.5 ROOT PRUNING

A. Prune tree roots that are affected by temporary and permanent construction. Prune roots as follows:

1. Cut roots manually by digging a trench and cutting exposed roots with sharp pruning instruments; do not break, tear, chop, or slant the cuts. Do not use a backhoe or other equipment that rips, tears, or pulls roots.
2. Cut Ends: Do not paint cut root ends.
3. Temporarily support and protect roots from damage until they are permanently redirected and covered with soil.
4. Cover exposed roots with burlap and water regularly.
5. Backfill as soon as possible according to requirements in Section 312000 "Earth Moving."

B. Root Pruning at Edge of Protection Zone: Prune tree roots flush with the edge of the protection zone by cleanly cutting all roots to the depth of the required excavation.

C. Root Pruning within Protection Zone: Clear and excavate by hand or with air spade to the depth of the required excavation to minimize damage to tree root systems. If excavating by hand, use narrow-tine spading forks to comb soil to expose roots. Cleanly cut roots as close to excavation as possible.

3.6 CROWN PRUNING

A. Prune branches that are affected by temporary and permanent construction. Prune branches under direction of arborist.

1. Prune to remove only injured, broken, dying, or dead branches unless otherwise indicated. Do not prune for shape unless otherwise indicated.
2. Do not remove or reduce living branches to compensate for root loss caused by damaging or cutting root system.
3. Pruning Standards: Prune trees according to ANSI A300 (Part 1) and as indicated on Drawings.

    a. Type of Pruning: Cleaning, raising, reducing, and thinning where indicated.
    b. Specialty Pruning: Structural, restoration and utility where indicated.

B. Unless otherwise directed by arborist and acceptable to Architect, do not cut tree leaders.

C. Cut branches with sharp pruning instruments; do not break or chop.

D. Do not paint or apply sealants to wounds.

E. Provide subsequent maintenance pruning during Contract period as recommended by arborist.

F. Chip removed branches and dispose of off-site unless requested for compost or mulch by Owner.

3.7 REGRADING

A. Lowering Grade: Where new finish grade is indicated below existing grade around trees, slope grade beyond the protection zone. Maintain existing grades within the protection zone.

B. Lowering Grade within Protection Zone: Where new finish grade is indicated below existing grade around trees, slope grade away from trees as recommended by arborist unless otherwise indicated.

1. Root Pruning: Prune tree roots exposed by lowering the grade. Do not cut main lateral roots or taproots; cut only smaller roots. Cut roots as required for root pruning.

C. Raising Grade: Where new finish grade is indicated above existing grade around trees, slope grade beyond the protection zone. Maintain existing grades within the protection zone.

D. Minor Fill within Protection Zone: Where existing grade is 2 inches (50 mm) or less below elevation of finish grade, fill with backfill soil. Place backfill soil in a single uncompacted layer and hand grade to required finish elevations.

3.8 FIELD QUALITY CONTROL

A. Inspections: Engage a qualified arborist to direct plant-protection measures in the vicinity of trees, shrubs, and other vegetation indicated to remain and to prepare inspection reports.

3.9 REPAIR AND REPLACEMENT

A. General: Repair or replace trees, shrubs, and other vegetation indicated to remain or to be relocated that are damaged by construction operations, in a manner approved by Architect.

1. Submit details of proposed pruning and repairs.
2. Perform repairs of damaged trunks, branches, and roots within 24 hours according to arborist's written instructions.
3. Replace trees and other plants that cannot be repaired and restored to full-growth status, as determined by Architect.

B. Trees: Remove and replace trees indicated to remain that are more than 25 percent dead or in an unhealthy condition before the end of the corrections period or are damaged during construction operations that Architect determines are incapable of restoring to normal growth pattern.

1. Small Trees: Provide new trees of same size and species as those being replaced for each tree that measures 4 inches (100 mm) or smaller in caliper size.
2. Large Trees: Provide new tree(s) of 6-inch (150-mm) caliper size for each tree being replaced that measures more than 6 inches (150 mm) in caliper size, in increments of 6-inch caliper such that the cumulative caliper inch meets or exceeds that of the tree removed.

    a. Species: As selected by Architect.

3. Plant and maintain new trees as specified in Section 329300 "Plants."

C. Excess Mulch: Rake mulched area within protection zones, being careful not to injure roots. Rake to loosen and remove mulch that exceeds a 4-inch (100-mm) uniform thickness to remain.

D. Soil Aeration: Where directed by Architect, aerate surface soil compacted during construction. Aerate 10 feet (3 m)] beyond drip line and no closer than 36 inches (900 mm) to tree trunk. Drill 2-inch- (50-mm-) diameter holes a minimum of 12 inches (300 mm) deep at 24 inches (600 mm) o.c. Backfill holes with an equal mix of augered soil and sand.

3.10 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Disposal: Remove excess excavated material, displaced trees, trash, and debris and legally dispose of them off Owner's property.

END OF SECTION 015639

SECTION 017300 - EXECUTION

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes general administrative and procedural requirements governing execution of the Work including, but not limited to, the following:

1. Construction layout.
2. Field engineering and surveying.
3. Installation of the Work.
4. Cutting and patching.
5. Coordination of Owner-installed products.
6. Progress cleaning.
7. Starting and adjusting.
8. Protection of installed construction.
9. Correction of the Work.

B. Related Requirements:

1. Section 011000 "Summary" for limits on use of Project site.
2. Section 017700 "Closeout Procedures" for submitting final property survey with Project Record Documents, recording of Owner-accepted deviations from indicated lines and levels, and final cleaning.

1.2 INFORMATIONAL SUBMITTALS

A. Certificates: Submit certificate signed by land surveyor or professional engineer certifying that location and elevation of improvements comply with requirements.

1.3 QUALITY ASSURANCE

A. Cutting and Patching: Comply with requirements for and limitations on cutting and patching of construction elements.

1. Structural Elements: When cutting and patching structural elements, notify Architect of locations and details of cutting and await directions from Architect before proceeding. Shore, brace, and support structural element during cutting and patching. Do not cut and patch structural elements in a manner that could change their load-carrying capacity or increase deflection

    a. Penetrations of end of remaining portion of the existing structure.

2. Operational Elements: Do not cut and patch operating elements and related components in a manner that results in reducing their capacity to perform as intended or that result in increased maintenance or decreased operational life or safety.

3. Other Construction Elements: Do not cut and patch other construction elements or components in a manner that could change their load-carrying capacity, that results in

reducing their capacity to perform as intended, or that results in increased maintenance or decreased operational life or safety

4. Visual Elements: Do not cut and patch construction in a manner that results in visual evidence of cutting and patching. Do not cut and patch exposed construction in a manner that would, in Architect's opinion, reduce the building's aesthetic qualities. Remove and replace construction that has been cut and patched in a visually unsatisfactory manner.

B. Conflicts within or among Contract Documents: If conflicts between Contract Documents are discovered, the CMR will, first, notify the Architect of the conflict and, second, assume that the higher quality choice is what is intended.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Comply with requirements specified in other Sections.

B. In-Place Materials: Use materials for patching identical to in-place materials. For exposed surfaces, use materials that visually match in-place adjacent surfaces to the fullest extent possible.

1. If identical materials are unavailable or cannot be used, use materials that, when installed, will provide a match acceptable to Architect for the visual and functional performance of in-place materials.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Existing Conditions: The existence and location of underground and other utilities and construction indicated as existing are not guaranteed. Before beginning site work, investigate and verify the existence and location of underground utilities, mechanical and electrical systems, and other construction affecting the Work.

1. Before construction, verify the location and invert elevation at points of connection of sewage treatment facility, storm sewer, and water-service piping; underground electrical services, and other utilities.
2. Furnish location data for work related to Project that must be performed by public utilities serving Project site.

B. Examination and Acceptance of Conditions: Before proceeding with each component of the Work, examine substrates, areas, and conditions, with Installer or Applicator present where indicated, for compliance with requirements for installation tolerances and other conditions affecting performance. Record observations.

1. Examine roughing-in for mechanical and electrical systems to verify actual locations of connections before equipment and fixture installation.
2. Examine walls, floors, and roofs for suitable conditions where products and systems are to be installed.

3. Verify compatibility with and suitability of substrates, including compatibility with existing finishes or primers.

C. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the Work indicates acceptance of surfaces and conditions.

3.2 PREPARATION

A. Existing Utility Information: Furnish information to local utility that is necessary to adjust, move, or relocate existing utility structures, utility poles, lines, services, or other utility appurtenances located in or affected by construction. Coordinate with authorities having jurisdiction.

B. Field Measurements: Take field measurements as required to fit the Work properly. Recheck measurements before installing each product. Where portions of the Work are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

C. Space Requirements: Verify space requirements and dimensions of items shown diagrammatically on Drawings.

D. Review of Contract Documents and Field Conditions: Immediately on discovery of the need for clarification of the Contract Documents caused by differing field conditions outside the control of Contractor, submit a request for information to Architect according to requirements in Section 013100 "Project Management and Coordination."

3.3 CONSTRUCTION LAYOUT

A. Verification: Before proceeding to lay out the Work, verify layout information shown on Drawings, in relation to the property survey and existing benchmarks. If discrepancies are discovered, notify Architect promptly.

B. Record Log: Maintain a log of layout control work. Record deviations from required lines and levels. Make the log available for reference by Architect.

3.4 INSTALLATION

A. General: Locate the Work and components of the Work accurately, in correct alignment and elevation, as indicated.

1. Make vertical work plumb and make horizontal work level.
2. Where space is limited, install components to maximize space available for maintenance and ease of removal for replacement.
3. Conceal pipes, ducts, and wiring in finished areas unless otherwise indicated.

B. Comply with manufacturer's written instructions and recommendations for installing products in applications indicated.

C. Install products at the time and under conditions that will ensure the best possible results. Maintain conditions required for product performance until Beneficial Occupancy.

D. Conduct construction operations so no part of the Work is subjected to damaging operations or loading in excess of that expected during normal conditions of occupancy.

E. Sequence the Work and allow adequate clearances to accommodate movement of construction items on site and placement in permanent locations.

F. Tools and Equipment: Do not use tools or equipment that produces harmful noise levels.

G. Templates: Obtain and distribute to the parties involved templates for work specified to be factory prepared and field installed. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing products to comply with indicated requirements.

H. Attachment: Provide blocking and attachment plates and anchors and fasteners of adequate size and number to securely anchor each component in place, accurately located and aligned with other portions of the Work. Where size and type of attachments are not indicated, verify size and type required for load conditions.

1. Mounting Heights: Where mounting heights are not indicated, mount components at heights directed by Architect.
2. Allow for building movement, including thermal expansion and contraction.
3. Coordinate installation of anchorages. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

I. Joints: Make joints of uniform width. Where joint locations in exposed work are not indicated, coordinate with the Architect to arrange joints for the best visual effect. Fit exposed connections together to form hairline joints.

J. Hazardous Materials: Use products, cleaners, and installation materials that are not considered hazardous.

3.5 CUTTING AND PATCHING

A. Cutting and Patching, General: Employ skilled workers to perform cutting and patching. Proceed with cutting and patching at the earliest feasible time, and complete without delay.

1. Cut in-place construction to provide for installation of other components or performance of other construction, and subsequently patch as required to restore surfaces to their original condition.

B. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during installation or cutting and patching operations, by methods and with materials so as not to void existing warranties.

C. Temporary Support: Provide temporary support of work to be cut.

D. Protection: Protect in-place construction during cutting and patching to prevent damage. Provide protection from adverse weather conditions for portions of Project that might be exposed during cutting and patching operations.

E. Existing Utility Services and Mechanical/Electrical Systems: Where existing services/systems are required to be removed relocated, or abandoned, bypass such services/systems before cutting to minimize interruption to occupied areas.

F. Cutting: Cut in-place construction by sawing, drilling, breaking, chipping, grinding, and similar operations, including excavation, using methods least likely to damage elements retained or adjoining construction. If possible, review proposed procedures with original Installer; comply with original Installer's written recommendations.

1. In general, use hand or small power tools designed for sawing and grinding, not hammering and chopping. Cut holes and slots neatly to minimum size required, and with minimum disturbance of adjacent surfaces. Temporarily cover openings when not in use.
2. Finished Surfaces: Cut or drill from the exposed or finished side into concealed surfaces.
3. Concrete and Masonry: Cut using a cutting machine, such as an abrasive saw or a diamond-core drill.
4. Mechanical and Electrical Services: Cut off pipe or conduit in walls or partitions to be removed. Cap, valve, or plug and seal remaining portion of pipe or conduit to prevent entrance of moisture or other foreign matter after cutting.
5. Proceed with patching after construction operations requiring cutting are complete.

G. Patching: Patch construction by filling, repairing, refinishing, closing up, and similar operations following performance of other work. Patch with durable seams that are as invisible as practicable. Provide materials and comply with installation requirements specified in other Sections, where applicable.

1. Inspection: Where feasible, test and inspect patched areas after completion to demonstrate physical integrity of installation.
2. Exposed Finishes: Restore exposed finishes of patched areas and extend finish restoration into retained adjoining construction in a manner that will minimize evidence of patching and refinishing.
3. Floors and Walls: Where walls or partitions that are removed extend one finished area into another, patch and repair floor and wall surfaces in the new space. Provide an even surface of uniform finish, color, texture, and appearance. Remove in-place floor and wall coverings and replace with new materials, if necessary, to achieve uniform color and appearance.
4. Ceilings: Patch and repair in-place ceilings as necessary to provide an even-plane surface of uniform appearance.

H. Cleaning: Clean areas and spaces where cutting and patching are performed. Remove paint, mortar, oils, putty, and similar materials from adjacent finished surfaces.

3.6 PROGRESS CLEANING

A. General: Clean Project site and work areas daily, including common areas. Enforce requirements strictly. Dispose of materials lawfully.

1. Comply with requirements in NFPA 241 for removal of combustible waste materials and debris.

B. Work Areas: Clean areas where work is in progress to the level of cleanliness necessary for proper execution of the Work.

1. Remove liquid spills promptly.

2. Where dust would impair proper execution of the Work, broom-clean or vacuum the entire work area, as appropriate.

C. Installed Work: Keep installed work clean. Clean installed surfaces according to written instructions of manufacturer or fabricator of product installed, using only cleaning materials specifically recommended. If specific cleaning materials are not recommended, use cleaning materials that are not hazardous to health or property and that will not damage exposed surfaces.

D. Concealed Spaces: Remove debris from concealed spaces before enclosing the space.

E. Exposed Surfaces in Finished Areas: Clean exposed surfaces and protect as necessary to ensure freedom from damage and deterioration at time of Beneficial Occupancy.

F. During handling and installation, clean and protect construction in progress and adjoining materials already in place. Apply protective covering where required to ensure protection from damage or deterioration at Beneficial Occupancy.

G. Clean and provide maintenance on completed construction as frequently as necessary through the remainder of the construction period. Adjust and lubricate operable components to ensure operability without damaging effects.

H. Limiting Exposures: Supervise construction operations to assure that no part of the construction completed or in progress, is subject to harmful, dangerous, damaging, or otherwise deleterious exposure during the construction period.

3.7 STARTING AND ADJUSTING

A. Start equipment and operating components to confirm proper operation. Remove malfunctioning units, replace with new units, and retest.

B. Adjust equipment for proper operation. Adjust operating components for proper operation without binding.

C. Test each piece of equipment to verify proper operation. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.8 PROTECTION OF INSTALLED CONSTRUCTION

A. Provide final protection and maintain conditions that ensure installed Work is without damage or deterioration at time of Beneficial Occupancy.

B. Comply with manufacturer's written instructions for temperature and relative humidity.

END OF SECTION 017300

SECTION 017700 - CLOSEOUT PROCEDURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for contract closeout, including, but not limited to, the following:

1. Beneficial Occupancy procedures.
2. Final completion procedures.
3. Warranties.
4. Final cleaning.
5. Repair of the Work.

B. Related Requirements:

1. Section 017839 "Project Record Documents" for submitting record Drawings, record Specifications, and record Product Data.

1.2 ACTION SUBMITTALS

A. Contractor's List of Incomplete Items: Initial submittal at Beneficial Occupancy.

B. Certified List of Incomplete Items: Final submittal at Final Completion.

1.3 CLOSEOUT SUBMITTALS

All of the following documents are available on the NC Office of State Construction Web Site: http://www.nc-sco.com/documents.aspx, under the heading “Project Closeout Forms”.

A. Certificates of Release: From authorities having jurisdiction.

B. Certificate of Insurance: For continuing coverage.

C. Project Approval Authorization; Partial Utilization (Beneficial Occupancy)

D. Project Approval Authorization; Final Inspection for Owner Occupancy.

E. Certificate of Compliance.

F. Certificate of Completion.

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. Schedule of Maintenance Material Items: For maintenance material submittal items specified in other Sections.

1.5 BENEFICIAL OCCUPANCY PROCEDURES

A. CMR's List of Incomplete Items: Prepare and submit a list of items to be completed and corrected (Contractor's punch list), indicating the value of each item on the list and reasons why the Work is incomplete.

B. Submittals Prior to Beneficial Occupancy: Complete the following a minimum of 10 days prior to requesting inspection for determining date of Beneficial Occupancy. List items below that are incomplete at time of request.

1. Certificates of Release: Obtain and submit releases from authorities having jurisdiction permitting Owner unrestricted use of the Work and access to services and utilities. Include occupancy permits, operating certificates, and similar releases.
2. Submit closeout submittals specified in other Division 01 Sections, including project record documents, operation and maintenance manuals, and similar final record information.
3. Submit closeout submittals specified in individual Sections, including specific warranties, workmanship bonds, maintenance service agreements, final certifications, and similar documents.
4. Submit maintenance material submittals specified in individual Sections, including tools, spare parts, extra materials, and similar items, and deliver to location designated by Architect. Label with manufacturer's name and model number where applicable.

    a. Schedule of Maintenance Material Items: Prepare and submit schedule of maintenance material submittal items, including name and quantity of each item and name and number of related Specification Section. Obtain Owner’s signature for receipt of submittals.

5. Submit test/adjust/balance records, if required.
6. Submit changeover information related to Owner's occupancy, use, operation, and maintenance.

C. Procedures Prior to Beneficial Occupancy: Complete the following a minimum of 10 days prior to requesting inspection for determining date of Beneficial Occupancy. List items below that are incomplete at time of request.

1. Perform preventive maintenance on equipment used prior to Beneficial Occupancy.
2. Instruct Owner's personnel in operation, adjustment, and maintenance of products, equipment, and systems.
3. Terminate and remove temporary facilities from Project site, along with mockups, construction tools, and similar elements.
4. Complete final cleaning requirements, including touchup painting.
5. Touch up and otherwise repair and restore marred exposed finishes to eliminate visual defects.

D. Inspection: Submit a written request for inspection to determine Beneficial Occupancy a minimum of 10 days prior to date the work will be completed and ready for final inspection and tests. On receipt of request, Architect will either proceed with inspection or notify Contractor of unfulfilled requirements. Architect will prepare the Certificate of Beneficial Occupancy after inspection or will notify CMR of items, either on CMR's list or additional items identified by Architect, that must be completed or corrected before certificate will be issued.

1. Re-inspection: Request re-inspection when the Work identified in previous inspections as incomplete is completed or corrected.
2. Results of completed inspection will form the basis of requirements for final completion.

1.6 FINAL COMPLETION PROCEDURES

A. Preliminary Procedures: Before requesting final inspection for determining Beneficial Occupancy, complete the following:

1. Submit a final Application for Payment according to Section 012900 "Payment Procedures."
2. Certified List of Incomplete Items: Submit certified copy of Architect's Beneficial Occupancy inspection list of items to be completed or corrected (punch list), endorsed and dated by Architect. Certified copy of the list shall state that each item has been completed or otherwise resolved for acceptance.
3. Certificate of Insurance: Submit evidence of final, continuing insurance coverage complying with insurance requirements.
4. Instruct Owner's personnel in operation, adjustment, and maintenance of products, equipment, and systems.

B. Inspection: Submit a written request for final inspection to determine acceptance. On receipt of request, Architect will either proceed with inspection or notify CMR of unfulfilled requirements. Architect will prepare a final Certificate for Payment after inspection or will notify Contractor of construction that must be completed or corrected before certificate will be issued.

1. Re-inspection: Request re-inspection when the Work identified in previous inspections as incomplete is completed or corrected.

1.7 LIST OF INCOMPLETE ITEMS (PUNCH LIST)

A. Organization of List: Include name and identification of each space and area affected by construction operations for incomplete items and items needing correction including, if necessary, areas disturbed by CMR that are outside the limits of construction.

1. Organize items applying to each major element, including categories for ceiling, individual walls, floors, equipment, and building systems.
2. Submit list of incomplete items in the following format:

    a. PDF, for review by Architect.
    b. Provide this list in a timely manner, and include the Designer review of these items as an item on the Project Schedule.

1.8 SUBMITTAL OF PROJECT WARRANTIES

A. Time of Submittal: All written warranties submitted to the Architect for designated portions of the Work shall commence on the date of Final Acceptance, or a later date when delay in submittal of warranties might limit Owner's rights under warranty.

B. Organize warranty documents into an orderly sequence based on the table of contents of the Project Manual.

1. Bind warranties and bonds in heavy-duty, three-ring, vinyl-covered, loose-leaf binders, thickness as necessary to accommodate contents, and sized to receive 8-1/2-by-11-inch (215-by-280-mm) paper.
2. Provide heavy paper dividers with plastic-covered tabs for each separate warranty. Mark tab to identify the product or installation. Provide a typed description of the product or

installation, including the name of the product and the name, address, and telephone number of Installer.

3. Identify each binder on the front and spine with the typed or printed title "WARRANTIES," Project name, and name of CMR.
4. Warranty Electronic File: Scan warranties and bonds and assemble complete warranty and bond submittal package into a single indexed electronic PDF file with links enabling navigation to each item. Provide bookmarked table of contents at beginning of document.

C. Provide additional copies of each warranty to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Cleaning Agents: Use cleaning materials and agents recommended by manufacturer or fabricator of the surface to be cleaned. Do not use cleaning agents that are potentially hazardous to health or property or that might damage finished surfaces.

PART 3 - EXECUTION

3.1 FINAL CLEANING

A. General: Perform final cleaning. Conduct cleaning and waste-removal operations to comply with local laws and ordinances and Federal and local environmental and antipollution regulations.

B. Cleaning: Employ experienced workers or professional cleaners for final cleaning. Clean each surface or unit to condition expected in an average commercial building cleaning and maintenance program. Comply with manufacturer's written instructions.

1. Complete the following cleaning operations before requesting inspection for certification of Beneficial Occupancy for entire Project or for a designated portion of Project:

    a. Clean Project areas of rubbish, waste material, litter, and other foreign substances.
    b. Remove tools, construction equipment, machinery, and surplus material from Project area.
    c. Clean exposed hard-surfaced finishes to a dirt-free condition, free of stains, films, and similar foreign substances. Restore reflective surfaces to their original condition.
    d. Remove debris and surface dust from limited access spaces, plenums, and similar spaces.
    e. Sweep concrete floors broom clean in unoccupied spaces.
    f. Vacuum carpet and similar soft surfaces, removing debris and excess nap; clean according to manufacturer's recommendations if visible soil or stains remain.
    g. Remove labels that are not permanent.
    h. Wipe surfaces of mechanical and electrical equipment and similar equipment.
    i. Replace disposable air filters and clean permanent air filters. Clean exposed surfaces of diffusers, registers, and grills.
    j. Clean light fixtures, lamps, globes, and reflectors to function with full efficiency.
    k. Leave Project clean and ready for occupancy.

3.2 REPAIR OF THE WORK

A. Complete repair and restoration operations before requesting inspection for determination of Beneficial Occupancy.

B. Repair or remove and replace defective construction. Repairing includes replacing defective parts, refinishing damaged surfaces, touching up with matching materials, and properly adjusting operating equipment. Where damaged or worn items cannot be repaired or restored, provide replacements. Remove and replace operating components that cannot be repaired. Restore damaged construction and permanent facilities used during construction to specified condition.

1. Remove and replace chipped, scratched, and broken glass, reflective surfaces, and other damaged transparent materials.
2. Touch up and otherwise repair and restore marred or exposed finishes and surfaces. Replace finishes and surfaces that that already show evidence of repair or restoration.

    a. Do not paint over "UL" and other required labels and identification, including mechanical and electrical nameplates. Remove paint applied to required labels and identification.

3. Replace parts subject to operating conditions during construction that may impede operation or reduce longevity.
4. Replace burned-out bulbs, bulbs noticeably dimmed or flickering, and defective and noisy starters in fluorescent fixtures to comply with requirements for new fixtures.

END OF SECTION 017700

THIS PAGE IS INTENTIONALLY LEFT BLANK

SECTION 017823 – OPERATION, MAINTENANCE, AND EMERGENCY SHUT OFF MANUALS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes requirements for preparing applicable operation, maintenance and emergency shut off manuals. This will be on loose leaf document that includes the following:

1. Directory of Vendors.
2. Operation manuals for systems, subsystems, and equipment.
3. Emergency shut off procedures for mechanical, electrical, and plumbing equipment and fixtures.

1.2 CLOSEOUT SUBMITTALS

A. Manual Content: Operations and maintenance manual content is specified in individual Specification Sections to be reviewed at the time of Section submittals.

1. Submit two paper copies and a PDF electronic file. Include a complete operation and maintenance directory. Enclose title pages and directories in clear plastic sleeves.

B. Manual Submittal: Submit each manual in final form prior to requesting inspection for Beneficial Occupancy and at least 10 days before commencing demonstration and training. Note this on the Project Schedule.

PART 2 - PRODUCTS

2.1 REQUIREMENTS FOR EMERGENCY, OPERATION, AND MAINTENANCE MANUALS

A. The manual shall contain the following materials, in the order listed:

1. Title Page: Include the following information:

a. Subject matter included in manual.
b. Name and address of Project.
c. Name and address of Owner.
d. Date of submittal.
e. Name and contact information for CMR.
f. Name and contact information for Architect.
g. Names and contact information for major consultants to the Architect that designed the systems contained in the manuals.

2. Table of Contents: List each product included in manual, identified by product name, indexed to the content of the volume, and cross-referenced to Specification Section number in Project Manual.

3. Directory of Vendors.

a. Include names and contact information for subcontractors and vendors who installed the systems contained in the manuals.

4. Operation manuals for systems, subsystems, and equipment shall include:

a. System, subsystem, and equipment descriptions. Use designations for systems and equipment indicated on Contract Documents.
b. Performance and design criteria if CMR is delegated design responsibility.
c. Operating standards.

d. Operating procedures.
e. Operating logs.
f. Wiring diagrams.
g. Control diagrams.
h. Piped system diagrams.
i. Precautions against improper use.
j. License requirements including inspection and renewal dates.

5. Emergency instructions will include shut off and re-start procedures for mechanical, electrical, and plumbing equipment and fixtures. Include locations of electrical panels, including main and sub panels, mechanical equipment controls and disconnects, and plumbing main and branch shut off valves (including connections to water main). The instructions shall cover procedures for the following types of emergencies:

a. Fire.
b. Flood.
c. Gas leak.
d. Water leak.
e. Power failure.

PART 3 - EXECUTION

3.1 MANUAL PREPARATION

A. Comply with Section 017700 "Closeout Procedures" for schedule for submitting operation and maintenance documentation. If applicable, provide the following information for specific equipment and systems:

1. Service and lubrication requirements, list of required lubricants for equipment, and separate schedules for preventive and routine maintenance and service with standard time allotment.
2. Lists of replacement and repair parts, with parts identified and cross-referenced to manufacturers' maintenance documentation and local sources of maintenance materials and related services.
3. Copies of maintenance agreements with name and telephone number of service agent.
4. Copies of warranties and bonds and lists of circumstances and conditions that would affect validity of warranties or bonds.

B. Manuals, Paper Copy: Submit manuals in the form of hard copy, bound and labeled volumes.

1. Binders: Heavy-duty, three-ring, vinyl-covered, loose-leaf binders, in thickness necessary to accommodate contents, sized to hold 8-1/2-by-11-inch (215-by-280-mm) paper; with clear plastic sleeve on spine to hold label describing contents and with pockets inside covers to hold folded oversize sheets.

2. Drawings: Attach reinforced, punched binder tabs on drawings and bind with text.

a. If oversize drawings are necessary, fold drawings to same size as text pages and use as foldouts.
b. If drawings are too large to be used as foldouts, fold and place drawings in labeled envelopes and bind envelopes in rear of manual. At appropriate locations in manual, insert typewritten pages indicating drawing titles, descriptions of contents, and drawing locations.

C. Manuals, Electronic Copy: Submit PDF version of Manuals on CD-ROM for the State, the NCDCNR, and the Aquarium.

END OF SECTION 017823

SECTION 017839 - PROJECT RECORD DOCUMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for project record documents, including the following:

1. Record Drawings.
2. Record Specifications.
3. Record Product Data.

B. Related Requirements:

1. Section 017823 "Operation and Maintenance Data" for operation and maintenance manual requirements.

1.2 CLOSEOUT SUBMITTALS

A. Record Drawings: Comply with the following:

1. Number of Copies: CMR submit one set of marked-up record prints; two CDRs.

B. Record Specifications: CMR submit one paper copy of Project's Specifications, including addenda and contract modifications; two CDRs.

PART 2 - PRODUCTS

2.1 RECORD DRAWINGS

A. Record Prints: CMR maintain one set of marked-up paper copies of the Contract Drawings and Shop Drawings, incorporating new and revised Drawings as modifications are issued. ***This set will be reviewed by the Architect at each Monthly Progress Meeting and must be kept current.***

1. Preparation: Mark record prints to show the actual installation where installation varies from that shown originally. Require individual or entity who obtained record data, whether individual or entity is Installer, subcontractor, or similar entity, to provide information for preparation of corresponding marked-up record prints.

   a. Give particular attention to information on concealed elements that would be difficult to identify or measure and record later.
   b. Record data as soon as possible after obtaining it.
   c. Record and check the markup before enclosing concealed installations.

2. Mark the Contract Drawings and Shop Drawings completely and accurately. Use personnel proficient at recording graphic information in production of marked-up record prints.

3. Mark record sets with erasable, red-colored pencil. Use other colors to distinguish between changes for different categories of the Work at same location.
4. Note Construction Change Directive numbers, alternate numbers, Change Order numbers, and similar identification, where applicable.

2.2 RECORD SPECIFICATIONS

A. Preparation: CMR mark Specifications to indicate the actual product installation where installation varies from that indicated in Specifications, addenda, and contract modifications.

1. Give particular attention to information on concealed products and installations that cannot be readily identified and recorded later.
2. Mark copy with the proprietary name and model number of products, materials, and equipment furnished, including substitutions and product options selected.
3. Record the name of manufacturer, supplier, Installer, and other information necessary to provide a record of selections made.
4. Note related Change Orders and record Drawings where applicable.

B. Format: Submit record Specifications as paper copy.

PART 3 - EXECUTION

3.1 RECORDING AND MAINTENANCE

A. Recording: CMR maintain one copy of each submittal during the construction period for project record document purposes. Post changes and revisions to project record documents as they occur; do not wait until end of Project.

B. CMR maintenance of Record Documents and Samples: Store record documents and Samples in the field office apart from the Contract Documents used for construction. Do not use project record documents for construction purposes. Maintain record documents in good order and in a clean, dry, legible condition, protected from deterioration and loss. Provide access to project record documents for Architect's reference during normal working hours.

C. CMR submit Record Documents to the Architect for final review at the time of Beneficial Occupancy in the form of CDRs.

END OF SECTION 017839

SECTION 017900 - DEMONSTRATION AND TRAINING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes administrative and procedural requirements for instructing Owner's personnel, including the following:

1. Demonstration of operation of systems, subsystems, and equipment.
2. Training in operation and maintenance of systems, subsystems, and equipment.
3. Demonstration and training video recordings.

1.2 COORDINATION

A. Coordinate instruction schedule with Owner's operations. Adjust schedule as required to minimize disrupting Owner's operations and to ensure availability of Owner's personnel.

B. Coordinate content of training modules with content of approved emergency, operation, and maintenance manuals. Do not submit instruction program until operation and maintenance data has been reviewed and approved by Architect.

PART 2 - PRODUCTS

2.1 INSTRUCTION PROGRAM

A. Program Structure: Develop an instruction program that includes individual training modules for each system and for equipment not part of a system, as required by individual Specification Sections.

B. Training Modules: Develop a learning objective and teaching outline for each module. Include a description of specific skills and knowledge that participant is expected to master. For each module, include instruction for the following as applicable to the system, equipment, or component:

1. Basis of System Design, Operational Requirements, and Criteria: Include the following:

    a. System, subsystem, and equipment descriptions.
    b. Performance and design criteria if Contractor is delegated design responsibility.
    c. Operating standards.
    d. Regulatory requirements.
    e. Equipment function.
    f. Operating characteristics.
    g. Limiting conditions.
    h. Performance curves.

2. Documentation: Review the following items in detail:

a. Emergency manuals.
b. Operations manuals.
c. Maintenance manuals.
d. Project record documents.
e. Identification systems.
f. Warranties and bonds.
g. Maintenance service agreements and similar continuing commitments.

3. Emergencies: Include the following, as applicable:

a. Instructions on meaning of warnings, trouble indications, and error messages.
b. Instructions on stopping.
c. Shutdown instructions for each type of emergency.
d. Operating instructions for conditions outside of normal operating limits.
e. Sequences for electric or electronic systems.
f. Special operating instructions and procedures.

4. Operations: Include the following, as applicable:

a. Startup procedures.
b. Equipment or system break-in procedures.
c. Routine and normal operating instructions.
d. Regulation and control procedures.
e. Control sequences.
f. Safety procedures.
g. Instructions on stopping.
h. Normal shutdown instructions.
i. Operating procedures for emergencies.
j. Operating procedures for system, subsystem, or equipment failure.
k. Seasonal and weekend operating instructions.
l. Required sequences for electric or electronic systems.
m. Special operating instructions and procedures.

5. Adjustments: Include the following:

a. Alignments.
b. Checking adjustments.
c. Noise and vibration adjustments.
d. Economy and efficiency adjustments.

6. Troubleshooting: Include the following:

a. Diagnostic instructions.
b. Test and inspection procedures.

7. Maintenance: Include the following:

a. Inspection procedures.
b. Types of cleaning agents to be used and methods of cleaning.
c. List of cleaning agents and methods of cleaning detrimental to product.
d. Procedures for routine cleaning
e. Procedures for preventive maintenance.
f. Procedures for routine maintenance.
g. Instruction on use of special tools.

8. Repairs: Include the following:

a. Diagnosis instructions.
b. Repair instructions.
c. Disassembly; component removal, repair, and replacement; and reassembly instructions.
d. Instructions for identifying parts and components.
e. Review of spare parts needed for operation and maintenance.

PART 3 - EXECUTION

3.1 PREPARATION

A. Assemble educational materials necessary for instruction, including documentation and training module. Assemble training modules into a training manual organized in coordination with requirements in Section 017823 "Operation and Maintenance Data."

3.2 INSTRUCTION

A. Engage qualified instructors to instruct Owner's personnel to adjust, operate, and maintain systems, subsystems, and equipment not part of a system.

1. Architect will furnish an instructor to describe basis of system design, operational requirements, criteria, and regulatory requirements.
2. Owner will furnish an instructor to describe Owner's operational philosophy.
3. Owner will furnish Contractor with names and positions of participants.

B. Scheduling: Provide instruction at mutually agreed on times. For equipment that requires seasonal operation, provide similar instruction at start of each season.

1. Schedule training with Owner with at least seven days' advance notice.

C. Training Location and Reference Material: Conduct training on-site in the completed and fully operational facility using the actual equipment in-place. Conduct training using final operation and maintenance data submittals.

1

2

3 END OF SECTION 017900

SECTION 024119 - SELECTIVE STRUCTURE DEMOLITION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Demolition and removal of selected portions of building or structure.
2. Demolition and removal of selected site elements.
3. Salvage of existing items to be reused or recycled.

B. Related Requirements:

1. Section 011000 "Summary" for restrictions on the use of the premises, Owner-occupancy requirements, and phasing requirements.
2. Section 017300 "Execution" for cutting and patching procedures.
3. Section 311000 "Site Clearing" for site clearing and removal of above- and below-grade improvements.
4. CMR's Abatement Report included with this Specification.

1.3 DEFINITIONS

A. Remove: Detach items from existing construction and legally dispose of them off-site unless indicated to be removed and salvaged or removed and reinstalled.

B. Remove and Salvage: Carefully detach from existing construction, in a manner to prevent damage, and deliver to Owner **ready for reuse**.

C. Remove and Reinstall: Detach items from existing construction, prepare for reuse, and reinstall where indicated.

D. Existing to Remain: Existing items of construction that are not to be permanently removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

E. Dismantle: To remove by disassembling or detaching an item from a surface, using gentle methods and equipment to prevent damage to the item and surfaces; disposing of items unless indicated to be salvaged or reinstalled.

1.4 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition waste becomes property of CMR.

B. Door control hardware to be uninstalled and turned over to owner for all doors that are being removed.

C. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, Donor signage, Sculptures (including water features), commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.

1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.5 PREINSTALLATION MEETINGS

A. Predemolition Conference: Conduct conference at **Project site**.

1. Inspect and discuss condition of construction to be selectively demolished.
2. Review structural load limitations of existing structure.
3. Review and finalize selective demolition schedule and verify availability of materials, demolition personnel, equipment, and facilities needed to make progress and avoid delays.
4. Review requirements of work performed by other trades that rely on substrates exposed by selective demolition operations.
5. Review areas where existing construction is to remain and requires protection.

1.6 INFORMATIONAL SUBMITTALS

A. Proposed Protection Measures: Submit report, including drawings, that indicates the measures proposed for protecting individuals and property**, for environmental protection, for dust control and, for noise control**. Indicate proposed locations and construction of barriers.

B. Schedule of Selective Demolition Activities: Indicate the following:

1. Detailed sequence of selective demolition and removal work, with starting and ending dates for each activity. Ensure Owner's adjacent on-site operations are uninterrupted.
2. Interruption of utility services. Indicate how long utility services will be interrupted.
3. Coordination for shutoff, capping, and continuation of utility services.
4. Use of elevator and stairs.

C. Inventory: Submit a list of items to be removed and salvaged and deliver to Owner prior to start of demolition.

D. Predemolition Photographs or Video: Submit before Work begins.

E. Warranties: Documentation indicated that existing warranties are still in effect after completion of selective demolition.

1.7 CLOSEOUT SUBMITTALS

A. Inventory: Submit a list of items that have been removed and salvaged.

B. Landfill Records: Indicate receipt and acceptance of hazardous wastes by a landfill facility licensed to accept hazardous wastes.

1.8 FIELD CONDITIONS

A. Conditions existing at time of inspection for bidding purpose will be maintained by Owner as far as practical. The following items will be addressed in the prior project phase:

1. Before selective demolition, Owner will remove and address the following items:

a. AV Systems in Auditorium, Control Booth & Classrooms

b. Life Support systems

B. Items to be demolished as part of this Phase, as shown on Drawings AD-1.11 through AD-1.23 A include:

1. Structural Floor Slabs, Wood Decking, Interior Wall Partitions, Finished Flooring, Acoustic Ceiling Tiles, Light Fixtures, Casework, Plumbing Fixtures, Toilet Partitions, and Architectural Woodwork.

C. Utility Service: Maintain existing utilities indicated to remain in service and protect them against damage during selective demolition operations.

1. Maintain fire-protection facilities in service during selective demolition operations.

D. Notify Architect of discrepancies between existing conditions and Drawings before proceeding with selective demolition.

E. Hazardous material remediation is specified elsewhere in the Contract Documents.

F. A Report confirming the removal of hazardous materials must be issued prior to the commencement of Selective Demolition.

G. Equipment Sizes: Demolition and hauling equipment and other materials shall be of sizes that clear surfaces within existing spaces, areas, rooms, and openings, including temporary protection, by 12 inches (300 mm) or more.

H. Storage or sale of removed items or materials on-site is not permitted.

1.9 WARRANTY

A. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during selective demolition, by methods and with materials so as not to void existing warranties. Notify warrantor before proceeding. Existing warranties include the following:

1. Roofing.
2. Carpeting.

B. Notify warrantor on completion of selective demolition, and obtain documentation verifying that existing system has been inspected and warranty remains in effect. Submit documentation at Project closeout.

PART 2 - PRODUCTS

2.1 PEFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning selective demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

B. Standards: Comply with ANSI/ASSE A10.6 and NFPA 241.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that utilities have been disconnected and capped before starting selective demolition operations.

B. Review record documents of existing construction provided by Owner. Owner does not guarantee that existing conditions are same as those indicated in record documents.

C. Survey existing conditions and correlate with requirements indicated to determine extent of selective demolition required.

D. When unanticipated mechanical, electrical, or structural elements that conflict with intended function or design are encountered, investigate and measure the nature and extent of conflict. Promptly submit a written report to Architect.

E. Perform surveys as the Work progresses to detect hazards resulting from selective demolition activities.

F. Verify that hazardous materials have been remediated before proceeding with building demolition operations.

G. Survey of Existing Conditions: Record existing conditions by use of **measured drawings** and **preconstruction photographs**.

1. Comply with requirements specified in Section 013233 "Photographic Documentation."
2. Inventory and record the condition of items to be removed and salvaged. Provide **photographs or video** of conditions that might be misconstrued as damage caused by salvage operations.
3. Before selective demolition or removal of existing building elements that will be reproduced or duplicated in final Work, make permanent record of measurements, materials, and construction details required to make exact reproduction.

3.2 UTILITY SERVICES AND MECHANICAL/ELECTRICAL SYSTEMS

A. Existing Services/Systems to Remain: Maintain services/systems indicated to remain and protect them against damage.

1. Comply with requirements for existing services/systems interruptions specified in Section 011000 "Summary."

B. Existing Services/Systems to Be Removed, Relocated, or Abandoned: Locate, identify, disconnect, and seal or cap off indicated utility services and mechanical/electrical systems serving areas to be selectively demolished.

1. **Owner** will arrange to shut off indicated services/systems when requested by CMR.
2. Arrange to shut off indicated utilities with utility companies.
3. If services/systems are required to be removed, relocated, or abandoned, provide temporary services/systems that bypass area of selective demolition and that maintain continuity of services/systems to other parts of building, if needed.
4. Disconnect, demolish, and remove fire-suppression systems, plumbing, and HVAC systems, equipment, and components indicated to be removed.

    a. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
    b. Piping to Be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material.
    c. Equipment to Be Removed: Disconnect and cap services and remove equipment.
    d. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
    e. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.
    f. Ducts to Be Removed: Remove portion of ducts indicated to be removed and plug remaining ducts with same or compatible ductwork material.
    g. Ducts to Be Abandoned in Place: Cap or plug ducts with same or compatible ductwork material.

C. Engineering Disciplines have separate drawings and specifications to cover the extent of their demolition work.

3.3 PREPARATION

A. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

1. Comply with requirements for access and protection specified in Section 015000 "Temporary Facilities and Controls."

B. Temporary Facilities: Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.

1. Provide protection to ensure safe passage of people around selective demolition area and to and from occupied portions of building.
2. Provide temporary weather protection, during interval between selective demolition of existing construction on exterior surfaces and new construction, to prevent water leakage and damage to structure and interior areas.
3. Protect walls, ceilings, floors, and other existing finish work that are to remain or that are exposed during selective demolition operations.
4. Cover and protect furniture, furnishings, and equipment that have not been removed.
5. Comply with requirements for temporary enclosures, dust control, heating, and cooling specified in Section 015000 "Temporary Facilities and Controls."

C. Temporary Shoring: Provide and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement, or collapse of construction and finishes to remain, and to prevent unexpected or uncontrolled movement or collapse of construction being demolished.

1. Strengthen or add new supports when required during progress of selective demolition.

D. Remove temporary barricades and protections where hazards no longer exist.

3.4 SELECTIVE DEMOLITION, GENERAL

A. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:

1. Proceed with selective demolition systematically, from higher to lower level. Complete selective demolition operations above each floor or tier before disturbing supporting members on the next lower level.
2. Neatly cut openings and holes plumb, square, and true to dimensions required. Use cutting methods least likely to damage construction to remain or adjoining construction. Use hand tools or small power tools designed for sawing or grinding, not hammering and chopping, to minimize disturbance of adjacent surfaces. Temporarily cover openings to remain.
3. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.
4. Do not use cutting torches until work area is cleared of flammable materials. At concealed spaces, such as duct and pipe interiors, verify condition and contents of hidden space before starting flame-cutting operations. Maintain **fire watch and** portable fire-suppression devices during flame-cutting operations and for at least 48 hours after the flame-cutting operations.
5. Maintain adequate ventilation when using cutting torches.
6. Remove decayed, vermin-infested, or otherwise dangerous or unsuitable materials and promptly dispose of off-site.
7. Remove structural framing members and lower to ground by method suitable to avoid free fall and to prevent ground impact or dust generation.
8. Locate selective demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.
9. Dispose of demolished items and materials promptly.
10. Remove and dispose of the fixed seating.

B. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

C. Removed and Salvaged Items:

1. Clean salvaged items.
2. Pack or crate items after cleaning. Identify contents of containers.
3. Store items in a secure area until delivery to Owner.
4. Transport items to Owner's storage area **designated by Owner**.
5. Protect items from damage during transport and storage.

D. Removed and Reinstalled Items:

1. Clean and repair items to functional condition adequate for intended reuse.
2. Pack or crate items after cleaning and repairing. Identify contents of containers.
3. Protect items from damage during transport and storage.
4. Reinstall items in locations indicated. Comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make item functional for use indicated.

E. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during selective demolition. When permitted by Architect, items may be removed to a suitable, protected storage location during selective demolition, **cleaned** and reinstalled in their original locations after selective demolition operations are complete.

3.5 SELECTIVE DEMOLITION PROCEDURES FOR SPECIFIC MATERIALS

A. Concrete: Demolish in small sections. Using power-driven saw, cut concrete to a depth of at least 3/4 inch (19 mm) at junctures with construction to remain. Dislodge concrete from reinforcement at perimeter of areas being demolished, cut reinforcement, and then remove remainder of concrete. Neatly trim openings to dimensions indicated.

B. Concrete: Demolish in sections. Cut concrete full depth at junctures with construction to remain and at regular intervals using power-driven saw, then remove concrete between saw cuts.

C. Masonry: Demolish in small sections. Cut masonry at junctures with construction to remain, using power-driven saw, then remove masonry between saw cuts.

D. Concrete Slabs-on-Grade: Saw-cut perimeter of area to be demolished, then break up and remove.

E. Resilient Floor Coverings: Remove floor coverings and adhesive according to recommendations in RFCI's "Recommended Work Practices for the Removal of Resilient Floor Coverings." Do not use methods requiring solvent-based adhesive strippers.

F. Roofing: Remove no more existing roofing than what can be covered in one day by new roofing and so that building interior remains watertight and weather tight. If needed, insert requirements for other materials, products, equipment, and services.

1. Remove existing roof membrane, flashings, copings, and roof accessories.
2. Remove existing roofing system down to substrate.

3.6 DISPOSAL OF DEMOLISHED MATERIALS

A. General: Except for items or materials indicated to be reused, salvaged, reinstalled, or otherwise indicated to remain Owner's property, remove demolished materials from Project site **and legally dispose of them in an EPA-approved landfill**.

1. Do not allow demolished materials to accumulate on-site.
2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
3. Remove debris from elevated portions of building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.

B. Burning: Do not burn demolished materials.

C. Disposal: Transport demolished materials off Owner's property and legally dispose of them.

3.7 CLEANING

A. Clean adjacent structures and improvements of dust, dirt, and debris caused by selective demolition operations. Return adjacent areas to condition existing before selective demolition operations began.

3.8 SELECTIVE DEMOLITION SCHEDULE

1. xxxx

B. Existing Items to Be Removed and Salvaged:

1. xxxx

C. Existing Items to Remain:

1. xxxx

END OF SECTION 024119

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Form-facing material for cast-in-place concrete.
2. Shoring, bracing, and anchoring.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at[Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For each of the following:

1. Exposed surface form-facing material.
2. Concealed surface form-facing material.
3. Form ties.
4. Waterstops.
5. Form-release agent.

B. Shop Drawings: Prepared by, and signed and sealed by, a qualified professional engineer responsible for their preparation, detailing fabrication, assembly, and support of forms.

1. For exposed vertical concrete walls, indicate dimensions and form tie locations.
2. Indicate dimension and locations of construction and movement joints required to construct the structure in accordance with ACI 301.

    a. Location of construction joints is subject to approval of the Architect.

3. Indicate location of waterstops.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

B. Minutes of preinstallation conference.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Concrete Formwork: Design, engineer, erect, shore, brace, and maintain formwork, shores, and reshores in accordance with ACI 301, to support vertical, lateral, static, and dynamic loads, and

construction loads that might be applied, until structure can support such loads, so that resulting concrete conforms to the required shapes, lines, and dimensions.

1. Design wood panel forms in accordance with APA's "Concrete Forming Design/Construction Guide."
2. Design formwork to limit deflection of form-facing material to 1/240 of center-to-center spacing of supports.

2.2 FORM-FACING MATERIALS

A. As-Cast Surface Form-Facing Material:

1. Provide continuous, true, and smooth concrete surfaces.
2. Furnish in largest practicable sizes to minimize number of joints.
3. Acceptable Materials: As required to comply with Surface Finish designations specified in Section 033000 "Cast-In-Place Concrete, and as follows:

    a. Plywood, metal, or other approved panel materials.
    b. Exterior-grade plywood panels, suitable for concrete forms, complying with DOC PS 1, and as follows:

        1) APA HDO (high-density overlay).
        2) APA MDO (medium-density overlay); mill-release agent treated and edge sealed.
        3) APA Structural 1 Plyform, B-B or better; mill oiled and edge sealed.
        4) APA Plyform Class I, B-B or better; mill oiled and edge sealed.

B. Concealed Surface Form-Facing Material: Lumber, plywood, metal, plastic, or another approved material.

1. Provide lumber dressed on at least two edges and one side for tight fit.

2.3 WATERSTOPS

A. Flexible PVC Waterstops: U.S. Army Corps of Engineers CRD-C 572,with factory-installed metal eyelets, for embedding in concrete to prevent passage of fluids through joints, with factory fabricate corners, intersections, and directional changes.
1. Profile: Ribbed with center bulb and Ribbed without center bulb.
2. Dimensions: 6 inches by 3/8 inch thick; nontapered.

B. Self-Expanding Butyl Strip Waterstops: Manufactured rectangular or trapezoidal strip, butyl rubber with sodium bentonite or other hydrophilic polymers, for adhesive bonding to concrete, 3/4 by 1 inch (19 by 25 mm).

2.4 RELATED MATERIALS

A. Reglets: Fabricate reglets of not less than 0.022-inch- thick, galvanized-steel sheet. Temporarily fill or cover face opening of reglet to prevent intrusion of concrete or debris.

B. Dovetail Anchor Slots: Hot-dip galvanized-steel sheet, not less than 0.034 inch thick, with bent tab anchors. Temporarily fill or cover face opening of slots to prevent intrusion of concrete or debris.

C. Chamfer Strips: Wood, metal, PVC, or rubber strips, 3/4 by 3/4 inch, minimum.

D. Rustication Strips: Wood, metal, PVC, or rubber strips, kerfed for ease of form removal.

E. Form-Release Agent: Commercially formulated form-release agent that does not bond with, stain, or adversely affect concrete surfaces and does not impair subsequent treatments of concrete surfaces.

1. Formulate form-release agent with rust inhibitor for steel form-facing materials.
2. Form release agent for form liners shall be acceptable to form liner manufacturer.

F. Form Ties: Factory-fabricated, removable or snap-off, glass-fiber-reinforced plastic or metal form ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.

1. Furnish units that leave no corrodible metal closer than 1 inch to the plane of exposed concrete surface.
2. Furnish ties that, when removed, leave holes no larger than 1 inch in diameter in concrete surface.
3. Furnish ties with integral water-barrier plates to walls indicated to receive dampproofing or waterproofing.

PART 3 - EXECUTION

3.1 INSTALLATION OF FORMWORK

A. Comply with ACI 301.

B. Construct formwork, so concrete members and structures are of size, shape, alignment, elevation, and position indicated, within tolerance limits of ACI 117 (ACI 117M) and to comply with the Surface Finish designations specified in Section 033000 "Cast-In-Place Concrete" for as-cast finishes.

C. Limit concrete surface irregularities as follows:

1. Surface Finish-1.0: ACI 117 Class D, 1 inch.
2. Surface Finish-2.0: ACI 117 Class B, 1/4 inch.
3. Surface Finish-3.0: ACI 117 Class A, 1/8 inch.

D. Construct forms tight enough to prevent loss of concrete mortar.

1. Minimize joints.
2. Exposed Concrete: Symmetrically align joints in forms.

E. Construct removable forms for easy removal without hammering or prying against concrete surfaces.

1. Provide crush or wrecking plates where stripping may damage cast-concrete surfaces.

2. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical.
3. Install keyways, reglets, recesses, and other accessories, for easy removal.

F. Do not use rust-stained, steel, form-facing material.

G. Set edge forms, bulkheads, and intermediate screed strips for slabs to achieve required elevations and slopes in finished concrete surfaces.

1. Provide and secure units to support screed strips.
2. Use strike-off templates or compacting-type screeds.

H. Provide temporary openings for cleanouts and inspection ports where interior area of formwork is inaccessible.

1. Close openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar.
2. Locate temporary openings in forms at inconspicuous locations.

I. Chamfer exterior corners and edges of permanently exposed concrete.

J. At construction joints, overlap forms onto previously placed concrete not less than 12 inches (305 mm).

K. Form openings, chases, offsets, sinkages, keyways, reglets, blocking, screeds, and bulkheads required in the Work.

1. Determine sizes and locations from trades providing such items.
2. Obtain written approval of Architect prior to forming openings not indicated on Drawings.

L. Construction and Movement Joints:

1. Construct joints true to line with faces perpendicular to surface plane of concrete.
2. Install so strength and appearance of concrete are not impaired, at locations indicated or as approved by Architect.
3. Place joints perpendicular to main reinforcement.
4. Locate joints for beams, slabs, joists, and girders in the middle third of spans.

    a. Offset joints in girders a minimum distance of twice the beam width from a beam-girder intersection.

5. Locate horizontal joints in walls and columns at underside of floors, slabs, beams, and girders and at the top of footings or floor slabs.
6. Space vertical joints in walls as indicated on Drawings.

    a. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible.

M. Provide temporary ports or openings in formwork where required to facilitate cleaning and inspection.

1. Locate ports and openings in bottom of vertical forms, in inconspicuous location, to allow flushing water to drain.
2. Close temporary ports and openings with tight-fitting panels, flush with inside face of form, and neatly fitted, so joints will not be apparent in exposed concrete surfaces.

N. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.

O. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.

P. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.

3.2 INSTALLATION OF EMBEDDED ITEMS

A. Place and secure anchorage devices and other embedded items required for adjoining work that is attached to or supported by cast-in-place concrete.

1. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
2. Install anchor rods, accurately located, to elevations required and complying with tolerances in Section 7.5 of AISC 303.
3. Install reglets to receive waterproofing and to receive through-wall flashings in outer face of concrete frame at exterior walls, where flashing is shown at lintels, shelf angles, and other conditions.
4. Install dovetail anchor slots in concrete structures, as indicated on Drawings.
5. Clean embedded items immediately prior to concrete placement.

3.3 INSTALLATION OF WATERSTOPS

A. Flexible Waterstops: Install in construction joints and at other joints indicated to form a continuous diaphragm.

1. Install in longest lengths practicable.
2. Locate waterstops in center of joint unless otherwise indicated on Drawings.
3. Allow clearance between waterstop and reinforcing steel of not less than 2 times the largest concrete aggregate size specified in Section 033000 "Cast-In-Place Concrete."
4. Secure waterstops in correct position at 12 inches on center.
5. Field fabricate joints in accordance with manufacturer's instructions using heat welding.

    a. Miter corners, intersections, and directional changes in waterstops.
    b. Align center bulbs.

6. Clean waterstops immediately prior to placement of concrete.
7. Support and protect exposed waterstops during progress of the Work.

B. Self-Expanding Strip Waterstops: Install in construction joints and at other locations indicated on Drawings, according to manufacturer's written instructions, by adhesive bonding, mechanically fastening, and firmly pressing into place.

1. Install in longest lengths practicable.
2. Locate waterstops in center of joint unless otherwise indicated on Drawings.
3. Protect exposed waterstops during progress of the Work.

3.4 SHORING AND RESHORING INSTALLATION

A. Comply with ACI 318 and ACI 301 for design, installation, and removal of shoring and reshoring.

1. Do not remove shoring or reshoring until measurement of slab tolerances is complete.

B. In multistory construction, extend shoring or reshoring over a sufficient number of stories to distribute loads in such a manner that no floor or member will be excessively loaded or will induce tensile stress in concrete members without sufficient steel reinforcement.

C. Plan sequence of removal of shores and reshore to avoid damage to concrete. Locate and provide adequate reshoring to support construction without excessive stress or deflection.

3.5 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage a special inspector to perform field tests and inspections and prepare test reports.

B. Testing Agency: Engage a qualified testing and inspecting agency to perform tests and inspections and to submit reports.

C. Inspections:

1. Inspect formwork for shape, location, and dimensions of the concrete member being formed.
2. Inspect insulating concrete forms for shape, location, and dimensions of the concrete member being formed.

END OF SECTION 031000

SECTION 032000 - CONCRETE REINFORCING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Steel reinforcement bars.
2. Welded-wire reinforcement.

1.2 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.3 ACTION SUBMITTALS

A. Product Data: For the following:

1. Each type of steel reinforcement.
2. Bar supports.
3. Mechanical splice couplers.

B. Shop Drawings: Comply with ACI SP-066:

1. Include placing drawings that detail fabrication, bending, and placement.
2. Include bar sizes, lengths, materials, grades, bar schedules, stirrup spacing, bent bar diagrams, bar arrangement, location of splices, lengths of lap splices, details of mechanical splice couplers, details of welding splices, tie spacing, hoop spacing, and supports for concrete reinforcement.

C. Construction Joint Layout: Indicate proposed construction joints required to build the structure.

1. Location of construction joints is subject to the approval of the Architect.

1.4 INFORMATIONAL SUBMITTALS

A. Welding certificates.

1. Reinforcement to Be Welded: Welding procedure specification in accordance with AWS D1.4/D1.4M

B. Material Test Reports: For the following, from a qualified testing agency:

1. Steel Reinforcement:

a. For reinforcement to be welded, mill test analysis for chemical composition and carbon equivalent of the steel in accordance with ASTM A706/A706M.

2. Mechanical splice couplers.

C. Field quality-control reports.

D. Minutes of preinstallation conference.

1.5 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel in accordance with AWS D1.4/D 1.4M.

PART 2 - PRODUCTS

2.1 STEEL REINFORCEMENT

A. Reinforcing Bars: ASTM A615/A615M, Grade 60, deformed.

B. Low-Alloy Steel Reinforcing Bars: ASTM A706/A706M, deformed.

C. Headed-Steel Reinforcing Bars: ASTM A970/A970M.

D. Galvanized Reinforcing Bars:

1. Steel Bars: ASTM A615/A615M, Grade 60, deformed bars.
2. Zinc Coating: ASTM A767/A767M, Class II zinc coated after fabrication and bending.

E. Plain-Steel Welded-Wire Reinforcement: ASTM A1064/A1064M, plain, fabricated from as-drawn steel wire into flat sheets.

F. Deformed-Steel Welded-Wire Reinforcement: ASTM A1064/A1064M, flat sheet.

G. Galvanized-Steel Welded-Wire Reinforcement: ASTM A1064/A1064M, plain, fabricated from galvanized-steel wire into flat sheets.

2.2 REINFORCEMENT ACCESSORIES

A. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded-wire reinforcement in place.

1. Manufacture bar supports from steel wire, plastic, or precast concrete in accordance with CRSI's "Manual of Standard Practice," of greater compressive strength than concrete and as follows:

a. For concrete surfaces exposed to view, where legs of wire bar supports contact forms, use CRSI Class 1 plastic-protected steel wire, all-plastic bar supports, or CRSI Class 2 stainless steel bar supports.
b. For zinc-coated reinforcement, use galvanized wire or dielectric-polymer-coated wire bar supports.

B. Mechanical Splice Couplers: ACI 318 Type 2, same material of reinforcing bar being spliced; tension-compression type, dowel-bar type or mechanical-lap type.

C. Steel Tie Wire: ASTM A1064/A1064M, annealed steel, not less than 0.0508 inch in diameter.

1. Finish: Plain and Galvanized.

2.3 FABRICATING REINFORCEMENT

A. Fabricate steel reinforcement according to CRSI's "Manual of Standard Practice."

PART 3 - EXECUTION

3.1 PREPARATION

A. Protection of In-Place Conditions:

1. Do not cut or puncture vapor retarder.
2. Repair damage and reseal vapor retarder before placing concrete.

B. Clean reinforcement of loose rust and mill scale, earth, ice, and other foreign materials that reduce bond to concrete.

3.2 INSTALLATION OF STEEL REINFORCEMENT

A. Comply with CRSI's "Manual of Standard Practice" for placing and supporting reinforcement.

B. Accurately position, support, and secure reinforcement against displacement.

1. Locate and support reinforcement with bar supports to maintain minimum concrete cover.
2. Do not tack weld crossing reinforcing bars.

C. Preserve clearance between bars of not less than 1 inch, not less than one bar diameter, or not less than 1-1/3 times size of large aggregate, whichever is greater.

D. Provide concrete coverage in accordance with ACI 318.

E. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.

F. Splices: Lap splices as indicated on Drawings.

1. Bars indicated to be continuous, and all vertical bars shall be lapped not less than 36 bar diameters at splices, or 24 inches, whichever is greater.
2. Stagger splices in accordance with ACI 318.
3. Mechanical Splice Couplers: Install in accordance with manufacturer's instructions.
4. Weld reinforcing bars in accordance with AWS D1.4/D 1.4M, where indicated on Drawings.

G. Install welded-wire reinforcement in longest practicable lengths.

1. Support welded-wire reinforcement in accordance with CRSI "Manual of Standard Practice."

a. For reinforcement less than W4.0 or D4.0, continuous support spacing shall not exceed 12 inches.

2. Lap edges and ends of adjoining sheets at least one wire spacing plus 2 inches for plain wire and 8 inches for deformed wire.
3. Offset laps of adjoining sheet widths to prevent continuous laps in either direction.
4. Lace overlaps with wire.

3.3 JOINTS

A. Construction Joints: Install so strength and appearance of concrete are not impaired, at locations indicated or as approved by Architect.

1. Place joints perpendicular to main reinforcement.
2. Continue reinforcement across construction joints unless otherwise indicated.
3. Do not continue reinforcement through sides of strip placements of floors and slabs.

3.4 INSTALLATION TOLERANCES

A. Comply with ACI 117.

3.5 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage a special inspector to perform field tests and inspections and prepare test reports.

B. Testing Agency: Engage a qualified testing and inspecting agency to perform tests and inspections and to submit reports.

C. Inspections:

1. Steel-reinforcement placement.
2. Steel-reinforcement mechanical splice couplers.
3. Steel-reinforcement welding.

END OF SECTION 032000

SECTION 033000 - CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Cast-in-place concrete, including concrete materials, mixture design, placement procedures, and finishes.

B. Related Requirements:

1. Section 031000 "Concrete Forming and Accessories" for form-facing materials, form liners, insulating concrete forms, and waterstops.
2. Section 032000 "Concrete Reinforcing" for steel reinforcing bars and welded-wire reinforcement.

1.2 DEFINITIONS

A. Cementitious Materials: Portland cement alone or in combination with one or more of the following: blended hydraulic cement, fly ash, slag cement, and other pozzolans materials subject to compliance with requirements.

B. Water/Cement Ratio (w/cm): The ratio by weight of water to cementitious materials.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Product Data: For each of the following.

1. Portland cement.
2. Fly ash.
3. Slag cement.
4. Aggregates.
5. Admixtures:
    a. Include limitations of use, including restrictions on cementitious materials, supplementary cementitious materials, air entrainment, aggregates, temperature at time of concrete placement, relative humidity at time of concrete placement, curing conditions, and use of other admixtures.
6. Vapor retarders.
7. Liquid floor treatments.
8. Curing materials.
9. Joint fillers.

B. Design Mixtures: For each concrete mixture, include the following:

1. Mixture identification.
2. Minimum 28-day compressive strength.
3. Durability exposure class.
4. Maximum w/cm.
5. Calculated equilibrium unit weight, for lightweight concrete.
6. Slump limit.
7. Air content.
8. Nominal maximum aggregate size.
9. Indicate amounts of mixing water to be withheld for later addition at Project site if permitted.
10. Intended placement method.
11. Submit alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

C. Shop Drawings:

1. Construction Joint Layout: Indicate proposed construction joints required to construct the structure.

    a. Location of construction joints is subject to approval of the Architect.

D. Concrete Schedule: For each location of each Class of concrete indicated in "Concrete Mixtures" Article, including the following:

1. Concrete Class designation.
2. Location within Project.
3. Exposure Class designation.
4. Formed Surface Finish designation and final finish.
5. Final finish for floors.
6. Curing process.
7. Floor treatment if any.

1.5 INFORMATIONAL SUBMITTALS

A. Material Certificates: For each of the following, signed by manufacturers:

1. Cementitious materials.
2. Admixtures.
3. Curing compounds.
4. Vapor retarders.
5. Joint-filler strips.

B. Material Test Reports: For the following, from a qualified testing agency:

1. Portland cement.
2. Fly ash.
3. Slag cement.
4. Aggregates.
5. Admixtures:

C. Research Reports: For concrete admixtures in accordance with ICC's Acceptance Criteria AC198.

D. Preconstruction Test Reports: For each mix design.

E. Field quality-control reports.

F. Minutes of preinstallation conference.

1.6 QUALITY ASSURANCE

A. Ready-Mixed Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C94/C94M requirements for production facilities and equipment.

1.7 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Engage a qualified testing agency to perform preconstruction testing on each concrete mixture.

1. Include the following information in each test report:

a. Admixture dosage rates.
b. Slump.
c. Air content.
d. Seven-day compressive strength.
e. 28-day compressive strength.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Comply with ASTM C94/C94M and ACI 301.

1.9 FIELD CONDITIONS

A. Cold-Weather Placement: Comply with ACI 301 and ACI 306.1.

B. Hot-Weather Placement: Comply with ACI 301 and ACI 305.1.

PART 2 – PRODUCTS

2.1 FORM-FACING MATERIALS

A. Smooth-Formed Finished Concrete: Form-facing panels that will provide continuous, true, and smooth concrete surfaces. Furnish in largest practicable sizes to minimize number of joints.

B. Rough-Formed Finished Concrete: Plywood, lumber, metal, or another approved material. Provide lumber dressed on at least two edges and one side for tight fit.

2.2 CONCRETE MATERIALS

A. Cementitious Material: Use the following cementitious materials, of the same type, brand and source, throughout Project:

1. Portland Cement: ASTM C 150, Type II Supplement with the following:
    a. Fly Ash: ASTM C 618, Class C or F.
    b. Slag Cement: ASTM C 989, Grade 100 or 120.

B. Normal-Weight Aggregates: ASTM C 33, Class 3 S coarse aggregate or better, graded. 3/4-inch (19-mm) nominal maximum coarse-aggregate size. Provide aggregates from single source.

1. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.
2. Lightweight Aggregate: ASTM C 330, 1/2-inch (13-mm) nominal maximum aggregate size.

C. Water: ASTM C 94/C 94M and potable.

D. Air-Entraining Admixture: ASTM C 260. Concrete not exposed to weather does not require air-entrainment.

E. Crystalline-Forming Waterproofing Admixture: A powder admixture capable of producing concrete that is watertight under hydrostatic pressure up to seven atmospheres when tested in accordance with Corps of Engineers test CRD-C48 and capable of sealing cracks up to 0.4 mm.

1. Products: Subject to compliance with requirements, provide the following at dosage rates per manufacturer's recommendation.

    a. ICS/Penetron International/Ltd; Penetron Admix.
    b. Kryton International, Inc.; Krystol Internal Membrane (ESR-1515).
    c. Xypex Chemical Corporation; Xypex Admix C1000 or C500.
    d. Sika Corporation; Sika WT-215P
    e. BASF Corporation; MasterLife 300D
    f. The Euclid Chemical Company; Eucon Vandex AM-10

F. Waterproofing Additive: Integral waterproofing that can close concrete pores and inhibit reinforcement corrosion with no decrease in concrete strength or chemical resistance and reduce water absorption to less than 1%.

1. Potable Water Contact Approval: NSF certification for use on structures holding potable water, based on testing in accordance with NSF 61.
2. Manufacturers:

    a. Xypex Chemical Corporation: www.xypex.com.
    b. Penetron, Penetron Admix: www.penetron.com
    c. Sika USA, WT-240 P, usa.sika.com

G. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and that will not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.

1. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
2. Retarding Admixture: ASTM C 494/C 494M, Type B.
3. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
4. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
5. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
6. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.

2.3 VAPOR RETARDERS

A. Vapor barrier shall have all the following qualities:

1. Maintain permeance of less than 0.01 Perms [grains/(ft^2 · hr · inHg)] as tested in accordance with mandatory conditioning tests per ASTM E1745 Section 7.1 (7.1.1-7.1.5).
2. Other performance criteria:
    a. Strength: ASTM E1745 Class A.
    b. Thickness: 15 mils minimum
3. Provide third party documentation that all testing was performed on a single production roll per ASTM E1745 Section 8.1
4. Warranty: (a) compliance with the designated ASTM E1745 classification, and (b) no manufacturing defects in the product for, at least, the Life of the Building.

B. Vapor barrier products – provide the following or equivalent:

1. Basis of Design: Stego Wrap Vapor Barrier (15-mil) by Stego Industries LLC., (877) 464-7834 www.stegoindustries.com
2. Seams:
    a. Stego Tape by Stego Industries LLC, or equivalent.
3. Sealing Penetrations of Vapor barrier:
    a. Stego Mastic by Stego Industries LLC, or equivalent.
4. Stego Tape by Stego Industries LLC, or equivalent.
5. Perimeter/terminated edge seal:
    a. Stego Crete Claw (textured tape) by Stego Industries LLC, or equivalent.
    b. Stego Term Bar by Stego Industries LLC, or equivalent
    c. Stego Tack Tape (double-sided sealant tape) by Stego Industries LLC, (or equivalent. (One-sided seaming tape is not a recommended method of sealing at the terminated edge).
6. Penetration Prevention:
    a. Beast Foot by Stego Industries LLC, or equivalent.
    b. Beast Form Stake by Stego Industries LLC, or equivalent.
7. Vapor Barrier-Safe Hand Screed System
    a. Beast Screed by Stego Industries, LLC, or equivalent.

C. Granular Fill: Clean mixture of crushed stone or crushed or uncrushed gravel; ASTM D 448, Size 57, with 100 percent passing a 1-1/2-inch sieve and 0 to 5 percent passing a No. 8 sieve.

2.4 CURING MATERIALS

A. Evaporation Retarder: Waterborne, monomolecular film forming, manufactured for application to fresh concrete.

B. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. (305 g/sq. m) when dry.

C. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.

D. Water: Potable.

E. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, non-dissipating, certified by curing compound manufacturer to not interfere with bonding of floor covering.

2.5 RELATED MATERIALS

A. Expansion- and Isolation-Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber or ASTM D 1752, cork or self-expanding cork.

B. Abrasive Cast Aluminum Step Nosings:

1. Provide Cast Aluminum nosings for each concrete stair tread.
2. Nosings shall bee 4-inches deep by 8-inches less than the length of the tread and centered on the edge of the tread.
3. Abrasive shall bee #20 virgin grain Aluminum Oxide (AL203), integrally cast into the walking surface to a minimum depth of 1/32 inch.
4. Provide concealed anchors of the slotted rivet type.
5. Fasteners shall be 1/4" (6.35 mm) F.H.M. plated screws and nuts with steel wing anchors for fresh concrete are standard fasteners for nosings.
6. Cast aluminum shall be No. 43 prime and secondary ingot; low copper content.
7. Provide cross-hatched, fluted surface.
8. Nosings shall be “Alumogrit” Type 116A, as manufactured by Wooster Industries or equivalent product meeting the requirements of this specification

2.6 CONCRETE MIXTURES, GENERAL AND BUILDING ELEMENTS

A Prepare design mixtures for each type and strength of concrete, proportioned on the basis of laboratory trial mixture or field test data, or both, according to ACI 301.

B. Cementitious Materials: Use fly ash as needed to reduce the total amount of Portland cement, which would otherwise be used, by not less than 20 percent and not more than 30 percent.

C. Foundations: Proportion normal weight concrete mixture used for footings, grade beams, and tie beams as follows:

1. Exposure Class: ACI 318 F0, S1, W1, C2
2. Minimum Compressive Strength 4000 psi (20.7 Mpa) at 28 days.
3. Maximum Water-Cementitious Materials Ratio: 0.50.
4. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.

D. Slabs-on-Grade: Proportion normal-weight concrete mixture for interior slabs-on-grade as follows:

1. Exposure Class: ACI 318 F0, S1, W0, C2
2. Minimum Compressive Strength 4500 psi at 28 days.
3. Maximum Water-Cementitious Materials Ratio: 0.50.
5. Do not air-entrain concrete to receive a hard trowel finish.
6. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.

E. Slabs on Metal Deck: Proportion structural lightweight concrete mixture for interior suspended slabs on metal deck as follows:

1. Exposure Class: ACI 318 F0, S0, W0, C0
2. Minimum Compressive Strength 3500 psi at 28 days.
3. Calculated Equilibrium Unit Weight: 110 lb/cu. ft. (1842 kg/cu. m, plus or minus 3 lb/cu. ft. (48.1 kg/cu. m) as determined by ASTM C 567.
4. Air Content: Do not allow air content of troweled finished floors to exceed 3 percent.
5. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.5 lb/cu. yd. (0.90 kg/cu. m).
6. Limit water-soluble, chloride-ion content in hardened concrete to 1.00 percent by weight of cement.

F. Tank Walls: Proportion normal weight concrete mixture used for tank walls as follows:

1. Exposure Class: ACI 318 F0, S1, W1, C2
2. Minimum Compressive Strength: 5000 psi at 28 days
3. Maximum w/cm: 0.5
4. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.

G. Building Frame Members: Proportion normal-weight concrete used for columns, beams, and elevated slabs as follows:

1. Exposure Class: ACI 318 F0, S1, W1, C2
2. Minimum Compressive Strength: 5000 psi at 28 days
3. Maximum w/cm: 0.5
4. Air Content: Do not allow air content of troweled finished floors to exceed 3 percent.
5. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.

H. Building Walls: Proportion normal-weight concrete used for building walls not part of tanks.

1. Exposure Class: ACI 318 F0, S1, W1, C2
2. Minimum Compressive Strength: 5000 psi at 28 days
3. Maximum w/cm: 0.5
4. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement

2.7 CONCRETE MIXING

A. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M and ASTM C 1116.

PART 3 - EXECUTION

3.1 INSTALLATION OF EMBEDDED ITEMS

A. Place and secure anchorage devices and other embedded items required for adjoining Work that is attached to or supported by cast-in-place concrete.

1. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

2. Install anchor rods, accurately located, to elevations required and complying with tolerances in Section 7.5 of ANSI/AISC 303.
3. Install reglets to receive waterproofing and to receive through-wall flashings in outer face of concrete frame at exterior walls, where flashing is shown at lintels, shelf angles, and other conditions.

3.2 INSTALLATION OF VAPOR RETARDER

A. Sheet Vapor Retarders: Place, protect, and repair sheet vapor retarder in accordance with ASTM E1643 and manufacturer's written instructions.

1. Install vapor retarder with longest dimension parallel with direction of concrete pour.
2. Face laps away from exposed direction of concrete pour.
3. Lap vapor retarder over footings and grade beams not less than 6 inches, sealing vapor retarder to concrete.
4. Lap joints 6 inches and seal with manufacturer's recommended tape.
5. Terminate vapor retarder at the top of floor slabs, grade beams, and pile caps, sealing entire perimeter to floor slabs, grade beams, foundation walls, or pile caps.
6. Seal penetrations in accordance with vapor retarder manufacturer's instructions.
7. Protect vapor retarder during placement of reinforcement and concrete.

    a. Repair damaged areas by patching with vapor retarder material, overlapping damages area by 6 inches on all sides, and sealing to vapor retarder.

3.3 JOINTS

A. Construct joints true to line, with faces perpendicular to surface plane of concrete.

B. Construction Joints: Coordinate with floor slab pattern and concrete placement sequence.

1. Install so strength and appearance of concrete are not impaired, at locations indicated on Drawings or as approved by Architect.
2. Place joints perpendicular to main reinforcement.

    a. Continue reinforcement across construction joints unless otherwise indicated.
    b. Do not continue reinforcement through sides of strip placements of floors and slabs.

3. Form keyed joints as indicated. Embed keys at least 1-1/2 inches into concrete.
4. Locate joints for beams, slabs, joists, and girders at third points of spans. Offset joints in girders a minimum distance of twice the beam width from a beam-girder intersection.
5. Locate horizontal joints in walls and columns at underside of floors, slabs, beams, and girders and at the top of footings or floor slabs.

C. Control Joints in Slabs-on-Ground: Form weakened-plane control joints, sectioning concrete into areas as indicated. Construct control joints for a depth equal to at least one-fourth of concrete thickness as follows:

1. Grooved Joints: Form control joints after initial floating by grooving and finishing each edge of joint to a radius of 1/8 inch. Repeat grooving of control joints after applying surface finishes. Eliminate groover tool marks on concrete surfaces.
2. Sawed Joints: Form control joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch-wide joints into concrete when cutting action does

not tear, abrade, or otherwise damage surface and before concrete develops random cracks.

D. Isolation Joints in Slabs-on-Ground: After removing formwork, install joint-filler strips at slab junctions with vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.

1. Extend joint-filler strips full width and depth of joint, terminating flush with finished concrete surface unless otherwise indicated on Drawings.
2. Terminate full-width joint-filler strips not less than 1/2 inch or more than 1 inch below finished concrete surface, where joint sealants, specified in Section 079200 "Joint Sealants," are indicated.
3. Install joint-filler strips in lengths as long as practicable. Where more than one length is required, lace or clip sections together.

3.4 CONCRETE PLACEMENT

A. Before placing concrete, verify that installation of formwork, reinforcement, embedded items, and vapor retarder is complete and that required inspections are completed.

1. Immediately prior to concrete placement, inspect vapor retarder for damage and deficient installation, and repair defective areas.
2. Provide continuous inspection of vapor retarder during concrete placement and make necessary repairs to damaged areas as Work progresses.

B. Notify Architect and testing and inspection agencies 24 hours prior to commencement of concrete placement.

C. Before test sampling and placing concrete, water may be added at Project site, subject to limitations of ACI 301, but not to exceed the amount indicated on the concrete delivery ticket.

1. Do not add water to concrete after adding high-range water-reducing admixtures to mixture.

D. Deposit concrete continuously in one layer or in horizontal layers of such thickness that no new concrete is placed on concrete that has hardened enough to cause seams or planes of weakness.

1. If a section cannot be placed continuously, provide construction joints as indicated.
2. Deposit concrete to avoid segregation.
3. Deposit concrete in horizontal layers of depth not to exceed formwork design pressures and in a manner to avoid inclined construction joints.
4. Consolidate placed concrete with mechanical vibrating equipment in accordance with ACI 301.

    a. Do not use vibrators to transport concrete inside forms.
    b. Insert and withdraw vibrators vertically at uniformly spaced locations to rapidly penetrate placed layer and at least 6 inches into preceding layer.
    c. Do not insert vibrators into lower layers of concrete that have begun to lose plasticity.
    d. At each insertion, limit duration of vibration to time necessary to consolidate concrete, and complete embedment of reinforcement and other embedded items without causing mixture constituents to segregate.

E. Deposit and consolidate concrete for floors and slabs in a continuous operation, within limits of construction joints, until placement of a panel or section is complete.

1. Do not place concrete floors and slabs in a checkerboard sequence.
2. Consolidate concrete during placement operations, so concrete is thoroughly worked around reinforcement and other embedded items and into corners.
3. Maintain reinforcement in position on chairs during concrete placement.
4. Screed slab surfaces with a straightedge and strike off to correct elevations.
5. Level concrete, cut high areas, and fill low areas.
6. Slope surfaces uniformly to drains where required.
7. Begin initial floating using bull floats or darbies to form a uniform and open-textured surface plane, before excess bleedwater appears on the surface.
8. Do not further disturb slab surfaces before starting finishing operations.

3.5 FINISHING FORMED SURFACES

A. As-Cast Surface Finishes:

1. ACI 301 Surface Finish SF-1.0: As-cast concrete texture imparted by form-facing material.

    a. Patch voids larger than 1-1/2 inches wide or 1/2 inch deep.
    b. Remove projections larger than 1 inch.
    c. Tie holes do not require patching.
    d. Surface Tolerance: ACI 117 Class D.
    e. Apply to concrete surfaces not exposed to public view.

2. ACI 301 Surface Finish SF-3.0:

    a. Patch voids larger than 3/4 inch wide or 1/2 inch deep.
    b. Remove projections larger than 1/8 inch.
    c. Patch tie holes.
    d. Surface Tolerance: ACI 117 Class A.
    e. Locations: Apply to concrete surfaces exposed to public view, to receive a rubbed finish, or to be covered with a coating or covering material applied directly to concrete.

B. Related Unformed Surfaces:

1. At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a color and texture matching adjacent formed surfaces.
2. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces unless otherwise indicated.

3.6 FINISHING FLOORS AND SLABS

A. Comply with ACI 302.1R recommendations for screeding, restraightening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.

B. Scratch Finish:

1. While still plastic, texture concrete surface that has been screeded and bull-floated or darbied.
2. Use stiff brushes, brooms, or rakes to produce a profile depth of 1/4 inch in one direction.
3. Apply scratch finish to surfaces to receive concrete floor toppings or to receive mortar setting beds for bonded cementitious floor finishes.

C. Float Finish:

1. When bleedwater sheen has disappeared and concrete surface has stiffened sufficiently to permit operation of specific float apparatus, consolidate concrete surface with power-driven floats or by hand floating if area is small or inaccessible to power-driven floats.
2. Repeat float passes and restraightening until surface is left with a uniform, smooth, granular texture and complies with ACI 117 tolerances for conventional concrete.
3. Apply float finish to surfaces to receive trowel finish and to be covered with fluid-applied or sheet waterproofing, built-up or membrane roofing, or sand-bed terrazzo.

D. Trowel Finish:

1. After applying float finish, apply first troweling and consolidate concrete by hand or power-driven trowel.
2. Continue troweling passes and restraighten until surface is free of trowel marks and uniform in texture and appearance.
3. Grind smooth any surface defects that would telegraph through applied coatings or floor coverings.
4. Do not add water to concrete surface.
5. Do not apply hard-troweled finish to concrete, which has a total air content greater than 3 percent.
6. Apply a trowel finish to surfaces exposed to view or to be covered with resilient flooring, carpet, ceramic or quarry tile set over a cleavage membrane, paint, or another thin-film-finish coating system.

E. Trowel and Fine-Broom Finish: Apply a first trowel finish to surfaces where ceramic or quarry tile is to be installed by either thickset or thinset method. While concrete is still plastic, slightly scarify surface with a fine broom perpendicular to main traffic route.

1. Coordinate required final finish with Architect before application.
2. Comply with flatness and levelness tolerances for trowel-finished floor surfaces.

F. Broom Finish: Apply a broom finish to exterior concrete platforms, steps, ramps, and locations indicated on Drawings.

1. Immediately after float finishing, slightly roughen trafficked surface by brooming with fiber-bristle broom perpendicular to main traffic route.
2. Coordinate required final finish with Architect before application.

G. Slip-Resistive Finish: Before final floating, apply slip-resistive aggregate finish to concrete stair treads, platforms, ramps, and other rooms as indicated on drawings, reference A-9.1.

1. Apply in accordance with manufacturer's written instructions and as follows:

    a. Uniformly spread 25 lb/100 sq. ft. of dampened slip-resistive aggregate over surface in one or two applications.
    b. Tamp aggregate flush with surface, but do not force below surface.
    c. After broadcasting and tamping, apply float finish.
    d. After curing, lightly work surface with a steel wire brush or an abrasive stone and water to expose slip-resistive aggregate.

3.7 INSTALLATION OF MISCELLANEOUS CONCRETE ITEMS

A. Filling In:

1. Fill in holes and openings left in concrete structures after Work of other trades is in place unless otherwise indicated.
2. Mix, place, and cure concrete, as specified, to blend with in-place construction.
3. Provide other miscellaneous concrete filling indicated or required to complete the Work.

B. Curbs: Provide monolithic finish to interior curbs by stripping forms while concrete is still green and by steel-troweling surfaces to a hard, dense finish with corners, intersections, and terminations slightly rounded.

C. Equipment Bases and Foundations:

1. Coordinate sizes and locations of concrete bases with actual equipment provided.
2. Construct concrete bases 6 inches high unless otherwise indicated on Drawings and extend base not less than 6 inches in each direction beyond the maximum dimensions of supported equipment unless otherwise indicated on Drawings, or unless required for seismic anchor support.
3. Minimum Compressive Strength: 4000 psi at 28 days.
4. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
5. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete substrate.
6. Prior to pouring concrete, place and secure anchorage devices.

    a. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
    b. Cast anchor-bolt insert into bases.
    c. Install anchor bolts to elevations required for proper attachment to supported equipment.

D. Steel Pan Stairs: Provide concrete fill for steel pan stair treads, landings, and associated items.

1. Cast-in inserts and accessories, as shown on Drawings.
2. Screed, tamp, and trowel finish concrete surfaces.

3.8 CONCRETE CURING

A. Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.

1. Comply with ACI 301 and ACI 306.1 for cold weather protection during curing.
2. Comply with ACI 301 and ACI 305.1 for hot-weather protection during curing.
3. Maintain moisture loss no more than 0.2 lb/sq. ft. x h, calculated in accordance with ACI 305.1, before and during finishing operations.

B. Curing Formed Surfaces: Comply with ACI 308.1 as follows:

1. Cure formed concrete surfaces, including underside of beams, supported slabs, and other similar surfaces.
2. Cure concrete containing color pigments in accordance with color pigment manufacturer's instructions.
3. If forms remain during curing period, moist cure after loosening forms.

4. If removing forms before end of curing period, continue curing for remainder of curing period, as follows:

a. Continuous Fogging: Maintain standing water on concrete surface until final setting of concrete.
b. Continuous Sprinkling: Maintain concrete surface continuously wet.
c. Absorptive Cover: Pre-dampen absorptive material before application; apply additional water to absorptive material to maintain concrete surface continuously wet.
d. Water-Retention Sheeting Materials: Cover exposed concrete surfaces with sheeting material, taping, or lapping seams.
e. Membrane-Forming Curing Compound: Apply uniformly in continuous operation by power spray or roller in accordance with manufacturer's written instructions.

1) Recoat areas subject to heavy rainfall within three hours after initial application.
2) Maintain continuity of coating and repair damage during curing period.

C. Curing Unformed Surfaces: Comply with ACI 308.1 as follows:

1. Begin curing immediately after finishing concrete.
2. Interior Concrete Floors:

a. Floors to Receive Floor Coverings Specified in Other Sections: Contractor has option of the following:

1) Absorptive Cover: As soon as concrete has sufficient set to permit application without marring concrete surface, install prewetted absorptive cover over entire area of floor.

a) Lap edges and ends of absorptive cover not less than 12-inches.
b) Maintain absorptive cover water saturated, and in place, for duration of curing period, but not less than seven days.

2) Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive.

a) Immediately repair any holes or tears during curing period, using cover material and waterproof tape.
b) Cure for not less than seven days.

3) Ponding or Continuous Sprinkling of Water: Maintain concrete surfaces continuously wet for not less than seven days, utilizing one, or a combination of, the following:

a) Water.
b) Continuous water-fog spray.

b. Floors to Receive Penetrating Liquid Floor Treatments: Contractor has option of the following:

1) Absorptive Cover: As soon as concrete has sufficient set to permit application without marring concrete surface, install prewetted absorptive cover over entire area of floor.

a) Lap edges and ends of absorptive cover not less than 12 inches.
b) Maintain absorptive cover water saturated, and in place, for duration of curing period, but not less than seven days.

2) Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive.

a) Immediately repair any holes or tears during curing period, using cover material and waterproof tape.
b) Cure for not less than seven days.

3) Ponding or Continuous Sprinkling of Water: Maintain concrete surfaces continuously wet for not less than seven days, utilizing one, or a combination of, the following:

a) Water.
b) Continuous water-fog spray.

c. Floors to Receive Polished Finish: Contractor has option of the following:

1) Absorptive Cover: As soon as concrete has sufficient set to permit application without marring concrete surface, install prewetted absorptive cover over entire area of floor.

a) Lap edges and ends of absorptive cover not less than 12 inches.
b) Maintain absorptive cover water saturated, and in place, for duration of curing period, but not less than seven days.

2) Ponding or Continuous Sprinkling of Water: Maintain concrete surfaces continuously wet for not less than seven days, utilizing one, or a combination of, the following:

a) Water.
b) Continuous water-fog spray.

d. Floors to Receive Chemical Stain:

1) As soon as concrete has sufficient set to permit application without marring concrete surface, install curing paper over entire area of floor.
2) Install curing paper square to building lines, without wrinkles, and in a single length without end joints.
3) Butt sides of curing paper tight; do not overlap sides of curing paper.
4) Leave curing paper in place for duration of curing period, but not less than 28 days.

e. Floors to Receive Urethane Flooring:

1) As soon as concrete has sufficient set to permit application without marring concrete surface, install prewetted absorptive cover over entire area of floor.

2) Rewet absorptive cover and cover immediately with polyethylene moisture-retaining cover with edges lapped 6 inches and sealed in place.
3) Secure polyethylene moisture-retaining cover in place to prohibit air from circulating under polyethylene moisture-retaining cover.
4) Leave absorptive cover and polyethylene moisture-retaining cover in place for duration of curing period, but not less than 28 days.

f. Floors to Receive Curing Compound:

1) Apply uniformly in continuous operation by power spray or roller in accordance with manufacturer's written instructions.
2) Recoat areas subjected to heavy rainfall within three hours after initial application.
3) Maintain continuity of coating, and repair damage during curing period.
4) Removal: After curing period has elapsed, remove curing compound without damaging concrete surfaces by method recommended by curing compound manufacturer unless manufacturer certifies curing compound does not interfere with bonding of floor covering used on Project.

g. Floors to Receive Curing and Sealing Compound:

1) Apply uniformly to floors and slabs indicated in a continuous operation by power spray or roller in accordance with manufacturer's written instructions.
2) Recoat areas subjected to heavy rainfall within three hours after initial application.
3) Repeat process 24 hours later, and apply a second coat. Maintain continuity of coating, and repair damage during curing period.

3.9 TOLERANCES

A. Conform to ACI 117.

3.10 APPLICATION OF LIQUID FLOOR TREATMENTS

A. Penetrating Liquid Floor Treatment: Prepare, apply, and finish penetrating liquid floor treatment in accordance with manufacturer's written instructions.

1. Remove curing compounds, sealers, oil, dirt, laitance, and other contaminants and complete surface repairs.
2. Do not apply to concrete that is less than 14 days' old.
3. Apply liquid until surface is saturated, scrubbing into surface until a gel forms; rewet; and repeat brooming or scrubbing.
4. Rinse with water; remove excess material until surface is dry.
5. Apply a second coat in a similar manner if surface is rough or porous.

3.11 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage a special inspector to perform field tests and inspections and prepare testing and inspection reports.

B. Testing Agency: Owner will engage a qualified testing and inspecting agency to perform tests and inspections and to submit reports.

1. Testing agency shall be responsible for providing curing container for composite samples on Site and verifying that field-cured composite samples are cured in accordance with ASTM C31/C31M.
2. Testing agency shall immediately report to Architect, Contractor, and concrete manufacturer any failure of Work to comply with Contract Documents.
3. Testing agency shall report results of tests and inspections, in writing, to Owner, Architect, Contractor, and concrete manufacturer within 48 hours of inspections and tests.

    a. Test reports shall include reporting requirements of ASTM C31/C31M, ASTM C39/C39M, and ACI 301, including the following as applicable to each test and inspection:

        1) Project name.
        2) Name of testing agency.
        3) Names and certification numbers of field and laboratory technicians performing inspections and testing.
        4) Name of concrete manufacturer.
        5) Date and time of inspection, sampling, and field testing.
        6) Date and time of concrete placement.
        7) Location in Work of concrete represented by samples.
        8) Date and time sample was obtained.
        9) Truck and batch ticket numbers.
        10) Design compressive strength at 28 days.
        11) Concrete mixture designation, proportions, and materials.
        12) Field test results.
        13) Information on storage and curing of samples before testing, including curing method and maximum and minimum temperatures during initial curing period.
        14) Type of fracture and compressive break strengths at seven days and 28 days.

C. Batch Tickets: For each load delivered, submit three copies of batch delivery ticket to testing agency, indicating quantity, mix identification, admixtures, design strength, aggregate size, design air content, design slump at time of batching, and amount of water that can be added at Project site.

D. Inspections:

1. Headed bolts and studs.
2. Verification of use of required design mixture.
3. Concrete placement, including conveying and depositing.
4. Curing procedures and maintenance of curing temperature.
5. Verification of concrete strength before removal of shores and forms from beams and slabs.
6. Batch Plant Inspections: On a random basis, as determined by Architect.

E. Concrete Tests: Testing of composite samples of fresh concrete obtained in accordance with ASTM C 172/C 172M shall be performed in accordance with the following requirements:

1. Testing Frequency: Obtain one composite sample for each day's pour of each concrete mixture exceeding 5 cu. yd., but less than 25 cu. yd., plus one set for each additional 50 cu. yd. or fraction thereof.

    a. When frequency of testing provides fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.

2. Slump: ASTM C143/C143M:

   a. One test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture.
   b. Perform additional tests when concrete consistency appears to change.

3. Air Content: ASTM C231/C231M pressure method, for normal-weight concrete; ASTM C173/C173M volumetric method, for structural lightweight concrete.

   a. One test for each composite sample, but not less than one test for each day's pour of each concrete mixture.

4. Concrete Temperature: ASTM C1064/C1064M:

   a. One test hourly when air temperature is 40 deg F and below or 80 deg F and above, and one test for each composite sample.

5. Unit Weight: ASTM C567/C567M fresh unit weight of structural lightweight concrete.

   a. One test for each composite sample, but not less than one test for each day's pour of each concrete mixture.

6. Compression Test Specimens: ASTM C31/C31M:

   a. Cast and laboratory cure two sets of two 6-inch by 12-inch or 4-inch by 8-inch cylinder specimens for each composite sample.
   b. Cast, initial cure, and field cure two sets of two standard cylinder specimens for each composite sample.

7. Compressive-Strength Tests: ASTM C39/C39M.

   a. Test one set of four laboratory-cured specimens at seven days and one set of two specimens at 28 days.
   b. Test one set of two field-cured specimens at seven days and one set of two specimens at 28 days.
   c. A compressive-strength test shall be the average compressive strength from a set of two specimens obtained from same composite sample and tested at age indicated.

8. When strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, Contractor shall evaluate operations and provide corrective procedures for protecting and curing in-place concrete.
9. Strength of each concrete mixture will be satisfactory if every average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength, and no compressive-strength test value falls below specified compressive strength by more than 500 psi if specified compressive strength is 5000 psi, or no compressive strength test value is less than 10 percent of specified compressive strength if specified compressive strength is greater than 5000 psi.
10. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Architect but will not be used as sole basis for approval or rejection of concrete.
11. Additional Tests:

a. Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Architect.
b. Testing and inspecting agency may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C42/C42M or by other methods as directed by Architect.

1) Acceptance criteria for concrete strength shall be in accordance with ACI 301, section 1.6.6.3.

12. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
13. Correct deficiencies in the Work that test reports and inspections indicate do not comply with the Contract Documents.

F. Measure floor and slab flatness and levelness in accordance with ASTM E1155 within 48 hours of completion of floor finishing and promptly report test results to Architect.

3.12 CONCRETE SURFACE REPAIRS

A. Defective Concrete - Repair and patch defective areas when approved by Architect. Remove and replace concrete that cannot be repaired and patched to Architect's approval. In all cases cracks in slabs and exposed, formed surfaces are considered to be defects. Refer to ACI 224R for appropriate methods of crack repair.:

1. Repair and patch defective areas when approved by Architect.
2. Remove and replace concrete that cannot be repaired and patched to Architect's approval.

B. Patching Mortar: Mix dry-pack patching mortar, consisting of 1 part Portland cement to 2-1/2 parts fine aggregate passing a No. 16 sieve, using only enough water for handling and placing.

C. Repairing Formed Surfaces: Surface defects include color and texture irregularities, cracks, spalls, air bubbles, honeycombs, rock pockets, fins and other projections on the surface, and stains and other discolorations that cannot be removed by cleaning.

1. Immediately after form removal, cut out honeycombs, rock pockets, and voids more than 1/2 inch in any dimension to solid concrete.

a. Limit cut depth to 3/4 inch.
b. Make edges of cuts perpendicular to concrete surface.
c. Clean, dampen with water, and brush-coat holes and voids with bonding agent.
d. Fill and compact with patching mortar before bonding agent has dried.
e. Fill form-tie voids with patching mortar or cone plugs secured in place with bonding agent.

2. Repair defects on surfaces exposed to view by blending white Portland cement and standard Portland cement, so that, when dry, patching mortar matches surrounding color.

a. Patch a test area at inconspicuous locations to verify mixture and color match before proceeding with patching.
b. Compact mortar in place and strike off slightly higher than surrounding surface.

3. Repair defects on concealed formed surfaces that will affect concrete's durability and structural performance as determined by Architect.

D. Repairing Unformed Surfaces:

1. Test unformed surfaces, such as floors and slabs, for finish, and verify surface tolerances specified for each surface.

    a. Correct low and high areas.
    b. Test surfaces sloped to drain for trueness of slope and smoothness; use a sloped template.

2. Repair finished surfaces containing surface defects, including spalls, popouts, honeycombs, rock pockets, crazing, and cracks in excess of 0.01 inch wide or that penetrate to reinforcement or completely through unreinforced sections regardless of width, and other objectionable conditions.
3. After concrete has cured at least 14 days, correct high areas by grinding.
4. Correct localized low areas during, or immediately after, completing surface-finishing operations by cutting out low areas and replacing with patching mortar.

    a. Finish repaired areas to blend into adjacent concrete.

5. Correct other low areas scheduled to receive floor coverings with a repair underlayment.

    a. Prepare, mix, and apply repair underlayment and primer in accordance with manufacturer's written instructions to produce a smooth, uniform, plane, and level surface.
    b. Feather edges to match adjacent floor elevations.

6. Correct other low areas scheduled to remain exposed with repair topping.

    a. Cut out low areas to ensure a minimum repair topping depth of 1/4 inch to match adjacent floor elevations.
    b. Prepare, mix, and apply repair topping and primer in accordance with manufacturer's written instructions to produce a smooth, uniform, plane, and level surface.

7. Repair defective areas, except random cracks and single holes 1 inch or less in diameter, by cutting out and replacing with fresh concrete.

    a. Remove defective areas with clean, square cuts, and expose steel reinforcement with at least a 3/4-inch clearance all around.
    b. Dampen concrete surfaces in contact with patching concrete and apply bonding agent.
    c. Mix patching concrete of same materials and mixture as original concrete, except without coarse aggregate.
    d. Place, compact, and finish to blend with adjacent finished concrete.
    e. Cure in same manner as adjacent concrete.

8. Repair random cracks and single holes 1 inch or less in diameter with patching mortar.

    a. Groove top of cracks and cut out holes to sound concrete, and clean off dust, dirt, and loose particles.
    b. Dampen cleaned concrete surfaces and apply bonding agent.
    c. Place patching mortar before bonding agent has dried.
    d. Compact patching mortar and finish to match adjacent concrete.
    e. Keep patched area continuously moist for at least 72 hours.

E. Perform structural repairs of concrete, subject to Architect's approval, using epoxy adhesive and patching mortar.

F. Repair materials and installation not specified above may be used, subject to Architect's approval.

3.13 PROTECTION

A. Protect concrete surfaces as follows:

1. Protect from petroleum stains.
2. Diaper hydraulic equipment used over concrete surfaces.
3. Prohibit vehicles from interior concrete slabs.
4. Prohibit use of pipe-cutting machinery over concrete surfaces.
5. Prohibit placement of steel items on concrete surfaces.
6. Prohibit use of acids or acidic detergents over concrete surfaces.
7. Protect liquid floor treatment from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by liquid floor treatments installer.

Protect concrete surfaces scheduled to receive surface hardener or polished concrete finish using Floor Slab Protective Covering.

END OF SECTION 033000

SECTION 033300 - LANDSCAPE ARCHITECTURAL CONCRETE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes cast-in-place architectural concrete, including form facings, reinforcement and accessories, concrete materials, concrete mixture design, placement procedures, and finishes.

1. Requirements in Section 033000 "Cast-in-Place Concrete" apply to landscape architectural concrete.
    a. Includes CIP site stairs
    b. Includes CIP site seat walls

B. Related Requirements:

1. Section 033000 "Cast-in-Place Concrete" for concrete not designated as landscape architectural concrete.

1.3 DEFINITIONS

A. Cast-in-Place Architectural Concrete: Formed concrete that is exposed to view on surfaces of completed structure or building and that requires special concrete materials, formwork, placement, or finishes to obtain specified architectural appearance. Refer to drawings where Landscape Architectural Concrete scope is identified.

B. Cementitious Materials: Portland cement alone or in combination with one or more of the following: blended hydraulic cement, fly ash, slag cement, other pozzolans, and silica fume; materials subject to compliance with requirements.

C. W/C Ratio: The ratio by weight of water to cementitious materials.

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1. Require representatives of each entity directly concerned with cast-in-place architectural concrete to attend, including the following:

    a. Contractor's superintendent.
    b. Independent testing agency responsible for concrete design mixtures.
    c. Ready-mix concrete manufacturer.
    d. Cast-in-place architectural concrete Subcontractor.

2. Review concrete finishes and finishing, cold- and hot-weather concreting procedures, curing procedures, construction joints, forms and form-removal limitations, reinforcement accessory installation, concrete repair procedures, and protection of cast-in-place architectural concrete.
3. Before submitting design mixtures, review concrete design mixture and examine procedures for ensuring quality of concrete materials.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Design Mixtures: For each concrete mixture. Submit alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.

1. DO NOT add water to concrete during delivery, at Project site, or during placement unless approved by Architect.

C. Formwork Shop Drawings: Show formwork construction, including form-facing joints, rustications, construction and contraction joints, form joint-sealant details, form tie locations and patterns, inserts and embedments, cutouts, cleanout panels, and other items that visually affect cast-in-place architectural concrete.

D. Placement Schedule: Submit concrete placement schedule before start of placement operations. Include locations of all joints, including construction joints.

E. Samples: For each of the following materials:

1. Form-facing panels.
2. Form ties.
3. Form liners.
4. Exposed aggregates.
5. Coarse- and fine-aggregate gradations.
6. Chamfers and rustications.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For manufacturer.

B. Material Certificates: For each of the following, signed by manufacturers:

1. Cementitious materials.
2. Admixtures.
3. Form materials and form-release agents.
4. Repair materials.

C. Material Test Reports: For the following, by a qualified testing agency:

1. Aggregates. Include service-record data indicating absence of deleterious expansion of concrete due to alkali-aggregate reactivity.

1.7 QUALITY ASSURANCE

A. Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.

1. Manufacturer certified according to NRMCA's "NRMCA Quality Control Manual - Section 3, Certification of Ready Mixed Concrete Production Facilities."

B. Mockups: Before casting architectural concrete, build mockups to verify selections made under Sample submittals and to demonstrate typical joints, surface finish, texture, tolerances, and standard of workmanship. Build mockups to comply

C. with the following requirements, using materials indicated for the completed Work:

1. Build mockups in the location and of the size indicated or, if not indicated, as directed by Architect.
2. Build mockups of typical exterior wall of cast-in-place architectural concrete as shown on Drawings. Refer to drawings for size of mockup requirements.
3. Demonstrate curing, cleaning, and protecting of cast-in-place architectural concrete, finishes, and contraction joints, as applicable.
4. In presence of Architect, damage part of the exposed-face surface for each finish, color, and texture, and demonstrate materials and techniques proposed for repair of tie holes and surface blemishes to match adjacent undamaged surfaces.
5. Obtain Architect's approval of mockups before casting architectural concrete.
6. ***Approved mockups may NOT become part of the completed Work.***

1.8 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Engage a qualified testing agency to perform preconstruction testing on concrete mixtures.

1.9 FIELD CONDITIONS

A. Cold-Weather Placement: Comply with ACI 306.1 and as follows. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.

1. When average high and low temperature is expected to fall below 40 deg F for three successive days, maintain delivered concrete mixture temperature within the temperature range required by ACI 301.
2. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
3. Do not use calcium chloride, salt, or other materials containing antifreeze agents.
4. Do not use chemical accelerators unless otherwise specified and approved in design mixtures.

B. Hot-Weather Placement: Comply with ACI 301 and as follows:

1. Maintain concrete temperature below 90 deg F at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.

2. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade uniformly moist without standing water, soft spots, or dry areas.

PART 2 - PRODUCTS

2.1 CONCRETE, GENERAL

A. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:

1. ACI 301.
2. ACI 303.1.

2.2 FORM-FACING MATERIALS

A. General: Comply with Section 033000 "Cast-in-Place Concrete" for formwork and other form-facing material requirements.

B. Source Limitations: Obtain each type form-facing material from single source from single manufacturer.

Form Liners: Units of face design, texture, arrangement, and configuration indicated. Furnish with manufacturer's recommended liquid-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent surface treatments of concrete. Refer to drawings for indication of which finish (Type 'A' applies to site walls and site seat walls on Landscape (L Series) drawings. site walls and site cast-in-place concrete elements. Form liner types/ requirements for Type 'A' are identified below.

Form Liner Types:

1. Architectural Grade Form-Liner Finish (Type 'A' Finish Quality):

a. Available manufacturers include but are not limited to the following:
- **1) Richmond International**
- **2) Performance Panels**
- **3) Paneltech**

b. Basis of Design:
- **1) Manufacturer: Richmond International**
- **2) Model: Richform Titanium**
- **3) Material: Phenolic Film Faced Plyform, HDO Concrete Form/ Certified Film Face**
- **4) Ply Dimension: ¾" Ply thickness**
- **5) Grade: A/A**
- **6) Phenolic Type: 240g/m2**
- **7) Edge Sealed: Waterproof paint**
- **8) Tolerance: (+/-) 0.3 mm**

C. Rustication Strips: Metal or rigid plastic, or with sides beveled and back kerfed; nonstaining; in longest practicable lengths.

D. Chamfer Strips: Metal, rigid plastic, elastomeric rubber, or dressed wood, dimensions per details; nonstaining; in longest practicable lengths.

E. Form Joint Tape: Compressible foam tape; pressure sensitive; AAMA 800; minimum 1/4 inch thick.

F. Form Joint Sealant: Elastomeric sealant complying with ASTM C 920, Type M or Type S, Grade NS, that adheres to form joint substrates.

1. Silicone type sealants and other sealants with history of potential staining/ streaking are not allowed.

G. Form-Release Agent: Commercially formulated, colorless form-release agent that will not bond with, stain, or adversely affect architectural concrete surfaces and will not impair subsequent treatments of those surfaces.

1. Formulate form-release agent with rust inhibitor for steel form-facing materials.

H. Form Ties: Factory-fabricated, internally disconnecting ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.
1. Furnish internally disconnecting ties that will leave no metal closer than 1-1/2 inches, from the architectural concrete surface.

2.3 STEEL REINFORCEMENT AND ACCESSORIES

A. General: Comply with Section 033000 "Cast-in-Place Concrete" for steel reinforcement and other requirements for reinforcement accessories.

B. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded-wire fabric in place; manufactured according to CRSI's "Manual of Standard Practice."

1. Where legs of wire bar supports contact forms, use CRSI Class 1, gray, plastic-protected bar supports.

2.4 CONCRETE MATERIALS

A. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant, obtain aggregate from single source, and obtain admixtures from single source from single manufacturer.

B. Cementitious Materials:

1. Portland Cement: ASTM C 150/C 150M, Type I , gray.
2. Fly Ash: ASTM C 618, Class F.
3. Slag Cement: ASTM C 989/C 989M, Grade 100 or Grade 120.
4. Silica Fume: ASTM C 1240 amorphous silica.

C. Normal-Weight Aggregates: ASTM C 33/C 33M, Class 5S coarse aggregate or better, graded. Provide aggregates from single source with documented service-record data of at least 10

years' satisfactory service in similar applications and service conditions using similar aggregates and cementitious materials.

1. Maximum Coarse-Aggregate Size: 1/2 inch.
2. Gradation: Uniformly graded.

D. Normal-Weight Fine Aggregate: ASTM C 33/C 33M, manufactured or natural sand, from same source for entire Project.

E. Air-Entraining Admixture: ASTM C 260/C 260M.

F. Chemical Admixtures: Certified by manufacturer to be compatible with other admixtures and that does not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.

1. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.

2. Retarding Admixture: ASTM C 494/C 494M, Type B.

3. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.

4. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.

5. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
6. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.

G. Water: Potable, complying with ASTM C 94/C 94M, except free of wash water from mixer washout operations.

2.5 CURING MATERIALS

A. Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B.

2.6 REPAIR MATERIALS

A. Bonding Agent: ASTM C 1059/C 1059M, Type II, nonredispersible, acrylic emulsion or styrene butadiene.

B. Epoxy Bonding Adhesive: ASTM C 881/C 881M two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class suitable for application temperature and of grade to suit requirements.
1. Types IV and V, load bearing, for bonding hardened or freshly mixed concrete to hardened concrete.

2.7 CONCRETE MIXTURES

A. Obtain each color, size, type, and variety of concrete mixture from single manufacturer with resources to provide cast-in-place architectural concrete of consistent quality in appearance and physical properties.

B. Prepare design mixtures for each type and strength of cast-in-place architectural concrete proportioned on basis of laboratory trial mixture or field test data, or both, according to ACI 301.

1. Use a qualified independent testing agency for preparing and reporting proposed design mixtures based on laboratory trial mixtures.

C. Cementitious Materials: For cast-in-place architectural concrete exposed to deicers, limit percentage, by weight, of cementitious materials other than portland cement according to ACI 301 requirements. Use fly ash, pozzolan, slag cement, and silica fume as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent.

D. Limit water-soluble, chloride-ion content in hardened concrete to 0.15 percent by weight of cement.

E. Admixtures: Use admixtures according to manufacturer's written instructions.

F. Concrete Mixtures:

1. Compressive Strength (28 Days): 5000 psi.
2. Maximum W/C Ratio: 0.46.
3. Slump Limit: 8 inches for concrete with verified slump of 2 to 4 inches before adding high-range water-reducing admixture or plasticizing admixture plus or minus 1 inch.
4. Air Content: 6 percent, plus or minus 1.5 percent at point of delivery.

2.8 CONCRETE MIXING

A. Ready-Mixed Architectural Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M and furnish batch ticket information.

1. Clean equipment used to mix and deliver cast-in-place architectural concrete to prevent contamination from other concrete.
2. When air temperature is between 85 and 90 deg F reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F , reduce mixing and delivery time to 60 minutes.

PART 3 - EXECUTION

3.1 FORMWORK INSTALLATION

A. General: Comply with Section 033000 "Cast-in-Place Concrete" for formwork, embedded items, and shoring and reshoring.

B. In addition to ACI 303.1 limits on form-facing panel deflection, limit cast-in-place architectural concrete surface irregularities, designated by ACI 347 as abrupt or gradual, as follows:

1. Class A, 1/8 inch.

C. Construct forms to result in cast-in-place architectural concrete that complies with ACI 117 (ASI 117M).

D. Construct forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast-in-place surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical. Kerf wood rustications, keyways, reglets, recesses, and the like, for easy removal.

1. Seal form joints and penetrations at form ties with form joint tape or form joint sealant to prevent cement paste leakage.
2. Do not use rust-stained steel form-facing material.

E. Provide temporary openings for cleanouts and inspection ports where interior area of formwork is inaccessible. Close openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar. Locate temporary openings in forms at inconspicuous locations.

F. Do not chamfer exterior corners and edges of cast-in-place architectural concrete unless indicated on drawing details.

G. Coat contact surfaces of wood rustications and chamfer strips with sealer before placing reinforcement, anchoring devices, and embedded items.

H. Form openings, chases, offsets, sinkages, keyways, reglets, blocking, screeds, and bulkheads required in the Work. Determine sizes and locations from trades providing such items.

I. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.

J. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.

K. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.

L. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and attach securely to prevent deflection and maintain stability of liners during concreting. Prevent form liners from sagging and stretching in hot weather. Seal joints of form liners and form-liner accessories to prevent mortar leaks. Coat form liner with form-release agent.

3.2 REINFORCEMENT AND INSERT INSTALLATION

A. General: Comply with Section 033000 "Cast-in-Place Concrete" for fabricating and installing steel reinforcement. Securely fasten steel reinforcement and wire ties against shifting during concrete placement.

B. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.

3.3 REMOVING AND REUSING FORMS

A. Formwork for sides of beams, walls, columns, and similar parts of the Work that does not support weight of concrete may be removed after cumulatively curing at not less than 50 deg F for 24 hours after placing concrete if concrete is hard enough to not be damaged by form-removal operations and curing and protection operations are maintained.

1. Schedule form removal to maintain surface appearance that matches approved mockups.

B. Clean and repair surfaces of forms to be reused in the Work. Do not use split, frayed, delaminated, or otherwise damaged form-facing material. Apply new form-release agent.

C. When forms are reused, clean surfaces, remove fins and laitance, and tighten to close joints. Align and secure joints to avoid offsets. Do not use patched forms for cast-in-place architectural concrete surfaces.

3.4 JOINTS

A. Construction Joints: Install construction joints true to line, with faces perpendicular to surface plane of cast-in-place architectural concrete, so strength and appearance of concrete are not impaired, at locations indicated or as approved by Architect.

1. Place joints perpendicular to main reinforcement. Continue reinforcement across construction joints unless otherwise indicated.
2. Form keyed joints as indicated. Align construction joint within rustications attached to form-facing material.
3. Space vertical joints in walls as indicated. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible.

B. Contraction Joints: Form weakened-plane contraction joints true to line, with faces perpendicular to surface plane of cast-in-place architectural concrete, so

C. strength and appearance of concrete are not impaired, at locations indicated or as approved by Architect.

3.5 CONCRETE PLACEMENT

A. Before placing concrete, verify that installation of formwork, form-release agent, reinforcement, and embedded items is complete and that required inspections have been performed.

B. Do not add water to concrete during delivery, at Project site, or during placement unless approved by Architect.

C. Deposit concrete continuously between construction joints. Deposit concrete to avoid segregation.

1. Deposit concrete in horizontal layers of depth to not exceed formwork design pressures and in a manner to avoid inclined construction joints.
2. Consolidate placed concrete with mechanical vibrating equipment according to ACI 303.1.
3. Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations to rapidly penetrate placed layer and at least 6 inches into preceding layer. Do not insert vibrators into lower layers of concrete that have begun to lose plasticity. Do not permit vibrators to contact forms.

3.6 FINISHES, GENERAL

A. Architectural Concrete Finish: Match Architect's design reference sample, identified and described as indicated, to satisfaction of Architect.

B. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces.

1. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces unless otherwise indicated.

C. Maintain uniformity of special finishes over construction joints unless otherwise indicated.

3.7 AS-CAST FORMED FINISHES

A. Architectural Grade Form-Liner Finish (Type 'A' Finish Quality): Produce a smooth, textured surface free of pockets, streaks, and honeycombs, and of uniform appearance, color, and texture by use of a lined high density overlay form material.

3.8 CONCRETE PROTECTING AND CURING

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and with ACI 301 for hot-weather protection during curing.

B. Begin curing cast-in-place architectural concrete immediately after removing forms from concrete. Cure according to ACI 308.1, by one or a combination of the following methods that will not mottle, discolor, or stain concrete:

1. Curing Compound: Mist concrete surfaces with water. Apply curing compound uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating, and repair damage during curing period.

3.9 FIELD QUALITY CONTROL

A. General: Comply with field quality-control requirements in Section 033000 "Cast-in-Place Concrete."

B. In Progress - As Built Survey

1. Contractor is to provide an as-built survey by a licensed engineer for construction of the cast-in-place concrete seatwalls in entry plaza. This does not supercede any requirements for State Construction Office or University closeout / final approval procedures.

3.10 REPAIR, PROTECTION, AND CLEANING

A. Repair and cure damaged finished surfaces of cast-in-place architectural concrete when approved by Architect. Match repairs to color, texture, and uniformity of surrounding surfaces and to repairs on approved mockups.

1. Remove and replace cast-in-place architectural concrete that cannot be repaired and cured to Architect's approval.

B. Protect corners, edges, and surfaces of cast-in-place architectural concrete from damage; use guards and barricades.

C. Protect cast-in-place architectural concrete from staining, laitance, and contamination during remainder of construction period.

D. Clean cast-in-place architectural concrete surfaces after finish treatment to remove stains, markings, dust, and debris.

E. Wash and rinse surfaces according to concrete finish applicator's written instructions. Protect other Work from staining or damage due to cleaning operations.

1. Do not use cleaning materials or processes that could change the appearance of cast-in-place architectural concrete finishes.

END OF SECTION 033300

SECTION 042000 - UNIT MASONRY

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Concrete masonry units (CMU's).
2. Concrete building brick.

B. Related Sections:

1. 055000, Metal Fabrications.
2. 084113, Aluminum-Framed Entrances and Storefronts.
3. 092900, Gypsum Board.
4. 093000, Tiling
5. 099123, Interior Painting.
6. 100000, Miscellaneous Specialties.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For reinforcing steel. Detail bending and placement of unit masonry reinforcing bars. Comply with ACI 315, "Details and Detailing of Concrete Reinforcement."

C. Samples for Verification: For each type and color of exposed masonry unit.

1.3 INFORMATIONAL SUBMITTALS

A. Material Certificates: For each type and size of product indicated. For masonry units include material test reports substantiating compliance with requirements.

B. Mix Designs: For each type of mortar and grout. Include description of type and proportions of ingredients.

1. Include test reports for mortar mixes required to comply with property specification. Test according to ASTM C109/C109M for compressive strength, ASTM C1506 for water retention, and ASTM C91/C91M for air content.
2. Include test reports, according to ASTM C 1019, for grout mixes required to comply with compressive strength requirement.

1.4 QUALITY ASSURANCE

A. Masonry Standard: Comply with ACI 530.1/ASCE 6/TMS 602 unless modified by requirements in the Contract Documents.

1 1.5 PROJECT CONDITIONS

2 A. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice
3 or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost
4 or by freezing conditions. Comply with cold-weather construction requirements contained in
5 ACI 530.1/ASCE 6/TMS 602.

6 B. Hot-Weather Requirements: Comply with hot-weather construction requirements contained in
7 ACI 530.1/ASCE 6/TMS 602.

8 PART 2 - PRODUCTS

9 2.1 MASONRY UNITS, GENERAL

10 A. Defective Units: Referenced masonry unit standards may allow a certain percentage of units to
11 contain chips, cracks, or other defects exceeding limits stated in the standard. Do not use units
12 where such defects will be exposed in the completed Work.

13 B. Fire-Resistance Ratings: Where indicated, provide units that comply with requirements for fire-
14 resistance ratings indicated as determined by testing according to ASTM E 119, by equivalent
15 masonry thickness, or by other means, as acceptable to authorities having jurisdiction.

16 2.2 CONCRETE MASONRY UNITS

17 A. Shapes: Provide shapes indicated and for lintels, corners, jambs, sashes, movement joints,
18 headers, bonding, and other special conditions.

19 B. CMUs: ASTM C 90.

20 1. Unit Compressive Strength: Provide units with minimum average net-area compressive
21 strength of 2800 psi.
22 2. Density Classification: Lightweight unless otherwise indicated.

23 C. Concrete Building Brick: ASTM C 55.

24 1. Unit Compressive Strength: Provide units with minimum average net-area compressive
25 strength of 2800 psi.
26 2. Density Classification: Lightweight.

27 2.3 MASONRY LINTELS

28 A. General: Provide one of the following:

29 B. Masonry Lintels: Prefabricated or built-in-place masonry lintels made from bond beam CMUs
30 with reinforcing bars placed as indicated and filled with coarse grout.

31 2.4 MORTAR AND GROUT MATERIALS

32 A. Portland Cement: ASTM C 150, Type I or II, except Type III may be used for cold-weather
33 construction. Provide natural color.

34 B. Hydrated Lime: ASTM C 207, Type S.

35 C. Masonry Cement: ASTM C 91.

D. Aggregate for Mortar: ASTM C 144.

1. For joints less than 1/4 inch (6 mm) thick, use aggregate graded with 100 percent passing the No. 16 (1.18-mm) sieve.

E. Aggregate for Grout: ASTM C 404.

F. Cold-Weather Admixture: Non-chloride, noncorrosive, accelerating admixture complying with ASTM C 494/C 494M, Type C, and recommended by manufacturer for use in masonry mortar of composition indicated.

G. Water: Potable.

2.5 REINFORCEMENT

A. Uncoated Steel Reinforcing Bars: ASTM A 615/A 615M or ASTM A 996/A 996M, Grade 60 (Grade 420).

B. Masonry Joint Reinforcement, General: ASTM A 951/A 951M.

1. Interior Walls: Hot-dip galvanized, carbon steel.
2. Exterior Walls: Hot-dip galvanized, carbon steel.
3. Wire Size for Side Rods: 0.187-inch (4.76-mm) diameter.
4. Wire Size for Cross Rods: 0.187-inch (4.76-mm) diameter.
5. Spacing of Cross Rods, Tabs, and Cross Ties: Not more than 16 inches (407 mm) o.c.
6. Provide in lengths of not less than 10 feet (3 m), with prefabricated corner and tee units.

C. Masonry Joint Reinforcement for Single-Wythe Masonry: Either ladder or truss type with single pair of side rods.

D. Masonry Joint Reinforcement for Multiwythe Masonry:

1. Ladder type with 1 side rod at each face shell of hollow masonry units more than 4 inches (100 mm) wide, plus 1 side rod at each wythe of masonry 4 inches (100 mm) wide or less.

2.6 TIES AND ANCHORS

A. Materials: Provide ties and anchors specified in this article that are made from materials that comply with the following unless otherwise indicated.

1. Hot-Dip Galvanized, Carbon-Steel Wire: ASTM A 82/A 82M; with ASTM A 153/A 153M, Class B-2 coating.
2. Steel Sheet, Galvanized after Fabrication: ASTM A 1008/A 1008M, Commercial Steel, with ASTM A 153/A 153M, Class B coating.
3. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

B. Adjustable Anchors for Connecting to Structural Steel Framing: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.

1. Anchor Section for Welding to Steel Frame: Crimped 1/4-inch- (6.35-mm-) diameter, hot-dip galvanized steel wire.
2. Tie Section: Triangular-shaped wire tie, sized to extend within 1 inch (25 mm) of masonry face, made from 0.25-inch- (6.35-mm-) diameter, hot-dip galvanized steel wire.

C. Adjustable Anchors for Connecting to Concrete: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.

1. Connector Section: Dovetail tabs for inserting into dovetail slots in concrete and attached to tie section; formed from 0.105-inch-thick steel sheet, galvanized after fabrication
2. Tie Section: Triangular-shaped wire tie made from 0.187-inch-diameter, hot-dip galvanized-steel wire.

D. Partition Top Anchors: 0.105-inch-thick metal plate with a 3/8-inch-diameter metal rod 6 inches long welded to plate and with closed-end plastic tube fitted over rod that allows rod to move in and out of tube. Fabricate from steel, hot-dip galvanized after fabrication.

E. Rigid Anchors: Fabricate from steel bars 1-1/2 inches wide by 1/4 inch thick by 24 inches long, with ends turned up 2 inches or with cross pins unless otherwise indicated.

1. Corrosion Protection: Hot-dip galvanized to comply with ASTM A153/A153M.

F. Anchor Bolts: Headed or L-shaped steel bolts complying with ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6); with ASTM A 563 (ASTM A 563M) hex nuts and, where indicated, flat washers; hot-dip galvanized to comply with ASTM A 153/A 153M, Class C.

2.7 MISCELLANEOUS MASONRY ACCESSORIES

A. Compressible Filler: Pre-molded filler strips complying with ASTM D 1056, Grade 2A1; compressible up to 35 percent; formulated from neoprene, urethane, or PVC.

B. Bond-Breaker Strips: Asphalt-saturated, organic roofing felt complying with ASTM D 226, Type I (No. 15 asphalt felt).

2.8 FOAM-PLASTIC BOARD INSULATION

A. Extruded-Polystyrene Board Insulation: ASTM C 578, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E 84. Refer to Section 072100.

2.9 MASONRY CLEANERS

A. Use detergent expressly approved for intended use by cleaner manufacturer and manufacturer of masonry units being cleaned.

2.10 MORTAR AND GROUT MIXES

A. General: Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, antifreeze compounds, or other admixtures, unless otherwise indicated.

1. Do not use calcium chloride in mortar or grout.
2. Use portland cement-lime mortar unless otherwise indicated.
3. For exterior masonry, use portland cement-lime mortar.
4. For reinforced masonry, use portland cement-lime mortar.

B. Mortar for Unit Masonry: Comply with ASTM C 270, Proportion Specification. Provide the following types of mortar for applications stated unless another type is indicated.

1. For masonry below grade or in contact with earth, use Type S.
2. For reinforced masonry, use Type S.
3. For exterior and interior, above-grade, load-bearing walls use Type S.

C. Grout for Unit Masonry: Comply with ASTM C 476.

1. Use grout of type indicated or, if not otherwise indicated, of type (fine or coarse) that will comply with Table 1.15.1 in ACI 530.1/ASCE 6/TMS 602 for dimensions of grout spaces and pour height.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.

B. Select and arrange units for exposed unit masonry to produce a uniform blend of textures.

3.2 TOLERANCES

A. Dimensions and Locations of Elements:

1. For dimensions in cross section or elevation do not vary by more than plus 1/2 inch (12 mm) or minus 1/4 inch (6 mm).
2. For location of elements in plan do not vary from that indicated by more than plus or minus 1/2 inch (12 mm).
3. For location of elements in elevation do not vary from that indicated by more than plus or minus 1/4 inch (6 mm) in a story height or 1/2 inch (12 mm) total.

B. Lines and Levels:

1. For bed joints and top surfaces of bearing walls do not vary from level by more than 1/4 inch in 10 feet (6 mm in 3 m), or 1/2 inch (12 mm) maximum.
2. For conspicuous horizontal lines, such as lintels, sills, parapets, and reveals, do not vary from level by more than 1/8 inch in 10 feet (3 mm in 3 m), 1/4 inch in 20 feet (6 mm in 6 m), or 1/2 inch (12 mm) maximum.
3. For vertical lines and surfaces do not vary from plumb by more than 1/4 inch in 10 feet (6 mm in 3 m), 3/8 inch in 20 feet (9 mm in 6 m), or 1/2 inch (12 mm) maximum.
4. For conspicuous vertical lines, such as external corners, door jambs, reveals, and expansion and control joints, do not vary from plumb by more than 1/8 inch in 10 feet (3 mm in 3 m), 1/4 inch in 20 feet (6 mm in 6 m), or 1/2 inch (12 mm) maximum.
5. For lines and surfaces do not vary from straight by more than 1/4 inch in 10 feet (6 mm in 3 m), 3/8 inch in 20 feet (9 mm in 6 m), or 1/2 inch (12 mm) maximum.

C. Joints:

1. For bed joints, do not vary from thickness indicated by more than plus or minus 1/8 inch (3 mm), with a maximum thickness limited to 1/2 inch (12 mm).
2. For head and collar joints, do not vary from thickness indicated by more than plus 3/8 inch (9 mm) or minus 1/4 inch (6 mm).
3. For exposed head joints, do not vary from thickness indicated by more than plus or minus 1/8 inch (3 mm).

3.3 LAYING MASONRY WALLS

A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.

B. Bond Pattern for Exposed Masonry: Unless otherwise indicated, lay exposed masonry in running bond; do not use units with less than nominal 4-inch (100-mm) horizontal face dimensions at corners or jambs.

C. Built-in Work: As construction progresses, build in items specified in this and other Sections. Fill in solidly with masonry around built-in items.

D. Fill cores in hollow CMUs with grout 24 inches (600 mm) under bearing plates, beams, lintels, posts, and similar items unless otherwise indicated.

3.4 MORTAR BEDDING AND JOINTING

A. Lay CMUs as follows:

1. With face shells fully bedded in mortar and with head joints of depth equal to bed joints.
2. With webs fully bedded in mortar in all courses of piers, columns, and pilasters.
3. With webs fully bedded in mortar in grouted masonry, including starting course on footings.
4. With entire units, including areas under cells, fully bedded in mortar at starting course on footings where cells are not grouted.

B. Lay solid masonry units with completely filled bed and head joints; butter ends with sufficient mortar to fill head joints and shove into place. Do not deeply furrow bed joints or slush head joints.

C. Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness unless otherwise indicated.

3.5 MASONRY JOINT REINFORCEMENT

A. General: Install entire length of longitudinal side rods in mortar with a minimum cover of 5/8 inch (16 mm) on exterior side of walls, 1/2 inch (13 mm) elsewhere. Lap reinforcement a minimum of 6 inches (150 mm).

1. Space reinforcement not more than 16 inches (406 mm) o.c.
2. Space reinforcement not more than 8 inches (203 mm) o.c. in foundation walls and parapet walls.
3. Provide reinforcement not more than 8 inches (203 mm) above and below wall openings and extending 12 inches (305 mm) beyond openings in addition to continuous reinforcement.

B. Interrupt joint reinforcement at control and expansion joints unless otherwise indicated.

C. Provide continuity at wall intersections by using prefabricated T-shaped units.

D. Provide continuity at corners by using prefabricated L-shaped units.

3.6 ANCHORING MASONRY TO STRUCTURAL STEEL AND CONCRETE

A. Anchor masonry to structural steel and concrete where masonry abuts or faces structural steel or concrete to comply with the following:

1. Provide an open space not less than 1 inch (25 mm) wide between masonry and structural steel or concrete unless otherwise indicated. Keep open space free of mortar and other rigid materials.
2. Anchor masonry with anchors embedded in masonry joints and attached to structure.
3. Space anchors as indicated, but not more than 24 inches (610 mm) o.c. vertically and 36 inches (915 mm) o.c. horizontally.

3.7 REINFORCED UNIT MASONRY INSTALLATION

A. Temporary Formwork and Shores: Construct formwork and shores as needed to support reinforced masonry elements during construction.

1. Construct formwork to provide shape, line, and dimensions of completed masonry as indicated. Make forms sufficiently tight to prevent leakage of mortar and grout. Brace, tie, and support forms to maintain position and shape during construction and curing of reinforced masonry.
2. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and other loads that may be placed on them during construction.

B. Placing Reinforcement: Comply with requirements in ACI 530.1/ASCE 6/TMS 602.

C. Grouting: Do not place grout until entire height of masonry to be grouted has attained enough strength to resist grout pressure.

1. Comply with requirements in ACI 530.1/ASCE 6/TMS 602 for cleanouts and for grout placement, including minimum grout space and maximum pour height.
2. Limit height of vertical grout pours to not more than 60 inches (1520 mm).

3.8 PROTECTION, REPAIRING, POINTING, AND CLEANING

A. Prior to the application of wall coatings, protect exposed wall corners with corrugated cardboard, extending a minimum of three inches on each side of the corner.

B. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.

3.9 MASONRY WASTE DISPOSAL

A. Waste Disposal as Fill Material: Dispose of clean masonry waste, including excess or soil-contaminated sand, waste mortar, and broken masonry units, by crushing and mixing with fill material as fill is placed.

1. Do not dispose of masonry waste as fill within 18 inches (450 mm) of finished grade.

B. Excess Masonry Waste: Remove excess clean masonry waste that cannot be used as fill, as described above, and other masonry waste, and legally dispose of off Owner's property.

END OF SECTION 042000

SECTION 051200 - STRUCTURAL STEEL

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Structural steel.
2. Shear stud connectors.
3. Shrinkage-resistant grout.

1.2 DEFINITIONS

A. Structural Steel: Elements of the structural frame indicated on Drawings and as described in ANSI/AISC 303.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Product Data:

1. Structural-steel materials.
2. High-strength, bolt-nut-washer assemblies.
3. Shear stud connectors.
4. Anchor rods.
5. Threaded rods.
6. Shop primer.
7. Galvanized-steel primer.
8. Galvanized repair paint.
9. Shrinkage-resistant grout.

B. Shop Drawings: Show fabrication of structural-steel components.

C. Delegated-Design Submittal: For structural-steel connections indicated on Drawings to comply with design loads, include analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Welding certificates.

B. Mill test reports for structural-steel materials, including chemical and physical properties.

C. Source quality-control reports.

D. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Fabricator Qualifications: A qualified fabricator that participates in the AISC Quality Certification Program and is designated an AISC-Certified Plant, Category BU or is accredited by the IAS Fabricator Inspection Program for Structural Steel (Acceptance Criteria 172).

B. Welding Qualifications: Qualify procedures and personnel in accordance with AWS D1.1/D1.1M.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Comply with applicable provisions of the following specifications and documents:

1. ANSI/AISC 303.
2. ANSI/AISC 360.
3. RCSC's "Specification for Structural Joints Using High-Strength Bolts."

B. Connection Design Information:

1. Option 3 and 3B: Design connections and final configuration of member reinforcement at connections in accordance with ANSI/AISC 303 by fabricator's qualified professional engineer.

    a. Use Load and Resistance Factor Design; data are given at factored-load level.

C. Moment Connections: Type FR, fully restrained.

D. Construction: As indicated.

2.2 STRUCTURAL-STEEL MATERIALS

A. W-Shapes: ASTM A992/A992M.

B. Channels, Angles, M-Shapes, S-Shapes: ASTM A36/A36M.

C. Plate and Bar: ASTM A36/A36M.

D. Cold-Formed Hollow Structural Sections: ASTM A500/A500M, Grade C structural tubing.

E. Steel Pipe: ASTM A53/A53M, Type E or Type S, Grade B.

F. Welding Electrodes: Comply with AWS requirements.

2.3 BOLTS AND CONNECTORS

A. High-Strength A325 Bolts, Nuts, and Washers: ASTM F3125/F3125M, Grade A325 (Grade A325M), Type 1, heavy-hex steel structural bolts; ASTM A563, Grade DH (ASTM A563M,

Class 10S), heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers; all with plain finish.

1. Direct-Tension Indicators: ASTM F959/F959M, Type 325-1 (Type 8.8-1), compressible-washer type with plain finish.

B. Zinc-Coated High-Strength A325 Bolts, Nuts, and Washers: ASTM F3125/F3125M, Grade A325 (Grade A325M), Type 1, heavy-hex steel structural bolts; ASTM A563, Grade DH (ASTM A563M, Class 10S), heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers.

1. Finish: Hot-dip zinc coating.
2. Direct-Tension Indicators: ASTM F959/F959M, Type 325-1 (Type 8.8-1), compressible-washer type with mechanically deposited zinc coating finish.

C. Shear Stud Connectors: ASTM A108, AISI C-1015 through C-1020, headed-stud type, cold-finished carbon steel; AWS D1.1/D1.1M, Type B.

2.4 RODS

A. Unheaded Anchor Rods: ASTM F1554, Grade 36.

1. Configuration: Straight.
2. Finish: Plain or Hot-dip zinc coating, ASTM A153/A153M, Class C.

B. Headed Anchor Rods: ASTM F1554, Grade 36, straight.

1. Finish: Plain or Hot-dip zinc coating, ASTM A153/A153M, Class C.

C. Threaded Rods: ASTM A36/A36M.

1. Finish: Plain or Hot-dip zinc coating, ASTM A153/A153M, Class C.

2.5 PRIMER

A. Steel Primer:

1. Comply with Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."
2. SSPC-Paint 23, latex primer.
3. Fabricator's standard lead- and chromate-free, nonasphaltic, rust-inhibiting primer complying with MPI#79 and compatible with topcoat.

B. Galvanized-Steel Primer:

1. Etching Cleaner: MPI#25, for galvanized steel.
2. Galvanizing Repair Paint: MPI#18, MPI#19, or SSPC-Paint 20.

2.6 SHRINKAGE-RESISTANT GROUT

A. Metallic, Shrinkage-Resistant Grout: ASTM C1107/C1107M, factory-packaged, metallic aggregate grout, mixed with water to consistency suitable for application and a 30-minute working time.

B. Nonmetallic, Shrinkage-Resistant Grout: ASTM C1107/C1107M, factory-packaged, nonmetallic aggregate grout, noncorrosive and nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.

2.7 FABRICATION

A. Structural Steel: Fabricate and assemble in shop to greatest extent possible. Fabricate in accordance with ANSI/AISC 303 and to ANSI/AISC 360.

B. Shear Stud Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Weld using automatic end welding of headed-stud shear connectors in accordance with AWS D1.1/D1.1M and manufacturer's written instructions.

2.8 SHOP CONNECTIONS

A. High-Strength Bolts: Shop install high-strength bolts in accordance with RCSC's "Specification for Structural Joints Using High-Strength Bolts" for type of bolt and type of joint specified.

1. Joint Type: Snug tightened.

B. Weld Connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.

2.9 GALVANIZING

A. Hot-Dip Galvanized Finish: Apply zinc coating by the hot-dip process to structural steel in accordance with ASTM A123/A123M.

1. Fill vent and drain holes that are exposed in the finished Work unless they function as weep holes, by plugging with zinc solder and filing off smooth.

2.10 SHOP PRIMING

A. Shop prime steel surfaces, except the following:

1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches (50 mm).
2. Surfaces to be field welded.
3. Surfaces of high-strength bolted, slip-critical connections.
4. Surfaces to receive sprayed fire-resistive materials (applied fireproofing).
5. Galvanized surfaces unless indicated to be painted.
6. Surfaces enclosed in interior construction.

B. Surface Preparation of Steel: Clean surfaces to be painted. Remove loose rust and mill scale and spatter, slag, or flux deposits. Prepare surfaces in accordance with the following specifications and standards:

1. SSPC-SP 2.
2. SSPC-SP 3.
3. SSPC-SP 7 (WAB)/NACE WAB-4.

4. SSPC-SP 6 (WAB)/NACE WAB-3.

C. Surface Preparation of Galvanized Steel: Prepare galvanized-steel surfaces for shop priming by thoroughly cleaning steel of grease, dirt, oil, flux, and other foreign matter, and treating with etching cleaner or in accordance with SSPC-SP 16.

D. Priming: Immediately after surface preparation, apply primer in accordance with manufacturer's written instructions and at rate recommended by SSPC to provide a minimum dry film thickness of 1.5 mils (0.038 mm). Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.

2.11 SOURCE QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform shop tests and inspections.

1. Allow testing agency access to places where structural-steel work is being fabricated or produced to perform tests and inspections.
2. Bolted Connections: Inspect shop-bolted connections in accordance with RCSC's "Specification for Structural Joints Using High-Strength Bolts."
3. Welded Connections: Visually inspect shop-welded connections in accordance with AWS D1.1/D1.1M and the following inspection procedures, at testing agency's option:

    a. Liquid Penetrant Inspection: ASTM E165/E165M.
    b. Magnetic Particle Inspection: ASTM E709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration are not accepted.
    c. Ultrasonic Inspection: ASTM E164.
    d. Radiographic Inspection: ASTM E94/E94M.

4. In addition to visual inspection, test and inspect shop-welded shear stud connectors in accordance with requirements in AWS D1.1/D1.1M.
5. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify, with certified steel erector present, elevations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedments for compliance with requirements.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 ERECTION

A. Set structural steel accurately in locations and to elevations indicated and in accordance with ANSI/AISC 303 and ANSI/AISC 360.

B. Baseplates: Clean concrete- and masonry-bearing surfaces of bond-reducing materials, and roughen surfaces prior to setting plates. Clean bottom surface of plates.

1. Set plates for structural members on wedges, shims, or setting nuts as required.
2. Weld plate washers to top of baseplate.
3. Snug-tighten anchor rods after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of plate before packing with grout.
4. Promptly pack shrinkage-resistant grout solidly between bearing surfaces and plates, so no voids remain. Neatly finish exposed surfaces; protect grout and allow to cure. Comply with manufacturer's written installation instructions for grouting.

C. Maintain erection tolerances of structural steel within ANSI/AISC 303.

3.3 FIELD CONNECTIONS

A. High-Strength Bolts: Install high-strength bolts in accordance with RCSC's "Specification for Structural Joints Using High-Strength Bolts" for bolt and joint type specified.

1. Joint Type: Snug tightened.

B. Weld Connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.

1. Comply with ANSI/AISC 303 and ANSI/AISC 360 for bearing, alignment, adequacy of temporary connections, and removal of paint on surfaces adjacent to field welds.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage a special inspector to perform the following special inspections:

1. Verify structural-steel materials and inspect steel frame joint details.
2. Verify weld materials and inspect welds.
3. Verify connection materials and inspect high-strength bolted connections.

B. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

1. Bolted Connections: Inspect bolted connections in accordance with RCSC's "Specification for Structural Joints Using High-Strength Bolts."
2. Welded Connections: Visually inspect field welds in accordance with AWS D1.1/D1.1M.

a. In addition to visual inspection, test and inspect field welds in accordance with AWS D1.1/D1.1M and the following inspection procedures, at testing agency's option:

1) Liquid Penetrant Inspection: ASTM E165/E165M.
2) Magnetic Particle Inspection: ASTM E709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration are not accepted.
3) Ultrasonic Inspection: ASTM E164.
4) Radiographic Inspection: ASTM E94/E94M.

END OF SECTION 051200

SECTION 052100 - STEEL JOISTS

PART 1 – GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. K-series steel Joists
2. Steel joist accessories

1.2 SUBMITTALS

A. Product Data: For each type of joists, accessory, and product indicated.

B. Shop Drawings:

C. Product certificates.

D. Welding certificates.

E. Research/evaluation reports.

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications: A manufacturer certified by SJI to manufacture joists complying with applicable standard specifications and load tables in SJI's "Specifications."

1. Manufacturer's responsibilities include providing professional engineering services for designing special joists to comply with performance requirements.

B. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel,".

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Consolidated

2.3 STEEL JOISTS

A. K-Series Steel Joist: Manufactured steel joists of type indicated according to "Standard Specification for Open Web Steel Joists, K-Series" in SJI's "Specifications," with steel-angle top- and bottom-chord members, underslung ends, and parallel top chord.

2.4 STEEL JOIST ACCESSORIES

C. Bridging:

1. Provide bridging anchors and number of rows of horizontal or diagonal bridging of material, size, and type required by SJI's "Specifications" for type of joist, chord size, spacing, and span. Furnish additional erection bridging if required for stability.
2. Schematically indicated. Detail and fabricate according to SJI's "Specifications." Furnish additional erection bridging if required for stability.
3. Fabricate as indicated on Drawings and according to SJI's "Specifications. Furnish additional erection bridging if required for stability.

D. High-Strength Bolts, Nuts, and Washers: ASTM F3125/F3125M, Grade A325 (Grade A325M), Type 1, heavy-hex steel structural bolts; ASTM A563, Grade DH, (ASTM A563M, Class 10S) heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers.

1. Finish: Plain or Hot-dip zinc coating, ASTM A153/A153M, Class C.

E. Furnish miscellaneous accessories including splice plates and bolts required by joist manufacturer to complete joist assembly.

CLEANING AND SHOP PAINTING

F. Clean and remove loose scale, heavy rust, and other foreign materials from fabricated joists and accessories.

G. Apply one coat of shop primer to joists and joist accessories.

H. Shop priming of joists and joist accessories is specified in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."

PART 2 - EXECUTION

2.1 INSTALLATION

A. Do not install joists until supporting construction is in place and secured.

B. Install joists and accessories plumb, square, and true to line; securely fasten to supporting construction according to SJI's "Specifications," joist manufacturer's written instructions, and requirements in this Section.

1. Before installation, splice joists delivered to Project site in more than one piece.
2. Space, adjust, and align joists accurately in location before permanently fastening.
3. Install temporary bracing and erection bridging, connections, and anchors to ensure that joists are stabilized during construction.

C. Field weld joists to supporting steel bearing plates and framework. Coordinate welding sequence and procedure with placement of joists. Comply with AWS requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.

D. Bolt joists to supporting steel framework using carbon-steel bolts.

E. Install and connect bridging concurrently with joist erection, before construction loads are applied. Anchor ends of bridging lines at top and bottom chords if terminating at walls or beams.

2.2 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Visually inspect field welds according to AWS D1.1/D1.1M.

C. Visually inspect bolted connections.

D. Prepare test and inspection reports.

END OF SECTION 052100

SECTION 053100 - STEEL DECK

PART 1 – GENERAL

1.1 SUMMARY

A. This Section includes the following:

1.2 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1, "Structural Welding Code--Steel," and AWS D1.3, "Structural Welding Code--Sheet Steel."

B. Fire-Test-Response Characteristics: Where indicated, provide steel deck units identical to those steel deck units tested for fire resistance per ASTM E 119 by a testing and inspection agency acceptable to authorities having jurisdiction.

1. Fire-Resistance Ratings: Indicated by design designations from UL's "Fire Resistance Directory" or from the listings of another testing and inspecting agency.
2. Steel deck units shall be identified with appropriate markings of applicable testing and inspecting agency.

C. AISI Specifications: Calculate structural characteristics of steel deck according to AISI's "Specification for the Design of Cold-Formed Steel Structural Members."

PART 2 – PRODUCTS

2.1 COMPOSITE FLOOR DECK

A. Composite Steel Floor Deck: Fabricate panels, with integrally embossed or raised pattern ribs and interlocking side laps, to comply with “SDI Specifications and Commentary for Composite Steel Floor Deck,” in SDI Publication No. 31, with the minimum section properties indicated, and with the following:

1. Galvanized Steel Sheet: ASTM A 653/ A 653M, Structural Steel (SS), Grade 33 (230), G90 zinc coating.
2. Profile Depth: As indicated on structural drawings.
3. Design Uncoated-Steel Thickness: As indicated on structural drawings.

2.2 ROOF DECK

A. Roof Deck: Fabricate panels, without top-flange stiffening grooves, to comply with "SDI Specifications and Commentary for Steel Roof Deck," in SDI Publication No. 31, and with the following:

1. Galvanized-Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 33, G60 zinc coating.
2. Deck Profile: As indicated.

3. Profile Depth: As indicated.
4. Design Uncoated-Steel Thickness: As indicated.
5. Span Condition: As indicated.
6. Side Laps: Overlapped or interlocking seam at Contractor's option.

2.4 ACCESSORIES

A. Accessories: Steel deck manufacturer's standard accessory materials, including mechanical fasteners, closure strips, pour stops, and closures for deck.

B. Galvanizing Repair Paint: SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.

C. Mechanical Fasteners: Corrosion-resistant, low-velocity, power-actuated or pneumatically driven carbon-steel fasteners; or self-drilling, self-threading screws.

D. Side-Lap Fasteners: Corrosion-resistant, hexagonal washer head; self-drilling, carbon-steel screws, No. 10 (4.8-mm) minimum diameter.

E. Flexible Closure Strips: Vulcanized, closed-cell, synthetic rubber.

F. Miscellaneous Sheet Metal Deck Accessories: Steel sheet, minimum yield strength of 33,000 psi, not less than 0.0359-inch design uncoated thickness, of same material and finish as deck; of profile indicated or required for application.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Install deck panels and accessories according to applicable specifications and commentary in SDI Publication No. 31, manufacturer's written instructions, and requirements in this Section.

B. Place deck panels flat and square and fasten to supporting frame without warp or deflection.

C. Cut and neatly fit deck panels and accessories around openings and other work projecting through or adjacent to deck.

D. Provide additional reinforcement and closure pieces at openings as required for strength, continuity of deck, and support of other work.

E. Comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods used for correcting welding work.

F. Mechanical fasteners may be used in lieu of welding to fasten deck. Locate mechanical fasteners and install according to deck manufacturer's written instructions.

G. Miscellaneous Roof-Deck Accessories: Install ridge and valley plates, finish strips, end closures, and reinforcing channels according to deck manufacturer's written instructions. Weld or mechanically fasten to substrate to provide a complete deck installation.

1. Weld cover plates at changes in direction of roof-deck panels unless otherwise indicated.

H. Pour Stops and Girder Fillers: Weld steel sheet pour stops and girder fillers to supporting structure according to SDI recommendations unless otherwise indicated.

I. Floor-Deck Closures: Weld steel sheet column closures, cell closures, and Z-closures to deck, according to SDI recommendations, to provide tight-fitting closures at open ends of ribs and sides of deck.

3.2 REPAIR

A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on both surfaces of deck with galvanized repair paint according to ASTM A780/A780M and manufacturer's written instructions.

1 END OF SECTION 053100

SECTION 054000 - COLD-FORMED METAL FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Exterior non-load-bearing wall framing.
2. Exterior ceiling joist, soffit and fascia framing.
3. Interior suspended overhead framing including ceilings, ceiling clouds, bulkheads and soffits.
4. All framing designated as “CFSF-S” on drawings.

B. Related Sections include the following:

1. Division 1 Section “Special Inspection Services” for administrative and procedural requirements for special inspection services.
2. Section 033000 Cast-in-Place Concrete.
3. Section 042000 Unit Masonry.
4. Section 061053 Miscellaneous Rough Carpentry.
5. Section 061600 Sheathing.
6. Section 064023 Interior Architectural Woodwork, for support blocking.
7. Section 072100 Insulation.
8. Section 079200 Joint Sealants.
9. Section 092216 Non-Structural Metal Framing
10. Section 092900 Gypsum Board.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide cold-formed metal framing capable of withstanding design loads within limits and under conditions indicated.

1. Design Loads:

   a. Dead Loads: Weights of materials and construction.
   b. Wind Loads: As indicated.

2. Deflection Limits: Design framing systems to withstand design loads without deflections greater than the following:

   a. Exterior Non-Load-Bearing Framing: Horizontal deflection of 1/600 of the wall height.

3. Design framing systems to provide for movement of framing members without damage or overstressing, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient temperature change of 120 deg F.

4. Design framing system to maintain clearances at openings, to allow for construction tolerances, and to accommodate live load deflection of primary building structure as follows:

a. Upward and downward movement of 1/2 inch.

B. Cold-Formed Steel Framing, General: Design according to AISI's "Standard for Cold-Formed Steel Framing - General Provisions."

1. Headers: Design according to AISI's "Standard for Cold-Formed Steel Framing - Header Design."
2. Design exterior non-load-bearing wall framing to accommodate horizontal deflection without regard for contribution of sheathing materials.

1.4 SUBMITTALS

A. Product Data: For each type of cold-formed metal framing product and accessory indicated.

B. Shop Drawings: Show layout, spacings, sizes, thicknesses, and types of cold-formed metal framing; fabrication; and fastening and anchorage details, including mechanical fasteners. Show reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachment to adjoining work.

1. For cold-formed metal framing indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Welding certificates.

D. Product Test Reports: From a qualified testing agency, unless otherwise stated, indicating that each of the following complies with requirements, based on evaluation of comprehensive tests for current products:

1. Expansion anchors.
2. Power-actuated anchors.
3. Mechanical fasteners.
4. Vertical deflection clips.
5. Miscellaneous structural clips and accessories.

1.5 QUALITY ASSURANCE

A. Engineering Responsibility: Preparation of Shop Drawings, design calculations, and other structural data by a qualified professional engineer.

B. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of cold-formed metal framing that are similar to those indicated for this Project in material, design, and extent.

C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code--Steel," and AWS D1.3, "Structural Welding Code--Sheet Steel."

D. AISI Specifications and Standards: Comply with AISI's "North American Specification for the Design of Cold-Formed Steel Structural Members" and its "Standard for Cold-Formed Steel Framing - General Provisions."

1. Comply with AISI's "Standard for Cold-Formed Steel Framing - Header Design."

1.6 DELIVERY, STORAGE, AND HANDLING

A. Protect cold-formed metal framing from corrosion, deformation, and other damage during delivery, storage, and handling.

B. Store cold-formed metal framing, protect with a waterproof covering, and ventilate to avoid condensation.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Steel Sheet: ASTM A 1003/A 1003M, Structural Grade, Type H, metallic coated, of grade and coating weight as follows:

1. Grade: As required by structural performance.
2. Coating: G90.

B. Steel Sheet for Vertical Deflection Clips: ASTM A 653/A 653M, structural steel, zinc coated, of grade and coating as follows:

1. Grade: 50, Class 1 or 2.
2. Coating: G90.

2.2 EXTERIOR NON-LOAD-BEARING WALL FRAMING

A. Steel Studs: Manufacturer's standard C-shaped steel studs, of web depths indicated, punched, with stiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: 0.0428 inch.
2. Flange Width: 1-5/8 inches.

B. Steel Track: Manufacturer's standard U-shaped steel track, of web depths indicated, unpunched, with unstiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: 0.0428 inch.
2. Flange Width: 1-1/4 inches.

C. Vertical Deflection Clips: Manufacturer's standard bypass clips, capable of accommodating upward and downward vertical displacement of primary structure through positive mechanical attachment to stud web.

2.3 EXTERIOR CEILING JOIST, SOFFIT AND FASCIA FRAMING

A. Members: Manufacturer's standard C-shaped steel sections, of web depths indicated, with stiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: 0.0329 inch.
2. Flange Width: 1-5/8 inches, minimum.

2.4 INTERIOR SUSPENDED OVERHEAD FRAMING

A. Members: Manufacturer's standard C-shaped steel sections, of web depths indicated, with stiffened flanges, and as follows:

1. Minimum Base-Metal Thickness: 0.0329 inch.
2. Flange Width: 1-5/8 inches, minimum.

2.5 FRAMING ACCESSORIES

A. Fabricate steel-framing accessories from steel sheet, ASTM A 1003/A 1003M, Structural Grade, Type H, metallic coated, of same grade and coating weight used for framing members.

B. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:

1. Supplementary framing.
2. Bracing, bridging, and solid blocking.
3. Web stiffeners.
4. Anchor clips.
5. End clips.
6. Foundation clips.
7. Stud kickers, knee braces, and girts.
8. Hole reinforcing plates.
9. Backer plates.
10. 18 Gauge galvanized steel flat strapping, 8 to 10-inches wide, in lieu of wood blocking to support millwork, toilet partitions, toilet accessories, et cetera, in metal stud walls.

2.6 ANCHORS, CLIPS, AND FASTENERS

A. Steel Shapes and Clips: ASTM A 36/A 36M, zinc coated by hot-dip process according to ASTM A 123/A 123M.

B. Expansion Anchors: Fabricated from corrosion-resistant materials, with capability to sustain, without failure, a load equal to 5 times design load, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.

C. Power-Actuated Anchors: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with capability to sustain, without failure, a load equal to 10 times design load, as determined by testing per ASTM E 1190 conducted by a qualified independent testing agency.

D. Mechanical Fasteners: ASTM C 1513, corrosion-resistant-coated, self-drilling, self-tapping steel drill screws.

1. Head Type: Low-profile head beneath sheathing, manufacturer's standard elsewhere.

E. Welding Electrodes: Comply with AWS standards.

2.7 MISCELLANEOUS MATERIALS

A. Galvanizing Repair Paint: ASTM A 780.

B. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, non-staining grout containing selected silica sands, portland cement, shrinkage-compensating agents, and plasticizing and water-reducing agents, complying with ASTM C 1107/C 1107M, with fluid consistency and 30-minute working time.

C. Shims: Load bearing, high-density multi-monomer plastic, and non-leaching; or of cold-formed steel of same grade and coating as framing members supported by shims.

D. Sealer Gaskets: Closed-cell neoprene foam, 1/4 inch (6.4 mm) thick, selected from manufacturer's standard widths to match width of bottom track or rim track members.

2.8 FABRICATION

A. Fabricate cold-formed metal framing and accessories plumb, square, and true to line, and with connections securely fastened, according to referenced AISI's specifications and standards, manufacturer's written instructions, and requirements in this Section.

1. Fabricate framing assemblies using jigs or templates.
2. Cut framing members by sawing or shearing; do not torch cut.
3. Fasten cold-formed metal framing members by welding or screw fastening. Wire tying of framing members is not permitted.

a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
b. Locate mechanical fasteners and install according to Shop Drawings, with screw penetrating joined members by not less than three exposed screw threads.

4. Fasten other materials to cold-formed metal framing by welding or screw fastening, according to Shop Drawings.

B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or permanent distortion.

C. Fabrication Tolerances: Fabricate assemblies level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:

1. Spacing: Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
2. Squareness: Fabricate each cold-formed metal framing assembly to a maximum out-of-square tolerance of 1/8 inch.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine supporting substrates and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

A. Cold-formed metal framing may be shop or field fabricated for installation, or it may be field assembled.

B. Install cold-formed metal framing according to AISI's "Standard for Cold-Formed Steel Framing - General Provisions" and to manufacturer's written instructions unless more stringent requirements are indicated.

C. Install shop- or field-fabricated, cold-formed framing and securely anchor to supporting structure.

1. Screw or weld wall panels at horizontal and vertical junctures to produce flush, even, true-to-line joints with maximum variation in plane and true position between fabricated panels not exceeding 1/16 inch.

D. Install cold-formed metal framing and accessories plumb, square, and true to line, and with connections securely fastened.

1. Cut framing members by sawing or shearing; do not torch cut.
2. Fasten cold-formed metal framing members by welding or screw fastening. Wire tying of framing members is not permitted.

a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
b. Locate mechanical fasteners and install according to Shop Drawings, and complying with requirements for spacing, edge distances, and screw penetration.

E. Install framing members in one-piece lengths unless splice connections are indicated for track or tension members.

F. Install temporary bracing and supports to secure framing and support loads comparable in intensity to those for which structure was designed. Maintain braces and supports in place, undisturbed, until entire integrated supporting structure has been completed and permanent connections to framing are secured.

G. Do not bridge building expansion and control joints with cold-formed metal framing. Independently frame both sides of joints.

H. Install insulation, specified in Division 07 Section "Thermal Insulation," in built-up exterior framing members, such as headers, sills, boxed joists, and multiple studs at openings, that are inaccessible on completion of framing work.

I. Fasten hole reinforcing plate over web penetrations that exceed size of manufacturer's standard punched openings.

J. Erection Tolerances: Install cold-formed metal framing level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:

1. Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.

3.3 EXTERIOR NON-LOAD-BEARING WALL INSTALLATION

A. Install continuous tracks sized to match studs. Align tracks accurately and securely anchor to supporting structure as indicated.

B. Fasten both flanges of studs to bottom track, unless otherwise indicated. Space studs as follows:

1. Stud Spacing: 16 inches, maximum.

C. Set studs plumb, except as needed for diagonal bracing or required for nonplumb walls or warped surfaces and similar requirements.

D. Isolate non-load-bearing steel framing from building structure to prevent transfer of vertical loads while providing lateral support.

1. Connect vertical deflection clips to bypassing studs and anchor to building structure.

E. Install horizontal bridging in wall studs, spaced in rows indicated on Shop Drawings but not more than 48 inches apart. Fasten at each stud intersection.

1. Bridging: Cold-rolled steel channel, welded or mechanically fastened to webs of punched studs.
2. Bridging: Proprietary bridging bars installed according to manufacturer's written instructions.

F. Install miscellaneous framing and connections, including stud kickers, web stiffeners, clip angles, continuous angles, anchors, fasteners, and stud girts, to provide a complete and stable wall-framing system.

G. Install seal gaskets under all exterior metal stud walls.

3.4 EXTERIOR CEILING JOIST, SOFFIT AND FASCIA INSTALLATION

A. Install perimeter joist track sized to match joists. Align and securely anchor or fasten track to supporting structure at corners, ends, and spacings indicated on Shop Drawings.

B. Install joists bearing on supporting frame, level, straight, and plumb; adjust to final position, brace, and reinforce. Fasten joists to both flanges of joist track.

1. Install joists over supporting frame with a minimum end bearing of 1-1/2 inches.

2. Reinforce ends and bearing points of joists with web stiffeners, end clips, joist hangers, steel clip angles, or steel-stud sections as indicated on Shop Drawings.

C. Space joists not more than 2 inches from abutting walls, and as follows:

1. Joist Spacing: 24 inches, maximum.

D. Frame openings with built-up joist headers consisting of joist and joist track, nesting joists, or another combination of connected joists if indicated.

E. Install joist reinforcement at interior supports with single, short length of joist section located directly over interior support, with lapped joists of equal length to joist reinforcement, or as indicated on Shop Drawings.

F. Install bridging at intervals indicated on Shop Drawings. Fasten bridging at each joist intersection as follows:

1. Bridging: Joist-track solid blocking of width and thickness indicated, secured to joist webs.

G. Secure joists to load-bearing walls or supporting framing to prevent lateral movement of bottom flange.

H. Install miscellaneous joist framing and connections, including web stiffeners, closure pieces, clip angles, continuous angles, hold-down angles, anchors, and fasteners, to provide a complete and stable joist-framing assembly.

3.5 INTERIOR SUSPENDED OVERHEAD FRAMING INSTALLATION

A. Install perimeter joist track sized to match joists. Align and securely anchor or fasten track to supporting structure at corners, ends, and spacings indicated on Shop Drawings.

B. Install joists bearing on supporting frame, level, straight, and plumb; adjust to final position, brace, and reinforce. Fasten joists to both flanges of joist track.

1. Install joists over supporting frame with a minimum end bearing of 1-1/2 inches.

2. Reinforce ends and bearing points of joists with web stiffeners, end clips, joist hangers, steel clip angles, or steel-stud sections as indicated on Shop Drawings.

C. Space joists not more than 2 inches from abutting walls, and as follows:

1. Joist Spacing: 24 inches, maximum.

D. Frame openings with built-up joist headers consisting of joist and joist track, nesting joists, or another combination of connected joists if indicated.

E. Install joist reinforcement at interior supports with single, short length of joist section located directly over interior support, with lapped joists of equal length to joist reinforcement, or as indicated on Shop Drawings.

F. Install bridging at intervals indicated on Shop Drawings. Fasten bridging at each joist intersection as follows:

1. Bridging: Joist-track solid blocking of width and thickness indicated, secured to joist webs.

G. Secure joists to load-bearing walls or supporting framing to prevent lateral movement of bottom flange.

H. Install miscellaneous joist framing and connections, including web stiffeners, closure pieces, clip angles, continuous angles, hold-down angles, anchors, and fasteners, to provide a complete and stable joist-framing assembly.

3.6 SPECIAL INSPECTIONS

A. Special Inspections and tests shall be performed by the Special Inspector or Special Inspection Agency.

B. Verification and inspection of steel construction shall be in accordance with Table 1704.3 of 2012 North Carolina Building Code, and as follows:

1. Welding: Welding inspection shall be in compliance with AWS D1.3.

2. Details: Perform an inspection of the installed cold-formed metal framing to verify compliance with the details shown on the construction documents and approved shop drawings such as member size, gage, location and spacing, connection details and miscellaneous framing.

C. Correct deficiencies in Work that test reports and inspections indicate does not comply with the Contract Documents.

D. Additional testing performed to determine compliance of corrected work with specified requirements shall be at CMR's expense.

3.7 REPAIRS AND PROTECTION

A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on fabricated and installed cold-formed metal framing with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.

B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that cold-formed metal framing is without damage or deterioration at time of Acceptance by Owner.

END OF SECTION 054000

SECTION 055000 - METAL FABRICATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Miscellaneous steel framing and supports.
2. Steel weld plates and angles.
3. Loose steel lintels.
4. Pipe and Tube Railings and Handrails.

PART 2 - PRODUCTS

2.1 METALS

A. Metal Surfaces, General: For metal fabrications exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.

1. Steel plates, Shapes, and Bars: ASTM A 36/A 36M.
2. Stainless Steel Bars and Shapes: ASTM A276/A276M. Type 316L
3. Steel Tubing: ASTM A500/A500M
4. Aluminum Extrusions: ASTM B 221 (ASTM B 221M), Alloy 6063-T6.

2.2 FASTENERS

A. General: Type 304 or 316 stainless steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B633, Class Fe/Zn 5, at exterior walls. Provide stainless steel fasteners for fastening aluminum. Select fasteners for type, grade, and class required.

B. Cast-in-Place Anchors in Concrete: Either threaded or wedge type unless otherwise indicated; galvanized ferrous castings, either ASTM A47/A47M malleable iron or ASTM A27/A27M cast steel. Provide bolts, washers, and shims as needed, hot-dip galvanize per ASTM F2329/F2329M.

C. Post-Installed Anchors: Torque-controlled expansion anchors or chemical anchors.

1. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B633 or ASTM F1941/F1941M, Class Fe/Zn 5, unless otherwise indicated.
2. Material for Exterior Locations and Where Stainless Steel Is Indicated: Alloy Gour 1 or Group 2 stainless steel bolts. ASTM F593, and nits, ASTM F594.

2.3 MISCELLANEOUS MATERIALS

A. Universal Shop Primer: Fast curing, lead and chromate-free, universal modified-alkyd primer complying with MPI #107.

B. Galvanizing Repair Paint: SSPC-Paint 20, high zinc-dust-content paint for re-galvanizing welds in steel.

C. Nonshrink, Nonmetallic Grout: Factory-packaged, non-staining, noncorrosive, nongaseous grout complying with ASTM C 1107.

D. Concrete Materials and Properties: Comply with requirements in Division 3 Section. “Cast-in-Place Concrete” for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi (20 Mpa), unless otherwise indicated.

2.4 FINISHES:

A. Comply with NAAMM's Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Finish metal fabrications after assembly.

B. Steel and Iron Finishes:

1. Hot-dip galvanize all exterior lintels, handrails and railings and other items as indicated to comply with ASTM A 123/A 123M or ASTM A 153/A 153M as applicable.

2. Preparation for Shop Priming: Prepare un-coated ferrous-metal surfaces to comply with requirements indicated below for environmental exposure conditions of installed metal fabrications:

a. Exteriors (SSPC Zone 1B) SSPC-SP 6/NACE No. 3. "Commercial Blast Cleaning.

3. Shop Priming: Apply shop primer to uncoated surfaces of metal fabrications, except those with galvanized finishes and those to be embedded in concrete, sprayed-on fireproofing, or masonry, to comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting," for shop painting.

END OF SECTION 055000

SECTION 055100 - METAL STAIRS, METAL PIPE AND TUBE RAILINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Preassembled steel stairs with concrete-filled treads.
2. Industrial-type stairs with steel floor plate and grating treads.
3. Steel spiral stairs.
4. Steel tube railings attached to metal stairs.
5. Steel tube handrails attached to walls adjacent to metal stairs.

B. Related Sections include the following:

1. Division 03 Section "Cast-in-Place Concrete" for concrete fill for stair treads and platforms.
2. Division 05 Section "Metal Fabrications" for metal treads and nosings not installed in metal stairs.
4. Division 06 Section "Miscellaneous Rough Carpentry" for wood blocking for anchoring railings.
5. Division 09 Section “Resilient Base and Accessories” for applied tread and riser covering.
6. Division 9 Section “High Performance Coating” for painting metal surfaces that are exposed to view.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance of Stairs: Provide metal stairs capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Uniform Load: 100 lbf/sq. ft.
2. Concentrated Load: 300 lbf applied on an area of 4 sq. in.
3. Uniform and concentrated loads need not be assumed to act concurrently.
4. Stair Framing: Capable of withstanding stresses resulting from railing loads in addition to loads specified above.
5. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less.

B. Structural Performance of Railings: Provide railings capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Handrails:

a. Uniform load of 50 lbf/ ft. applied in any direction.
b. Concentrated load of 200 lbf applied in any direction.
c. Uniform and concentrated loads need not be assumed to act concurrently.

C. Seismic Performance: Provide metal stairs capable of withstanding the effects of earthquake motions determined according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 9, "Earthquake Loads."

1.4 SUBMITTALS

A. Product Data: For metal stairs and the following:

1. Prefilled metal-pan stair treads.
2. Paint products.
3. Grout.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Provide templates for anchors and bolts specified for installation under other Sections.
2. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Samples for Initial Selection: For products involving selection of color, texture, or design.

D. Welding certificates.

E. Qualification Data: For professional engineer.

F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for stairs and railings.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Fabricator of products.

B. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," for class of stair designated, unless more stringent requirements are indicated.

1. Preassembled Stairs: Commercial class.

C. Welding: Qualify procedures and personnel according to the following:

1. AWS D1.1, "Structural Welding Code--Steel."
2. AWS D1.3, "Structural Welding Code--Sheet Steel."

1.6 COORDINATION

A. Coordinate installation of anchorages for metal stairs. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

B. Coordinate locations of hanger rods and struts with other work so that they will not encroach on required stair width and will be within the fire-resistance-rated stair enclosure.

C. Verify the upper floor elevation with the CMR and with the structural steel shop drawings to assure the heights of risers and landings are evenly spaced.

PART 2 - PRODUCTS

2.1 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth, flat surfaces, unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, raised welds, roller marks, rolled trade names, or blemishes.

2.2 FERROUS METALS

A. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

B. Steel Tubing: ASTM A 500 (cold formed) or ASTM A 513, Type 5 (mandrel drawn).

C. Rolled-Steel Floor Plate: ASTM A 786/A 786M, rolled from plate complying with ASTM A 36/A 36M or ASTM A 283/A 283M, Grade C or D.

D. Steel Bars for Grating Treads: ASTM A 36/A 36M.

E. Wire Rod for Grating Crossbars: ASTM A 510.

F. Iron Castings: Either gray or malleable iron, unless otherwise indicated.

1. Malleable Iron: ASTM A 47/A 47M.

G. Uncoated, Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, either commercial steel, Type B, or structural steel, Grade 25, unless another grade is required by design loads; exposed.

2.3 ABRASIVE NOSINGS FOR EMBEDDING IN CONCRETE STEPS

A. Provide anchors for embedding units in concrete, either integral or applied to units, as standard with manufacturer. Length to be 8 inches shorter than tread; centered on the tread.

B. Apply bituminous paint to concealed bottoms, sides, and edges of cast-metal

units set into concrete.

C. Apply clear lacquer to concealed bottoms, sides, and edges of extruded units set into concrete.

2.4 FASTENERS

A. General: Provide zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 25 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required.

B. Bolts and Nuts: Regular hexagon-head bolts, ASTM A 307, Grade A; with hex nuts, ASTM A 563; and, where indicated, flat washers.

C. Anchor Bolts: ASTM F 1554, Grade 36.

1. Provide hot-dip or mechanically deposited, zinc-coated anchor bolts for exterior stairs.

D. Machine Screws: ASME B18.6.3.

E. Lag Bolts: ASME B18.2.1.

F. Plain Washers: Round, ASME B18.22.1.

G. Lock Washers: Helical, spring type, ASME B18.21.1.

H. Expansion Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

1. Material for Anchors in Interior Locations: Carbon-steel components zinc-plated to comply with ASTM B 633, Class Fe/Zn 5.

2.5 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

B. Galvanizing Repair Paint: High-zinc-dust-content paint for regalvanizing welds in steel, complying with SSPC-Paint 20.

C. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

D. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

E. Concrete Materials and Properties: Comply with requirements in Division 03 Section "Cast-in- Place Concrete" for normal-weight, air-entrained, ready-mix concrete with a minimum 28-day compressive strength of 3000 psi, unless otherwise indicated.

2.6 FABRICATION, GENERAL

A. Provide complete stair assemblies, including metal framing, hangers, struts, railings, clips, brackets, bearing plates, and other components necessary to support and anchor stairs and platforms on supporting structure.

1. Join components by welding, unless otherwise indicated.
2. Use connections that maintain structural value of joined pieces.
3. Fabricate treads and platforms of exterior stairs so finished walking surfaces slope to drain.

B. Preassembled Stairs: Assemble stairs in shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

E. Form exposed work true to line and level with accurate angles and surfaces and straight edges.

F. Weld connections to comply with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Weld exposed corners and seams continuously, unless otherwise indicated.
5. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

G. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts unless otherwise indicated. Locate joints where least conspicuous.

H. Fabricate joints that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

2.7 STEEL-FRAMED STAIRS

A. Stair Framing:

1. Fabricate stringers of steel plates or channels.

a. Provide closures for exposed ends of channel stringers.

2. Construct platforms of steel plate or channel headers and miscellaneous framing members as needed to comply with performance requirements indicated.
3. Weld stringers to headers; weld framing members to stringers and headers.
4. Where stairs are enclosed by gypsum board shaft-wall assemblies, provide hanger rods or struts to support landings from floor construction above or below. Locate hanger rods and struts where they will not encroach on required stair width and will be within the fire- resistance-rated stair enclosure.
5. Where masonry walls support metal stairs, provide temporary supporting struts designed for erecting steel stair components before installing masonry.

B. Metal-Pan Stairs: Form risers, subtread pans, and subplatforms to configurations shown from steel sheet of thickness needed to comply with performance requirements but not less than 0.0677 inch.

1. Steel Sheet: Uncoated cold-rolled steel sheet, unless otherwise indicated.
2. Directly weld metal pans to stringers; locate welds on top of subtreads where they will be concealed by concrete fill. Do not weld risers to stringers.
3. Shape metal pans to include nosing integral with riser.
4. At CMR's option, provide stair assemblies with metal-pan subtreads filled with reinforced concrete during fabrication.
5. Provide sub-platforms of configuration indicated or, if not indicated, the same as sub-treads. Weld sub-platforms to platform framing.

a. Smooth Soffit Construction: Construct sub-platforms with smooth soffits, where exposed to view.

2.8 STEEL TUBE RAILINGS

A. General: Fabricate railings to comply with requirements indicated for design, dimensions, details, finish, and member sizes, including wall thickness of tube, post spacings, and anchorage, but not less than that needed to withstand indicated loads.

1. Configuration: As indicated and detailed. Each stair needs railings at two different heights.

B. Welded Connections: Fabricate railings with welded connections. Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.

C. Form changes in direction of railings as follows:

1. As detailed.

D. Close exposed ends of railing members with prefabricated end fittings.

E. Provide wall returns at ends of wall-mounted handrails, unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch or less.

F. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, end closures, flanges, miscellaneous fittings, and anchors for interconnecting components and for attaching to other work. Furnish inserts and other anchorage devices for connecting to

concrete or masonry work.

1. Connect posts to stair framing by direct welding, unless otherwise indicated.
2. Use all galvanized railings. Provide galvanized fittings, brackets, fasteners, sleeves, and other ferrous-metal components.
3. For nongalvanized railings, provide nongalvanized ferrous-metal fittings, brackets, fasteners, and sleeves, except galvanize anchors embedded in exterior masonry and concrete construction.

G. Fillers: Provide fillers made from galvanized steel plate, or other suitably crush-resistant material, where needed to transfer wall bracket loads through wall finishes to structural supports. Size fillers to suit wall finish thicknesses and to produce adequate bearing area to prevent bracket rotation and overstressing of substrate.

2.9 FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish metal stairs after assembly. Galvanizing: Hot-dip galvanize all items to comply with applicable standard listed below:

ASTM A 123/A 123M, for galvanizing steel and iron products. ASTM A 153/A 153M, for galvanizing steel and iron hardware. Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.

C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete, unless otherwise indicated.

D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

F. Field Welding: Comply with the following requirements:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

G. Place and finish concrete fill for treads and platforms to comply with Division 03 Section "Cast- in-Place Concrete."

1. Install abrasive nosings with anchors fully embedded in concrete. Center nosings on tread width.

3.2 INSTALLING METAL STAIRS WITH GROUTED BASEPLATES

A. Clean concrete and masonry bearing surfaces of bond-reducing materials, and roughen to improve bond to surfaces. Clean bottom surface of baseplates.

B. Set steel stair baseplates on wedges, shims, or leveling nuts. After stairs have been positioned and aligned, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.

1. Use nonmetallic, nonshrink grout, unless otherwise indicated.
2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.3 INSTALLING STEEL TUBE RAILINGS

A. Adjust railing systems before anchoring to ensure matching alignment at abutting joints. Space posts at spacing indicated or, if not indicated, as required by design loads. Plumb posts in each direction. Secure posts and rail ends to building construction as follows:

1. Anchor posts to steel by welding directly to steel supporting members.
2. Anchor handrail ends to concrete and masonry with steel round flanges welded to rail ends and anchored with postinstalled anchors and bolts.

B. Attach handrails to wall with wall brackets. Provide bracket with 1-1/2-inch clearance from inside face of handrail and finished wall surface. Locate brackets as indicated or, if not indicated, at spacing required to support structural loads. Secure wall brackets to building construction as follows:

1. Use type of bracket with flange tapped for concealed anchorage to threaded hanger bolt.
2. For concrete and solid masonry anchorage, use drilled-in expansion shields and hanger or lag bolts.
3. For hollow masonry anchorage, use toggle bolts.

END OF SECTION 055100

SECTION 055213 - PIPE AND TUBE RAILINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Exterior aluminum handrails.
   2. Exterior aluminum guardrails.

1.3 COORDINATION

A. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project

B. site in time for installation.

1.4 ACTION SUBMITTALS

A. Product Data: For the following:

   1. Manufacturer's product lines of mechanically connected railings.
   2. Railing brackets.
   3. Grout, anchoring cement, and paint products.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

   1. Shop drawings for pipe and tube railings are to be signed and sealed by a qualified professional engineer currently licensed to practice in North Carolina.

C. Samples: For each type of exposed finish required.

   1. Sections of each distinctly different linear railing member, including handrails, top rails, posts, and balusters, including finish.
   2. Fittings and brackets.
   3. Assembled Sample of railing system, made from full-size components, including top rail, post, handrail, and infill. Sample need not be full height.

      a. Show method of connecting and finishing members at intersections.

D. Delegated-Design Submittal: For railings, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Welding certificates.

C. Mill Certificates: Signed by manufacturers of stainless-steel products certifying that products furnished comply with requirements.

D. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.

E. Product Test Reports: For pipe and tube railings, for tests performed by a qualified testing agency, according to ASTM E 894 and ASTM E 935.

F. Evaluation Reports: For post-installed anchors, from ICC-ES.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.6/D1.6M, "Structural Welding Code - Stainless Steel."

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

1.8 FIELD CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.

PART 2 - PRODUCTS

2.1 GUARDRAILS

A. Guardrail with aluminum infill panel:
   1. Basis-of-Design Product: Subject to compliance with requirements, provide Greco Aluminum Panel Rail or comparable product by one of the following:
   2. Manufacturer: Greco Architectural Metal Products
   3. Model: Panel Infill Railing G506A
   4. Height: Refer to Drawings.

B. Source Limitations: Obtain each type of railing from single source from single manufacturer.

2.2 HANDRAILS

A. Handrail
   1. Design: Refer to Drawings.

2. Height: Refer to Drawings.
3. Material: Anodized Aluminum, to match guardrail finish.

B. Source Limitations: Obtain each type of railing from single source from single manufacturer.

2.3 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design railings, including attachment to building construction.

B. Structural Performance: Railings, including attachment to building construction, shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Handrails and Top Rails of Guards:

a. Uniform load of 50 lbf/ ft. applied in any direction.
b. Concentrated load of 200 lbf applied in any direction.
c. Uniform and concentrated loads need not be assumed to act concurrently.

2. Deflection Limits:

a. Maximum Deflection Limit: 0.60 inches unless current code requires more stringent limit.

1) Limit based on NC State Building Code and International Building Code for structural system requirements to not exceed most restrictive deflection limits.

C. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

2.4 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

B. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails unless otherwise indicated.
1. Provide formed stainless steel brackets with predrilled hole for bolted anchorage and with snap-on cover that matches rail finish and conceals bracket base and bolt head and that provides 1-1/2-inch clearance from inside face of handrail to finished wall surface.

2.5 STAINLESS STEEL

A. Tubing: ASTM A 554, Grade MT 304.

2.6 FASTENERS

A. General: Provide the following:
   1. Stainless-Steel Railings: Type 304 stainless-steel fasteners.
   2. Provide exposed fasteners with finish matching appearance, including color and texture, of railings.

B. Fasteners for Interconnecting Railing Components:

   1. Provide concealed fasteners for interconnecting railing components and for attaching them to other work, unless otherwise indicated.

2.7 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

   1. For stainless-steel railings, provide type and alloy as recommended by producer of metal to be welded and as required for color match, strength, and compatibility in fabricated items.

B. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications.

C. Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.

   1. Water-Resistant Product: At exterior locations provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

2.8 FABRICATION

A. General: Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.

B. Shop assemble railings to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

D. Form work true to line and level with accurate angles and surfaces.

E. Fabricate connections that are exposed to weather in a manner that excludes water. Provide weep holes where water may accumulate.

F. Connections: Fabricate railings with welded connections unless otherwise indicated.

G. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove flux immediately.
4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.

H. Nonwelded Connections: Connect members with concealed mechanical fasteners and fittings. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.

1. Fabricate splice joints for field connection using an epoxy structural adhesive if this is manufacturer's standard splicing method.

I. Form Changes in Direction as Follows:

1. As detailed.

J. For changes in direction made by bending, use jigs to produce uniform curvature for each repetitive configuration required. Maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of components.

K. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work unless otherwise indicated.

1. At brackets and fittings fastened to plaster or gypsum board partitions, provide crush-resistant fillers or other means to transfer loads through wall finishes to structural supports and prevent bracket or fitting rotation and crushing of substrate.

L. For railing posts set in concrete, provide stainless-steel sleeves not less than 8 inches long with inside dimensions not less than 1/2 inch greater than outside dimensions of post, with metal plate forming bottom closure.

2.9 STAINLESS-STEEL FINISHES

A. Remove tool and die marks and stretch lines, or blend into finish.

B. Grind and polish surfaces to produce uniform, directionally textured, polished finish indicated, free of cross scratches. Run grain with long dimension of each piece.

C. Directional Satin Finish: No. 4, or as needed to match finish of exterior illuminated railings.

D. When polishing is completed, passivate and rinse surfaces. Remove embedded foreign matter and leave surfaces chemically clean.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine plaster and gypsum board assemblies, where reinforced to receive anchors, to verify that locations of concealed reinforcements are clearly marked for Installer. Locate reinforcements and mark locations if not already done.

3.2 INSTALLATION, GENERAL

A. Fit exposed connections together to form tight, hairline joints.

B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.

1. Do not weld, cut, or abrade surfaces of railing components that are coated or finished after fabrication and that are intended for field connection by mechanical or other means without further cutting or fitting.
2. Set posts plumb within a tolerance of 1/16 inch in 3 feet.
3. Align rails so variations from level for horizontal members and variations from parallel with rake of steps and ramps for sloping members do not exceed 1/4 inch in 12 feet.

C. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

1. Coat, with a heavy coat of bituminous paint, concealed surfaces of aluminum that are in contact with grout, concrete, masonry, wood, or dissimilar metals.

D. Adjust railings before anchoring to ensure matching alignment at abutting joints.

E. Fastening to In-Place Construction: Use anchorage devices and fasteners where necessary for securing railings and for properly transferring loads to in-place construction.

3.3 RAILING CONNECTIONS

A. Nonwelded Connections: Use mechanical or adhesive joints for permanently connecting railing components. Seal recessed holes of exposed locking screws using plastic cement filler colored to match finish of railings.

B. Welded Connections: Use fully welded joints for permanently connecting railing components. Comply with requirements for welded connections in "Fabrication" Article whether welding is performed in the shop or in the field.

C. Expansion Joints: Install expansion joints at locations indicated but not farther apart than required to accommodate thermal movement. Provide slip-joint internal sleeve extending 2 inches beyond joint on either side, fasten internal sleeve securely to one side, and locate joint within 6 inches of post.

3.4 ANCHORING POSTS

A. Use metal sleeves preset and anchored into concrete for installing posts. After posts are inserted into sleeves, fill annular space between post and sleeve with nonshrink, nonmetallic grout, mixed and placed to comply with anchoring material manufacturer's written instructions.

B. Form or core-drill holes not less than 8 inches deep and 3/4 inch larger than OD of post for installing posts in concrete. Clean holes of loose material, insert posts, and fill annular space between post and concrete with nonshrink, nonmetallic grout, mixed and placed to comply with anchoring material manufacturer's written instructions.

C. Cover anchorage joint with flange of same metal as post as indicated.

D. Leave anchorage joint exposed with 1/8-inch buildup, sloped away from post.

3.5 ADJUSTING AND CLEANING

A. Clean stainless steel by washing thoroughly with clean water and soap and rinsing with clean water.

3.6 PROTECTION

A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Final Acceptance.

END OF SECTION 055213

SECTION 055300 - METAL GRATINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. Metal bar gratings.
2. Metal frames and supports for gratings.

B. Related Sections include the following:

1. Division 05 Section "Structural Steel" for structural-steel framing system components.
2. Division 05 Section "Metal Stairs, Pipe and Tube Railings " for grating treads and landings of steel-framed stairs, and for metal pipe and tube handrails and railings.

1.3 PERFORMANCE REQUIREMENTS

A. Structural Performance of Gratings: Provide gratings capable of withstanding the effects of gravity loads and the following loads and stresses within limits and under conditions indicated:

1. Walkways and Elevated Platforms Used as Exits: Uniform load of 100 lbf/sq. ft.
2. Limit deflection to L/360 or 1/4 inch, whichever is less.

B. Seismic Performance: Provide gratings capable of withstanding the effects of earthquake motions determined according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures" : Section 9, "Earthquake Loads."

1.4 SUBMITTALS

A. Product Data: For the following:

1. Clips and anchorage devices for gratings.
2. Paint products.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1. Provide templates for anchors and bolts specified for installation under other Sections.

2. For installed products indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Welding certificates.

D. Qualification Data: For professional engineer.

1.5 QUALITY ASSURANCE

A. Metal Bar Grating Standards: Comply with NAAMM MBG 531, "Metal Bar Grating Manual" and NAAMM MBG 532, "Heavy-Duty Metal Bar Grating Manual."

B. Welding: Qualify procedures and personnel according to the following:

1. AWS D1.1, "Structural Welding Code--Steel."
2. AWS D1.3, "Structural Welding Code--Sheet Steel."

1.6 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with gratings by field measurements before fabrication and indicate measurements on Shop Drawings.

1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating gratings without field measurements. Coordinate wall and other contiguous construction to ensure that actual dimensions correspond to established dimensions.
2. Provide allowance for trimming and fitting at site.

1.7 COORDINATION

A. Coordinate installation of anchorages for gratings, grating frames, and supports. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Metal Bar Gratings:

a. Alabama Metal Industries Corporation.
b. All American Grating, Inc.
c. Barnett/Bates Corp.
d. Fisher & Ludlow.
e. IKG Industries; a Harsco Company.
f. Marwas Steel Co.; Laurel Steel Products Division.
g. Ohio Gratings, Inc.
h. Seidelhuber Metal Products, Inc.
i. Tru-Weld.

2.2 FERROUS METALS

A. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

B. Wire Rod for Grating Crossbars: ASTM A 510.

2.3 FASTENERS

A. General: Unless otherwise indicated, provide Type 316 stainless-steel fasteners for and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, at exterior walls. Provide stainless-steel fasteners for fastening aluminum. Select fasteners for type, grade, and class required.

B. Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM A 307, Grade A; with hex nuts, ASTM A 563; and, where indicated, flat washers.

C. Stainless-Steel Bolts and Nuts: Regular hexagon-head annealed stainless-steel bolts, nuts, and, where indicated, flat washers; ASTM F 593 for bolts and ASTM F 594 for nuts, Alloy Group 1.

D. Plain Washers: Round, ASME B18.22.1.

E. Lock Washers: Helical, spring type, ASME B18.21.1.

F. Anchors: Provide cast-in-place, chemical or torque-controlled expansion anchors with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.

1. Material for Anchors in Interior Locations: Carbon-steel components zinc-plated to
2. comply with ASTM B 633, Class Fe/Zn 5.

2.4 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy that is welded.

B. Zinc-Rich Primer: Zinc-rich primer, complying with SSPC-Paint 20 or SSPC-Paint 29 and compatible with topcoat.

1. Products: Subject to compliance with requirements, provide one of the following:

    a. Benjamin Moore & Co.; Epoxy Zinc-Rich Primer CM18/19.
    b. Carboline Company; Carbozinc 621.
    c. ICI Devoe Coatings; Catha-Coat 313.
    d. PPG Architectural Finishes, Inc.; Aquapon Zinc-Rich Primer 97-670.
    e. Sherwin-Williams Company (The); Corothane I GalvaPac Zinc Primer.
    f. Tnemec Company, Inc.; Tneme-Zinc 90-97.

B. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.5 FABRICATION

A. Shop Assembly: Fabricate grating sections in shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

B. Cut, drill, and punch material cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

C. Form from materials of size, thickness, and shapes indicated, but not less than that needed to support indicated loads.

D. Fit exposed connections accurately together to form hairline joints.

E. Welding: Comply with AWS recommendations and the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.

F. Provide for anchorage of type indicated; coordinate with supporting structure. Fabricate and space the anchoring devices to secure gratings, frames, and supports rigidly in place and to support indicated loads.

1. Fabricate toeplates for attaching in the field.
2. Toeplate Height: 4 inches, unless otherwise indicated.

2.6 METAL BAR GRATINGS

A. Welded Steel Grating:

1. Bearing Bar Spacing: 11/16-inch o.c.
2. Bearing Bar Depth: As required to comply with structural performance requirements.
3. Bearing Bar Thickness: As required to comply with structural performance requirements.
4. Crossbar Spacing: 2 inches o.c.
5. Traffic Surface: Serrated.
6. Steel Finish: Shop primed.

C. Fabricate cutouts in grating sections for penetrations indicated. Arrange cutouts to permit grating removal without disturbing items penetrating gratings.

1. Edge-band openings in grating that interrupt four or more bearing bars with bars of same size and material as bearing bars.

C. Do not notch bearing bars at supports to maintain elevation.

2.7 GRATING FRAMES AND SUPPORTS

A. Frames and Supports for Metal Gratings: Fabricate from metal shapes, plates, and bars of welded construction to sizes, shapes, and profiles indicated and as necessary to receive gratings. Miter and weld connections for perimeter angle frames. Cut, drill, and tap units to receive hardware

and similar items.

1. Unless otherwise indicated, fabricate from same basic metal as gratings.
2. Equip units indicated to be cast into concrete or built into masonry with integrally welded anchors. Unless otherwise indicated, space anchors 24 inches o.c. and provide minimum anchor units in the form of steel straps 1-1/4 inches wide by 1/4 inch thick by 8 inches long.

2.10 STEEL FINISHES

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish gratings, frames, and supports after assembly.

C. Hot Dip Galvanize all components to comply with ASTM A 123/A 123M or ASTM A 153/A 153M as applicable.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing gratings to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing gratings. Set units accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.

C. Provide temporary bracing or anchors in formwork for items that are to be built into concrete or masonry.

D. Fit exposed connections accurately together to form hairline joints.

1. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade the surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

E. Attach toeplates to gratings by welding at locations indicated.

F. Field Welding: Comply with the following requirements:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.

G. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout,

concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

3.2 INSTALLING METAL BAR GRATINGS

A. General: Install gratings to comply with recommendations of referenced metal bar grating standards that apply to grating types and bar sizes indicated, including installation clearances and standard anchoring details.

B. Attach nonremovable units to supporting members by welding where both materials are same; otherwise, fasten by bolting as indicated above.

3.3 INSTALLING METAL PLANK GRATINGS

A. General: Comply with manufacturer's written instructions for installing gratings. Use manufacturer's standard anchor clips and hold-down devices for bolted connections.

3.4 ADJUSTING AND CLEANING

A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting to comply with SSPC-PA 1 requirements for touching up shop-painted surfaces.

1. Apply by brush or spray to provide a minimum 2.0-mil dry film thickness.

END OF SECTION 055300

SECTION 061053 - MISCELLANEOUS ROUGH CARPENTRY

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Wood blocking and nailers.
2. Wood furring.
3. Wood sleepers.
4. Plywood backing panels.
5. Plywood for roof edge framing.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

1.3 INFORMATIONAL SUBMITTALS

A. Evaluation Reports: For the following, from ICC-ES:

1. Preservative-treated wood.
2. Fire-retardant-treated wood.
3. Power-driven fasteners.

PART 2 - PRODUCTS

2.1 WOOD PRODUCTS, GENERAL

A. Lumber: DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Provide lumber graded by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.

1. Factory mark each piece of lumber with grade stamp of grading agency.
2. For exposed lumber indicated to receive a stained or natural finish, mark grade stamp on end or back of each piece.
3. Provide dressed lumber, S4S, unless otherwise indicated.

B. Maximum Moisture Content of Lumber: 19 percent unless otherwise indicated.

2.2 WOOD-PRESERVATIVE-TREATED MATERIALS

A. Preservative Treatment by Pressure Process: AWPA U1; Use Category UC2 for interior construction not in contact with the ground, Use Category UC3b for exterior construction not in contact with the ground, and Use Category UC4a for items in contact with the ground.

1. Preservative Chemicals: Acceptable to authorities having jurisdiction and containing no arsenic or chromium. Do not use inorganic boron (SBX) for sill plates.

B. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or does not comply with requirements for untreated material.

C. Mark lumber with treatment quality mark of an inspection agency approved by the ALSC Board of Review.

D. Application: Treat all miscellaneous carpentry unless otherwise indicated.

2.3 FIRE-RETARDANT-TREATED MATERIALS

A. Fire-Retardant-Treated Lumber and Plywood by Pressure Process: Products with a flame spread index of 25 or less when tested according to ASTM E 84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet (3.2 m) beyond the centerline of the burners at any time during the test.

1. Interior Type A: Treated materials shall have a moisture content of 28 percent or less when tested according to ASTM D 3201 at 92 percent relative humidity. Use where exterior type is not indicated.

B. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Identify fire-retardant-treated wood with appropriate classification marking of testing and inspecting agency acceptable to authorities having jurisdiction.

C. Application: Treat items indicated on Drawings, and the following:

1. Plywood backing panels.
2. Elsewhere as noted on the Drawings.

2.4 MISCELLANEOUS LUMBER

A. General: Provide miscellaneous lumber indicated and lumber for support or attachment of other construction, including the following:

1. Blocking.
2. Nailers.
3. Furring.

B. For items of dimension lumber size, provide Construction or No. 2 grade lumber of any species. At exterior walls and roof use pressure-treated lumber (PTW) Grade UC4A.

C. For concealed boards, provide lumber with 15 percent maximum moisture content and of the following species and grade:

1. Mixed southern pine, No. 2 grade; SPIB.

2.5 PLYWOOD BACKING PANELS

A. Equipment Backing Panels: DOC PS 1, Exposure 1, C-D Plugged, fire-retardant treated, in thickness indicated or, if not indicated, not less than 1/2-inch (13-mm) nominal thickness.

1. Plywood shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.6 PLYWOOD FOR ROOF EDGE FRAMING

A. DOC PS 1, Exterior, C-D, preservative treated, in thickness indicated or, if not indicated, not less than 3/4-inch nominal thickness.

2.7 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

1. Where carpentry is exposed to weather, in ground contact, pressure-preservative treated, or in area of high relative humidity, provide fasteners with hot-dip zinc coating complying with ASTM A 153/A 153M.

B. Power-Driven Fasteners: NES NER-272.

C. Screws for Fastening to Metal Framing: ASTM C 1002, length as recommended by screw manufacturer for material being fastened.

2.8 TPO MEMBRANE BETWEEN CONCRETE/CMU AND PTW OR METAL DECKING

A. Fabric-Reinforced Thermoplastic Polyolefin Sheet: ASTM D 6878, internally fabric or scrim reinforced, uniform, flexible fabric backed TPO sheet.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. Carlisle SynTec Incorporated.
b. Firestone Building Products Company.
c. GAF Materials Corporation.
d. Johns Manville.

2. Thickness: 45 mils (1.1 mm), nominal.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Set carpentry to required levels and lines, with members plumb, true to line, cut, and fitted. Fit carpentry to other construction; scribe and cope as needed for accurate fit.

B. Where wood-preservative-treated lumber is installed adjacent to metal decking or concrete/concrete masonry, install continuous flexible flashing separator (TPO) between wood and metal decking or concrete/concrete masonry.

C. Framing Standard: Comply with AF&PA's WCD 1, "Details for Conventional Wood Frame Construction," unless otherwise indicated.

D. Install plywood backing panels by fastening to studs; coordinate locations with utilities requiring backing panels.

E. Do not splice structural members between supports unless otherwise indicated.

F. Comply with AWPA M4 for applying field treatment to cut surfaces of preservative-treated lumber.

G. Securely attach carpentry work to substrate by anchoring and fastening as indicated, complying with the following:

1. NES NER-272 for power-driven fasteners.
2. Table 2304.9.1, "Fastening Schedule," in ICC's International Building Code.
3. Table R602.3(1), "Fastener Schedule for Structural Members," and Table R602.3(2), "Alternate Attachments," in ICC's International Residential Code for One- and Two-Family Dwellings.

3.2 PROTECTION

A. Protect wood that has been treated with inorganic boron (SBX) from weather. If, despite protection, inorganic boron-treated wood becomes wet, apply EPA-registered borate treatment. Apply borate solution by spraying to comply with EPA-registered label.

END OF SECTION 061053

SECTION 061600 - SHEATHING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Wall sheathing and soffit panels under EIFS finish system or EIFS coating.
2. Sheathing joint and penetration treatment.
3. Marine plywood sheathing at interior curved walls.

B. Related Sections Include:

1. 042100, Unit Masonry.
2. 054000, Cold-Formed Metal Framing.
3. 061053, Miscellaneous Rough Carpentry.
4. 072100, Thermal Insulation.
5. 072419, Water Drainage Exterior Insulation and Finish System (EIFS)
6. 072726, Fluid-Applied Membrane Air Barrier
7. 084113, Aluminum-Framed Entrances and Storefronts.
8. 084414, Glazed Aluminum Curtain Walls.
9. 092900, Gypsum Board.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

PART 2 - PRODUCTS

2.1 WALL SHEATHING

A. Glass-Mat Gypsum Sheathing Board: ASTM C 1177/C 1177M, with fiberglass mat laminated to both sides and with manufacturer's standard edges. Use for EIFS backer board and exterior soffits.

1. Type and Thickness: Regular, 1/2 inch (13 mm) thick.

2.2 FASTENERS

A. General: Provide fasteners of size and type indicated that comply with requirements specified in this article for material and manufacture.

1. For wall sheathing, provide fasteners with hot-dip zinc coating complying with ASTM A 153/A 153M.

2.3 SHEATHING JOINT-AND-PENETRATION TREATMENT MATERIALS

A. Sealant for Glass-Mat Gypsum Sheathing: Silicone emulsion sealant complying with ASTM C 834, compatible with sheathing tape and sheathing and recommended by tape and

sheathing manufacturers for use with glass-fiber sheathing tape and for covering exposed fasteners.

1. Sheathing Tape: Self-adhering glass-fiber tape, minimum 2 inches (50 mm) wide, 10 by 10 or 10 by 20 threads/inch (390 by 390 or 390 by 780 threads/m), of type recommended by sheathing and tape manufacturers for use with silicone emulsion sealant in sealing joints in glass-mat gypsum sheathing and with a history of successful in-service use.

2.4 SPECIAL WALL SHEATHING FOR INTERIOR CURVED SURFACES

A. APA 1/4" B-B Marine Grade Plywood with MDO surfaces.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Do not use materials with defects that impair quality of sheathing or pieces that are too small to use with minimum number of joints or optimum joint arrangement. Arrange joints so that pieces do not span between fewer than three support members.

B. Cut panels at penetrations, edges, and other obstructions of work; fit tightly against abutting construction unless otherwise indicated.

C. Securely attach to substrate by fastening as indicated, complying with the following:

1. Table 2304.9.1, "Fastening Schedule," in ICC's "International Building Code."

D. Coordinate wall sheathing installation with flashing and joint-sealant installation so these materials are installed in sequence and manner that prevent exterior moisture from passing through completed assembly.

E. Do not bridge building expansion joints; cut and space edges of panels to match spacing of structural support elements.

3.2 GYPSUM SHEATHING INSTALLATION

A. Comply with GA-253 and with manufacturer's written instructions.

1. Fasten gypsum sheathing to cold-formed metal framing with screws.
2. Install boards with a 3/8-inch (9.5-mm) gap where non-load-bearing construction abuts structural elements.
3. Install boards with a 1/4-inch (6.4-mm) gap where they abut masonry or similar materials that might retain moisture, to prevent wicking.

B. Seal sheathing joints according to sheathing manufacturer's written instructions.

1. Apply glass-fiber sheathing tape to glass-mat gypsum sheathing joints and apply and trowel silicone emulsion sealant to embed entire face of tape in sealant. Apply sealant to exposed fasteners with a trowel so fasteners are completely covered. Seal other penetrations and openings.

END OF SECTION 061600

SECTION 062700 – FIBERGLASS SCULPTURE

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Polystyrene foam block
2. Fiberglass fabric
3. Polyester resin
4. Timber and Steel framing

1.2 ACTION SUBMITTALS

A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

PART 2 - PRODUCTS

2.1 MATERIALS TO CREATE SCULPTURE OF WHALE TAIL – WHERE SHOWN ON THE DRAWINGS

A. Extruded polystyrene, 1-pound density, sized as required to sculpt item.

1. Provide latex protective coating material.

B. Fiberglass Materials for Touch Tank. Basis of Design Products are as manufactured by Evercoat Marine. Product by other manufacturers having the same properties will be acceptable.

1. Glass fiber fabric: 6 oz. “Sea-glass”,
2. Polyester resin: Catalyzing resin mixed with methyl-ethyl-ketone, “Boat Yard Resin”.
3. Laminating resin.
4. Polyester gel coat and coloring agent.

C. Materials for suspending the Sculpture. Match sizes used for the current mounting which will be dismantled.

1. ¾-inch APA B-B marine plywood and PTW lumber for anchoring the sculpture.
2. ¼-inch 316 stainless steel plate for anchoring the sculpture.
3. Stainless steel eye hook and cable for suspending the sculpture.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Do not use materials with defects that impair quality of the finished sculpture.

B. Carve polystyrene foam to required shape. Encase the timber plywood and steel in the foam.

C. Coat the assembly in protective latex. Apply fiberglass and gelcoat.

D. Securely bolt the sculpture to existing, adjoining piece and attach to ceiling by stainless steel cable.

E. The sculpture will resemble the existing whale tail and be adjusted to upward stroke of swimming position to clear the adjacent pedestrian walkway passage.

F. Finish the assembly to match the rest of the existing sculpture, with detailed markings including barnacles.

END OF SECTION 062700

SECTION 064023 – INTERIOR ARCHITECTURAL WOODWORK

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Plastic-laminate cabinets, including acrylic polymer composite countertops and facing material, where shown.

B. Related Sections:

1. 061053, Miscellaneous Rough Carpentry.
2. 079200, Joint Sealants.
3. 090000, Color Schedule.
4. 092216, Non-Structural Metal Framing. Assure dimension lumber or galvanized steel strapping is installed for blocking to support cabinets.
5. 096513, Resilient Base and Accessories.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product, including panel products, high-pressure decorative laminate, adhesive for bonding plastic laminate, and cabinet hardware and accessories.

B. Shop Drawings: Show location of each item, dimensioned plans and elevations, large-scale details, attachment devices, and other components.

C. Samples:

1. Plastic laminates, for each color, pattern, and surface finish.
2. PVC edge banding.
3. Samples of each solid surface material.

1.3 QUALITY ASSURANCE

A. Fabricator Qualifications: AWI membership.

B. Installer Qualifications: Fabricator of products.

1.4 FIELD CONDITIONS

A. Environmental Limitations: Do not deliver or install cabinets until building is enclosed, wet work is complete, and HVAC system is operating and maintaining temperature and relative humidity at occupancy levels during the remainder of the construction period.

PART 2 - PRODUCTS

2.1 PLASTIC-LAMINATE-FACED ARCHITECTURAL CABINETS

A. Quality Standard: Unless otherwise indicated, comply with the "Architectural Woodwork Standards" for grades of architectural plastic-laminate cabinets indicated for construction, finishes, installation, and other requirements.

B. Grade: Custom.

C. Type of Construction: Frameless.

D. Cabinet, Door, and Drawer Front Interface Style: Flush overlay.

E. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated or if not indicated, as required by woodwork quality standard.

1. Manufacturers: Subject to compliance with requirements, [available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Formica Corporation.
b. Lamin-Art, Inc.
c. Wilsonart International; Div. of Premark International, Inc.(Basis of Design Product).

F. Laminate Cladding for Exposed Surfaces:

1. Horizontal Surfaces: Grade HGS 107HW.
2. Vertical Surfaces: Grade VGS 335HW.
3. Pattern Direction: Vertically for drawer fronts, doors, and fixed panels.

G. Materials for Semi-exposed Surfaces:

1. Surfaces Other Than Drawer Bodies Thermoset decorative panels.
2. Drawer Sides and Backs: Thermoset decorative panels with PVC or polyester edge banding.
3. Drawer Bottoms: Thermoset decorative panels.

H. Optional drawer construction: Manufactured drawer units with integral heavy-duty drawer slides (Blum Metabox, or equivalent).

I. Colors, Patterns, and Finishes: Provide materials and products that result in colors and textures of exposed laminate surfaces as selected by the Architect. Refer to 090000 “Color Schedule”.

2.2 WOOD CABINETS AND WALL PANELS FOR TRANSPARENT FINISH

A. Grade: Premium.

B. Type of Construction: Frameless.

C. Cabinet and Door and Drawer Front Interface Style: Flush overlay.

D. Wood for Exposed Surfaces:

1. Species: White oak.

2. Cut: Rift cut/rift sawn.
3. Grain Direction: Vertically for drawer fronts, doors, and fixed panels.
4. Matching of Veneer Leaves: Book match.
5. Veneer Matching within Panel Face: Running match.
6. Wood panels for wall applications shall match the cabinet species, cut, grain direction and veneer matching.

E. Semi-exposed Surfaces: Provide surface materials indicated below:

1. Surfaces Other Than Drawer Bodies: Thermoset decorative panels or a compatible species to that indicated for exposed surfaces, stained to match.
2. Drawer Sub-fronts, Backs, and Sides: Solid-hardwood lumber, stained to match species indicated for exposed surfaces or thermoset decorative panels with PVC or polyester edge banding.
3. Drawer Bottoms: Hardwood plywood or thermoset decorative panels.

2.3 OTHER MATERIALS

A. Wood Products: Provide materials that comply with requirements of referenced quality standard for each type of woodwork and quality grade specified unless otherwise indicated.

1. Wood Moisture Content: 5 to 10 percent.

B. Composite Wood and Agri-fiber Products: Provide materials that comply with requirements of referenced quality standard for each type of woodwork and quality grade specified unless otherwise indicated.

1. Medium-Density Fiberboard: ANSI A208.2, Grade 130, made with binder containing no urea formaldehyde.
2. Softwood Plywood: DOC PS 1, Exterior Glue, medium-density overlay.
3. Thermoset Decorative Panels: Particleboard or medium-density fiberboard finished with thermally fused, melamine-impregnated decorative paper and complying with requirements of NEMA LD 3, Grade VGL, for test methods 3.3, 3.4, 3.6, 3.8, and 3.10.
4. Marine Grade plywood will be required at all countertop sinks: cut from 4’ x 8’ x ¾-inch A-B grade panel,

C. Acrylic polymer composite countertops and facing sheets - “Solid Surface”: Basis of Design, Formica “Signatures”, or equivalent product in function and appearance by Wilsonart and Corian. Refer to Color Schedule 090000 for selected Corian color/pattern. ½ - inch material with edges built up to 1 1/2 – inches.

D. Engineered quartz countertops. Provide MSI, Silestone, Caesarstone, or equivalent; color to be selected by the architect from manufacturer’s full range. 20 mm material with edges built up to 1 37.5 mm.

2.4 CABINET HARDWARE AND ACCESSORIES

A. General: Provide cabinet hardware and accessory materials associated with architectural woodwork, except for items specified in Division 08 Section "Door Hardware." **Substitutions that do not meet the intent of the specifications below (i.e.- requesting to substitute concealed hinges or line-bored shelving supports) will not be considered.**

B. Butt Hinges: 2-3/4-inch (70-mm), 5-knuckle steel hinges made from 0.095-inch- (2.4-mm-) thick metal, and as follows:

1. Semi-concealed Hinges for Overlay Doors: BHMA A156.9, B01521; Hospital Tip.

C. Adjustable Shelf Standards and Supports for wall shelves: BHMA A156.9, with shelf brackets and rests: Knape & Vogt 85/185, or equivalent.

D. Adjustable Shelf Standards and Supports for interior cabinet shelves: BHMA A156.9, B04013; Knape & Vogt 255/256 Series, or equivalent.

E. Work Station Brackets: 1/8-inch thick powder coated steel capable of supporting 1000 pounds; sized 24 inches by 29 inches, 1 ½ inch forms with multiple ¼ inch mounting holes per side and 3 inch notch at elbow for wire management. Finish: matte black.

F. Grommets for Countertop Wire Management: As manufactured by the Doug Mockett Company, www.mockett.com: Flip-Top Grommet Model XG3, matte black. Products by Wurth Lewis and Co, and Richelieu Building Specialties meeting the specifications for appearance and performance will be acceptable.

G. Back-Mounted Pulls: BHMA A156.9, B02011.

H. Wire Pulls: Back mounted, solid metal, 4 inches (100 mm) long, 5/16 inch (8 mm) in diameter.

I. Catches: Roller catches, BHMA A156.9, B03071 or Ball friction catches, BHMA A156.9, B03013.

J. Drawer Slides: BHMA A156.9, B05091.

1. Heavy Duty (Grade 1HD-100 and Grade 1HD-200): Side mounted; full-extension type; zinc-plated steel ball-bearing slides.

K. Door Locks: BHMA A156.11, E07121; keyed to building system.

L. Drawer Locks: BHMA A156.11, E07041; keyed to building system.

M. Exposed Hardware Finishes: For exposed hardware, provide finish that complies with BHMA A156.18 for BHMA finish number indicated.

1. Satin Stainless Steel: BHMA 630.

2.5 MISCELLANEOUS MATERIALS

A. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln-dried to less than 15 percent moisture content.

B. Adhesives, General: Adhesives shall not contain urea formaldehyde.

A. VOC Limits for Installation Adhesives: Installation adhesives hall have a VOC content of 30 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.6 MISCELLANEOUS MATERIALS

A. Furring, Blocking, Shims, and Hanging Strips: Softwood or hardwood lumber, kiln dried to less than 15 percent moisture content.

B. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide metal expansion sleeves or expansion bolts for post-installed anchors. Use nonferrous-metal or hot-dip galvanized anchors and inserts at inside face of exterior walls and at floors.

C. Adhesives: Do not use adhesives that contain urea formaldehyde.

D. Adhesives: Use adhesives that meet the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

E. Adhesive for Bonding Plastic Laminate: Contact cement.

1. Adhesive for Bonding Edges: Hot-melt adhesive or adhesive specified above for faces.

F. Adhesives for bonding Solid Surface Counter Tops to substrate: Adhesive: Type recommended by solid surface manufacturer.

2.7 FABRICATION

A. Complete fabrication, including assembly and hardware application, to maximum extent possible before shipment to Project site. Disassemble components only as necessary for shipment and installation. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.

B. Shop-cut openings to maximum extent possible to receive hardware, appliances, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.

C. Fabrication of Solid Surface Counter Tops:

1. Cut composite panels accurately to required shapes and dimensions.
2. Radius exposed edges.
3. Fabricate with hairline joints.
4. Cut holes for sinks, faucets, and toilet accessories.

D. Provide 3 mm pvc edge banding on all exposed edges of doors and drawers; Canplast or equivalent. Exposed edges of cabinet boxes may be self-edged laminate VGS.

E. Provide HGS finish on the tops of all wall-hung and full-height cabinets as well as the countertops.

2.8 SHOP FINISHING FOR WOOD CABINETS AND WALL PANELS FOR TRANSPARENT FINISH

A. General: Finish architectural wood cabinets at fabrication shop as specified in this Section. Defer only final touchup, cleaning, and polishing until after installation.

B. Finish Materials: Use finish materials that meet the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. Preparation for Finishing: Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces, and similar preparations for finishing architectural wood cabinets, as applicable to each unit of work.

1. Back priming: Apply one coat of sealer or primer, compatible with finish coats, to concealed surfaces of cabinets.

D. Transparent Finish:

1. Grade: Premium.
2. Finish: System - 11, catalyzed polyurethane.
3. Wash Coat for Closed-Grain Woods: Apply wash-coat sealer to cabinets made from closed-grain wood before staining and finishing.
4. Staining: Match Architect's sample.
5. Sheen: Satin, 31-45 gloss units measured on 60-degree gloss meter per ASTM D 523.

PART 3 - EXECUTION

3.1 PREPARATION

A. Before installation, condition cabinets to average prevailing humidity conditions in installation areas.

3.2 INSTALLATION

A. Grade: Install cabinets to comply with same grade as item to be installed.

B. Install cabinets level, plumb, true, and straight. Shim as required with concealed shims. Install level and plumb to a tolerance of 1/8 inch in 96 inches (3 mm in 2400 mm).

C. Scribe and cut cabinets to fit adjoining work, refinish cut surfaces, and repair damaged finish at cuts.

D. Anchor cabinets to anchors or blocking built in or directly attached to substrates. Secure with countersunk, concealed fasteners and blind nailing. Use fine finishing nails or finishing screws for exposed fastening, countersunk and filled flush with woodwork.

E. Cabinets: Install without distortion so doors and drawers will fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.

1. Install cabinets with no more than 1/8 inch in 96-inch (3 mm in 2400-mm) sag, bow, or other variation from a straight line.
2. Fasten wall cabinets through back, near top and bottom, and at ends not more than 16 inches (400 mm) o.c. with No. 10 wafer-head screws sized for not less than 1-1/2-inch (38-mm) penetration into metal framing, wood blocking, or hanging strips.

F. All locations where millwork abuts walls shall be sealed with clear silicone for the entire length of exposure (top/backsplash or side).

END OF SECTION 064116

SECTION 066010 - PULTRUDED INDUSTRIAL GRATING
(FIBERGLASS REINFORCED PLASTICS - FRP - FABRICATIONS)

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. The CONTRACTOR shall furnish, fabricate (where necessary), and install all fiberglass reinforced plastic (FRP) items, with all appurtenances, accessories and incidentals necessary to produce a complete, operable and serviceable installation as shown on the Contract Drawings and as specified herein, and in accordance with the requirements of the Contract Documents.

1.2 REFERENCES

A. The publications listed below (latest revision applicable) form a part of this specification to the extent referenced herein. The publications are referred to within the text by the designation only.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM) Test Methods:

ASTM D 635 Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in a Horizontal Position

ASTM D 732 Shear Strength of Plastics by Punch Tool

ASTM E 84 Surface Burning Characteristics of Building Materials

1.3 SUBMITTALS

A. Shop drawings of all fabricated gratings and accessories in accordance with the provisions of this Section.

B. Shop drawings clearly showing material sizes, types, styles, part or catalog numbers, complete details for the fabrication of and erection of components including, but not limited to, location, lengths, type and sizes of fasteners, clip angles, member sizes, and connection details.

C. Published literature including structural design data, structural properties data, grating load/deflection tables, corrosion resistance tables, certificates of compliance, test reports as applicable, concrete anchor systems and their allowable load tables, and design calculations for systems not sized or designed in the contract documents.

D. Sample pieces of each item specified herein for acceptance by the ENGINEER as to quality and color. Sample pieces shall be manufactured by the method to be used in the WORK.

1.4 QUALITY ASSURANCE

A. All items to be provided under this Section shall be furnished only by manufacturers having a minimum of ten (10) years experience in the design and manufacture of similar products and

systems. Additionally, if requested, a record of at least five (5) previous, separate, similar successful installations in the last five (5) years shall be provided.

B. Manufacturer shall offer a 3 year limited warranty on all FRP products against defects in materials and workmanship.

C. Manufacturer shall be certified to the ISO 9001-2008 standard.

D. Manufacturer shall provide proof of certification from at least two other quality assurance programs for its facilities or products (DNV, ABS, USCG, AARR).

1.5 PRODUCT DELIVERY AND STORAGE

A. Delivery of Materials: Manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Adhesives, resins and their catalysts and hardeners shall be crated or boxed separately and noted as such to facilitate their movement to a dry indoor storage facility.

B. Storage of Products: All materials shall be carefully handled to prevent them from abrasion, cracking, chipping, twisting, other deformations, and other types of damage. Store items in an enclosed area and free from contact with soil and water. Store adhesives, resins and their catalysts and hardeners in dry indoor storage facilities between 70 and 85 degrees Fahrenheit (21 to 29 degrees Celsius) until they are required.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Pultruded grating shall be based on Safe-T-Span® as manufactured by:

Fibergrate Composite Structures Inc.
5151 Belt Line Road, Suite 1212
Dallas, Texas 75254-7028 USA
(800) 527-4043 Phone (972) 250-1530 Fax

Website: www.fibergrate.com
E-mail: info@fibergrate.com

B. Products meeting the requirements of this specification include but are not limited to:

1. Strongwell Corporation. www.strongwell.com.

2. Bedford Reinforced Plastics. www.bedfordreinforced.com.

2.2 GENERAL

A. All FRP items furnished under this Section shall be composed of fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as specified in the Contract Documents.

B. Fiberglass reinforcement shall be a combination of continuous roving, continuous strand mat, and surfacing veil in sufficient quantities as needed by the application and/or physical

properties required.

C. Resins shall be ISOPHTHALIC with chemical formulations as necessary to provide the corrosion resistance, strength and other physical properties as required.

D. All finished surfaces of FRP items and fabrications shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes or unreinforced areas. All glass fibers shall be well covered with resin to protect against their exposure due to wear or weathering.

E. All pultruded structural shapes shall be further protected from ultraviolet (UV) light with 1) integral UV inhibitors in the resin and 2) a synthetic surfacing veil to help produce a resin rich surface.

F. All FRP products shall have a tested flame spread rating of 25 or less per ASTM E-84 Tunnel Test. Gratings shall not burn past the 25 mm reference mark and will be classified HB per ASTM D635.

G. All grating clips shall be manufactured of Type 316SS (stainless steel).

2.3 PULTRUDED GRATING

A. Manufacture: Grating components shall be high strength and high stiffness pultruded elements having a maximum of 70% and a minimum of 60% glass content (by weight) of continuous roving and continuous strand mat fiberglass reinforcements. The finished surface of the product shall be provided with a surfacing veil to provide a resin rich surface which improves corrosion resistance and resistance to ultraviolet degradation. Bearing bars shall be interlocked and epoxied in place with a two-piece cross rod system to provide a mechanical and chemical lock. Cross rods should be below the walking surface of the grating. Gratings with cross rods that are flush with the walking surface are excluded.

B. Non-slip surfacing: Grating shall be provided with a quartz grit bonded and baked to the top surface of the finished grating product.

C. Fire rating: Grating shall be fire retardant with a tested flame spread rating of 25 or less when tested in accordance with ASTM E 84. Manufacturer may be required to provide certification of ASTM E84 test on grating panels from an independent testing laboratory. Test data shall be from full scale testing of actual production grating, of the same type and material supplied on the project. Test data performed only on the base resin shall not be acceptable.

D. Resin system: The resin system used in the manufacture of the grating shall be ISOFR. Manufacturer may be required to submit corrosion data from tests performed on actual grating products in standard chemical environments. Corrosion resistance data of the base resin from the manufacturer is not a true indicator of grating corrosion resistance and shall not be accepted.

E. Color: Gray or Yellow.

F. Depth: 1" deep load bars with a tolerance of plus or minus 1/32".

G. Mesh Configuration: 1-1/2" load bar spacing, 6" tie bar spacing on centers. Grating shall be SAFE-T-SPAN® I6010V or I6010I as manufactured by **Fibergrate Composite Structures Incorporated.**

H. Load/Deflection: Grating shall meet manufacturers published safe recommended loadings with deflection not to exceed the following:

Uniform distributed load over a 48" span: 50 pounds per square foot, with a maximum deflection of 0.14".

I. Substitutions: Other products of equal strength, stiffness, corrosion resistance and overall quality may be submitted with the proper supporting data to the engineer for approval.

2.4 GRATING FABRICATION

A. Measurements: Grating supplied shall meet the minimum dimensional requirements as shown or specified. The Contractor shall provide and/or verify measurements in field for work fabricated to fit field conditions as required by grating manufacturer to complete the work. Determine correct size and locations of required holes or cutouts from field dimensions before grating fabrication.

B. Layout: Each grating section shall be readily removable, except where indicated on drawings. Manufacturer to provide openings and holes where located on the contract drawings. Grating supports shall be provided at openings in the grating by contractor where necessary to meet load/deflection requirements specified herein. Grating openings which fit around protrusions (pipes, cables, machinery, etc.) shall be discontinuous at approximately the centerline of opening so each section of grating is readily removable.

C. Sealing: All shop fabricated grating cuts shall be coated with vinyl ester resin to provide maximum corrosion resistance. All field fabricated grating cuts shall be coated similarly by the contractor in accordance with the manufacturer's instructions.

D. Hardware: Type 316 stainless steel hold-down clips shall be provided and spaced at a maximum of four feet apart with a minimum of four per piece of grating, or as recommended by the manufacturer.

PART 3 - EXECUTION

3.1 INSPECTION

A. Shop inspection is authorized as required by the Owner and shall be at Owner's expense. The fabricator shall give ample notice to Contractor prior to the beginning of any fabrication work so that inspection may be provided. The grating shall be as free, as commercially possible, from visual defects such as foreign inclusions, delamination, blisters, resin burns, air bubbles and pits.

3.2 INSTALLATION

A. Contractor shall install gratings in accordance with manufacturer’s assembly drawings. Lock grating panels securely in place with hold-down fasteners as specified herein. Field cut and drill fiberglass reinforced plastic products with carbide or diamond tipped bits and blades. Seal cut or drilled surfaces in accordance with manufacturer's instructions. Follow manufacturer's instructions when cutting or drilling fiberglass products or using resin products; provide adequate ventilation.

END OF SECTION

SECTION 066050 - MOLDED STAIR TREADS - FIBERGLASS REINFORCED PLASTICS (FRP)

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. The CONTRACTOR shall furnish, fabricate (where necessary), and install all fiberglass reinforced plastic (FRP) items, with all appurtenances, accessories and incidentals necessary to produce a complete, operable and serviceable installation as shown on the Contract Drawings and as specified herein, and in accordance with the requirements of the Contract Documents.

1.2 REFERENCES

A. The publications listed below (latest revision applicable) form a part of this specification to the extent referenced herein. The publications are referred to within the text by the designation only.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM) Test Methods:

ASTM D 635 Rate of Burning and/or Extent and Time of Burning of Self-Supporting Plastics in Horizontal Position

ASTM E 84 Surface Burning Characteristics of Building Materials

1.3 SUBMITTALS

A. Shop drawings of all fabricated stair treads and accessories in accordance with the provisions of this Section.

B. Manufacturer's shop drawings clearly showing material sizes, types, styles, part or catalog numbers, complete details for the fabrication of and erection of components including, but not limited to, location, lengths, type and sizes of fasteners, support member sizes, and connection details.

C. Manufacturer’s published literature including structural design data, structural properties data, stair tread load/deflection tables, corrosion resistance tables, certificates of compliance, test reports as applicable, concrete anchor systems and their allowable load tables (as applicable) and design calculations for systems not sized or designed in the contract documents.

D. Sample pieces of each Fibertred® item specified herein for acceptance by the ENGINEER as to quality and color. Sample pieces shall be manufactured by the method to be used in the WORK.

1.4 QUALITY ASSURANCE

A. All items to be provided under this Section shall be furnished only by manufacturers having a minimum of ten (10) years experience in the design and manufacture of similar products and systems. Additionally, if requested, a record of at least five (5) previous, separate, similar successful installations in the last five (5) years shall be provided.

B. Manufacturer shall offer a 3 year limited warranty on all FRP products against defects in materials and workmanship.

C. Manufacturer shall be certified to the ISO 9001-2008 standard.

D. Manufacturer shall provide proof of certification from at least two other quality assurance programs for its facilities or products (DNV, ABS, USCG, AARR).

1.5 PRODUCT DELIVERY AND STORAGE

A. Delivery of Materials: Manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Adhesives, resins and their catalysts and hardeners shall be crated or boxed separately and noted as such to facilitate their movement to a dry indoor storage facility.

B. Storage of Products: All materials shall be carefully handled to prevent them from abrasion, cracking, chipping, twisting, other deformations, and other types of damage. Store adhesives, resins and their catalysts and hardeners in dry indoor storage facilities between 70 and 85 degrees Fahrenheit (21 to 29 degrees Celsius) until they are required.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Stair treads shall be based on Fibertred® as manufactured by:

Fibergrate Composite Structures Inc.
5151 Belt Line Road, Suite 1212
Dallas, Texas 75254-7028 USA
(800) 527-4043 Phone (972) 250-1530 Fax

Website: www.fibergrate.com
E-mail: info@fibergrate.com

B. Products meeting the requirements of this specification include but are not limited to:

1. Strongwell Corporation. www.strongwell.com.

2. Bedford Reinforced Plastics. www.bedfordreinforced.com.

2.2 GENERAL

A. All FRP items furnished under this Section shall be composed of fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as specified in the Contract Documents.

B. Fiberglass reinforcement shall be continuous roving in sufficient quantities as needed by the application and/or physical properties required.

C. Resin shall be Isophthalic Polyester, with chemical formulations as necessary to provide the corrosion resistance, strength and other physical properties as required.

D. All finished surfaces of FRP items and fabrications shall be smooth, resin-rich, and as free as commercially possible of voids, dry spots, cracks, crazes or unreinforced areas. All glass fibers

shall be well covered with resin to protect against their exposure due to wear or weathering.

E. All stair tread products shall have a tested flame spread rating of 25 or less per ASTM E-84 Tunnel Test. Stair treads shall not burn past the 25 mm reference mark and will be classified HB per ASTM D635.

F. All mechanical stair tread clips and fasteners shall be manufactured of Type 316SS (stainless steel).

2.3 STAIR TREADS

A. Manufacture: Stair treads shall be FIBERTRED® as manufactured by Fibergrate Composite Structures Incorporated. Fibertred® stair treads shall be of a one-piece molded construction and shall have a 1-1/2" x 6" rectangular mesh pattern providing unidirectional strength in the tread span direction. Fibertred® shall be reinforced with continuous rovings in each direction. The top layer of reinforcement shall be no more than 1/8" below the top surface of the tread so as to provide maximum stiffness and prevent resin chipping of unreinforced surfaces. Percentage of glass (by weight) shall not exceed 35% so as to achieve maximum corrosion resistance, and as required to maintain the structural requirements of the CONTRACT. After molding, no dry glass fibers shall be visible on any surface of bearing bars or cross bars. All bars shall be smooth and uniform with no evidence of fiber orientation irregularities, interlaminar voids, porosity, resin rich or resin starved areas.

B. Non-slip surfacing: Fibertred® stair treads shall be manufactured with a concave, meniscus profile on the top of each bar providing maximum slip resistance. For additional safety, and to meet OSHA requirements, stair treads shall be manufactured with a 1-1/2" solid, molded nosing. Nosing shall be gritted with an angular quartz grit, integrally molded into the top surface of the nosing area only.

C. Fire rating: Fibertred® stair treads shall be fire retardant with a tested flame spread rating of 25 or less when tested in accordance with ASTM E 84. Test data performed only on the resin shall not be accepted.

D. Resin system: The resin system used in the manufacture of Fibertred® stair treads shall be {Vi-Corr®, FGI-AM®, Corvex®, ELS, XFR or Super Vi-Corr® - choose one}. Manufacturer may be required to submit corrosion data from tests performed on actual stair tread products in standard chemical environments. Corrosion resistance data of the base resin from the manufacturer is not a true indicator of stair tread product corrosion resistance and shall not be accepted.

E. Thickness: 1-1/2" thick with a tolerance of plus or minus 1/16".

F. Mesh Configuration: 1-1/2" x 6" rectangular mesh pattern with double cross bars on 6" centers which allows optimum utilization and ease of fabrication.

G. Load/Deflection: Fibertred® stair treads shall meet manufacturer's published recommended loading with deflection not to exceed the following:

Concentrated load of 500 pounds, placed at the centerline of a 36" tread span with a maximum deflection not to exceed 0.32".

The concentrated load is applied at the centerline of the tread, over a width of 4" and a depth of 6", starting at the nosing edge to simulate the landing of a foot.

H. The manufacturer shall certify that the stiffness of all panels manufactured are never more than 2.5% below the published load-deflection values.

I. Substitutions: Other products of equal strength, stiffness, corrosion resistance and overall quality may, with prior approval, be submitted with the proper supporting data to the engineer for approval.

2.4 STAIR TREAD FABRICATION

A. Measurements: Fibertred® stair treads supplied shall meet the dimensional requirements and tolerances as shown or specified. The Contractor shall provide and/or verify measurements in field for work fabricated to conform to field conditions as required by stair tread manufacturer to complete the work. When field dimensions are not required, contractor shall determine correct size and locations of required holes or cutouts from field dimensions before grating fabrication.

B. Sealing: All shop fabricated stair tread cuts shall be coated with vinyl ester resin to provide maximum corrosion resistance. All field fabricated stair tread cuts shall be coated similarly by the contractor in accordance with the manufacturer's instructions.

C. Hardware: Type 316 stainless steel hold-down clips shall be provided and spaced as recommended by the manufacturer. A minimum of four hold-down clips shall be required for each tread.

PART 3 - EXECUTION

3.1 INSPECTION

A. Shop inspection is authorized as required by the Owner and shall be at Owner's expense. The fabricator shall give ample notice to Contractor prior to the beginning of any fabrication work so that inspection may be provided. The Fibertred® stair treads shall be as free, as commercially possible, from visual defects such as foreign inclusions, delamination, blisters, resin burns, air bubbles and pits. The surface shall have a smooth finish (except for grit top surfaces).

3.2 INSTALLATION

A. Contractor shall install Fibertred® stair treads in accordance with manufacturer’s assembly drawings. Fasten stair treads securely in place with hold-down fasteners as specified herein. Field cut and drill fiberglass reinforced plastic products with carbide or diamond tipped bits and blades. Seal cut or drilled surfaces in accordance with manufacturer's instructions. Follow manufacturer's instructions when cutting or drilling fiberglass products or using resin products; provide adequate ventilation.

SECTION 066100 - PULTRUDED FIBERGLASS STRUCTURAL SHAPES

(FIBERGLASS REINFORCED PLASTICS (FRP) FABRICATIONS)

PART 1 - GENERAL

1.0 GENERAL

1.1 REFERENCES

The publications listed below (latest revision applicable) form a part of this specification to the extent referenced herein. The publications are referred to within the text by the designation only.

AMERICAN SOCIETY FOR TESTING AND MATERIALS (ASTM) Test Methods:

ASTM D-638-Tensile Properties of Plastics

ASTM D-790-Flexural Properties of Unreinforced and Reinforced Plastics

ASTM D-2344-Apparent Interlaminar Shear Strength of Parallel Fiber Composites by Short Beam Method

ASTM D-696-Coefficient of Linear Thermal Expansion for Plastics

ASTM E-84-Surface Burning Characteristics of Building Materials

NSF/ANSI STANDARD 61

1.2 SUBMITTALS

A. Shop drawings of all fabricated structural systems and accessories in accordance with the provisions of this Section.

B. Shop drawings clearly showing material sizes, types, styles, part or catalog numbers, complete details for the fabrication of and erection of components including, but not limited to, location, lengths, type and sizes of fasteners, clip angles, member sizes, and connection details.

C. Published literature including structural design data, structural properties data, corrosion resistance tables, certificates of compliance, test reports as applicable, and design calculations for systems not sized or designed in the contract documents, sealed by a Professional Engineer.

D. Submit sample pieces of each item specified herein for acceptance by the ENGINEER as to quality and color. Sample pieces shall be manufactured by the method to be used in the WORK.

1.3 QUALITY ASSURANCE

A. All items to be provided under this Section shall be furnished only by manufacturers having a minimum of ten (10) years' experience in the design and manufacture of similar products and systems. Additionally, if requested, a record of at least five (5) previous, separate, similar successful installations in the last five (5) years shall be provided.

B. Manufacturer shall offer a 3-year limited warranty on all FRP products against defects in materials and workmanship.

C. Manufacturer shall be certified to the ISO 9001-2008 standard.

D. Manufacturer shall provide proof of certification from at least two other quality assurance programs for its facilities or products (DNV, ABS, USCG, AARR).

E. Manufacturer shall provide proof, via independent testing, that materials proposed as a solution do not contain heavy metals in amounts greater than that allowed by current EPA requirements.

1.4 PRODUCT DELIVERY AND STORAGE

A. Delivery of Materials: Manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Adhesives, resins and their catalysts and hardeners shall be crated or boxed separately and noted as such to facilitate their movement to a dry indoor storage facility.

B. Storage of Products: All materials shall be carefully handled to prevent them from abrasion, cracking, chipping, twisting, and other types of damage. Store adhesives, resins and their catalysts and hardeners in dry indoor storage facilities between 70 and 85 degrees Fahrenheit (21 to 29 degrees Celsius) until they are required.

PART 2 - MATERIALS

2.1 MANUFACTURER

A. Structural shapes are based on Dynaform® as manufactured by:

Fibergrate Composite Structures Inc.
5151 Belt Line Road, Suite 1212
Dallas, Texas 75254-7028 USA
(800) 527-4043 Phone (972) 250-1530 Fax

Website: www.fibergrate.com
E-mail: info@fibergrate.com

B. Products meeting the requirements of this specification include but are not limited to:

1. Strongwell Corporation. www.strongwell.com.
2. Bedford Reinforced Plastics. www.bedfordreinforced.com.
3. AMICO FRP Products. www.seasafe.com/custom-fabrication.
5. AMD Inc. www.amdgrating.com.

2.2 GENERAL

A. All structural shapes are to be manufactured by the pultrusion process with a glass content minimum of 45%, maximum of 55% by weight. The structural shapes shall be composed of fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as specified in the Contract Documents.

B. Fiberglass reinforcement shall be a combination of continuous roving, continuous strand mat, and surfacing veil in sufficient quantities as needed by the application and/or physical properties required.

C. Resins shall be {DYNAFORM® ISO, non-fire retardant isophthalic polyester or *ISO, non-fire retardant isophthalic polyester used to produce NSF Standard 61 certified shapes*; ISOFR, fire retardant isophthalic polyester; *VE, non-fire retardant vinyl ester used to produce NSF Standard 61 certified shapes* or VEFR, fire retardant vinyl ester, (*choose one*)} with chemical formulation necessary to provide the corrosion resistance, strength and other physical properties as required.

D. All finished surfaces of FRP items and fabrications shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes or unreinforced areas. All glass fibers shall be well covered with resin to protect against their exposure due to wear or weathering.

E. All pultruded structural shapes shall be further protected from ultraviolet (UV) attack with 1) integral UV inhibitors in the resin and 2) a synthetic surfacing veil to produce a resin rich surface.

F. All *fire retardant* FRP products shall have a tested flame spread rating of 25 or less per ASTM E-84 Tunnel Test.

G. All shapes products shall be certified to NSF/ANSI Standard 61 *{use only if choosing a resin system that can be used to produce shapes to the NSF Standard 61 in sections 2.2 C}.*

2.3 Pultruded structural shapes are to have the minimum longitudinal mechanical properties listed below:

Property	**ASTM Method**	**Value**	**Units**
Tensile Strength	D-638	30,000 (206)	psi (MPa)
Tensile Modulus	D-638	2.5×10^6 (17.2)	psi (GPa)
Flexural Strength	D-790	30,000 (206)	psi (MPa)
Flexural Modulus	D-790	1.8×10^6 (12.4)	psi (GPa)
Flexural Modulus (Full Section)	N/A	2.8×10^6 (19.3)	psi (GPa)
Short Beam Shear (Transverse)	D-2344	4,500 (31)	psi (MPa)
Shear Modulus (Transverse)	N/A	4.5×10^5 (3.1)	psi (GPa)
Coefficient of Thermal Expansion	D-696	4.4×10^{-6} (8.0×10^{-6})	in/in/°F (cm/cm/°C)
Flame Spread	E-84	25 or less	N/A

PART 3 - EXECUTION

3.0 FABRICATION

A. Measurements: Structural Shapes supplied shall meet the minimum dimensional requirements as shown or specified. The Contractor shall provide and/or verify measurements in field for work fabricated to fit field conditions as required by manufacturer to complete the work. Determine correct size and locations of required holes or coping from field dimensions before structural shape fabrication.

B. Sealing: All shop fabricated cuts or drilling shall be coated with vinyl ester resin to provide maximum corrosion resistance. All field fabricated cuts or drilling shall be coated similarly by the contractor in accordance with the manufacturer's instructions.

C. Hardware: Type 316 stainless steel bolts shall be provided.

3.1 INSPECTION

A. Shop inspection is authorized as required by the Owner and shall be at Owner's expense. The fabricator shall give ample notice to Contractor prior to the beginning of any fabrication work so that inspection may be provided. The structural shapes shall be as free, as commercially possible, from visual defects such as foreign inclusions, delamination, blisters, resin burns, air bubbles and pits.

END OF SECTION

SECTION 068113 – PULTRUDED ROUND PROFILE GUARDRAIL AND HANDRAIL
(FIBERGLASS REINFORCED PLASTICS – FRP - FABRICATIONS)

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. This specification is for a pultruded round fiberglass railing system in compliance with 2015 IBC and OSHA 1910.29 Fall Protection and Falling Object Protection.

1.2 REFERENCES

A. The publications listed below (latest revision applicable) form a part of this specification to the extent referenced herein. The publications are referred to within the text by the designation only.

INTERNATIONAL CODE COUNCIL, INC.
The International Building Code, 2015

THE OCCUPATIONAL HEALTH AND SAFETY ADMINISTRATION
Code of Federal Regulations (CFR), Title 29, Section 1910.29

1.3 SUBMITTALS

A. Shop drawings of all fabricated railings and accessories in accordance with the provisions of this Section.

B. Shop drawings clearly showing material sizes, types, styles, part or catalog numbers, complete details for the fabrication of and erection of components including, but not limited to, location, lengths, type and sizes of fasteners, clip angles, member sizes, and connection details.

C. Manufacturer's published literature including structural design data, structural properties data, corrosion resistance tables, certificates of compliance, test reports as applicable, and design calculations for systems not sized or designed in the contract documents, sealed by a Professional Engineer.

D. Sample pieces of each item specified herein for acceptance by the ENGINEER as to quality and color. Sample pieces shall be manufactured by the method to be used in the WORK.

1.4 QUALITY ASSURANCE

A. All items to be provided under this Section shall be furnished only by manufacturers having a minimum of ten (10) years' experience in the design and manufacture of similar products and systems. Additionally, if requested, a record of at least five (5) previous, separate, similar successful installations in the last five (5) years shall be provided.

B. Manufacturer shall offer a 3-year limited warranty on all FRP products against defects in materials and workmanship.

C. Manufacturer shall be certified to the ISO 9001-2008 standard.

D. Manufacturer shall provide proof of certification from at least two other quality assurance programs for its facilities or products (DNV, ABS, USCG, AARR).

1.5 PRODUCT DELIVERY AND STORAGE

A. Delivery of Materials: Manufactured materials shall be delivered in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Adhesives, resins and their catalysts and hardeners shall be crated or boxed separately and noted as such to facilitate their movement to a dry indoor storage facility.

B. Storage of Products: All materials shall be carefully handled to prevent them from abrasion, cracking, chipping, twisting, other deformations, and other types of damage. Adhesives, resins and their catalysts are to be stored in dry indoor storage facilities between 70 and 85 degrees Fahrenheit (21 to 29 degrees Celsius) until they are required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Guardrail and/or Handrail system are based on DynaRound™ as manufactured by

Fibergrate Composite Structures Inc.
5151 Belt Line Road, Suite 1212
Dallas, Texas 75254-7028 USA
(800) 527-4043 Phone (972) 250-1530 Fax

Website: www.fibergrate.com
E-mail: info@fibergrate.com

B. Products meeting the requirements of this specification include but are not limited to:

1. Strongwell Corporation. www.strongwell.com.

2. Bedford Reinforced Plastics. www.bedfordreinforced.com.

2.2 GENERAL

A. All posts and rails are to be DYNAFORM® FRP structural shapes manufactured by the pultrusion process. The structural shapes shall be composed of fiberglass reinforcement and resin in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions specified in the Contract Documents.

B. Fiberglass reinforcement shall be a combination of continuous roving, continuous strand mat,

and surfacing veil in sufficient quantities as needed by the application and/or physical properties required.

C. Resin shall be DYNAFORM® VEFR, fire retardant vinyl ester with chemical formulation necessary to provide the corrosion resistance, strength and other physical properties as required.

D. All finished surfaces of FRP items and fabrications shall be smooth, resin-rich, free of voids and without dry spots, cracks, crazes or unreinforced areas. All glass fibers shall be well covered with resin to protect against their exposure due to wear or weathering.

E. All pultruded structural shapes shall be further protected from ultraviolet (UV) attack with 1) integral UV inhibitors in the resin, 2) a synthetic surfacing veil to help produce a resin rich surface, and 3) an appropriate UV resistant coating for outdoor exposures.

F. All FRP products shall have a tested flame spread rating of 25 or less per ASTM E-84 Tunnel Test.

G. Horizontal rails and vertical posts for guardrails are to be 1.9" OD x 0.2" wall (48.3 mm x 5.1 mm) round tube and the kick plate is to be ½" deep x 4" wide x 0.125" thick (12.7 mm x 101.6 mm x 3.2 mm) with two reinforcing corrugations. Offset rail used as handrail is to be 1.5" OD x 0.25" wall (38.1 mm x 6.4 mm) round tube.

H. The completed guardrail installation shall meet the following load requirements with a minimum factor of safety of 2.0:

Concentrated Load: 200 lb (891 N) applied in any direction at any point on the top rail.

Uniform Load: 50 lb/lf (730.5 N/m) applied in any direction on the top rail.

Loads are assumed not to act concurrently.

I. All rails, posts, and kick plates are to be integrally pigmented yellow.

J. The pultruded 1.9" OD x 0.2" wall (48.3 mm x 5.1 mm) round tube is to have the minimum longitudinal mechanical properties listed below:

Property	**ASTM Method**	**Value**	**Units**
Flexural Strength (Full Section)	---	70,000 (482)	psi (MPa)
Flexural Modulus (Full Section)	---	5.0×10^6 (34.4)	psi (GPa)
Short Beam Shear (Transverse)	D-2344	4,500 (31)	psi (MPa)
Shear Modulus (Transverse)	N/A	4.5×10^5 (3.1)	psi (GPa)
Density	D792	0.062 – 0.070 (1.71 – 1.93)	lb/in^3 (g/cc)
Coefficient of Thermal Expansion	D-696	8.0×10^{-6} (1.4×10^{-6})	in/in/°F (cm/cm/°C)
Flame Spread	E-84	25 or less	N/A

K. All fasteners used in the railing system are to be AISI 316 stainless steel. Rivets and rivet nuts are to be AISI 304 stainless steel.

PART 3 - EXECUTION

3.0 FABRICATION

A. The post/rail connections for the 1.9" OD x 0.2" wall guardrail system are to be fabricated using molded, glass reinforced saddle connectors. The saddle connectors are to be attached to the tubes via bonding and riveting. The saddle connectors are to be connected to the adjoining tubes or connectors with 316SS 1/4” diameter bolts and/or 304SS rivet nuts as required. No sharp, protruding edges are to remain after assembly of the railing system. No PVC or CPVC connectors are to be used as a load carrying component of the railing system. Spacing of the posts for horizontal runs is not to exceed 4’-0" (1.22 m). Spacing of posts for inclined runs and offset handrail supports shall not exceed 3’-6” (1.07 m).

B. The bases of guardrail posts are to be secured according to the contract drawings. The bases of the posts are to be internally reinforced to a height of 8.5" (216 mm). Posts are to be detailed with drain features that prevent the accumulation of water inside of the posts.

C. The 1.5” OD x 0.25” wall round tube offset handrail is to be installed at a height of 34 inches above the walking surface and/or stair nosings and extend beyond the upper and lower treads as required to comply with governing building codes. The ends of the offset handrail are to terminate via a smooth, molded transition into the guardrail or wall. The offset handrails are to be attached to guards or walls with brackets fabricated from 316 stainless steel and/or FRP components. The configuration of the offset handrail brackets is to meet all IBC 2015 graspability requirements.

D. For inline splices, the 1.9" OD x 0.2" wall horizontal rails are to be spliced using a 10" (152.4 mm) length of 1.5” OD x 1/4" (38.1 mm x 6.4 mm) FRP round tube bonded and riveted into place using epoxy adhesive. Inline splices for offset handrail to be a 5” (127 mm) length of 1” diameter (25.4 mm) FRP solid round rod.

E. For 90 degree splices, both the 1.9" OD x 0.2" wall horizontal rails and the 1.5” OD x 0.25” wall round tube offset handrail are to be spliced using a specially molded component which smoothly transitions between the spliced tubes with a constant radius. The spliced tubes are to be bonded and riveted to this molded 90-degree splice.

F. For non-90 degree splices, both the 1.9" OD x 0.2" wall horizontal rails and the 1.5” OD x 0.25” wall round tube offset handrail are to be connected using a molded adjustable splice which can be adjusted to an included angle of 180 to 39 degrees. The ends of the spliced tube are to be mitered to achieve a minimum-gap butt joint. The spliced tubes are to be bonded and riveted to the molded splice.

G. All shop fabricated cuts are to be sealed to provide maximum corrosion resistance. Field cuts are to be similarly coated by the contractor in accordance with the manufacturer’s instructions.

END OF SECTION

SECTION 071326 - SELF-ADHERING SHEET WATERPROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes self-adhering modified bituminous sheet waterproofing.

B. Locations: In elevator pits.

C. Pre-installation Conference: Conduct conference at Project Site.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Show locations and extent of waterproofing and details of substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.

1.3 INFORMATIONAL SUBMITTALS

A. Sample warranties.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by waterproofing manufacturer.

1.5 WARRANTY

A. Manufacturer's Warranty: Manufacturer's standard materials-only warranty in which manufacturer agrees to furnish replacement waterproofing material for waterproofing that does not comply with requirements or that fails to remain watertight within specified warranty period.

1. Warranty Period: Five years from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 MODIFIED BITUMINOUS SHEET WATERPROOFING

A. Modified Bituminous Sheet: Minimum 60-mil (1.5-mm) nominal thickness, self-adhering sheet consisting of 56 mils (1.4 mm) of rubberized asphalt laminated on one side to a 4-mil- (0.10-mm-) thick, polyethylene-film reinforcement, and with release liner on adhesive side; formulated for application with primer or surface conditioner that complies with VOC limits of authorities having jurisdiction.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

    a. American Hydrotech, Inc.; VM75.
    b. Carlisle Coatings & Waterproofing Inc.; CCW MiraDRI 860/861.
    c. CETCO Building Materials Group, a subsidiary of AMCOL International Corp.; Envirosheet.
    d. Grace, W. R., & Co. - Conn.; Bituthene 4000.
    e. Tamko Building Products, Inc.; TW-60.
    f. York Manufacturing, Inc.; HydroGard.

2. Physical Properties:

    a. Tensile Strength, Membrane: 325 psi minimum; ASTM D 412.
    b. Ultimate Elongation: 350 percent minimum; ASTM D 412.
    c. Low-Temperature Flexibility: Pass at minus 20 deg F (minus 29 deg C); ASTM D 1970.
    d. Crack Cycling: Unaffected after 100 cycles of 1/8-inch (3-mm) movement; ASTM C 836.
    e. Puncture Resistance: 60 lbf minimum; ASTM E 154.
    f. Water Absorption: 0.1 percent weight-gain maximum after 48-hour immersion at 70 deg F (21 deg C); ASTM D 570.
    g. Water Vapor Permeance: 0.05 perms maximum; ASTM E 96/E 96M, Water Method.
    h. Hydrostatic-Head Resistance: 230 feet minimum; ASTM D 5385.

3. Sheet Strips: Self-adhering, rubberized-asphalt strips of same material and thickness as sheet waterproofing.

2.2 AUXILIARY MATERIALS

A. General: Furnish auxiliary materials recommended by waterproofing manufacturer for intended use and compatible with sheet waterproofing.

1. Furnish liquid-type auxiliary materials that comply with VOC limits of authorities having jurisdiction.

B. Substrate Patching Membrane: Low-viscosity, two-component, modified asphalt coating.

C. Metal Termination Bars: Aluminum bars, approximately 1 by 1/8-inch (25 by 3 mm) thick, predrilled at 9-inch (229-mm) centers.

2.3 INSULATION DRAINAGE PANELS

A. Unfaced Wall-Insulation Drainage Panels: 1 inch thick extruded-polystyrene board insulation complying with ASTM C 578, Type VI, 40-psi (276-kPa) minimum compressive strength; unfaced; fabricated with shiplap or channel edges and with one side having grooved drainage channels.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

    a. DiversiFoam Products; CertiFoam 40 (with channel edges) Drainage Board.
    b. Dow Chemical Company (The); Styrofoam Perimate.
    c.

2.4 STORM SUB-DRAIN AND FOUNDATION DRAIN PIPING

A. Storm Sub-Drain Pipe and Fittings: SCH 40 PVC or dual-wall, smooth interior HDPE as specified above, with ½-in drilled perforations. Minimum 4-inch diameter unless otherwise indicated on the drawings. Non perforated pipe shall be used outside of area to be drained to connect sub-drains to drainage inlets.

B. Filter Fabric: Non-woven geotextile Drainage (Filter) Fabric conforming to NCDOT Section 956-1.

PART 3 - EXECUTION

3.1 MODIFIED BITUMINOUS SHEET-WATERPROOFING APPLICATION

A. Prepare surfaces and install modified bituminous sheets according to waterproofing manufacturer's written instructions and recommendations in ASTM D 6135.

B. Apply primer to substrates at required rate and allow it to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Re-prime areas exposed for more than 24 hours.

C. Apply and firmly adhere sheets over area to receive waterproofing. Accurately align sheets and maintain uniform 2-1/2-inch- (64-mm-) minimum lap widths and end laps. Overlap and seal seams, and stagger end laps to ensure watertight installation.

1. When ambient and substrate temperatures range between 25 and 40 deg F (minus 4 and plus 5 deg C), install self-adhering, modified bituminous sheets produced for low-temperature application. Do not use low-temperature sheets if ambient or substrate temperature is higher than 60 deg F (16 deg C).

D. Apply continuous sheets over already-installed sheet strips, bridging substrate cracks, construction, and contraction joints.

E. Seal edges of sheet-waterproofing terminations with mastic.

F. Install sheet-waterproofing and auxiliary materials to tie into adjacent waterproofing.

G. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Slit and flatten fish mouths and blisters. Patch with sheet waterproofing extending 6 inches (150 mm) beyond repaired areas in all directions.

H. Immediately install protection course with butted joints over waterproofing membrane.

1. Molded-sheet drainage panels may be used in place of a separate protection course to vertical applications when approved by waterproofing manufacturer and installed immediately.

3.2 INSULATION DRAINAGE-PANEL INSTALLATION

A. Install insulation drainage panels over waterproofed surfaces; cut and fit to within 3/4 inch (19 mm) of projections and penetrations.

B. Ensure that drainage channels are aligned and free of obstructions.

C. On vertical surfaces, set insulation drainage panels in adhesive or tape applied according to manufacturer's written instructions.

D. On horizontal surfaces, loosely lay insulation drainage panels according to manufacturer's written instructions. Stagger end joints and tightly abut insulation units.

3.3 PROTECTION, REPAIR, AND CLEANING

A. Do not permit foot or vehicular traffic on unprotected membrane.

B. Protect installed insulation drainage panels from damage due to UV light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

C. Correct deficiencies in or remove waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.

D. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

END OF SECTION 071326

SECTION 072100 - THERMAL INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Foam-plastic board insulation at foundations.
2. Glass-fiber blanket insulation, including for sound attenuation.

B. **Insulation requirements are based on Climate Zone 3 and must meet or exceed the minimum requirements of this zone.**

C. Related Sections:

1. 033000, Cast-in Place Concrete.
2. 035100, Tectum III Roof Deck.
3. 074100, Metal Wall Panel Rain Screen System.
4. 074219, Water Drainage Exterior Insulation and Finish System (EIFS).
5. 075422, Thermoplastic Polyolefin Roofing
7. 092216, Non-Structural Metal Framing.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1.3 INSTALLER QUALIFICATIONS FOR SPRAY FOAM INSULATION

A. The installer must be certified for this type of insulation installation by the manufacturer of the product and have installed a minimum of ten projects of at least 5,000 square feet of material, each.

PART 2 - PRODUCTS

2.1 FOAM-PLASTIC BOARD INSULATION

A. Extruded-Polystyrene Board Insulation (XPS): ASTM C 578, with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, per ASTM E 84.

1. Manufacturers: Subject to compliance with requirements available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. DiversiFoam Products.

b. Dow Chemical Company (The).
c. Owens Corning.

2. Type IV, 25 psi (173 kPa), **2-inch thickness, for R-10, down the foundation wall.**

2.2 GLASS-FIBER BLANKET INSULATION (BATT INSUL.)

A. Manufacturers: Subject to compliance with requirements available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. CertainTeed Corporation.
2. Johns Manville.
3. Owens Corning.

B. Unfaced Glass-Fiber Blanket Insulation: ASTM C 665, **6-inch thickness for R-19.** For use as sound attenuation in all partitions between Mechanical Rooms and occupied spaces and between occupied spaces, and in exterior metal stud walls.

C. Unfaced Glass-Fiber Blanket Insulation: ASTM C 665, **10-inch thickness for R-30.** For use as insulation exterior GWB soffits.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

D. Comply with insulation manufacturer's written instructions applicable to products and applications indicated.

E. Care must be taken to prevent aerosolized material from damaging adjacent structures and vehicles. Notify the Building Owner prior to spraying the insulation material and assure that all vehicles that could be damaged are move out of harm’s way. Protect portions of adjacent structure that may be damaged.

F. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed to ice, rain, or snow at any time.

G. Extend insulation to envelop entire area to be insulated. Cut and fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.

H. Provide sizes to fit applications indicated and selected from manufacturer's standard thicknesses, widths, and lengths. Apply single layer of insulation units to produce thickness indicated unless multiple layers are otherwise shown or required to make up total thickness.

3.2 INSTALLATION OF BELOW-GRADE INSULATION

A. Retain first option in first paragraph below if support is required during backfilling.

B. On vertical surfaces, set insulation units loosely laid according to manufacturer's written instructions.

1. If not otherwise indicated, extend insulation from the outer edge of the horizontal perimeter insulation down to the top of the footing (refer to wall section drawings).

C. On horizontal surfaces, loosely lay insulation units according to manufacturer's written instructions. Stagger end joints and tightly abut insulation units.

1. If not otherwise indicated, extend insulation a minimum of 24 inches (610 mm) in from exterior walls.

3.3 INSTALLATION OF INSULATION WITHIN FRAMED CONSTRUCTION

A. Apply insulation units to substrates by method indicated, complying with manufacturer's written instructions. If no specific method is indicated, bond units to substrate with adhesive or use mechanical anchorage to provide permanent placement and support of units.

B. Glass-Fiber Insulation: Install in cavities formed by framing members according to the following requirements:

2. Use insulation widths and lengths that fill the cavities formed by framing members. If more than one length is required to fill the cavities, provide lengths that will produce a snug fit between ends.

3. Place insulation in cavities formed by framing members to produce a friction fit between edges of insulation and adjoining framing members.

4. Install in miscellaneous voids to provide continuous insulation.

C. Lay soffit batt insulation in one or two layers. If in two layers, place the second layer perpendicular to the first.

END OF SECTION 072100

1 PAGE INTENTIONALLY LEFT BLANK

SECTION 072419 - WATER DRAINAGE EXTERIOR INSULATION AND FINISH SYSTEM (EIFS)

PART 1 GENERAL

1.1 SUMMARY

A. Provide a super hydrophobic EIFS system.

B. Provide air and moisture barrier, and compatible EIFS for vertical above grade exterior walls.

C. Provide ultra-high impact resistance on surfaces below 6-feet above finish floor height.

D. Related Sections

1. Section 042000: Unit Masonry
2. Section 061053: Miscellaneous Rough Carpentry
3. Section 061600: Sheathing, for exterior soffit board and wall sheathing.
4. Section 072100: Insulation
5. Section 076200: Sheet Metal Flashing and Trim
6. Section 079200: Joint Sealants
7. Section 084113: Aluminum-Framed Entrances and Storefronts

1.2 SUBMITTALS

A. Manufacturer's specifications, details, installation instructions and product data

B. Manufacturer’s code compliance report or test summary

C. Manufacturer's standard warranty

D. Applicator's industry training credentials

E. Samples for approval as directed by architect or owner

F. EPS board manufacturer's ICC ES Evaluation Report or UL Listing

G. Sealant manufacturer's certificate of compliance with ASTM C 1382

H. Product sample finish in the color selected by the Architect.

I. Letter from the System Manufacturer stating the details provided in the Contract Documents comply with the Warranty requirements; or submit alternate details that will comply with the project-specific requirements.

1.4 DESIGN REQUIREMENTS

A. Wind Load

1. Design for maximum allowable system deflection, normal to the plane of the wall, of L/240.
2. Design for wind load in conformance with NCSBC code requirements.
3. Maximum wind load resistance: ± 175 psf (8.37 kPa), provided structural supports and sheathing/sheathing attachment are adequate to resist these pressures.

B. Moisture Control

1. Prevent the accumulation of water behind the EIFS or into the wall assembly, either by condensation or leakage through the wall construction, in the design and detailing of the wall assembly:
   a. Provide flashing to direct water to the exterior where it is likely to penetrate components in the wall assembly, including, above window and door heads, beneath window and door sills, at roof/wall intersections, decks, abutments of lower walls with higher walls, above projecting features, at floor lines, and at the base of the wall.
   b. Air Leakage Prevention - provide continuity of the air barrier system at foundation, roof, windows, doors, and other penetrations through the wall with connecting and compatible air barrier components to minimize condensation and leakage caused by air movement.
   c. Vapor Diffusion and Condensation - perform a dew point analysis and/or dynamic hydrothermal modeling of the wall assembly to determine the potential for accumulation of moisture in the wall assembly by diffusion. Adjust insulation thickness and/or other wall assembly components accordingly to minimize risk. Avoid the use of vapor retarders on the interior side of the wall in warm, humid climates.

C. Impact Resistance

1. Provide ultra-high impact resistance of the EIFS to a minimum height of 6'-0" (1.8 m) above finished grade.

D. Color Selection

1. Select finish coat with a light reflectance value of 20 or greater. Refer to Section 090000, Color Schedule.

E. Joints

1. Provide minimum 3/4 inch (19 mm) wide joints in the EIFS where they exist in the substrate or supporting construction, where the cladding adjoins dissimilar construction or materials, at changes in building height, at expansion, control, and cold joints in construction, and at floor lines in multi-level wood frame construction. Size joints to correspond with anticipated movement. Align terminating edges of EIFS with joint edges of through wall expansion joints and similar joints in construction. Refer to Sto Details.
2. Provide minimum 1/2 inch (13 mm) wide perimeter sealant joints at all penetrations through the EIFS (windows, doors, mechanical, electrical, and plumbing penetrations, etc.).
3. Specify compatible backer rod and sealant that has been evaluated in accordance with ASTM C 1382, and that meets minimum 50% elongation after conditioning.
4. Provide joints so that air barrier continuity is maintained across the joint, and drain joints to the exterior, or provide other means to prevent or control water infiltration at joints.

F. Grade Condition

1. Do not extend the EIFS below grade. Provide minimum 6-inch (152 mm) clearance above grade or as required by code.

G. Trim, Projecting Architectural Features and Reveals

1. All trim and projecting architectural features must have a minimum 1:2 [27□] slope along their top surface.

H. Insulation Thickness

1. Minimum GPS insulation thickness is 1 ½ inch (37 mm).

1.5 PERFORMANCE REQUIREMENTS

A. Comply with ASTM E 2568, ASTM E 2570, and the requirements of the Basis-of-Design Product.

1.6 QUALITY ASSURANCE

A. Manufacturer Requirements

1. Member in good standing of the EIFS Industry Members Association (EIMA)
2. Air/moisture barrier and EIFS manufacturer for a minimum of thirty (30) years
3. Manufacturing facilities ISO 9001:2008 Certified Quality System and ISO 14001:2004 Certified Environmental Management System

B. Contractor Requirements

1. Engaged in application of similar systems for a minimum of three (3) years
2. Knowledgeable in the proper use and handling of Sto materials
3. Employ skilled mechanics who are experienced and knowledgeable in air/moisture barrier and EIFS application, and familiar with the requirements of

the specified work

4. Successful completion of minimum of three (3) projects of similar size and complexity to the specified project
5. Provide the proper equipment, manpower and supervision on the job site to install the system in compliance with Sto's published specifications and details and the project plans and specifications

C. Insulation Board Manufacturer Requirements

1. GPS (Graphite Polystyrene) board listed by an approved agency

1.7 DELIVERY, STORAGE AND HANDLING

A. Deliver all materials in their original sealed containers bearing manufacturer's name and identification of product

B. Protect coatings (pail products) from freezing and temperatures in excess of 90 degrees F (32 degrees C). Store away from direct sunlight.

C. Protect Portland cement-based materials (bag products) from moisture and humidity. Store under cover off the ground in a dry location.

1.8 PROJECT/SITE CONDITIONS

A. Maintain ambient and surface temperatures above 40 degrees F (4 degrees C) during application and drying period, minimum 24 hours after application of Air/Moisture barrier and EIFS products

B. Provide supplementary heat for installation in temperatures less than 40 degrees F (4 degrees C)

C. Provide protection of surrounding areas and adjacent surfaces from application of products

1.9 COORDINATION/SCHEDULING

A. Provide site grading such that the EIFS terminates above grade a minimum of 6 inches (150 mm) or as required by code

B. Coordinate installation of foundation waterproofing, roofing membrane, windows, doors and other wall penetrations to provide a continuously connected air and moisture barrier

C. Provide protection of rough openings before installing windows, doors, and other penetrations through the wall

D. Install window and door head flashing immediately after windows and doors are installed

E. Install diverter flashings wherever water can enter the wall assembly to direct water to the exterior

F. Install splices or tie-ins from air/moisture barrier over back leg of flashings, starter tracks, and similar details to form a shingle lap that directs incidental water to the exterior

G. Install copings and sealant immediately after installation of the EIFS when coatings are dry, and such that, where sealant is applied against the EIFS surface, it is applied

against the base coat or primed base coat surface

H. Schedule work such that air/moisture barrier is exposed to weather no longer than 30 days if Sto Gold Coat is used.

I. Attach penetrations through the EIFS to structural support and provide water tight seal at penetrations

1.10 WARRANTY

A. Provide manufacturer's warranty stating the system will be warranted against defects of all constituent products and as a system for a minimum of ten years from date of Acceptance by Owner.

B. Provide an installer warranty against defective workmanship for a period of two years from date of Acceptance by Owner.

C. Warranties shall be non-prorated.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Provide Air/Moisture Barrier and EIFS coatings and accessories from single source manufacturer or approved supplier

B. Subject to the requirements of this spec, including but not limited to the contact angle of water adhesion exhibited and documented for the Basis-of-Design product (125 degrees), the following are acceptable manufacturers:

1. Sto Corp. (Basis-of-Design System: StoTherm ci Lotusan)
2. Dryvit
3. Parex

2.2 AIR/MOISTURE BARRIER

A. StoGuard®

1. Joint Treatment, Rough Opening Protection, and Detail Components:

a. Sto Gold Coat® - ready mixed coating applied by brush, roller or spray for rough opening protection of frame walls and joint treatment of sheathing when used with StoGuard Fabric. Also used as a detail component with StoGuard Fabric to splice over back flange of starter track, flashing, and similar ship lap details

2. Waterproof Coating:

a. Sto Gold Coat® - ready mixed waterproof coating for concrete, concrete masonry, wood-based sheathing, and glass mat gypsum sheathing

2.3 ADHESIVE

A. Sto TurboStick™ - one component polyurethane spray foam adhesive

2.4 INSULATION BOARD

A. GPS graphite expanded polystyrene rigid foam plastic insulation board; 2-inch thickness.

2.5 BASE COAT

A. Sto BTS® Xtra - one component polymer modified cement based high build base coat for insulation board. Also used as a leveler for concrete and masonry surfaces

B. Waterproof Base Coat

1. Sto Watertight Coat – pre-packaged two component fiber reinforced acrylic based waterproof base coat (for use as a waterproof base coat over Sto BTS Xtra for foundations, parapets, splash areas, trim and other projecting architectural features)

2.6 REINFORCING MESHES

A. Standard Mesh

1. Sto Mesh - nominal 4.5 oz/yd^2(153 g/m^2), symmetrical, interlaced open-weave glass fiber fabric made with alkaline resistant coating for compatibility with Sto materials.
2. Sto Intermediate Mesh - nominal 11.2 oz./yd^2 (380 g/m^2), high impact, interwoven, open weave glass fiber fabric with alkaline resistant coating for compatibility with Sto materials.
3. Ultra-High Impact Mesh - Sto Armor Mat - nominal 15 oz/yd2 (509 g/m2), ultra-high impact, double strand, interwoven, open-weave glass fiber fabric with alkaline resistant coating for compatibility with Sto materials

2.7 FINISH COAT

A. Stolit Lotusan - acrylic based Bio-mimicry engineered, not silicone enhanced textured wall finish with graded marble aggregate and self- cleaning properties. Finish texture: Limestone.

2.8 JOB MIXED INGREDIENTS

A. Water - clean and potable

B. Portland cement - Type I, Type II, or Type I-II in conformance with ASTM C 150

2.9 ACCESSORIES

A. Starter Track – rigid PVC (polyvinyl chloride) plastic track Part No. STDE as furnished by Plastic Components, Inc., 9051 NW 97th Terrace, Miami, FL 33178 (800 327 – 7077).

B. Sto-Mesh Corner Bead Standard – one component PVC (polyvinyl chloride) accessory with integral reinforcing mesh for outside corner reinforcement.

C. Sto Drip Edge Profile - one component PVC (polyvinyl chloride) accessory with integral reinforcing mesh that creates a drip edge and plaster return

2.10 MIXING

A. Sto Gold Coat - mix with a clean, rust-free high-speed mixer to a uniform consistency

B. Sto BTS Xtra - mix ratio with water: 4.75- 5 quarts (4.5-4.7 L) of clean potable water per 38-pound (17.2 kg) bag of Sto BTS Xtra. Pour water into a clean mixing pail. Add Sto BTS Xtra, mix to a uniform consistency and allow to set for approximately 5 minutes. Adjust mix if necessary, with additional Sto BTS Xtra or water and remix to a uniform trowel consistency. Avoid retempering. Keep mix ratio consistent. Do not exceed maximum amount of water in mix ratio.

C. Sto Watertight Coat – pour liquid component into a clean mixing pail. Add dry component, mix to a uniform consistency and allow to set for approximately five minutes. Adjust mix if necessary and remix to a uniform trowel consistency. Avoid retempering. Keep mix ratio consistent.

D. Sto primer - mix with a clean, rust-free high-speed mixer to a uniform consistency

E. Stolit Lotusan - mix with a clean, rust-free high-speed mixer to a uniform consistency. A small amount of water may be added to adjust workability. Limit addition of water to amount needed to achieve the finish texture.

F. Mix only as much material as can readily be used

G. Do not use anti-freeze compounds or other additives

PART 3 - EXECUTION

3.1 EXAMINATION

A. Inspect concrete and masonry substrates prior to start of application for:

1. Contamination—algae, chalkiness, dirt, dust, efflorescence, form oil, fungus, grease, laitance, mildew or other foreign substances
2. Surface absorption and chalkiness
3. Cracks—measure crack width and record location of cracks
4. Damage and deterioration such as voids, honeycombs and spalls
5. Moisture content and moisture damage—use a moisture meter to determine if the surface is dry enough to receive the products and record any areas of moisture damage
6. Compliance with specification tolerances—record areas that are out of tolerance (greater than ¼ inch in 8-0 feet [6mm in 2438 mm] deviation in plane)

B. Inspect sheathing application for compliance with applicable requirement and installation in conformance with specification and manufacturer requirements:

1. Glass Mat Faced gypsum sheathing compliant with ASTM C 1177
2. Attachment into structural supports with adjoining sheets abutted and fasteners at required spacing to resist design wind pressures as determined by design professional
3. Fasteners seated flush with sheathing surface and not over-driven

C. Report deviations from the requirements of project specifications or other conditions that might adversely affect the Air/Moisture Barrier and the EIFS installation to the General Contractor. Do not start work until deviations are corrected.

3.2 SURFACE PREPARATION

A. Remove surface contaminants on concrete, concrete masonry, gypsum sheathing, or coated gypsum sheathing surfaces

B. Repair cracks, spalls or damage in concrete and concrete masonry surfaces and level concrete and masonry surfaces to comply with required tolerances

C. Apply conditioner (consult Sto) by spray or roller to chalking or excessively absorptive surfaces or pressure wash to remove surface chalkiness

D. Remove fasteners that are not anchored into supporting construction and seal holes with air barrier material

E. Seal over-driven fasteners with air barrier material and install additional fasteners as needed to comply with fastener spacing requirement

F. Fill large gaps between sheathing or voids around pipe, conduit, scupper, and similar penetrations with spray foam and shave flush with surface

G. Replace weather-damaged sheathing and repair or replace damaged or cracked sheathing

3.3 INSTALLATION

A. Air/Moisture Barrier Installation over Glass Mat Faced Gypsum Sheathing in Compliance with ASTM C 1177.

B. Transition Detailing

1. Detail transition areas with Sto RapidGuard or StoGuard Transition Membrane to achieve air barrier continuity. For illustrations of installation, refer to Sto guide Details and Sto RapidGuard Installation Guide or StoGuard Transition Membrane Installation Guide (www.stocorp.com)

C. Rough Opening Protection

1. Sto Gold Coat with StoGuard Fabric: apply coating liberally by spray or roller to corners of openings, immediately place StoGuard RediCorners in the wet coating, and apply additional coating over the RediCorners to completely embed them. After all corners have been completed apply coating liberally to the entire rough opening, immediately place StoGuard Fabric in the wet coating, smooth any wrinkles with a brush or roller, and apply additional coating over the fabric to completely embed it. Overlap all seams minimum 2 inches (51 mm). Once completed top coat with additional coating as needed to completely seal the surface. Allow to dry and inspect for pinholes or voids. If pinholes or voids are present, seal with additional coating or StoGuard RapidSeal

D. Sheathing Joint Treatment

1. Sto Gold Coat or Sto AirSeal with StoGuard Fabric: apply coating liberally by spray or roller along sheathing joints and immediately place 4 inch (102 mm) wide fabric centered over the joints into the wet coating, and 6 inch (152 mm) wide fabric centered and folded at inside and outside corners into the wet coating. Smooth any wrinkles with a brush or roller and apply additional coating to completely embed the fabric. Overlap seams minimum 2 inches (51 mm).

E. Air/Moisture Barrier Coating Installation

1. Gypsum Sheathing: apply waterproof coating by spray or roller over sheathing surface, including the dry joint treatment, rough opening protection, and transition areas, to a uniform wet mil thickness of 10 mils in one coat (Sto Gold Coat). Use ¾ inch (19 mm) nap roller for glass mat faced gypsum sheathing. Protect from weather until dry.

F. Air /Moisture Barrier Connections and Shingle Laps

1. Coordinate installation of connecting air barrier components with other trades to provide a continuous air tight membrane.
2. Coordinate installation of flashing and other moisture protection components with other trades to achieve complete moisture protection such that water is directed to the exterior, not into the wall assembly, and drained to the exterior at sources of leaks (windows, doors and similar penetrations through the wall assembly).
3. Splice-in head flashings above windows, doors, floor lines, roof/sidewall step flashing, and similar locations with StoGuard detail component to achieve shingle lap of the air/moisture barrier such that water is directed to the exterior.

3.5 EIFS Installation

A. Starter Track

1. Strike a level line at the base of the wall to mark where the top of the starter track terminates.
2. Attach the starter track even with the line into structural supports with the proper fastener: Type S-12 corrosion resistant screws for steel framing with minimum 3/8 inch (9 mm) and three thread penetration Attach between studs into blocking as needed to secure the track flat against the wall surface. Attach at maximum 16 inches (406 mm) on center into framing. For concrete/masonry surfaces, attach directly at 12 inches (305 mm) on center maximum.
3. Butt sections of starter track together. Miter cut outside corners and abut. Snip front flange of one inside corner piece (to allow XPS insulation board to be seated inside of track) and abut.
4. Install Starter Track at other EIFS terminations as designated on detail drawings: above roof along dormers or gable end walls, and beneath window sills with concealed flashing.

B. Detail Splice Strips for Starter Track, Flashing at Floor Lines, Head of Windows and Doors

1. Starter Track, Window/Door Head Flashing, Floor Line Flashing, and Roof/Side Wall Step Flashing: Install minimum 4 inch (100 mm) wide detail component over back flange of starter track, floor line flashing, head flashing, and roof/side wall step flashing.
   Center the detail component so it spans evenly between the back leg of flashing (or accessory) and the coated sheathing. Make a smooth transition to the coated sheathing with a trowel, knife, or roller, depending on the detail component material being used.

C. Back wrapping

1. Apply a strip of detail mesh to the dry air/moisture barrier at all system terminations (windows, doors, expansion joints, etc.) except where the Starter Track is installed. The mesh must be wide enough to adhere approximately 4 inches (100 mm) of

mesh onto the wall, be able to wrap around the insulation board edge and cover a minimum of 2 ½ inches (64 mm) on the outside surface of the insulation board. Attach mesh strips to the air/moisture barrier and allow them to dangle until the back-wrap procedure is completed. Alternatively, pre-wrap terminating edges of insulation board.

D. Adhesive Application and Installation of Insulation Board

1. Ensure the air/moisture barrier surface (Sto Gold Coat) is free of surface contamination. Install the insulation board within 30 days of the application of the air/moisture barrier coating (Sto Gold Coat), or clean the surface and recoat with Sto Gold Coat.
2. Cut the insulation board squarely to a 2 x 4-foot (0.6 x 1.2 m) dimension (if not already furnished pre-cut).
3. Rasp the interior lower face of insulation boards to provide a snug friction fit into the Starter Track.
4. Apply adhesive to the back of the insulation board with the dispensing pistol approximately ¾ inch (19 mm) from ends. Apply 6 additional ribbons spaced equally at no greater than 5-6 inches (127-152 mm) apart between the end ribbons for a total of 8 ribbons. Apply uniform ribbons of adhesive parallel with the SHORT dimension of the board so that when boards are placed on the wall the ribbons will be VERTICAL. Apply adhesive ribbons approximately ½ inch (51 mm) in diameter which will expand to ¾ - 1 inch (19 – 25 mm). Keep adhesive ½ inch (51 mm) short of board edges. Apply adhesive uniformly so ribbons of adhesive do not converge. Allow adhesive to “dwell” and become “tacky” before placing boards on wall. Adhesive will look smooth, not jagged, when ready to apply to wall surface. Place boards while adhesive is “tacky” and before adhesive “skins”.
5. Place insulation boards in a running bond pattern on the wall with the long dimension horizontal. Start by inserting the lower edge of the boards inside the starter track at the base of the wall until they contact the bottom of the track. Apply light pressure when placing the boards. After boards have been in place for 5-10 minutes use a straight edge to lightly press the boards inward and to keep board joints flush, as post expansion of the adhesive may force boards slightly outward.
6. Bridge sheathing joints by a minimum of 6 inches (152 mm). Interlock inside and outside corners.
7. Butt all board joints tightly together to eliminate any thermal breaks. Care must be taken to prevent any adhesive from getting between the joints of the boards.
8. Cut insulation board in an L-shaped pattern to fit around openings. Do not align board joints with corners of openings.
9. Check for satisfactory contact of the insulation board with the substrate. If any boards have loose areas use the dispensing pistol to create a hole through the board and inject adhesive to attach the loose area. Allow the adhesive to expand to the outer face of the board while withdrawing the pistol. Cut excess adhesive flush with the surface of the insulation. Do not use nails, screws, or any other type of non-thermal mechanical fastener.

E. Slivering and Rasping of Insulation Board Surface

1. Make sure insulation boards are fully adhered to the substrate before proceeding.
2. Fill any open joints in the insulation board layer with slivers of insulation or the spray foam adhesive.
3. Rasp the insulation board surface to achieve a smooth, even surface and to remove any ultraviolet ray damage.

F. Completion of Back wrapping

1. Complete the back-wrapping procedure by applying base coat to exposed edges of insulation board and approximately 4 inches (100 mm) onto the face of the insulation board. Pull mesh tight around the board and embed it in the base coat with a stainless-steel trowel. Use a corner trowel for clean, straight lines. Smooth any wrinkles or gaps in the mesh.

G. Accessory Installation

1. Corner Bead: cut the corner bead accessory to proper length as needed. Use full pieces wherever possible and avoid using short filler pieces. Offset accessory butt joints from substrate joints. Apply base coat with a stainless-steel trowel to an approximate thickness of 1/8 inch (3 mm) to the outside corner area that will receive the accessory. Immediately place the accessory directly into the wet base coat material. Do not slide into place. Press the accessory into place. A corner trowel is best for this purpose. Embed and completely cover the mesh and PVC by troweling from the corner to the edge of the mesh so that no mesh or PVC color is visible. Avoid excess build-up of base coat and feather along mesh edges. Adjoin separate pieces by abutting PVC to PVC and overlapping the mesh “tail” from one piece onto the next piece. Fully embed the accessory and mesh “tail” in base coat material. When installing field mesh reinforcement overlap accessory mesh minimum and PVC. Remove any excess base coat from the outside corner.
2. Drip Edge: install the drip edge accessory prior to application of field mesh. Install with arrow on mesh pointing UP. Cut the accessory to proper length as needed. Use full pieces wherever possible and avoid using short filler pieces. Offset accessory butt joints from substrate joints. Apply base coat with a stainless-steel trowel to an approximate thickness of 1/8 inch (3 mm) to the area that will receive the accessory. Immediately place the accessory directly into the wet base coat material and press into place. Do not slide into place. Embed and completely cover the mesh and PVC by troweling from the drip edge screed rail to the edge of the mesh. Avoid excess build-up of base coat, feather along mesh edges, and remove any excess base coat from the drip edge nosing. Abut adjoining pieces and install as described above. When installing field mesh reinforcement overlap accessory mesh 4 inches (10 cm) on both vertical and horizontal faces so the PVC is overlapped, and remove any excess base coat from the drip edge nosing. On vertical and horizontal faces of the accessory install finish to the drip edge lines and remove any protruding finish from the drip edge nosing.

H. Base Coat and Reinforcing Mesh Application

1. Ensure the insulation board is firmly adhered and free of surface contamination or UV degradation, and is thoroughly rasped before commencing the base coat application.
2. Apply minimum 9x12 inch (225x300 mm) diagonal strips of detail mesh at corners of windows, doors, and all penetrations through the system. Embed the strips in wet base coat and trowel from the center to the edges of the mesh to avoid wrinkles.
3. Apply detail mesh at trim, reveals and projecting architectural features. Embed the mesh in the wet base coat. Trowel from the base of reveals to the edges of the mesh.
4. Ultra-High impact mesh application (recommended to a minimum height of 6’-0" [1.8 m] above finished grade at all areas accessible to pedestrian traffic and other

areas exposed to abnormal stress or impact, and where indicated on contract drawings): apply base coat over the insulation board with a stainless-steel trowel to a uniform thickness of approximately 1/8 inch (3 mm). Work horizontally or vertically in strips of 40 inches (1016 mm), and immediately embed the mesh into the wet base coat by troweling from the center to the edge of the mesh. Butt ultra-high impact mesh at seams. Allow the base coat to dry.

5. Standard mesh application: Apply base coat over the insulation board, including areas with Ultra-High impact mesh, with a stainless-steel trowel to a uniform thickness of approximately ⅛ inch (3 mm). Work horizontally or vertically in strips of 40 inches (1016mm), and immediately embed the mesh into the wet base coat by troweling from the center to the edge of the mesh. Overlap mesh not less than 2-½ inches (64 mm) at mesh seams and at overlaps of detail mesh. Feather seams and edges. Double wrap all inside and outside corners with minimum 6 inch (152 mm) overlap in each direction. Avoid wrinkles in the mesh. The mesh must be fully embedded so that no mesh color shows through the base coat when it is dry. Re-skim with additional base coat if mesh color is visible.
6. Sloped Surfaces: for trim, reveals, aesthetic bands, cornice profiles, sills or other architectural features that project beyond the vertical wall plane more than 2 inches (51 mm) apply waterproof base coat with a stainless-steel trowel to the sloped surface and minimum four inches (100 mm) above and below it. Embed standard mesh or detail mesh in the waterproof base coat and overlap mesh seams a minimum of 2-½ inches (65 mm).
7. Allow base coat to thoroughly dry before applying primer or finish.

I. Finish Coat Application

1. Ensure the base coat surface or primed base coat is free of surface contamination before commencing the finish application.
2. Apply finish directly over the base coat or primed base coat when dry. Apply finish by spray or stainless-steel trowel, depending on the finish specified. Follow these general rules for application of finish:
   a. Avoid application in direct sunlight.
   b. Apply finish in a continuous application, and work to an architectural break in the wall.
   c. Weather conditions affect application and drying time. Hot or dry conditions limit working time and accelerate drying. Adjustments in the scheduling of work may be required to achieve desired results. Cool or damp conditions extend working time and retard drying and may require added measures of protection against wind, dust, dirt, rain and freezing. Adjust work schedule and provide protection.
   d. Do not install separate batches of finish side-by-side.
   e. Do not apply finish into or over sealant joints. Apply finish to outside face of wall only.
   f. Do not apply finish over irregular or unprepared surfaces, or surfaces not in compliance with the requirements of the project specifications.

3.6 EXTERIOR SOFFITS

A. Apply Sto Gold Coat with Base Coat and Reinforcing Mesh onto glass matt sheathing. Apply finish directly over the base coat or primed base coat when dry.

3.7 PROTECTION

A. Provide protection of installed materials from water infiltration into or behind them

B. Provide protection of installed materials from dust, dirt, precipitation, freezing and continuous high humidity until they are fully dry

3.8 CLEANING, REPAIR AND MAINTENANCE

A. Clean and maintain the EIFS for a fresh appearance and to prevent water entry into and behind the system. Repair cracks, impact damage, spalls or delamination promptly.

B. Maintain adjacent components of construction such as sealants, windows, doors, and flashing, to prevent water entry into or behind the EIFS and anywhere into the wall assembly

C. Refer to Sto reStore Repair and Maintenance Guide (reStore Program) for detailed information on restoration - cleaning, repairs, recoating, resurfacing and refinishing, or re-cladding

END OF SECTION 072419

SECTION 075423 - THERMOPLASTIC POLYOLEFIN (TPO) ROOFING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Fully Adhered TPO membrane roofing system.
2. Roof drain.
3. Walkway pads.

B. Related Sections:

061000	Rough Carpentry
072100	Thermal Insulation
072726	Fluid Applied Membrane Air Barriers
076200	Sheet Metal Flashing & Trim
079200	Joint Sealants

1.2 PERFORMANCE REQUIREMENTS

A. Solar Reflectance Index: Not less than 78 when calculated according to ASTM E 1980, based on testing identical products by a qualified testing agency.

B. Energy Performance: Provide roofing system that is listed on the DOE's ENERGY STAR "Roof Products Qualified Product List" for low-slope roof products.

1.3 PRE-INSTALLATION CONFERENCE

A. Prior to installation commencement of the roofing installation and associated work, conduct a meeting at the project site with the installer, architect, owner, GAF representative and any other persons directly involved with the performance of the work. The installer shall record conference discussions to include decisions and agreements reached (or disagreements), and furnish copies of recorded discussions to each attending party. The main purpose of this meeting is to review foreseeable methods and procedures related to roofing work.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For roofing system. Include plans, elevations, sections, details, and attachments to other work.

C. Samples for Verification: For the following products:

1. White Sheet roofing.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: A qualified firm that is approved, authorized, or licensed by membrane roofing system manufacturer to install manufacturer's product.

B. Source Limitations: Obtain components including roof insulation adhesive and fasteners for membrane roofing system from same manufacturer as membrane roofing or approved by membrane roofing manufacturer.

C. Exterior Fire-Test Exposure: ASTM E 108, Class C; for application and roof slopes indicated, as determined by testing identical membrane roofing materials by a qualified testing agency. Materials shall be identified with appropriate markings of applicable testing agency.

1.7 WARRANTIES

A. Manufacturer's Guarantee: Manufacturer's standard form, non-pro-rated, without monetary limitation or deductibles, in which manufacturer agrees to repair or replace components of roofing system that fail in materials or workmanship within specified warranty period. Failure includes roof leaks or breaches in the primary roof membrane causing moisture to enter the substrate below (even if visible leaks are not observed inside the facility).

1. Warranty to include but not be limited to membrane, insulation, adhesives, fasteners, sealants, flashings, polymer clad sheet metal, etc.
2. Warranty Period: Twenty years from date of Final Acceptance.
3. Warranty to remain in effect for wind speeds up to 72 mph.
4. Warranties requiring the Owner's signature are not acceptable.

B. Contractor's Warranty:

1. Two Year Warranty: Manufacturer's Representative and Contractor's Representative will attend post construction field inspection no earlier than one month prior to the expiration date of the Contractor's Warranty. Submit a written report within seven (7) days of the site visit to the Engineer listing observations, conditions and recommended repairs or remedial action.

PART 2 - PRODUCTS

2.1 TPO MEMBRANE ROOFING

B. Fabric-Reinforced Thermoplastic Polyolefin Sheet: ASTM D 6878, internally fabric or scrim reinforced, uniform, flexible fabric backed TPO sheet.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

a. GAF Materials Corporation. <u>Everguard Fleece-Back</u> is Basis of Design.
b. Carlisle SynTec Incorporated.
c. Sike Sarnafil.

2. Thickness: 60 mils (1.45 mm), nominal.

3. Membrane color: White.

2.2 AUXILIARY MEMBRANE ROOFING MATERIALS

A. General: Auxiliary membrane roofing materials recommended by roofing system manufacturer for intended use, and compatible with membrane roofing.

1. Liquid-type auxiliary materials shall comply with VOC limits of authorities having jurisdiction.

2. Adhesives and sealants that are not on the exterior side of weather barrier shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

   a. Plastic Foam Adhesives: 50 g/L.
   b. Gypsum Board and Panel Adhesives: 50 g/L.
   c. Multipurpose Construction Adhesives: 70 g/L.
   d. Fiberglass Adhesives: 80 g/L.
   e. Single-Ply Roof Membrane Adhesives: 250 g/L.
   f. Other Adhesives: 250 g/L.
   g. Single-Ply Roof Membrane Sealants: 450 g/L.
   h. Non-membrane Roof Sealants: 300 g/L.
   i. Sealant Primers for Nonporous Substrates: 250 g/L.
   j. Sealant Primers for Porous Substrates: 775 g/L.

B. Sheet Flashing: Manufacturer's standard unreinforced thermoplastic polyolefin sheet flashing, 55 mils (1.4 mm) thick, minimum, of same color as sheet membrane.

C. Bonding Adhesive: Manufacturer's standard.

D. Metal Termination Bars: Manufacturer's standard, predrilled stainless-steel or aluminum bars, approximately 1 by 1/8 inch (25 by 3 mm) thick; with anchors.

E. Metal Battens: Manufacturer's standard, aluminum-zinc-alloy-coated or zinc-coated steel sheet, approximately 1 inch wide by 0.05 inch thick (25 mm wide by 1.3 mm thick), pre-punched.

F. Concrete and Masonry Flashing Membrane Termination Anchors:

1. ¼-nch diameter metal-based expansion anchor with stainless steel pin of length to penetrate substrate a minimum of 1-1/2 inch.
2. Masonry screws approved my membrane manufacturer, 1/4 inch minimum diameter, corrosion resistant, with Phillips flat head. Length to provide minimum 1 ½ -inch embedment into substrate.

G. Solid Concrete Deck Fasteners and Plates:

1. #14 corrosion-resistant fastener used with approved plates for membrane attachment with shank diameter of 0.190 inch, a thread diameter of 0.245 inch and a #3 Phillips drive head with a diameter of 0.435 inch.
2. Nail-in, non-threaded fasteners with split bulb tip designed for securement of membrane and insulation to structural concrete roof decks, length to penetrate deck a minimum of 1" with plates as approved by roof membrane manufacturer.

H. Fasteners: Factory-coated steel fasteners and metal or plastic plates complying with corrosion-resistance provisions in FM Approvals 4470, designed for fastening membrane to substrate, and acceptable to membrane roofing system manufacturer.

I. Miscellaneous Accessories: Provide pourable sealers, preformed cone and vent sheet flashings, preformed inside and outside corner sheet flashings, T-joint covers, lap sealants, termination reglets, and other accessories.

2.3 ROOF INSULATION AND CANTS OR CRICKETS – TAPERED POLYISOCYANURATE OR MINERAL BASED

A. Material for cants or crickets shall be acceptable to the roofing manufacturer.

2.5 ROOF DRAINS

A. Provide Zurn Z-100 roof drain assembly or equivalent by Wade or Josam.

1. Sizes to meet requirements of roof drain leaders on the Drawings.

2.6 CURBS, PIPE BOOTS, ETC.

A. Provide items as required to complete the installation and protect all equipment and pipe penetrations.

2.7 WALKWAY PAD

A. Walkway Pad is a roll measuring 34" x 50' (864 mm x 15.24 m), and has a diamond pattern measuring 30" (762 mm) with 2” smooth sides for welding. Rolls are made of recycled TPO and “Everguard” or equivalent product, are 125-mil thickness and are in standard gray. Provide in areas shown on Sheet A3.3.

PART 3 - EXECUTION

3.1 INSULATION INSTALLATION

A. Coordinate installing membrane roofing system components so insulation is not exposed to precipitation or left exposed at the end of the workday.

B. Comply with membrane roofing system and insulation manufacturer's written instructions for installing roof insulation.

C. Provide continuous insulation sleeve for roof drains and piping that occur over tempered portions of the building. Refer to Plumbing Insulation Specification for type and thickness.

D. Install crickets at the high side of all obstructions (mechanical equipment, roof hatches, skylights, etc.) to assure water does not pond in these locations.

3.2 MEMBRANE INSTALLATION (ADHERED)

A. Over the properly installed and prepared substrate, spread membrane adhesive in accordance with the manufacturer's instructions and application rates utilizing equipment as required by the manufacturer.

1. Do not allow adhesive to skin-over or surface-dry prior to installation of roof membrane.
2. Do not utilize water based membrane adhesive if temperatures below 40º F (5º C) are expected during application or subsequent drying time.
3. Comply with the manufacturer's published requirements for adhesive application rates.
4. Count the amount of pails of adhesive used per area per day to verify conformance to the specified adhesive rate.
5. Do not apply adhesive in seam areas.
6. Replace notched squeegees daily or as notches are reduced below 1/4 inch.

B. Place roof membrane into the adhesive in accordance with manufacturer's instructions.

C. Shingle seams with flow of water. Overlap upslope, adjacent rolls 3 inches over previous roll. This process is repeated throughout the roof area.

D. After placement of membrane, press roll into place with the manufacturer's recommended roller by frequent rolling in two directions.

E. Weld membrane cover strips at fleeceback membrane seams without a factory selvage edge.

3.4 MEMBRANE TERMINATION

A. Terminate membrane at walls and curbs as shown in the contract drawings.

1. Roof Deck: Mechanically terminated using specified fasteners and plates 6 inches on center.
2. Wood Wall Substrate: Turn membrane up wall 1 inch and mechanically terminate using specified screws 8 inches on center with a termination bar.
3. Concrete/Masonry Wall Substrate: Turn membrane up wall 1 inch and mechanically terminated using specified anchors 8 inches on center with a termination bar.

B. Terminate membrane at penetrations as shown in the contract drawings.

1. Fasten membrane 6 inches on center or a minimum of 4 fasteners per penetration into the structural deck using fasteners and plates as approved by the membrane manufacturer for the deck substrate.

C. Extend membrane over roof edge a minimum of 2 inches below the perimeter wood blocking. If fleeceback membrane is utilized, trim membrane flush with outside edge of roof and hot-air weld a non fleeceback flashing membrane to extend over the roof edge.

3.3 BASE FLASHING INSTALLATION

A. Install sheet flashings and preformed flashing accessories and adhere to substrates according to membrane roofing system manufacturer's written instructions.

B. Apply bonding adhesive to substrate and underside of sheet flashing at required rate and allow to partially dry. Do not apply to seam area of flashing.

C. Flash penetrations and field-formed inside and outside corners with cured or uncured sheet flashing.

D. Clean seam areas, overlap, and firmly roll sheet flashings into the adhesive. Hot-air weld side and end laps to ensure a watertight seam installation.

E. Terminate and seal top of sheet flashings and mechanically anchor to substrate through termination bars a minimum of 8-inches above roofing surface and as shown on the drawings.

F. At expansion joints, extend flashing membrane over joint and dip into cavity to allow for expansion.

G. Roof Drain:

1. Mechanically attach membrane 6 inches on center into structural deck around drain sump. Adhere flashing membrane and hot-air weld to membrane a minimum of 4 inches.

2. Set flashing membrane in bed of sealant under the clamping ring.

H. Soil Pipe/Pipe Penetration:

1. Provide field wrapped pipe penetration flashing or manufacturer's prefabricated pipe boot as shown in detail drawing.
2. Apply aluminum tape to penetration if asphalt contamination is present.
3. Hot-air weld horizontal flashing membrane a minimum of four inches onto the membrane.
4. Adhere vertical flashing membrane adhered to pipe penetration and extend a minimum of 1.5 inches horizontal at the base of penetration. Hot-air weld vertical flashing membrane to horizontal flashing membrane.
5. Install stainless steel draw band and sealant or hot-air weld flashing cap to terminate top edge of pipe flashing.

3.4 TRAFFIC PROTECTION

A. Install walkway pads at all roof access locations and other designated locations including roof-mounted equipment work locations and areas of repeated rooftop traffic.

B. Walkway rolls or pads must be spaced 6" (152 mm) apart to allow for drainage between the pads.

C. Heat-weld walkway rolls or pads to the roof membrane surface continuously around the perimeter of the pad/roll.

3.5 FIELD QUALITY CONTROL

A Final Roof Inspection: Arrange for roofing system manufacturer’s technical personnel to inspect roofing installation on completion and provide the written inspection report to the Architect.

B. Repair or remove and replace components of membrane roofing system where inspections indicate that they do not comply with specified requirements.

END OF SECTION 075423

SECTION 076200 - SHEET METAL FLASHING AND TRIM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Formed receivers with counterflashing.
2. Formed roof-drainage sheet metal fabrications.
3. Formed roof edge trim.

B. Related Sections:

1. 033000, Cast-in Place Concrete.
2. 075422, Thermoplastic Polyolefin Roofing.
3. 074219, Water Drainage Exterior Insulation and Finish System (EIFS).
4. 084113, Aluminum-Framed Entrances and Storefronts.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For sheet metal flashing and trim.

1. Include plans, elevations, sections, and attachment details.
2. Distinguish between shop- and field-assembled work.
3. Include identification of finish for each item.
4. Include pattern of seams and details of termination points, expansion joints and expansion-joint covers, direction of expansion, roof-penetration flashing, and connections to adjoining work.

C. Samples: For each exposed product and for each color and texture specified.

1.3 INFORMATIONAL SUBMITTALS

A. Sample warranty.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.5 QUALITY ASSURANCE

A. Fabricator Qualifications: Employs skilled workers who custom fabricate sheet metal flashing and trim similar to that required for this Project and whose products have a record of successful in-service performance.

1.6 WARRANTY

A. Special Warranty on Finishes: Manufacturer agrees to repair finish or replace sheet metal flashing and trim that shows evidence of deterioration of factory-applied finishes within specified warranty period.

1. Finish Warranty Period: 10 years from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General: Sheet metal flashing and trim assemblies shall withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Completed sheet metal flashing and trim shall not rattle, leak, or loosen, and shall remain watertight.

B. Sheet Metal Standard for Flashing and Trim: Comply with NRCA's "The NRCA Roofing Manual" and SMACNA's "Architectural Sheet Metal Manual" requirements for dimensions and profiles shown unless more stringent requirements are indicated.

C. SPRI Wind Design Standard: Manufacture and install copings and roof edge flashings tested according to SPRI ES-1 and capable of resisting the following design pressure:

1. Design Pressure: As indicated on Drawings.

D. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.

1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 SHEET METALS

A. General: Protect mechanical and other finishes on exposed surfaces from damage by applying strippable, temporary protective film before shipping.

1. Metallic-Coated Steel Sheet: Provide aluminum-zinc alloy-coated steel sheet according to ASTM A 792/A 792M, Class AZ50 (Class AZM150) coating designation, Grade 40 (Grade 275); pre-painted by coil-coating process to comply with ASTM A 755/A 755M.
2. Surface: Manufacturer's standard clear acrylic coating on both sides.
3. Exposed Coil-Coated Finish:
4. Three-Coat Fluoropolymer: AAMA 621. Fluoropolymer finish containing not less than 70 percent PVDF resin by weight in both color coat and clear topcoat. Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturers' written instructions.

B. Color: Match color shown in Section 090000 “Color Schedule”.

2.3 MISCELLANEOUS MATERIALS

A. General: Provide materials and types of fasteners, solder, protective coatings, sealants, and other miscellaneous items as required for complete sheet metal flashing and trim installation and as recommended by manufacturer of primary sheet metal unless otherwise indicated.

B. Fasteners: Wood screws, annular threaded nails, self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design.

1. General: Blind fasteners or self-drilling screws, gasketed, with hex-washer head.

    1. Exposed Fasteners: Heads matching color of sheet metal using plastic caps or factory-applied coating. Provide metal-backed EPDM or PVC sealing washers under heads of exposed fasteners bearing on weather side of metal.
    2. Blind Fasteners: High-strength aluminum or stainless-steel rivets suitable for metal being fastened.
    3. Spikes and Ferrules: Same material as gutter; with spike with ferrule matching internal gutter width.

2. Fasteners for Aluminum Sheet: Aluminum or Series 300 stainless steel.

C. Sealant Tape: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, non-sag, nontoxic, non-staining tape 1/2 inch (13 mm) wide and 1/8 inch (3 mm) thick.

D. Elastomeric Sealant: ASTM C 920, elastomeric clear silicone polymer sealant; of type, grade, class, and use classifications required to seal joints in sheet metal flashing and trim and remain watertight.

E. Butyl Sealant: ASTM C 1311, single-component, solvent-release butyl rubber sealant; polyisobutylene plasticized; heavy bodied for hooked-type expansion joints with limited movement.

F. Epoxy Seam Sealer: Two-part, noncorrosive, aluminum seam-cementing compound, recommended by aluminum manufacturer for exterior nonmoving joints, including riveted joints.

G. Bituminous Coating: Cold-applied asphalt emulsion according to ASTM D 1187.

H. Asphalt Roofing Cement: ASTM D 4586, asbestos free, of consistency required for application.

2.4 FABRICATION, GENERAL

A. General: Custom fabricate sheet metal flashing and trim to comply with details shown and recommendations in cited sheet metal standard that apply to design, dimensions, geometry, metal thickness, and other characteristics of item required. Fabricate sheet metal flashing and trim in shop to greatest extent possible.

1. Obtain field measurements for accurate fit before shop fabrication.
2. Form sheet metal flashing and trim to fit substrates without excessive oil canning, buckling, and tool marks; true to line, levels, and slopes; and with exposed edges folded back to form hems.
3. Conceal fasteners and expansion provisions where possible. Do not use exposed fasteners on faces exposed to view.

B. Expansion Provisions: Form metal for thermal expansion of exposed flashing and trim.

1. Form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep, filled with butyl sealant concealed within joints.
2. Use lapped expansion joints only where indicated on Drawings.

C. Sealant Joints: Where movable, non-expansion-type joints are required, form metal to provide for proper installation of elastomeric sealant according to cited sheet metal standard.

D. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal.

E. Fabricate cleats and attachment devices of sizes as recommended by cited sheet metal standard for application, but not less than thickness of metal being secured.

F. Seams for Aluminum: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints where necessary for strength.

2.5 LOW-SLOPE ROOF SHEET METAL FABRICATIONS

A. All Exposed Flashing Except Roof Edge: Fabricate from the following materials:

1. Aluminum: 0.032 inch (0.81 mm) thick.

B. Roof Edge Coping Trim: Fabricate from the following materials:

1. Aluminum: 0.050 inch (1.27 mm) thick.

2.6 FASCIA AND SOFFIT SHEET METAL FABRICATIONS

A. All Exposed Flashing Except Roof Edge: Fabricate from the following materials:

1. Aluminum: 0.066 inch (1.68 mm) thick.

2.7 INSTALLATION, GENERAL

A. General: Anchor sheet metal flashing and trim and other components of the Work securely in place, with provisions for thermal and structural movement. Use fasteners, solder, protective coatings, separators, sealants, and other miscellaneous items as required to complete sheet metal flashing and trim system.

1. Install sheet metal flashing and trim true to line, levels, and slopes. Provide uniform, neat seams with minimum exposure of solder, welds, and sealant.
2. Install sheet metal flashing and trim to fit substrates and to result in watertight performance. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal.
3. Space cleats not more than 12 inches (300 mm) apart. Attach each cleat with at least two fasteners. Bend tabs over fasteners.
4. Install exposed sheet metal flashing and trim with limited oil canning, and free of buckling and tool marks.
5. Torch cutting of sheet metal flashing and trim is not permitted.

B. Metal Protection: Where dissimilar metals contact each other, or where metal contacts pressure-treated wood or other corrosive substrates, protect against galvanic action or corrosion by painting contact surfaces with bituminous coating or by other permanent separation as recommended by sheet metal manufacturer or cited sheet metal standard.

C. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at maximum of 10 feet (3 m) with no joints within 24 inches (600 mm) of corner or intersection.

1. Form expansion joints of intermeshing hooked flanges, not less than 1 inch (25 mm) deep, filled with sealant concealed within joints.

D. Fasteners: Use fastener sizes that penetrate wood blocking or sheathing not less than 1-1/4 inches (32 mm) for nails and not less than 3/4 inch (19 mm) for wood screws.

E. Conceal fasteners and expansion provisions where possible in exposed work and locate to minimize possibility of leakage. Cover and seal fasteners and anchors as required for a tight installation.

F. Seal joints as required for watertight construction. Prepare joints and apply sealants to comply with requirements herein and in Section 079200 "Joint Sealants."

G. Rivets: Rivet joints in aluminum where necessary for strength. Paint the exposed ends of the rivets to match the sheet metal finish.

2.8 ROOF FLASHING INSTALLATION

A. General: Install sheet metal flashing and trim to comply with performance requirements, and cited sheet metal standard. Provide concealed fasteners where possible, and set units true to line, levels, and slopes. Install work with laps, joints, and seams that are permanently watertight and weather resistant.

B. Roof Edge Flashing: Anchor to resist uplift and outward forces according to recommendations in cited sheet metal standard unless otherwise indicated. Interlock bottom edge of roof edge flashing with continuous cleat anchored to substrate.

C. Caps and Copings: Anchor to resist uplift and outward forces according to recommendations in cited sheet metal standard unless otherwise indicated.

D. Pipe or Post Counterflashing: Install counterflashing umbrella with close-fitting collar with top edge flared for elastomeric sealant, extending minimum of 4 inches (100 mm) over base flashing. Install stainless-steel draw band and tighten.

E. Counterflashing: Coordinate installation of counterflashing with installation of base flashing. Insert counterflashing in reglets or receivers and fit tightly to base flashing. Extend counterflashing 4 inches (100 mm) over base flashing. Lap counterflashing joints minimum of 4 inches (100 mm).

F. Roof-Penetration Flashing: Coordinate installation of roof-penetration flashing with installation of roofing and other items penetrating roof. Seal with butyl sealant and clamp flashing to pipes that penetrate roof.

2.9 CLEANING AND PROTECTION

A. Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering.

B. Clean and neutralize flux materials. Clean off excess solder.

C. Clean off excess sealants.

D. Remove temporary protective coverings and strippable films as sheet metal flashing and trim are installed unless otherwise indicated in manufacturer's written installation instructions.

END OF SECTION 076200

SECTION 079200 - JOINT SEALANTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Silicone joint sealants.
2. Urethane joint sealants.
3. Latex joint sealants.
4. Preformed joint sealants.
5. Acoustical joint sealants.

B. Related Sections:

1. 033000, Cast-in-Place Concrete.
2. 042000, Unit Masonry.
3. 064023, Interior Architectural Woodwork.
4. 074100, Metal Wall Panel Rain Screen System.
5. 074219, Water Drainage Exterior Insulation and Finish System (EIFS).
6. 076200, Sheet Metal Flashing and Trim.
7. 081743, FRP Fire-Rated Frames.
8. 084113, Aluminum-Framed Entrances and Storefronts.
9. 088000, Glazing.
10. 092900, Gypsum Board.
11. 093000, Tiling.
12. 099123, Interior Painting.
13. 099600, High Performance Coatings.
14. Divisions 22, 23, 26, 28 (wall penetrations and fixtures abutting walls).

1.2 ACTION SUBMITTALS

A. Samples: For each kind and color of joint sealant required.

B. Joint-Sealant Schedule: Include the following information:

1. Joint-sealant application, joint location, and designation.
2. Joint-sealant manufacturer and product name.
3. Joint-sealant formulation.
4. Joint-sealant color.

PART 2 - PRODUCTS

2.1 MATERIALS, GENERAL

A. VOC Content of Interior Sealants: Sealants and sealant primers used inside the weatherproofing system shall comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):

1. Architectural Sealants: 250 g/L.
2. Sealant Primers for Nonporous Substrates: 250 g/L.
3. Sealant Primers for Porous Substrates: 775 g/L.

B. Low-Emitting Interior Sealants: Sealants and sealant primers used inside the weatherproofing system shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

C. Stain-Test-Response Characteristics: Where sealants are specified to be non-staining to porous substrates, provide products that have undergone testing according to ASTM C 1248 and have not stained porous joint substrates indicated for Project.

D. Suitability for Contact with Food: Where sealants are indicated for joints that will come in repeated contact with food, provide products that comply with 21 CFR 177.2600.

2.2 SILICONE JOINT SEALANTS

A. Mildew-Resistant Neutral-Curing Silicone Joint Sealant: ASTM C 920.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. BASF Building Systems.
b. Dow Corning Corporation.
c. GE Advanced Materials - Silicones.
d. Pecora Corporation.
e. Tremco Incorporated.

2. Type: Single component (S).
3. Grade: Non-sag (NS).
4. Uses Related to Exposure: Nontraffic (NT).

2.3 URETHANE JOINT SEALANTS

A. Urethane Joint Sealant: ASTM C 920.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. BASF Building Systems.
b. Bostik, Inc.
c. Pecora Corporation.
d. Tremco Incorporated.

2. Type: Single component (S).
3. Grade: Non-sag (NS).
4. Uses Related to Exposure: Nontraffic (NT).

2.4 LATEX JOINT SEALANTS

A. Latex Joint Sealant: Acrylic latex or siliconized acrylic latex, ASTM C 834, Type OP, Grade NF.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. BASF Building Systems.
b. Bostik, Inc.
c. Pecora Corporation.
d. Tremco Incorporated.

2.5 ACOUSTICAL JOINT SEALANTS

A. Acoustical Joint Sealant: Manufacturer's standard non-sag, paintable, non-staining latex sealant complying with ASTM C 834. Product effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. Pecora Corporation .
b. USG Corporation.
c. Tremco Incorporated.

2.6 JOINT SEALANT BACKING

A. Cylindrical Sealant Backings: ASTM C 1330, Type C (closed-cell material with a surface skin), and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance.

B. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer.

2.7 MISCELLANEOUS MATERIALS

A. Primer: Material recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.

B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials.

C. Masking Tape: Non-staining, nonabsorbent material compatible with joint sealants and surfaces adjacent to joints.

PART 3 - EXECUTION

3.1 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions.

1. Remove laitance and form-release agents from concrete.
2. Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants.

B. Joint Priming: Prime joint substrates where recommended by joint-sealant manufacturer or as indicated by preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.

C. Masking Tape: Use masking tape where required to prevent contact of sealant or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.2 INSTALLATION

A. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

B. Install sealant backings of kind indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

1. Do not leave gaps between ends of sealant backings.
2. Do not stretch, twist, puncture, or tear sealant backings.
3. Remove absorbent sealant backings that have become wet before sealant application and replace them with dry materials.

C. Install bond-breaker tape behind sealants where sealant backings are not used between sealants and backs of joints.

D. Install sealants using proven techniques that comply with the following and at the same time backings are installed:

1. Place sealants so they directly contact and fully wet joint substrates.
2. Completely fill recesses in each joint configuration.
3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

E. Tooling of Non-sag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified in subparagraphs below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.

1. Remove excess sealant from surfaces adjacent to joints.
2. Use tooling agents that are approved in writing by sealant manufacturer and that do not discolor sealants or adjacent surfaces.
3. Provide concave joint profile per Figure 8A in ASTM C 1193, unless otherwise indicated.

F. Acoustical Sealant Installation: Comply with ASTM C 919 and with manufacturer's written recommendations.

G. Clean off excess sealant or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved in writing by manufacturers of joint sealants and of products in which joints occur.

3.3 JOINT-SEALANT SCHEDULE

A. Joint-Sealant Application: Exterior joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Locations:

a. Construction joints in cast-in-place concrete.
b. Joints between plant-precast architectural concrete units.
c. Control and expansion joints in unit masonry.
d. Joints between different materials listed above.
e. Perimeter joints between materials listed above and frames of doors, windows and louvers.
f. Control and expansion joints in ceilings and other overhead surfaces.
g. All exterior joints between all dissimilar items, including between wall finish materials and Plumbing, Mechanical, Electrical and Fire Alarm Devices.

2. Joint Sealant: Urethane.
3. Joint-Sealant Color: Refer to Color Schedule 090000.

B. Joint-Sealant Application: Interior joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Locations:

a. Control and expansion joints on exposed interior surfaces of exterior walls.
b. Perimeter joints of exterior openings where indicated.
c. Tile control and expansion joints.

d. Vertical joints on exposed surfaces of interior unit masonry, walls and partitions.
e. Perimeter joints between interior wall surfaces and frames of interior doors, windows and storefront framing.
f. Other joints as indicated including between wall finish materials and Plumbing, Mechanical, Electrical and Fire Alarm Devices.

2. Joint Sealant: Latex.
3. Joint-Sealant: Color Refer to Color Schedule 090000.

C. Joint-Sealant Application: Mildew-resistant interior joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Sealant Location:

a. Joints between plumbing fixtures and adjoining walls, floors, and counters.
b. Tile control and expansion joints where indicated.
c. On the edges and behind the backsplashes of all millwork items (use clear sealant in these locations).
d. Other joints as indicated, including between wall finish materials and Plumbing, Mechanical, Electrical and Fire Alarm Devices.

2. Joint Sealant: Silicone.
3. Joint-Sealant Color: Refer to Color Schedule 090000.

D. Joint-Sealant Application: Interior acoustical joints in vertical surfaces and horizontal non-traffic surfaces.

1. Joint Location:

a. Acoustical joints where interior walls and partitions abut Tectum roof panels, interior aluminum frames and structural steel.

2. Joint Sealant: Acoustical.
3. Joint-Sealant Color: Match adjacent material color.

END OF SECTION 079200

SECTION 081416 - FLUSH WOOD DOORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Solid-core doors with wood veneer faces.

B. Related Sections:

1. 081713, Fiberglass Fire-Rater Doors and Frames.
2. 084113, Aluminum-Framed Entrances and Storefronts.
3. 087100, Door Hardware.
4. 088000, Glazing.
5. 099123, Interior Painting.

1.2 QUALITY ASSURANCE

A. Quality Standard: In addition to requirements specified, comply with AWI's "Architectural Woodwork Quality Standards Illustrated" and WDMA I.S.1-A, "Architectural Wood Flush Doors."

1.3 ACTION SUBMITTALS

A. Product Data: For each type of door.

B. Shop Drawings: Indicate location, size, and hand of each door; elevation of each kind of door; construction details not covered in Product Data; and the following:

1. Dimensions and locations of blocking.
2. Dimensions and locations of mortises and holes for hardware.
3. Dimensions and locations of cutouts.
4. Undercuts.
5. Requirements for veneer matching.
6. Doors to be factory finished and finish requirements.
7. Fire-protection ratings for fire-rated doors.

C. Samples: For factory-finished doors.

1.1 WARRANTY

A. Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace doors that do not comply with requirements or that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Algoma Hardwoods, Inc.
2. Eggers Industries.
3. Graham; an Assa Abloy Group company.
4. Marshfield Door Systems, Inc.
5. Mohawk Flush Doors, Inc.; a Masonite company.
6. VT Industries Inc.

2.2 DOOR CONSTRUCTION, GENERAL

A. Low-Emitting Materials: Fabricate doors with adhesives and composite wood products that do not contain urea formaldehyde.

B. WDMA I.S.1-A Performance Grade:

1. Heavy Duty unless otherwise indicated.

C. Particleboard-Core Doors:

1. Particleboard: ANSI A208.1, Grade LD-2, made with binder containing no urea-formaldehyde resin.
2. Blocking: Provide wood blocking in particleboard-core doors as needed to eliminate through-bolting hardware.

2.3 VENEER-FACED DOORS FOR TRANSPARENT FINISH

A. Interior Solid-Core Doors

1. Grade: Custom, with Grade A faces.
2. Species: White Oak.
3. Cut: Quarter sawn.
4. Match between Veneer Leaves: Pleasing match.
5. Assembly of Veneer Leaves on Door Faces: Running match.
6. Core: Particleboard.
7. Construction: Five plies. Stiles and rails are bonded to core, and then entire unit is abrasive planed before veneering.

B. Provide MDO, painted doors where indicated, in lieu of transparent-finish veneer.

2.4 LIGHT FRAMES AND LOUVERS

A. Wood-Veneered Beads for Light Openings in Fire-Rated Doors: Manufacturer's standard wood-veneered noncombustible beads matching veneer species of door faces and approved for use in

doors of fire-protection rating indicated. Include concealed metal glazing clips where required for opening size and fire-protection rating indicated.

2.5 FABRICATION

A. Factory fit doors to suit frame-opening sizes indicated. Comply with clearance requirements of referenced quality standard for fitting unless otherwise indicated.

1. Comply with NFPA 80 requirements for fire-rated doors.

B. Factory machine doors for hardware that is not surface applied.

C. Openings: Factory cut and trim openings through doors.

1. Light Openings: Trim openings with moldings of material and profile indicated.
2. Glazing: Factory install glazing in doors indicated to be factory finished. Comply with applicable requirements in Section 088000 "Glazing."

2.5 FACTORY FINISHING

A. General: Comply with referenced quality standard for factory finishing. Complete fabrication, including fitting doors for openings and machining for hardware that is not surface applied, before finishing.

1. Finish faces, all four edges, edges of cutouts, and mortises. Stains and fillers may be omitted on top and bottom edges, edges of cutouts, and mortises.

B. Factory-finish doors that are indicated to receive transparent finish.

C. Transparent Finish:

1. Grade: Custom.
2. Finish: WDMA TR-6 catalyzed polyurethane.
3. Staining: Refer to Specification Section 090000.
4. Sheen: Satin.

PART 2 - EXECUTION

2.1 INSTALLATION

A. Hardware: For installation, see Section 087100 "Door Hardware." Installation Instructions: Install doors to comply with manufacturer's written instructions and referenced quality standard, and as indicated.

1. Install fire-rated doors according to NFPA 80.
2. Install smoke- and draft-control doors according to NFPA 105.

B. Job-Fitted Doors: Align and fit doors in frames with uniform clearances and bevels as indicated below; do not trim stiles and rails in excess of limits set by manufacturer or permitted for fire-rated doors. Machine doors for hardware. Seal edges of doors, edges of cutouts, and mortises after fitting and machining.

1. Clearances: Provide 1/8 inch (3.2 mm) at heads, jambs, and between pairs of doors. Provide 1/8 inch (3.2 mm) from bottom of door to top of decorative floor finish or covering unless otherwise indicated. Where threshold is shown or scheduled, provide 1/4 inch (6.4 mm) from bottom of door to top of threshold unless otherwise indicated.

   a. Comply with NFPA 80 for fire-rated doors.

C. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.

D. Factory-Finished Doors: Restore finish before installation if fitting or machining is required at Project site.

END OF SECTION 081416

SECTION 081743 – FIRE-RATED FRP DOORS AND FRAMES

PART 1 - GENERAL

1.01 SECTION INCLUDES

A. AF-222FR Sandstone Texture Fire-Rated Fiberglass Door installed in Fire-Rated Fiberglass Framing.

1.02 RELATED SECTIONS

A. Section 042000 – Masonry Mortar.
B. Section 055000 – Metal Fabrications.
C. Section 087100 – Door Hardware.
D. Section 088000 – Glazing.

1.03 REFERENCES

A. ASTM-D256 – Standard Test Methods for Determining the Pendulum Impact Resistance of Plastics.
B. ASTM-D570 – Standard Test Method for Water Absorption of Plastics.
C. ASTM-D638 – Standard Test Method for Tensile Properties of Plastics.
D. ASTM-D790 – Standard Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
E. ASTM-D2583 – Standard Test Method for Indentation Hardness of Rigid Plastics by Means of a Barcol Impressor.
F. ASTM D2794 – Standard Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
G. ASTM-D-4226 – Standard Test Methods for Impact Resistance of Rigid Poly(Vinyl Chloride) (PVC) Building Products

I. ASTM-G-53 - Standard Practice for Operating Light-and Water-Exposure Apparatus (Fluorescent UV-Condensation Type) for Exposure of Nonmetallic Materials
J. CAN / ULC S104 – Standard Method for Fire Tests of Door Assemblies.
K. UL 10B – Standard for Fire Tests of Door Assemblies.
L. UL 10C – Standard for Positive Pressure Fire Tests of Door Assemblies.
M. NFPA 80 – Standard for Fire Doors and Other Opening Protectives.
N. NFPA 252 – Fire Tests of Door Assemblies.

1.04 SUBMITTALS

A. Must comply with Section 013300 – Submittal Procedures.
B. Action Submittals/ Informational Submittals.
    1. Product Data.
        a. Submit manufacturer’s product data sheets, catalog pages illustrating the products, description of materials, components, fabrication, finishes, installation instructions, and applicable test reports.
    2. Shop Drawings.
        a. Submit manufacturer’s shop drawings, including elevations, sections, and details indicating dimensions, tolerances, materials, fabrication, doors, panels, framing, hardware schedule, and finish.

3. Samples.

a. Submit manufacturer's door sample composed of door face sheet, core, framing and finish.
b. Submit manufacturer's sample of standard colors for door face and frame.

4. Testing and Evaluation Reports.

a. Submit testing reports and evaluations provided by manufacturer conducted by and accredited independent testing agency certifying doors and frames comply with specified performance requirements listed in Section 2.01 C.

5. Manufacturer Reports.

a. Manufacturer's Project References.

1. Submit list of successfully completed projects including project name, location, name of architect, type, and quantity of doors manufactured.

C. Closeout Submittals.

1. Operation and Maintenance Manual.

a. Submit manufacturer's maintenance and cleaning instructions for doors and frames, including maintenance and operating instructions for hardware.

2. Warranty Documentation.

a. Submit manufacturer's standard warranty.

1.05 QUALITY ASSURANCE

A. Manufacturer's Qualifications.

1. Continuously engaged in manufacturing of doors of similar type to that specified, with a minimum of 25 years concurrent successful experience.
2. Door and frame components must be fabricated by same manufacturer.
3. Evidence of a documented complaint resolution quality management system.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Delivery.

1. Deliver materials to site in manufacturer's original, unopened, containers and packaging.
2. Labels clearly identifying opening, door mark, and manufacturer.

B. Storage.

1. Store materials in a clean, dry area, indoors in accordance with manufacturer's instructions.

C. Handling.

1. *Protect materials and finish from damage during handling and installation.*

1.07 WARRANTY

A. Warrant doors, frames, and factory installed hardware against failure in materials and workmanship, including excessive deflection, faulty operation, defects in hardware installation, and deterioration of finish or construction in excess of normal weathering.

B. Standard Period.

1. Ten years starting on date of shipment.

C. Limited lifetime

1. Covers failure of corner joinery, core deterioration, and delamination or bubbling of door skin and corrosion of all-fiberglass products while the door is in its specified application in its original installation.

D. Finish

1. SpecLite3® face sheets 10 years from Acceptance of the Project by the Owner.
2. Painted AF-220FR: 3 years after acceptance.
3. Painted FR frames: 3 years after acceptance.

PART 2 - PRODUCTS

2.01 FRP FIRE-RATED DOORS

A. Manufacturer (Basis of Design).

1. Special-Lite, Inc.
   a. PO Box 6, Decatur, Michigan 49045.
   b. Toll Free (800) 821-6531, Phone (269) 423-7068, Fax (800) 423-7610.
   c. Web Site www.special-lite.com.
   d. E-Mail info@special-lite.com.

B. Subject to the Requirements of this Specification, the following manufacturers are acceptable:

1. FRP Architectural Doors, Inc., Bensalem, PA.
2. CORRIM Company, Oshkosh, WI.

2.02 FRP FIRE-RATED FRAMES

A. Framing

1. FR-Series Framing
   a. Materials.
      1. ¼" thick, solid, pultruded, FRP profiles.
      2. No corrosive components or reinforcements.
      3. Solid tectonite filler.
      4. No steel or aluminum filler is allowed.
   b. Perimeter Frame Members.
      1. Factory fabricated.
      2. Integral 5/8" x 2-1/4" doorstop.
      3. Mitered with 4" x 4" x 3/8" pultruded FRP angle reinforcement with interlocking pultruded FRP brackets.
      4. 5-3/4", 6-3/4", 7-3/4", or 8-3/4" jamb depth.
      5. 2" face on jambs.
      6. 2" or 4" face on header.
      7. Knocked down for field assembly.
   c. Anchors
      1. Factory furnished as specified by drawings.
      2. Drywall tuck available.

2.03 PERFORMANCE

A. Face Sheet.

1. Standard Interior and Exterior Class C 0.120" thick, Sandstone texture, through color FRP sheet.
   a. Flexural Strength, ASTM-D790: 27 x 10^3 psi.

b. Flexural Modulus, ASTM-D790: 0.7 x 10^6 psi.
c. Tensile Strength, ASTM-D638: 18 x 10^3 psi.
d. Tensile Modulus, ASTM-D638: 1.0 x 10^6 psi.
e. Barcol Hardness, ASTM-D2583: 40.
f. Izod Impact, ASTM-D256: 7.0 ft-lb/in.
g. Gardner Impact Strength, ASTM-D5420: 30 in-lb.
h. Water Absorption, ASTM-D570: 0.16%/24hrs at 77°F.
i. Surface Burning, ASTM-E84: Flame Spread ≤ 200, Smoke Developed ≤ 450.
j. Chemical Resistance.

1. Excellent Rating.

a. Acetic Acid, Concentrated.
b. Acetic Acid, 5%.
c. Bleach Solution.
d. Detergent Solution.
e. Distilled Water.
f. Ethyl Acetate.
g. Formaldehyde.
h. Heptane.
i. Hydrochloric Acid, 10%.
j. Hydrogen Peroxide, 3%.
k. Isooctane.
l. Lactic Acid, 10%.

k. USDA/FSIS Requirements.

1. FRP face sheet with surfaseal is a finished outer surface material that is rigid; durable; non-toxic; non-corrosive; moisture resistant; a light, solid color such as white; easily inspected; smooth or an easily cleaned texture.
2. FRP face sheet with surfaseal does not contain any known carcinogen, mutagen, or teratogen classified as hazardous substances; heavy metals or toxic substances; antimicrobials; pesticides or substances with pesticidal characteristics.

B. Door Assembly.

1. 60 min pp category A door.
2. 90 min pp category B door.
3. 90 min pp category A door.
4. Temperature rise @ 30 min, 250 °F when vision lites do not exceed 100 in².
5. Temperature rise @ 60 min, 450 °F max.

2.04 MATERIALS

A. Fiberglass.

1. See 2.02.A.2.e.
2. See 2.02.B.2.e.
3. See 2.02.C.2.e

B. Fasteners.

1. All exposed fasteners will have a finish to match material being fastened.
2. 410 stainless steel or other non-corrosive metal.
3. Must be compatible with items being fastened.

2.05 FABRICATION

A. Factory Assembly.

1. Door and frame components from the same manufacturer.
2. Required size for door and frame units, shall be as indicated on the drawings.
3. Maintain continuity of line and accurate relation of planes and angles.

4. Secure attachments and support at mechanical joints with hairline fit at contact surfaces.

B. Shop Fabrication

1. All shop fabrication to be completed in accordance with manufactures process work instructions.
2. Quality control to be performed before leaving each department.

2.06 FINISHES

A. Door.

1. FRP Face Sheets

a. Through color.

1. Color.

a. Choose an item.

B. Door Paint

1. Two-component flexible acrylic urethane Satin topcoat. (STANDARD)

a. Color.

1. Choose an item.

b. Custom colors available consult manufacturer.
c. Excellent exterior durability.
d. Unique, high-solids, high-build, multifunctional coating.
e. Low VOC, Satin coating.
f. Impact Resistance, ASTM D-4226 Minimum 1.2 in/lb/mil
g. Color retention: ≤1Δ (CIE L.a.b.), Montreal 45° South: 12 months
h. Very good chemical resistance.

2. Two-component acrylic urethane enamel Gloss topcoat. (OPTIONAL)

a. Color.
b. Custom colors available consult manufacturer.
c. Unique, high-solids, high-build, multifunctional coating.
d. Low VOC, Gloss coating.
e. Impact Resistance, ASTM-D2794: 80-102 in/lb (direct), 40-80 in/lb (reverse) @ 1.5 mils thickness.
f. Color retention: Δ E < 5 (CIE L.a.b.), Florida Exposure: 18 months
g. Excellent chemical resistance.

C. Frame

1. Fiberglass.
2. Two-component flexible acrylic urethane Satin topcoat. (STANDARD)

a. Color.
1. Choose an item.
b. Custom colors available consult manufacturer.
c. Excellent exterior durability.
d. Unique, high-solids, high-build, multifunctional coating.
e. Low VOC, Satin coating.
f. Impact Resistance, ASTM D-4226 Minimum 1.2 in/lb/mil
g. Color retention: ≤1Δ (CIE L.a.b.), Montreal 45° South: 12 months
h. Very good chemical resistance.

3. Two-component acrylic urethane enamel Gloss topcoat. (OPTIONAL)

a. Color.
b. Custom colors available consult manufacturer.
c. Unique, high-solids, high-build, multifunctional coating.

d. Low VOC, Gloss coating.
e. Impact Resistance, ASTM-D2794: 80-102 in/lb (direct), 40-80 in/lb (reverse) @ 1.5 mils thickness.
f. Color retention: Δ E < 5 (CIE L.a.b.), Florida Exposure: 18 months
g. Excellent chemical resistance.

2.07 ACCESSORIES

A. Vision Lites.

1. Factory Glazing.
2. Stainless Steel vison kit with 3/16” NGP Firelite NT, clear.
3. Size as indicated on the drawings.
4. 60 to 90-minute rated doors.

a. Maximum 704 in² in listed and labeled kit for positive pressure applications using listed glazing. Minimum 5” from top or edge of door to lite cutout and minimum 5” from latch cutout to lite cutout.
b. Maximum 32” high.
c. Maximum 22” wide.
d. Multiple lights are allowed when the sum of the areas does not exceed the tested area with the maximum length and width limitations.

5. 20 to 45-minute rate doors.

a. Listed metal vison frames and listed glazing are limited to a maximum clear view area of 616 in² per lite with a maximum of 1232 in². Lite kits exceeding 100 in² void the temperature requirements per NFPA 80 unless temperature resistive glazing is used.

B. Hardware.

1. All hardware must be listed and labeled for use in mineral core fire doors.
2. Pre-machine doors in accordance with templates from specified hardware manufactures and hardware schedule.
3. Factory install hardware.
4. EPT Units

a. Allowed between top and middle hinge locations.
b. 1/16” maximum clearance per side when installing EPT.
c. Limited to maximum 60 min positive and neutral pressure applications.
d. Intumescent caulk or strips are required on bottom, top, and side of EPT device.

5. Hardware as Scheduled.

C. Wire Raceway

1. Single swing applications only.
2. 3/8” x 3/8” bore.
3. Maximum height of 40” from bottom edge of door.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine areas to receive doors.

B. Notify architect of conditions that would adversely affect installation or subsequent use.

C. Do no proceed with installation until unsatisfactory conditions are corrected.

3.02 PREPARATION

A. Ensure openings to receive frames are plumb, level, square, and in tolerance.

3.03 ERECTION

A. Install doors in accordance with manufacturer's instructions.

B. Install doors plumb, level, square, true to line, and without warp or rack.

C. Anchor frames securely in place.

D. Separate aluminum from other metal surfaces with bituminous coatings or other means approved by architect.

E. Set thresholds in bed of mastic and back seal.

F. Install exterior doors to be weathertight in closed position.

G. Repair minor damages to finish in accordance with manufacturer's instructions and as approved by architect.

H. Remove and replace damaged components that cannot be successfully repaired as determined by architect.

3.04 FIELD QUALITY CONTROL

A. Manufacture's Field Services.

1. Manufacturer's representative shall provide technical assistance and guidance for installation of doors.

3.05 ADJUSTING

A. Adjust doors, hinges, and locksets for smooth operation without binding.

3.06 CLEANING

A. Clean doors promptly after installation in accordance with manufacturer's instructions.

B. Do not use harsh cleaning materials or methods that would damage finish.

3.07 PROTECTION

A. Protect installed doors to ensure that, except for normal weathering, doors will be without damage or deterioration at time of substantial completion.

END OF SECTION 081743

SECTION 082550 - ALUMINUM FRP FLUSH DOORS AND FRAMES

PART 1- GENERAL

1.1 SECTION INCLUDES

A. Fiberglass reinforced polyester (FRP) flush doors with aluminum frames.

1.2 RELATED SECTIONS

072419, Water Drainage Exterior Insulation and Finish System.
079200, Joint Sealants.
087100, Door Hardware.
088000, Glazing.
090000, Color Schedule.
092216, Non-Structural Metal Framing.
092900, Gypsum Board.

1.3 PERFORMANCE REQUIREMENTS

A. General: Provide door assemblies that have been designed and fabricated to comply with specified performance requirements, as demonstrated by testing manufacturer's corresponding standard systems.

B. Air Infiltration: For a single door 3’-0” x 7’-0”, test specimen shall be tested in accordance with ASTM E 283 at pressure differential of 6.24 psf. Door shall not exceed 0.90 cfm per linear foot of perimeter crack.

C. Water Resistance: For a single door 3’-0” x 7’-0”, test specimen shall be tested in accordance with ASTM E 331 at pressure differential of 7.50 psf. Door shall not have water leakage.

D. Indoor air quality testing per ASTM D 6670-01: GREENGUARD Environmental Institute Certified including GREENGUARD for Children and Schools Certification.

E. Hurricane Test Standards, Single Door with Single-Point Latching:

1. Uniform Static Load, ASTM E 330: Plus or minus 75 pounds per square foot.
2. Forced Entry Test, 300 Pound Load Applied, SFBC 3603.2 (b)(5): Passed.
3. Cyclic Load Test, SFBC PA 203: Plus or minus 53 pounds per square foot.
4. Large Missile Impact Test, SFBC PA 201: Passed.

F. Wind Loads: 121 mph, per requirements in Chapter 16 of the NC Building Code.

G. Blast Test, Doors and Frames, ASTM F 1642-04, 6 psi / 41 psi-msec: Minimal Hazard.

H. Swinging Door Cycle Test, Doors and Frames, ANSI A250.4: Minimum of 25,000,000 cycles.

I. Cycle Slam Test Method, NWWDA T.M. 7-90: Minimum 5,000,000 Cycles.

J. Swinging Security Door Assembly, Doors and Frames, ASTM F 476: Grade 40.

K. Salt Spray, Exterior Doors and Frames, ASTM B 117: Minimum of 500 hours.

L. Sound Transmission, Exterior Doors, STC, ASTM E 90: Minimum of 25.

M. Thermal Transmission, Exterior Doors, U-Value, AAMA 1503-98: Maximum of 0.29 BTU/hr x sf x degrees F. Minimum of 55 CRF value.

N. Surface Burning Characteristics, FRP Doors and Panels, ASTM E 84:

1. Flame Spread: Maximum of 200, Class C.
2. Smoke Developed: Maximum of 450, Class C.

O. Surface Burning Characteristics, Class A Option On Interior Faces of FRP Exterior Panels and Both Faces of FRP Interior Panels, ASTM E 84:

1. Flame Spread: Maximum of 25.
2. Smoke Developed: Maximum of 450.

P. Impact Strength, FRP Doors and Panels, Nominal Value, ASTM D 256: 15.0 foot-pounds per inch of notch.

Q. Tensile Strength, FRP Doors and Panels, Nominal Value, ASTM D 638: 14,000 psi.

R. Flexural Strength, FRP Doors and Panels, Nominal Value, ASTM D 790: 21,000 psi.

S. Water Absorption, FRP Doors and Panels, Nominal Value, ASTM D 570: 0.20 percent after 24 hours.

T. Indentation Hardness, FRP Doors and Panels, Nominal Value, ASTM D 2583: 55.

U. Gardner Impact Strength, FRP Doors and Panels, Nominal Value, ASTM D 5420: 120 in-lb.

V. Abrasion Resistance, Face Sheet, Taber Abrasion Test, 25 Cycles at 1,000 Gram Weight with CS-17 Wheel: Maximum of 0.029 average weight loss percentage.

W. Stain Resistance, ASTM D 1308: Face sheet unaffected after exposure to red cabbage, tea, and tomato acid. Stain removed easily with mild abrasive or FRP cleaner when exposed to crayon and crankcase oil.

X. Chemical Resistance, ASTM D 543. Excellent rating.

1. Acetic acid, Concentrated.
2. Ammonium Hydroxide, Concentrated.
3. Citric Acid, 10%.
4. Formaldehyde.
5. Hydrochloric Acid, 10%
6. Sodium hypochlorite, 4 to 6 percent solution.

Y. Compressive Strength, Foam Core, Nominal Value, ASTM D 1621: 79.9 psi.

Z. Compressive Modulus, Foam Core, Nominal Value, ASTM D 1621: 370 psi.

AA. Tensile Adhesion, Foam Core, Nominal Value, ASTM D 1623: 45.3 psi.

BB. Thermal and Humid Aging, Foam Core, Nominal Value, 158 Degrees F and 100 Percent

Humidity for 14 Days, ASTM D 2126: Minus 5.14 percent volume change.

1.4 SUBMITTALS **(note that this product is a long-lead time order)**

A. Product Data: Submit manufacturer's product data, including description of materials, components, fabrication, finishes, and installation.

B. Shop Drawings: Submit manufacturer's shop drawings, including elevations, sections, and details, indicating dimensions, tolerances, materials, fabrication, doors, panels, framing, hardware schedule, and finish.

C. Samples:

1. Color: Submit manufacturer's samples of standard colors of FRP sheet.

D. Maintenance Manual: Submit manufacturer's maintenance and cleaning instructions for doors, including maintenance and operating instructions for hardware.

E. Warranty: Submit manufacturer's standard warranty, to commence upon Acceptance of the Project by the Owner.

1.6 QUALITY ASSURANCE

A. Manufacturer's Qualifications:

1. Continuously engaged in manufacturing of doors of similar type to that specified, with a minimum of 25 years successful experience.
2. Door and frame components from same manufacturer.
3. Evidence of a compliant documented quality management system.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying opening door mark and manufacturer.

B. Storage: Store materials in clean, dry area indoors in accordance with manufacturer's instructions.

C. Handling: Protect materials and finish from damage during handling and installation.

1.8 WARRANTY

A. Warrant doors, frames, and factory hardware against failure in materials and workmanship, including excessive deflection, faulty operation, defects in hardware installation, and deterioration of finish or construction in excess of normal weathering.

B. Warranty Period: Ten years starting on date of shipment. In addition, a limited lifetime (while the door is in its specified application in its original installation) warranty covering: failure of corner joinery, core deterioration, delamination or bubbling of door skin.

PART 2- PRODUCTS

2.1 BASIS OF DESIGN

A. SL-17 Flush Doors with SpecLite3 fiberglass reinforced polyester (FRP) face sheets. Special-Lite, Inc., PO Box 6, Decatur, Michigan 49045. Toll Free (800) 821-6531. Phone (269) 423-7068. Fax (800) 423-7610. Web Site www.special-lite.com. E-Mail info@special-lite.com.

B. Subject to compliance with the requirements of this specifications, the following will be acceptable substitutions:

1. Eliason Corp., Easy Swing Door Div., which is located at: 9229 Shaver Rd. ; Kalamazoo, MI 49024; Toll Free Tel: 800-828-3655; Tel: 269-327-7003; Fax: 800-828-3577; Email: request info (jasonh@eliasoncorp.com); Web: www.eliasoncorp.com.
2. Kawneer Corporation, Flushline FRP Doors.

2.2 FRP FLUSH DOORS

A. Model: SL-17 Flush Doors with SpecLite3 fiberglass reinforced polyester (FRP) face sheets.

B. Door Opening Size: As indicated on the Drawings.

C. Construction:

1. Door Thickness: 1-3/4 inches.
2. Stiles and Rails: Aluminum extrusions made from prime-equivalent billet that is produced from 100% reprocessed 6063-T5 alloy recovered from industrial processes, minimum of 2-5/16-inch depth.
3. Corners: Mitered.
4. Provide joinery of 3/8-inch diameter full-width tie rods through extruded splines top and bottom integral to standard tubular shaped stiles and rails reinforced to accept hardware as specified.
5. Securing Internal Door Extrusions: 3/16-inch angle blocks and locking hex nuts for joinery. Welds, glue, or other methods are not acceptable.
6. Furnish extruded stiles and rails with integral reglets to accept face sheets. Lock face sheets into place to permit flush appearance.
7. Rail caps or other face sheet capture methods are not acceptable.
8. Extrude top and bottom rail legs for interlocking continuous weather bar.
9. Meeting Stiles: Pile brush weatherseals. Extrude meeting stile to include integral pocket to accept pile brush weatherseals.
10. Bottom of Door: Install bottom weather bar with nylon brush weatherstripping into extruded, interlocking edge of bottom rail.
11. Glue: Use of glue to bond sheet to core or extrusions is not acceptable.

D. Face Sheet:

1. Material: SpecLite3 FRP, 0.120-inch thickness, finish color throughout.
2. Protective coating: Abuse-resistant engineered surface. Provide FRP with SpecLite3 protective coating, or equal.
3. Texture: Pebble.
4. Color: To be selected from manufacturer standard range. Refer to Section 090000 “Color Schedule”.

5. Adhesion: The use of glue to bond face sheet to foam core is prohibited.

E. Core:

1. Material: Poured-in-place polyurethane foam.
2. Density: Minimum of 5 pounds per cubic foot.
3. R-Value: Minimum of 9.

F. Cutouts:

1. Manufacture doors with cutouts for required vision lites, louvers, and panels.
2. Factory-install vision lites and panels.

G. Hardware:

1. Premachine doors in accordance with templates from specified hardware manufacturers and hardware schedule.
2. Factory-install hardware, except push bar and closer.

2.3 MATERIALS

A. Aluminum Members:

1. Aluminum extrusions made from prime-equivalent billet that is produced from 100% reprocessed 6063-T5 alloy recovered from industrial processes: ASTM B 221.
2. Sheet and Plate: ASTM B 209.
3. Alloy and Temper: As required by manufacturer for strength, corrosion resistance, application of required finish, and control of color.

B. Components: Door and frame components from same manufacturer.

C. Fasteners:

1. Material: Aluminum, 18-8 stainless steel, or other noncorrosive metal.
2. Compatibility: Compatible with items to be fastened.
3. Exposed Fasteners: Screws with finish matching items to be fastened.

2.4 FABRICATION

A. Sizes and Profiles: Required sizes for door and frame units, and profile requirements shall be as indicated on the Drawings.

B. Coordination of Fabrication: Field measure before fabrication and show recorded measurements on shop drawings.

C. Assembly:

1. Complete cutting, fitting, forming, drilling, and grinding of metal before assembly.
2. Remove burrs from cut edges.

D. Welding: Welding of doors or frames is not acceptable.

E. Fit:

1. Maintain continuity of line and accurate relation of planes and angles.
2. Secure attachments and support at mechanical joints with hairline fit at contacting members.

2.6 ALUMINUM DOOR FRAMING SYSTEMS

A. Tubular Framing:

1. Size and Type: As indicated on the Drawings.
2. Materials: Aluminum extrusions made from prime-equivalent billet that is produced from 100% reprocessed 6063-T5 alloy recovered from industrial processes, 1/8-inch minimum wall thickness.
3. Applied Door Stops: 0.625-inch high, with screws and weatherstripping. Door stop shall incorporate pressure gasketing for weathering seal. Counterpunch fastener holes in door stop to preserve full metal thickness under fastener head.
4. Frame Members: Box type with 4 enclosed sides. Open-back framing is not acceptable.
5. Caulking: Caulk joints before assembling frame members.
6. Joints:
    a. Secure joints with fasteners.
    b. Provide hairline butt joint appearance.
7. Field Fabrication: Field fabrication of framing using stick material is not acceptable.
8. Applied Stops: For side, transom, and borrowed lites and panels. Applied stops shall incorporate pressure gasketing for weathering seal. Reinforce with solid bar stock fill for frame hardware attachments.
9. Hardware:
    a. Premachine and reinforce frame members for hardware in accordance with manufacturer's standards and hardware schedule.
    b. Factory-install hardware.
10. Anchors:
    a. Anchors appropriate for wall conditions to anchor framing to wall materials.
    b. Door Jamb and Header Mounting Holes: Maximum of 24-inch centers.
    c. Secure head and sill members of transom, side lites, and similar conditions.
11. Transom Lite:
    a. Factory preassemble transom lite to greatest extent possible.
    b. Mark frame assemblies according to location.

B. Frame Capping:

1. Model: SL-70.
2. Capping: With insert frame as indicated on the Drawings.
3. Finish: Match framing.

2.7 HARDWARE

A. Premachine doors in accordance with templates from specified hardware manufacturers and hardware schedule.

B. Factory install hardware, except closer and push bar.

C. Hardware Schedule: As specified in Division 08.

D. Finish: Clear.

2.8 TRANSOM AND VISION LITES

A. Factory Glazing: 1-inch glass insulating units, tempered, noted on the drawings.

B. Lites in Exterior Doors: Allow for thermal expansion.

C. Rectangular Lites:

1. Size: As indicated on the Drawings.
2. Factory glazed with screw-applied aluminum stops anodized to match perimeter door rails.

2.10 ALUMINUM FINISHES

A. Class I finish, 0.7 mills thick.

1. Clear 215 R1, AA-M10C12C22A41, Class I, 0.7 mils thick.

PART 3- EXECUTION

3.1 EXAMINATION

A. Examine areas to receive doors. Notify Architect of conditions that would adversely affect installation or subsequent use. Do not proceed with installation until unsatisfactory conditions are corrected.

3.2 PREPARATION

A. Ensure openings to receive frames are plumb, level, square, and in tolerance.

3.3 INSTALLATION

A. Install doors in accordance with manufacturer's instructions.

B. Install doors plumb, level, square, true to line, and without warp or rack.

C. Anchor frames securely in place.

D. Separate aluminum from other metal surfaces with bituminous coatings or other means approved by Architect.

E. Set thresholds in bed of mastic and backseal.

F. Install exterior doors to be weathertight in closed position.

G. Repair minor damages to finish in accordance with manufacturer's instructions and as approved by Architect and remove and replace damaged components that cannot be successfully repaired as determined by Architect.

3.5 ADJUSTING

A. Adjust doors, hinges, and locksets for smooth operation without binding.

3.6 CLEANING

A. Clean doors promptly after installation in accordance with manufacturer's instructions.

B. Do not use harsh cleaning materials or methods that would damage finish.

3.7 PROTECTION

A. Protect installed doors to ensure that, except for normal weathering, doors will be without damage or deterioration at time of substantial completion.

END OF SECTION 082550

SECTION 083160 – FLOOD PANEL SYSTEM

PART 1 - GENERAL

1.01 Description and general notes

A. Work Included:

1) Provide flood barrier(s) factory assembled with frame(s) and hardware where shown on the A-2.2 Floor Plans and the A-9.4 Door Schedule, in accordance with the contract documents.
2) All Barrier heights shall be finished to 12” min. above Base Flood Elevation (BFE) unless otherwise stated by the Architect or Engineer of Record (EOR)
3) BFE and Building Sub Elevations shall be furnished to Barrier Manufacturer by the Architect or Engineer of Record.

B. The Manufacturer shall provide a structural design for the Removable Flood Panels sealed by an Engineer registered in the State of North Carolina. These shall be designed for hydrostatic hydrodynamic and impact debris flood loads with water pressures corresponding to maximum water height and flow speed of 8 ft. /sec. up to 10 ft. /sec. in order to certify minimum required flood elevation to top of Flood Panels.

C. Determine the required Panel height and flow speed for the design of Removable Flood Panels, based on FEMA's criteria (See Note #3) as well as per ASCE 24-14 Standard. Installation and construction of these Flood Panels for use within flood hazard areas shall be in accordance with the American Society of Civil Engineers Flood Resistant Design and Construction Standard SEI/ASCE 24-14.

D. Design criteria is for Type 2 Closures in chapter 7, section 70 1.1.2 of the Army Corp of Engineers, EP 1165-2-314 12/1195 and based on the 2015 Edition of the International Building Code, the corresponding provisions of ASCE 24-14, FEMA flood proofing non-residential structures manual FEMA 102, FEMA P-936 and FEMA Technical Bulletin 3-93. Design flood loads have been determined in accordance with ASCE 7-16. Design wind loads have been determined in accordance with ASCE 7-16 for 160 mph Basic Wind Speed for Risk Category III building. This flood barrier design criteria is for buildings in an "A" or "AE" flood zone and is not to be used in a Coastal "A" zone or high velocity "V" zone.

E. The Flood Barrier design system must be tested by an independent testing lab for water infiltration in accordance with FEMA 102 manual for flood proofing of non-residential structures, specifications Section 8, Page 70. Type 2 Flood closures or barriers are permitted allowable seepage rates. Seepage amounts will vary with building conditions encountered. ASCE 24-14 chapter 6 states "sump pumps shall be provided to remove water accumulated due to any passage of vapor and seepage of water during the flooding event." Owner acknowledges and is responsible for all drains, piping and sump pumps required to meet ASCE 24-14 requirements to offset water build up behind the barrier system. These materials and equipment are not provided by Flood Panel.

F. Flood Panel manufacturer shall install and use gaskets and approved sealants following all the recommendations and specifications of the manufacturers respectively.

G. Owner, General contractor or installer to verify all dimensions, wall and floor conditions at site before proceeding with the work, and shall notify this engineer if any discrepancy is found that would alter the structural design of these Flood Panels.

H. Existing slabs and walls adjacent to opening where Flood Panel is to be installed shall be given a surface treatment by means of water proof sealer before flood Panel is installed. Surface must be smooth, square, plumb and level.

I. Existing slabs and walls adjacent to openings where Flood Panels are to be installed shall be structurally designed by engineer of record, to sustain the same hydrostatic, hydrodynamic and impact pressures that correspond to maximum water elevation above finished floor at top of Panel, based on criteria mentioned on Note #3.

J. Drop-in anchors embedded into concrete for removable support installation shall be covered with a cap or similar device to protect their inside hold from dust, so that machine screws can easily be installed at time of flood warning. Concrete anchors by others.

K. Separation of Panel to window/door shall be measured from back of Panel to window/door including any knob, handle, or protruding device, and shall be 2" minimum.

L. All aluminum extrusions to be 6161-T6 alloy, 6063-T6 alloy, and 6005-T6 alloy.

M. All sheet metal screws shall be as manufactured by ITW/Buildex "TEK Screws", and to be made of non-corrosive material.

N. All bolts to be galvanized steel ASTM A-307 designation or 304 Series Stainless Steel.

O. All gaskets installed shall be neoprene.

P. All welding to conform to the American Welding Society AWS D1.2/d1.4m 2017 Regulations. Use certified welders. Use ER-5356 Electrodes for aluminum a E70 for steel.

Q. Surfaces against which the sealing gasket presses must be built "paper-smooth" to prevent excessive water extrusion, beyond that allowed by requirements. All surfaces must be plumb, square and level.

1.02 Standards

A. Comply with the provisions of (as applicable).

1) AWS Structural Welding Code D1.2/D1.4M 2017 Reg.
2) ASTM A36, A240,
3) ASCE 7-16, ASCE 24-14, SEI/ASCE 24-14
4) FBC Chapter 20, Section 2003.8.4.
5) QA program that is registered to ISO 9001·2000
6) 2018 North Carolina Building Code (based upon the 2015 Edition of the International Building Code)
7) FEMA 3-93, FEMA 102, FEMA P-936

1.03 Submittals

A. Calculations and signed and sealed drawings:

1) Submit calculations, approved by the manufacturer’s North Carolina engineer, to verify the barrier's ability to withstand the design pressure loading, based on current building code and specified load combinations, including signed and sealed drawings and calculations.

B. Shop Drawings:

1) Submit shop drawings for flood barriers including dimensioned plans and elevations, sections, connections and anchorage.

C. Manufacturers Data:

1) Submit installation and maintenance instructions for flood barriers.

D. Warranties

1) Provide manufacturer's warranty and warranty qualification stating that flood barriers for above project will be free from defects and workmanship for a period of one (1) year from date of substantial completion.
2) Flood Certificate, signed final inspection by EOR of installed flood barriers and final installation pictures of each opening is required by Flood Panel to issue a warranty.

E. Flood Certificate

1) Responsibility for filing the building FEMA "Flood Proofing Certificate" is the responsibility of the Owner.
2) Flood Emergency Operation Plan per FEMA 3-93 is the responsibility of Building Owner.

F. Inspection and Maintenance Plan per FEMA 3-93

1) Responsibility of Building Owner

1.04 Qualifications

A. Experience:

1) The manufacturer of the flood barrier(s) shall present evidence attesting to at least 5 years of successful experience in the design, manufacture, and site implementation of the flood barrier system type specified.

PART 2 - PRODUCTS

2.01 Flood Panel System Manufacturers

A. Flood Barriers (Basis-of-Design):
Flood Panel
1555 Jupiter Park Drive STE 5
Jupiter, Florida 33418
860-222-3055
Email: info@floodpanel.com Web: www.floodpanel.com

B. Flood Barrier Distributors:
19 Mantua Road
Mount Royal, NJ 08061
800-507-0865
Email: info@floodproofing.com Web: www.floodproofing.com

Flood Log labels noted after Manufacturers' List are proprietary names of the above company.

C. Subject to meeting the requirements of this specification, Products by the following manufacturers will be acceptable:

Flood Barrier Inc.
7314 N.W. 46th Street.
Miami, Florida 33166
(305) 594-7929
https://floodbarrier.com/

Garrison Systems LLC
New York, NY
929-299-2099
https://garrisonflood.com

2.02 Materials

A. Aluminum Flood Log (PP) Panels to be of 6005-T6

B. Intermediate and End Posts:

1) Wall supports extrusions to be 6061-T6 alloy or primed carbon steel from grade ST37 (S235 JR) or galvanized steel with the exception of below ground supports which are to be of grade 304 stainless steel or equal.
2) Mid-span and Corner supports are to be 6061-T6 aluminum alloy (Mid-span only) or painted carbon steel from grade ST37 (S235 JR) or galvanized steel.

C. All steel to be primed with one coat Sherwin Williams Kern Flash rust inhibitive, lead free, primer, or equivalent.

D. Base Gaskets to be sandwich composite combination low/high compressed set gaskets mechanically retained in the flood logs; 40D medium compression set gaskets retained mechanically in the top of each flood log and low compression gaskets in the jambs and mid-span supports.

2.03 Design

A. Loads for the design of the Flood Log Flood Panel System (PP) have been determined assuming that the location of the building where the system is to be installed is outside of High Risk Flood Hazard Areas, Coastal High Hazard Areas, and Coastal A zones, per Dry Flood proofing Limitations on ASCE 24-14, Section 6.2.1.

B. This Flood Log System Flood Panel System (PP) has been designed for the loads and load combinations listed on the ASCE 7-16, Section 2.0 (Combinations of Loads), including the following flood loads according with ASCE 7-16 Section 5.4 (Loads During Flooding):

Hydrostatic Loads, caused by water which is either stagnant or moves at velocities less than 8 ft./sec., according with ASCE 24-14, Section 6.2.1 and ASCE 7-16, Sections 5.4.2 and C5.4.2.

2) Hydrodynamic and Impact Loads: Not considered since the use of Dry Floodproofing is limited to flood velocities less than 5 ft/sec.

C. This Flood Log System Flood Panel System (PP) is designed for a maximum wind load pressure of +/- 100 psf, which is the maximum wall wind load pressure per Structural Drawings.

D. Frame(s) and Intermediate post(s) shall have mounting holes for connecting anchors and bolts. Anchor type, size, and method dependent on load capabilities of structure.

E. The individual Flood log sections shall be 3” deep by 12.25” tall with a top interlocking gasket slot system which includes gaskets and gasket channels between sections and full height in the jamb channels. Multiple logs are to be stacked to meet or exceed the base flood elevation plus additional 12” or 24” for wave action per the job requirements and location. Embed plates may be required at the sill and jambs based on the condition at the opening and the loads imposed on the system. Jamb supports are to be continuous structural steel channels designed specifically for the Flood log system and are to be anchored and sealed to the condition with embeds or mechanical anchors.

PART 3 - EXECUTION

3.01 Installation

A. Install flood barriers in accordance with manufacturer's instructions and approved shop drawings.

B. Building contractor to verify that all surfaces against which the sealing gasket presses must be built "paper-smooth" to prevent excessive water extrusion, beyond that allowed by requirements. All surfaces must be plumb, square and level before installation can begin.

C. All embed plates are to be installed using Dow Corning 995 caulk or equal or waterproof grout at back of support covering full height and width of support and producing squeeze out on all sides to assure proper seal. Sealer by others.

D. Existing slabs, walls and columns adjacent to openings where flood barriers are to be installed shall be waterproofed with a waterproof membrane or a water proof sealer surface treatment prior to the installation of the flood barriers by the contractor.

E. All fixed mill finish aluminum supports must have a protective barrier between the support and the concrete and any dissimilar metals to prevent corrosion.

F. Install all supports true and plumb without racking or warping.

G. For Flood Panel to warranty the product supplied, the Flood Barrier installer must provide photos of each opening during and following installation. Inspection of each opening is required per the Flood Certificate by the Engineer of record to verify installation compliance with the manufacturers shop drawings and installation instructions. Installer can then uninstall the barrier system and the building contractor shall move the barriers to a storage location as directed by the Architect or Owners representative.

3.02 Cleaning, Inspection and Storage

A. Inspect all barriers for damaged parts

B. Repair or replace damaged installed products and components

C. Touch up all damaged surfaces

D. Clean all exposed surfaces and let dry before storing

3.03 Protection

A. Building contractor to move all barriers to designated storage location and shall stack the barriers in a manner that does not damage the gaskets. Position all gaskets away from high traffic areas in the storage area to prevent damage to the gaskets.

B. Protect installed product and finish surfaces from damage during handling, storage and installation.

C. Protect all installed product and finished surfaces during normal and general operation.

END OF SECTION 083160

SECTION 083323 - INSULATED ROLLING SERVICE DOOR

PART 1 – GENERAL

1.1 SUMMARY

A. Section Includes: Manual overhead insulated rolling doors.

B. Related Sections:

1. 055000 - Metal Fabrications. Door opening jamb and head members.
2. 061053 - Rough Carpentry. Door opening jamb and head members.
3. 083100 - Access Doors and Panels. Access doors.
4. 087100 - Hardware. Padlocks. Master keyed cylinder.
5. 099123 - Painting. Field painting.

C. Products That May Be Supplied, But Are Not Installed Under This Section:

1. Control Station

1.2 SYSTEM DESCRIPTION

A. Design Requirements:

1. Air Infiltration to Comply With:

a. ASHRAE® (American Society of Heating, Refrigeration, and Air-Conditioning Engineers) Standard 90.1-2007, 2010 & 2013 requirements of less than .3 CFM/FT2
b. IECC® (International Energy Conservation Code) 2021 requirements of less than 0.9 CFM/FT2
c. California Title 24 requirements of less than 0.9 CFM/FT2

2. Wind Loading:

a. Supply doors to withstand up to 160 MPH design wind load.

3. Cycle Life:

a. Design doors of standard construction for normal use of up to 20 cycles per day maximum, and an overall maximum of 50,000 operating cycles for the life of the door.

4. Seismic Performance:

a. Provide manufacturer’s seismic calculations confirming ASCE7-10

5. Insulated Door Slat Material Requirements:

a. Flame Spread Index of 35 and a Smoke Developed Index of 400 as tested per ASTM E84

b. Sound Transmission Class (STC) rating up to 27 for the entire assembly. All configurations are evaluated per ASTM E90 and based on testing a complete, operable assembly
d. U-factor listing of 0.532 for entire door assembly per DASMA-105
e. Insulation to be CFC Free with an Ozone Depletion Potential (ODP) rating of zero.

6. Safety:

a. Chain operated doors shall be designed so that the door immediately stops upward or downward travel and is maintained in a stationary position when the hand chain is released by user.

7. Delegated Design:

a. Design rolling service door systems, including comprehensive engineering analysis by a qualified North Carolina-registered professional engineer, using performance requirements and design criteria indicated.

8. Wind Loads:

a. Refer to North Carolina State Building Code requirements as noted on Drawing R0.1, in Section “Structural Design”. Assume 153 mph wind speed per requirements in Chapter 16 of the NC Building Code.

1.3 SUBMITTALS

A. Reference Section 013300 Submittal Procedures; submit the following items:

1. Product Data

2. Shop Drawings: Include special conditions not detailed in Product Data. Show interface with adjacent work.

3. Quality Assurance/Control Submittals:

a. Provide manufacturer ISO 9001:2015 registration
b. Provide manufacturer's installation instruction

4. Closeout Submittals:

a. Operation and Maintenance Manual
b. Certificate stating that installed materials comply with this specification

1.4 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer Qualifications: ISO 9001:2015 registered and a minimum of five years experience in producing doors of the type specified

2. Installer Qualifications: Manufacturer's approval

1.5 DELIVERY STORAGE AND HANDLING

A. Follow manufacturer's instructions

1.6 WARRANTY

A. Standard Warranty: Two years from date of shipment against defects in material and workmanship

B. Maintenance: Submit for owner's consideration and acceptance of a maintenance service agreement for installed products

PART 2 – PRODUCT

2.1 MANUFACTURER

A. Manufacturer:

1. Cookson: 1901 South Litchfield Road, Goodyear, AZ 85338.
   Telephone: (855) 719-4040
2. Model: ESD40.

2.2 PRODUCT INFORMATON

A. Equivalent products matching the requirements of the Specification that are manufactured by the following companies will be acceptable.

1. Overhead Door Company
2. Alpine Overhead Doors

2.3 MATERIALS

A. Curtain: Thermally broken; Air infiltration rate of 0.29 CFM/FT2, as tested per ASTM E283 validated by an independent testing agency.

1. Fabrication:

a. Slat Material: No. 6B

1) 316 stainless steel.

b. Insulation: 7/8 inch (22 mm) thick fire-retardant mineral wool, ASTM C665-95 or ASTM C612-93
c. Total Slat Thickness: 15/16 inch (24 mm)
d. Flame Spread Index of 35 and a Smoke Developed Index of 400 as tested per ASTM E84

2. Finish (Slats only):

a. #4 finish.

B. Endlocks: Fabricate interlocking sections with high strength galvanized cast iron endlocks on alternate slats each secured with two ¼" (6.35 mm) rivets. Provide windlocks as required to meet specified wind load.

1. Galvanized cast iron: Required if above 21'-0" width (DBG - Distance Between Guides), applicable for smaller configurations requiring wind load.

C. Bottom Bar

1. Configuration:

a. Structural Steel Angles (Standard on doors larger than 21.5' DBG): 2 structural steel angles minimum 2"x2"x1/8"

2. Finish:

a. Hot-dip Galvanized: ASTM A 123, Grade 85 zinc coating, hot-dip galvanized after fabrication

3. Air Infiltration Certification Label: Must be affixed to bottom bar

D. Guides:

1. Fabrication:

a. Minimum 3/16 inch (4.76 mm) structural steel angles. Provide windlock bars of same material when windlocks are required to meet specified wind load. Top of inner and outer guide angles to be flared outwards to form bellmouth for smooth entry of curtain into guides. Provide removable guide stoppers to prevent over travel of curtain and bottom bar.

b. Top 16 ½" (419.10 mm) of coil side guide angles to be removable for ease of curtain installation and as needed for future curtain service

2. Finish:

a. Hot-dip Galvanized: ASTM A 123, Grade 85 zinc coating, hot-dip galvanized after fabrication

E. Counterbalance Shaft Assembly:

1. Barrel: Steel pipe capable of supporting curtain load with maximum deflection of 0.03 inches per foot (2.5 mm per meter) of width
2. Spring Balance: Oil-tempered, heat-treated steel helical torsion spring assembly designed for proper balance of door to ensure that maximum effort to operate will not exceed 25 lbs. (110 N). Provide wheel for applying and adjusting spring torque.

F. Brackets:

Fabricate from minimum 3/16-inch (5 mm) steel plate with permanently lubricated ball or roller bearings at rotating support points to support counterbalance shaft assembly and form end closures

1. Finish:

a. Hot-dip Galvanized: ASTM A 123, Grade 85 zinc coating, hot-dip galvanized after fabrication

G. Hood:

Minimum 24-gauge galvanized steel with reinforced top and bottom edges. Provide minimum ¼-inch (6.35 mm) steel intermediate support brackets as required to prevent excessive sag.

1. Finish:

a. GalvaNex™ Coating System (Stock Colors):

1) ASTM A 653 galvanized base coating treated with dual process rinsing agents in preparation for chemical bonding baked-on base coat and gray baked-on polyester finish coat

H. Weatherstripping:

1. Bottom Bar:

a. Manually Operated Doors: Replaceable, bulb-style, compressible EDPM gasket extending into guides

2. Guides: Replaceable vinyl strip on guides sealing against both sides of curtain
3. Lintel Seal: Double brush seal with EPDM sandwiched between the two brush seals at door header to impede air flow.
4. Hood: Neoprene/rayon baffle to impede air flow above coil
5. Guide Seal: For face of wall applications, a foam block will be supplied for the area between the inner guide angle and wall construction. For between jambs applications, silicone around each angle joint will be required.

2.4 OPERATION

A. Manual ControlGard Chain Hoist: Provide chain hoist operator with endless steel chain, chain pocket wheel and guard, geared reduction unit, and chain keeper secured to guide. Chain hoist to include integral brake mechanism that will immediately stop upward or downward travel and maintain the door in a stationary position when the hand chain is released by the user

2.5 ACCESSORIES

A. Locking:

1. Master keyable cylinder operable from both sides of bottom bar, options for all types of operation. Provide interlock switches on Motor operated units.

a. Schlage, to match Owner’s keying system for the building.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates upon which work will be installed and verify conditions are in accordance with approved shop drawings.

B. Coordinate with responsible entity to perform corrective work on unsatisfactory substrates.

C. Commencement of work by installer is acceptance of substrate.

3.2 INSTALLATION

A. General: Install door and operating equipment with necessary hardware, anchors, inserts, hangers and supports.

B. Follow manufacturer's installation instructions.

3.3 ADJUSTING

A. Following completion of installation, including related work by others, lubricate, test, and adjust doors for ease of operation, free from warp, twist, or distortion

3.4 CLEANING

A. Clean surfaces soiled by work as recommended by manufacturer.

B. Remove surplus materials and debris from the site.

3.5 DEMONSTRATION

A. Demonstrate proper operation to Owner's Representative.

B. Instruct Owner's Representative in maintenance procedures.

END OF SECTION 083323

SECTION 083919 - WATERTIGHT DOORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Single Swing and Paired Swing with removable mullion Pedestrian Flood Doors with Frames.
2. Door Hardware.

B. Related Sections:

1. Division 03 – Cast-In-Place Concrete.
2. Division 04 – Concrete Unit Masonry
3. Division 05 – Structural Steel Framing.

1.2 SUBMITTALS

A. Product Data: Manufacturer's data sheets on each product to be used, including:

1. Preparation instructions and recommendations.
2. Storage and handling requirements and recommendations.
3. Installation instructions.

B. Shop Drawings: Provide shop drawings showing layout, profiles, and product components, including anchorage, hardware, and finishes. Include dimensional plans, applicable material specifications, elevations and sections detailing mounting and connections, and load diagrams.

1. Contractor to provide manufacturer with field measurements and mounting structure prior to commencement of shop drawings.

C. Factory Testing Documentation: Furnish independent party witnessed factory testing documentation of the same model/type pedestrian flood door demonstrating a maximum leakage rate of 0.040 gallon per hour per linear foot of wetted perimeter, tested in accordance with the procedure set forth by the American National Standard for Flood Mitigation Equipment in ANSI/FM Approvals 2510-2020 section 4.3.3 for a minimum of 22 hours. Maximum leakage rate shall be published as the greater of the leakage rates recorded at both 10% and 100% of the maximum test water height. Leakage shall be collected through all portions of the product assembly which are below the test water depth, including hardware and lockset.

D. Calculations: Upon signed finalization and approval of dimensions, mounting location material and configuration, and load requirements;

1. Submit stamped calculations by a registered professional engineer from within the state or territory where the project will be constructed or substantially improved, to verify the flood door’s ability to withstand the design loading.

1 1.3 CLOSEOUT SUBMITTALS

2 A. Provide Operation and Maintenance data to include methods for maintaining installed products,
3 precautions against cleaning materials and methods detrimental to finishes and performance.

4 1.4 QUALITY ASSURANCE

5 A. Manufacturer Qualifications: Manufacturer must demonstrate a minimum of five (5) years
6 successful experience in design and manufacture of similar flood related closures. Upon request,
7 provide supporting evidence including list of installations, descriptions, name, and method of
8 contact.

9 B. Minimum Qualifications: Manufacturer must demonstrate compliance and certification of a Quality
10 Management System administered by the International Organization for Standardization (ISO).
11 Documentation of current certification status to be provided upon request.

12 C. Welder Qualifications: Welders Certified in accordance with American Welding Society
13 Procedures for applicable material used in production of specified product.

14 1.5 DELIVERY, STORAGE, AND HANDLING

15 A. Store products in manufacturer's unopened packaging container with identification markings
16 intact until ready for installation.

17 B. Protect materials from exposure to moisture during storage.

18 C. Store materials in a dry, warm, ventilated weathertight location. If outdoor storage is required,
19 block materials to store at an incline, to prevent pooling of any moisture and promote runoff. Tarp
20 materials in a tent-like arrangement, elevated above the product with open sides to allow airflow.
21 Store loose or high value components in a dry, controlled environment.

22 D. Use caution when unloading and handling product to avoid bending, denting, crushing, or other
23 damage to the product.

24 E. When using forklifts, use forks of proper length to fully support product being moved. Consult
25 "Approved for Construction" drawings or consult with factory for proper lift points.

26 1.6 PROJECT CONDITIONS

27 A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits
28 recommended by manufacturer for optimum results. Do not install products under environmental
29 conditions outside manufacturer's indicated limits.

30 1.7 COORDINATION

31 A. Conduct site survey and provide to flood door manufacturer, prior to manufacturer’s
32 commencement of shop drawings, the actual site conditions of the mounting location, to include;
33 material type, dimensions and configuration, interferences with mounting surface, or any other
34 condition that may impact the ability of the flood door to be properly installed.

35 B. Coordinate work with other operations and installation of adjacent materials to avoid damage.

36 1.8 WARRANTY

A. Manufacturer's Standard Warranty: Product to be free from defects in material and workmanship for a period of one (1) year from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Design flood resistance doors to support, solely or in combinations of, temporary super-imposed live loads as indicated below. All applied types of flood related loadings are transferred from the flood product barriers, solely or in combinations of, by mullion anchorage to structural floor slabs and/or jamb anchorage and direct pressure contact to structural walls or other structural elements.

1. Hydrostatic Loading
2. Wind Loading (Exterior applications only)

B. Engineer Code Practices: Engineer flood products to conform to the design requirements that are based on the latest adopted edition of the International Building Code (IBC). LFRD and/or ASD methodologies are applied as appropriate to align with specific project specifications and/or limited published material data.

C. Factory Testing Documentation: Furnish independent party witnessed factory testing documentation of the same model/type pedestrian flood door demonstrating a maximum leakage rate of 0.040 gallon per hour per linear foot of wetted perimeter, tested in accordance with the procedure set forth by the American National Standard for Flood Mitigation Equipment in ANSI/FM Approvals 2510-2020 section 4.3.3 for a minimum of 22 hours. Maximum leakage rate shall be published as the greater of the leakage rates recorded at both 10% and 100% of the maximum test water height. Leakage shall be collected through all portions of the product assembly which are below the test water depth, including hardware and lockset.

D. Water Density: 64 pcf, unless otherwise noted on drawings.

2.2 PEDESTRIAN FLOOD DOOR WITH FRAME

A. Description: Hinged, Pedestrian Flood Door including door frame, door panel, threshold, and door hardware.

1. Approved Manufacturer: PS Flood Barriers™, which is located at: 1150 S. 48th Street, Grand Forks, ND 58201; Toll Free Tel: 877.446.1519; Email: 4psinfo@psindustries.com; Web: www.psfloodbarriers.com or www.psindustries.com

    a. Basis of Design Product: Model: Hydro1-PD520.

B. Equivalent products meeting the requirements of this specification include units by Flood Panel, Jupiter, FL and Floodproofing.com, Mt Royal, NJ.

C. Single Source Responsibilities: Obtain all watertight doors and flood protection barriers from single manufacturer.

2.3 EQUIPMENT

A. Products Details:

1. Sealing Requirements: Flood Door and compression gasket design shall provide an effective barrier against short-term high-water situations, to the protection level indicated on drawings.
2. Operation:

    a. Door hardware operable from both sides. Flood Door shall utilize only the manufacturer's standard door hardware to create water-tight seal. No secondary latching or additional operations are acceptable.
    b. Flood Door utilized in emergency egress openings shall unlatch via activation of emergency egress panic hardware device. No secondary latching or additional operations are acceptable.

3. Mounting/Load Transfer: Anchor to existing structure. Flood Door designed for specified hydrostatic pressure (and other loads as specified) and will transfer loads to adjacent structure.
4. Frames to be anchored utilizing mechanical, chemical or other framing methods as designed. Manufacturer to include all anchors, water-stop, and sealants, as designed.
5. Loading Direction:

    a. Positive Pressure Loading, (direction of loading against flood door so as to further compress gaskets against flood door frame - "seating").

6. Provide rectangular door opening with square corners to facilitate easy passage.
7. Provide continuous, compression gasket which does not require air inflation.

2.4 MATERIALS

A. Exposed sheet metal of door panel and door frame to be formed of the following material type;

1. Stainless Steel: Type 316- No. 4 stainless steel of appropriate size and strength, welded and structurally bonded.

B. Flood door internal structure and mullion tube to be structural tubes, plates, and formed shapes of the following material type;

1. Stainless Steel Type 316: stainless steel of appropriate size and strength with welded construction.

C. Gaskets: Factory mounted, continuous, compressible rubber type, field replaceable. Gasket does not require air inflation.

1. Material: UV resistant EPDM, neoprene and rubber unless otherwise noted.
2. Location: Recessed into door perimeter, no gasket along threshold/walking surface.

D. Door Frame to be manufactured of the same material type and finish as door panel. Frame to include jambs, header jamb, and threshold members for field locating and installation on structure. Jamb members to be designed and fabricated with appropriate material as required for the loading.

E. Thresholds to be PS Flood Barriers™ proprietary threshold:

1. Aluminum: 6000 Series Alloy.

    a. ADA Compliant threshold (no more than ½" high).

b. Gasket-Free walking surface.

F. Frame Mounting Hard ware: Provide anchors, sealant, and water stop, as required.

G. Operating Hardware: Provide hardware appropriate for the size and weight of the flood door and loads. Hardware to be factory located on jambs and door panels, as practical. Latching hardware to be as indicated on drawings. Flood door panel to be factory prepared for applicable latching devices.

1. ~~Aluminum (AL689 finish) Hinge to be continuous type.~~ See Door Hardware, Section 087100.
2. ~~Standard Latching/Locking Hardware: Interior: Von Duprin 98/99 series Rim exit device. Exterior: Von Duprin 996L Lever, classroom function. (Note: this hardware has been specifically chosen and tested on the Hydro 1 PD-520, substitutions require manufacturer's engineering review.)~~

~~a. Closer; Townsteel TDC40 H-CUSH, Heavy Duty Grade 1 (AL689 finish)~~

H. Finish:

1. Stainless Steel products to be mill finish, welds are ground smooth, not polished.

a. No. 4 brushed, welds chemically passivated and cleaned.

I. Labeling: Each watertight door and frame will be individually identified for matched installation.

2.5 FABRICATION

A. Fit and factory assemble items in largest practical sections, for shipment to site.

B. Fabricate items with joints tightly fitted and secured.

C. Supply components required for anchorage of fabrications, unless otherwise noted.

D. Conduct shop operational test with factory installed gaskets to verify flood door assembly components operate as designed and flood protective gasket alignment and contact surfaces interact as intended.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Do not begin installation until mounting substrates have been properly prepared.

B. If substrate preparation is the responsibility of another subcontractor, notify Architect of uncompleted preparation before proceeding.

C. Inspect opening for compliance with door manufacturer requirements. Verify open conditions are within required tolerances.

3.2 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

A. Install in accordance with manufacturer's installation instructions, "Approved for Construction" drawings, shipping, handling, and storage instructions, and product carton instructions for installation.

B. Frames must be installed level, square, plumb, and rigid.

C. Perform chalk test for gasket alignment, continuity contact and pre-compression prior to field grouting.

D. Sealants, water-stop, and grouting to be applied per product application directions and in accordance with manufacturer's instructions, and "Approved for Construction" drawings.

E. Field Grouting to be completed by appropriate personnel, and in accordance with product application directions, manufacturer's instructions, and "Approved for Construction" drawings.

F. Tolerances: All dimensional requirements must be in accordance with manufacturer's installation instructions and "Approved for Construction" drawings.

G. Products to be operated and field verified that sealing surfaces maintain contact at the correct sealing points.

H. Inspect gaskets for damage, wear, and adhesion. Replace compromised gaskets immediately.

I. Verify all anchorage is in accordance with manufacture's installation instructions and applicable data sheets.

J. Inspect installation sealants to ensure a watertight juncture.

3.4 FIELD QUALITY CONTROL

A. Field Testing:
   1. Installer to perform hose test of door to frame in accordance with manufacturer’s standard Hose Test Procedure.
   2. Installer to construct temporary water barrier and test installed flood barrier under hydrostatic conditions.

3.5 CLEANING

A. Touch-up, repair or replace damaged products or components before Substantial Completion.

B. Clean all sealing surfaces.

3.6 PROTECTION

A. Protect installed products until completion of project.

END OF SECTION 083919

SECTION 084113 - ALUMINUM-FRAMED ENTRANCES AND STOREFRONTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Exterior storefront framing.
2. Storefront framing for punched openings.
3. Exterior manual-swing entrance doors and door frame units.
4. Interior manual-swing entrance doors and door frame units.
5. Insulated metal panel inserts.

B. Related Sections:

1. Section 033000, Cast-in-Place Concrete.
2. Section 042100, Unit Masonry.
3. Section 054000, Cold-Formed Metal Framing.
4. Section 061053, Miscellaneous Rough Carpentry.
5. Section 074219, EIFS.
6. Section 076200, Sheet Metal Flashing and Trim.
7. Section 079200, Joint Sealants.
8. Section 081416, Flush Wood Doors.
9. Section 082550, Aluminum FRP Flush Doors and Frames.
10. Section 087100, Door Hardware.
11. Section 088000, Glazing.
12. Section 088500, Special Glazing.
13. Section 089000, Louvers and Vents.

1.2 PERFORMANCE REQUIREMENTS

A. General Performance: Aluminum-framed systems shall withstand the effects of the following performance requirements without exceeding performance criteria or failure due to defective manufacture, fabrication, installation, or other defects in construction:

1. Movements of supporting structure indicated on Drawings including, but not limited to, story drift and deflection from uniformly distributed and concentrated live loads.
2. Dimensional tolerances of building frame and other adjacent construction.
3. Failure includes the following:
    a. Deflection exceeding specified limits.
    b. Thermal stresses transferring to building structure.
    c. Framing members transferring stresses, including those caused by thermal and structural movements to glazing.
    d. Noise or vibration created by wind and by thermal and structural movements.
    e. Loosening or weakening of fasteners, attachments, and other components.
    f. Failure of operating units.

B. Delegated Design: Design aluminum-framed systems, including comprehensive engineering analysis by a qualified North Carolina-registered professional engineer, using performance requirements and design criteria indicated.

C. Wind Loads: Refer to North Carolina State Building Code requirements as noted on Drawing R0.1, in Section “Structural Design”. Assume 153 mph wind speed per requirements in Chapter 16 of the NC Building Code.

1.3 ACTION SUBMITTALS **(note that doors are a long lead time order)**

A. Product Data: For each type of product indicated.

B. Shop Drawings: For aluminum-framed systems. Include plans, elevations, sections, details, and attachments to other work.

1. Include details of provisions for system expansion and contraction and for drainage of moisture in the system to the exterior.

C. Samples: For each type of exposed finish required.

D. Delegated-Design Submittal: For aluminum-framed systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Warranties: Sample of special warranties.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Engineering Responsibility: Prepare data for aluminum-framed systems, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in systems similar to those indicated for this Project.

C. Accessible Entrances: Comply with applicable provisions in ICC/ANSI A117.1.

D. Source Limitations for Aluminum-Framed Systems: Obtain from single source from single manufacturer.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of aluminum-framed systems that do not comply with requirements or that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Acceptance by Owner.

B. Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes do not comply with requirements or that fail in materials or workmanship within specified warranty period. Warranty does not include normal weathering.

1. Warranty Period: Five years from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide EFCO Corporation Model S403, for exterior storefront, Model S401, for interior storefront, and D500 Entrances, or comparable products by one of the following:

1. Kawneer Trifab VG 451 T, (exterior), Trifab 400 (interior), Wide Stile 500 doors.
2. Oldcastle Building Envelope.
3. TRACO.
4. Tubelite.
5. YKK AP America Inc.

2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

1. Sheet and Plate: ASTM B 209 (ASTM B 209M).
2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221 (ASTM B 221M).
3. Extruded Structural Pipe and Tubes: ASTM B 429.
4. Structural Profiles: ASTM B 308/B 308M.
5. Welding Rods and Bare Electrodes: AWS A5.10/A5.10M.

B. Steel Reinforcement: Manufacturer's standard zinc-rich, corrosion-resistant primer, complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.

1. Structural Shapes, Plates, and Bars: ASTM A 36/A 36M.
2. Cold-Rolled Sheet and Strip: ASTM A 1008/A 1008M.
3. Hot-Rolled Sheet and Strip: ASTM A 1011/A 1011M.

2.3 FRAMING SYSTEMS

A. Framing Members: Manufacturer's standard extruded-aluminum framing members of thickness required and reinforced as required for supporting imposed loads.

1. Construction: Thermally broken
2. Glazing System: Retained mechanically with gaskets on four sides.
3. Glazing Plane: Center.

B. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with non-staining, nonferrous shims for aligning system components.

C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, non-staining, non-bleeding fasteners and accessories compatible with adjacent materials.

1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
2. Reinforce members as required to receive fastener threads.

D. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts, complying with ASTM A 123/A 123M or ASTM A 153/A 153M.

E. Concealed Flashing: Manufacturer's standard corrosion-resistant, non-staining, non-bleeding flashing compatible with adjacent materials.

F. Framing System Gaskets and Sealants: Manufacturer's standard, recommended by manufacturer for joint type.

2.4 GLAZING SYSTEMS

A. Glazing: As specified in Section 088000 "Glazing."

B. Glazing Gaskets: Manufacturer's standard compression types; replaceable, molded or extruded, of profile and hardness required to maintain watertight seal. **Color shall be Grey.**

C. Spacers and Setting Blocks: Manufacturer's standard elastomeric type.

2.5 ENTRANCE DOOR SYSTEMS

A. Entrance Doors: Manufacturer's standard glazed entrance doors for manual-swing operation.

1. Door Construction: 1 ¾ -inch overall thickness, with minimum 0.188-inch- (4.8-mm-) thick, extruded-aluminum tubular rail and stile members. Mechanically fasten corners with reinforcing brackets that are deeply penetrated and fillet welded or that incorporate concealed tie rods.
2. Door Design: Wide stile; 5-inch (127-mm) nominal width.
    a. Accessible Doors: Smooth surfaced for width of door in area within 10 inches (255 mm) above floor or ground plane.
3. Glazing Stops and Gaskets: Beveled, snap-on, extruded-aluminum stops and preformed gaskets.
    a. Provide non-removable glazing stops on outside of door.

B. Entrance Door Hardware: As specified in Section 087100 "Door Hardware" except as described below.

2.6 ENTRANCE DOOR HARDWARE

A. General: Provide entrance door hardware for each entrance door to comply with requirements in this Section and Section Door Hardware 087100. Items following are provided by the Door Manufacturer. Items in Section Door Hardware 087100 are provided by the Contractor’s Hardware supplier.

B. Continuous-Gear Hinges: By Hardware Supplier.

C. Strikes: Provide strike with black-plastic dust box for each latch or lock bolt; fabricated for aluminum framing.

D. Removable Mullions: BHMA A156.3, extruded aluminum. By Hardware Supplier.

E. Weather Stripping: Manufacturer's standard replaceable components.

F. Weather Sweeps: By Hardware Supplier.

2.7 ACCESSORY MATERIALS

A. Bituminous Paint: Cold-applied, asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos; formulated for 30-mil (0.762-mm) thickness per coat.

B. Provide Stool Trim and Stool Trim Clips on interior, as detailed on the drawings, of same material as storefront; Part 1481, 8 inches wide, and Part 9873, continuous clip. Provide .050 clear anodized aluminum break metal sill on exterior of storefront and windows.

C. Provide extruded aluminum tubes at intersecting corners of storefront and where walls abut storefront, as shown on the drawings.

D. Insulated Metal Panels in Glazing Gaskets:

1. Provide Insulated Metal Panels as manufactured by High Standard Inc., Jaffrey, New Hampshire; www.hsipanels.com, or equivalent product matching the specifications.
2. Panel construction: Face metal/corrugated plastic/polyisocyanurate/corrugated plastic/back metal, one-inch thickness. Face metal shall be .032 Class II clear anodized aluminum.

2.8 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Framing Members, General: Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.
3. Means to drain water passing joints, condensation within framing members, and moisture migrating within the system to exterior.
4. Physical and thermal isolation of glazing from framing members.
5. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
6. Provisions for field replacement of glazing from interior.
7. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Mechanically Glazed Framing Members: Fabricate for flush glazing without projecting stops.

E. Entrance Door Frames: Reinforce as required to support loads imposed by door operation and for installing entrance door hardware.

F. Entrance Doors: Reinforce doors as required for installing entrance door hardware.

G. Entrance Door Hardware Installation: Factory install entrance door hardware to the greatest extent possible. Cut, drill, and tap for factory-installed entrance door hardware before applying finishes.

H. After fabrication, clearly mark components to identify their locations in Project according to Shop Drawings.

2.9 ALUMINUM FINISHES

A. Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General:

1. Comply with manufacturer's written instructions.
2. Do not install damaged components.
3. Fit joints to produce hairline joints free of burrs and distortion.
4. Rigidly secure non-movement joints.
5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration.
6. Seal joints watertight unless otherwise indicated.

B. Metal Protection:

1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or applying sealant or tape, or by installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within the system to exterior.

D. Set continuous sill members and flashing in full sealant bed as specified in Section 079200 "Joint Sealants" to produce weathertight installation.

E. Install components plumb and true in alignment with established lines and grades, and without warp or rack.

F. Install glazing as specified in Section 088000 "Glazing."

G. Entrance Doors: Install doors to produce smooth operation and tight fit at contact points.

1. Exterior Doors: Install to produce weathertight enclosure and tight fit at weather stripping. At double doors, coordinate with the hardware supplier for a tight seal at removable mullions and astragals. Weatherstripping shall be continuous on top and sides; door bottom weather sweeps shall run the full length of the door bottom.
2. Field-Installed Entrance Door Hardware: Install surface-mounted entrance door hardware according to entrance door hardware manufacturers' written instructions using concealed fasteners to greatest extent possible.

3.2 FIELD QUALITY CONTROL

A. Repair or remove work if inspections indicate that it does not comply with specified requirements.

END OF SECTION 084113

SECTION 084123 - ALUMINUM-FRAMED SLIDING MALL FRONT DOORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Commercial Automatic Sliding Door. Reference ANSI/BHMA A156.10 for safety requirements.
2. Panel Exterior Bi-Part Automatic Door System with DC Motor.
3. Microprocessor Control, Safety Sensors, and Hardware.

B. Related Sections:

1. Section 033000, Cast-in-Place Concrete.
2. Section 042100, Unit Masonry.
3. Section 054000, Cold-Formed Metal Framing.
4. Section 061053, Miscellaneous Rough Carpentry.
5. ***Section 088000, Glazing is not included by door manufacturer.***

1.2 PERFORMANCE REQUIREMENTS

A. General Performance: Aluminum-framed systems shall withstand the effects of the following performance requirements without exceeding performance criteria or failure due to defective manufacture, fabrication, installation, or other defects in construction:

1. Movements of supporting structure indicated on Drawings including, but not limited to, story drift and deflection from uniformly distributed and concentrated live loads.
2. Dimensional tolerances of building frame and other adjacent construction.
3. Failure includes the following:
    a. Deflection exceeding specified limits.
    b. Thermal stresses transferring to building structure.
    c. Framing members transferring stresses, including those caused by thermal and structural movements to glazing.
    d. Noise or vibration created by thermal and structural movements.
    e. Loosening or weakening of fasteners, attachments, and other components.
    f. Failure of operating units.

B. Delegated Design: Design aluminum-framed systems, including comprehensive engineering analysis by a qualified North Carolina-registered professional engineer, using performance requirements and design criteria indicated.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For aluminum-framed systems. Include plans, elevations, sections, details, and attachments to other work.

1. Include details of provisions for system expansion and contraction and for drainage of moisture in the system to the exterior.

C. Samples: For each type of exposed finish required.

D. Delegated-Design Submittal: For aluminum-framed systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS

A. Warranties: Sample of special warranties.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Engineering Responsibility: Prepare data for aluminum-framed systems, including Shop Drawings, based on testing and engineering analysis of manufacturer's standard units in systems similar to those indicated for this Project.

C. Accessible Entrances: Comply with applicable provisions in ICC/ANSI A117.1.

D. Source Limitations for Aluminum-Framed Systems: Obtain from single source from single manufacturer.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of aluminum-framed systems that do not comply with requirements or that fail in materials or workmanship within specified warranty period, including electrical components.

1. Warranty Period: Two years from date of Acceptance by Owner.

B. Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes do not comply with requirements or that fail in materials or workmanship within specified warranty period. Warranty does not include normal weathering.

1. Warranty Period: Five years from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Automatic Door and Hardware Maverick Pro Automatic Sliding Doors, 508 Pat Booker Rd, Ste 450, Universal City, TX 78148, or comparable products by one of the following:

1. Stanley Access Technology.

2. Horton Automatics.

2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

1. Sheet and Plate: ASTM B 209 (ASTM B 209M).
2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221 (ASTM B 221M).
3. Extruded Structural Pipe and Tubes: ASTM B 429.
4. Structural Profiles: ASTM B 308/B 308M.
5. Welding Rods and Bare Electrodes: AWS A5.10/A5.10M.

B. Steel Reinforcement: Manufacturer's standard zinc-rich, corrosion-resistant primer, complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.

1. Structural Shapes, Plates, and Bars: ASTM A 36/A 36M.
2. Cold-Rolled Sheet and Strip: ASTM A 1008/A 1008M.
3. Hot-Rolled Sheet and Strip: ASTM A 1011/A 1011M.

2.3 FRAMING SYSTEMS

A. Framing Members: Manufacturer's standard extruded-aluminum framing members of thickness required and reinforced as required for supporting imposed loads.

1. Construction: Non-thermal.
2. Glazing System: 1/4" Glass Stops (For 1/4" Glass).
3. Glazing Plane: Center.

B. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with non-staining, nonferrous shims for aligning system components.

C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, non-staining, non-bleeding fasteners and accessories compatible with adjacent materials.

1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
2. Reinforce members as required to receive fastener threads.

D. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts, complying with ASTM A 123/A 123M or ASTM A 153/A 153M.

E. Framing System Gaskets and Sealants: Manufacturer's standard, recommended by manufacturer for joint type.

2.4 GLAZING SYSTEMS

A. Glazing: As specified in Section 088000 "Glazing." Not part of this product.

B. Glazing Gaskets: Manufacturer's standard compression types; replaceable, molded or extruded, of profile and hardness required to maintain watertight seal. **Color shall be Grey.**

C. Spacers and Setting Blocks: Manufacturer's standard elastomeric type.

2.5 AUTOMATIC DOOR SYSTEMS

A. Full Breakout Design - All panels can break away in the event of an emergency

B. 5 position key switch with ON / OFF / REDUCED OPEN / HOLD OPEN / ONE WAY

C. Aluminum Header, 8-inches high by 6-inches deep, molded brushed DC One Motor operator with gear reduction assembly; Hardware to include a reinforced timing belt.

D. System to have a digital microprocessor control with built in diagnostics

E. 1-3/4" x 4-1/2" jambs

F. Narrow stiles on doors

G. Glass stops to accept 1/4" thick glass

H. System Monitored directional motion sensors and safety curtains. Sensors shall be microwave doppler radar for motion and active infrared with background analysis for presence.

I. 10" ADA bottom rail

J. Interlocking door panels with weather seal. Provide full breakout hardware

K. Mortise Hook Bolt Lock with keyed exterior and thumb turn cylinder on interior

L. Emergency breakaway hardware

M. No threshold

N. ANSI decals

O. Electrical Requirements: 120 VSC, 5 Amp.

2.6 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Framing Members, General: Fabricate components that, when assembled, have the following characteristics:

1. Profiles that are sharp, straight, and free of defects or deformations.
2. Accurately fitted joints with ends coped or mitered.
3. Physical and thermal isolation of glazing from framing members.
4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
5. Provisions for field replacement of glazing.
6. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.

D. Mechanically Glazed Framing Members: Fabricate for flush glazing without projecting stops.

E. Header shall be self-supporting.

F. Opening size: 12-foot one half inch wide by 7-foot eight- and one-half inch high.

2.7 ALUMINUM FINISHES

A. Clear Anodic Finish: AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General:

1. Comply with manufacturer's written instructions.
2. Do not install damaged components.
3. Fit joints to produce hairline joints free of burrs and distortion.
4. Rigidly secure non-movement joints.
5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration.
6. Seal joints watertight unless otherwise indicated.

B. Metal Protection:

1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or applying sealant or tape, or by installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within the system to exterior.

D. Set continuous sill members and flashing in full sealant bed as specified in Section 079200 "Joint Sealants" to produce weathertight installation.

E. Install components plumb and true in alignment with established lines and grades, and without warp or rack.

F. Install glazing as specified in Section 088000 "Glazing."

3.2 FIELD QUALITY CONTROL

A. Repair or remove work if inspections indicate that it does not comply with specified requirements.

1

2 END OF SECTION 084123

SECTION 084456 – ALUMINUM FLUSH -FRAMED CONCEALED DOORS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Specialty concealed aluminum frames.

B. Related Sections:

   1. Section 054000, Cold-Formed Metal Framing.
   2. Section 061053, Miscellaneous Rough Carpentry.
   3. Section 092900, Gypsum Board.

1.2 PERFORMANCE REQUIREMENTS

A. General Performance: Aluminum-framed systems shall withstand the effects of the following performance requirements without exceeding performance criteria or failure due to defective manufacture, fabrication, installation, or other defects in construction:

   1. Movements of supporting structure indicated on Drawings including, but not limited to, story drift and deflection from uniformly distributed and concentrated live loads.
   2. Dimensional tolerances of building frame and other adjacent construction.
   3. Failure includes the following:

      a. Deflection exceeding specified limits.
      b. Thermal stresses transferring to building structure.
      c. Framing members transferring stresses, including those caused by thermal and structural movements to glazing.
      d. Noise or vibration created by thermal and structural movements.
      e. Loosening or weakening of fasteners, attachments, and other components.
      f. Failure of operating units.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For concealed aluminum-framed systems. Include plans, elevations, sections, details, and attachments to other work.

C. Samples: For each type of exposed finish required.

1.4 INFORMATIONAL SUBMITTALS

A. Warranties: Sample of special warranties.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of aluminum-framed systems that do not comply with requirements or that fail in materials or workmanship within specified warranty period, including electrical components.

1. Warranty Period: Two years from date of Acceptance by Owner.

B. Special Finish Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components on which finishes do not comply with requirements or that fail in materials or workmanship within specified warranty period. Warranty does not include normal weathering.

1. Warranty Period: Five years from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide products by one of the following:

1. FlushDoorFrame.com.
2. AGS Systems, Model TCT45 (Basis-of-Design).
3. Equivalent product meeting the requirements of this specification

2.2 MATERIALS

A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.

1. Sheet and Plate: ASTM B 209 (ASTM B 209M).
2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221 (ASTM B 221M).
3. Extruded Structural Pipe and Tubes: ASTM B 429.
4. Structural Profiles: ASTM B 308/B 308M.
5. Welding Rods and Bare Electrodes: AWS A5.10/A5.10M.

B. Steel Reinforcement: Manufacturer's standard zinc-rich, corrosion-resistant primer, complying with SSPC-PS Guide No. 12.00; applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.

1. Structural Shapes, Plates, and Bars: ASTM A 36/A 36M.
2. Cold-Rolled Sheet and Strip: ASTM A 1008/A 1008M.
3. Hot-Rolled Sheet and Strip: ASTM A 1011/A 1011M.

2.3 FRAMING SYSTEMS

A. Framing Members: Manufacturer's standard extruded-aluminum framing members of thickness required and reinforced as required for supporting imposed loads.

1. Construction: Non-thermal.

B. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, non-staining, non-bleeding fasteners and accessories compatible with adjacent materials.

C. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts, complying with ASTM A 123/A 123M or ASTM A 153/A 153M.

2.4 FABRICATION

A. Form or extrude aluminum shapes before finishing.

B. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.

C. Framing Members, General: Fabricate components in raw untreated aluminum alloy EN EW-6060, for outswing doors without visible edge on the wall side, including support for the mesh to snap-in, corner connectors and bottom spreader bars to guaranty an easy assembly, moveable wall fixing brackets for a stable connection between frame and wall, mesh to snap-in to avoid wall cracking, incl. milling for striking plates and hinges according specifications.

D. Door leaf thickness: 44/45 - 56 mm

E. Opening size: refer to drawings at “Touch Tank”.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General:

1. Comply with manufacturer's written instructions.
2. Do not install damaged components.
3. Fit joints to produce hairline joints free of burrs and distortion.
4. Rigidly secure non-movement joints.
5. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration.
6. Seal joints watertight unless otherwise indicated.

B. Metal Protection:

1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer or applying sealant or tape, or by installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Install components to drain water passing joints, condensation occurring within framing members, and moisture migrating within the system to exterior.

D. Set continuous sill members and flashing in full sealant bed as specified in Section 079200 "Joint Sealants" to produce weathertight installation.

E. Install components plumb and true in alignment with established lines and grades, and without warp or rack.

F. Install glazing as specified in Section 088000 "Glazing."

3.2 FIELD QUALITY CONTROL

A. Repair or remove work if inspections indicate that it does not comply with specified requirements.

END OF SECTION 084456

SECTION 085800 - ALUMINUM BULLET RESISTANT TRANSACTION WINDOW

PART 1 – GENERAL

1.01 SUMMARY

A. This section includes:

1. Aluminum bullet resistant transaction windows as indicated in drawings and in sections.

1.02 SUBMITTALS

A. Product Data: Submit Manufacturer's technical product data substantiating that products comply.

B. Shop drawings: Submit for fabrication and installation of windows. Include details, elevations and installation requirement of finish hardware and cleaning.

C. Certification: Provide printed data in sufficient detail to indicate compliance with the contract documents.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Deliver windows crated to provide protection during transit and job storage

B. Inspect windows upon delivery for damage. Unless minor defects can be made to meet the Architect's specifications and satisfaction, damaged parts should be removed and replaced.

C. Store windows at building site under cover in dry location.

1.04 PROJECT CONDITIONS

A. Field measurements: Check opening by accurate field measurement before fabrication. Show recorded measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delay of work.

1.05 WARRANTY

A. All material and workmanship shall be warranted against defects for a period of one (1) year from the acceptance by Owner.

PART 2 - PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS

A. Basis of Design: Design is based on Model SUI-200-1 by Quikserv Inc., www.quikserv.com 11441 Brittmoore Park Dr. Houston, TX 77041

Equivalent products meeting the requirement of this specification will be acceptable.

2.02 MATERIALS

A. Unit Dimensions: 24" (w) x 48" (h) | Service opening: 20" (w) x 17-3/4" (h)

B. Finish: All aluminum to be clear anodized.

C. Glazing: 1/4-inch clear float, tempered.

PART 3 – EXECUTION

3.01 INSTALLATION

A. Install frames and glazing in accordance with manufacturer's printed instructions and recommendations. Repair damaged units as directed (if approved by the manufacturer and the architect) or replace with new units.

3.02 CLEANING

A. Clean frame and glazing surfaces after installation, complying with requirements contained in the manufacturer's instructions. Remove excess glazing sealant compounds, dirt or other substances.

3.03 PROTECTION

A. Institute protective measures required throughout the remainder of the construction period to ensure that all the windows do not incur any damage or deterioration, other than normal weathering, at the time of acceptance.

END OF SECTION 085800

SECTION 08 71 00 – DOOR HARDWARE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes:

1. Mechanical and electrified door hardware
2. Electronic access control system components
3. Field verification, preparation and modification of existing doors and frames to receive new door hardware.

B. Section excludes:

1. Windows
2. Cabinets (casework), including locks in cabinets
3. Signage
4. Toilet accessories
5. Overhead doors

C. Related Sections:

1. Division 01 "General Requirements" sections for Allowances, Alternates, Owner Furnished Contractor Installed, Project Management and Coordination.
2. Division 06 Section “Rough Carpentry”
3. Division 06 Section "Finish Carpentry”
4. Division 07 Section “Joint Sealants” for sealant requirements applicable to threshold installation specified in this section.
5. Division 08 Sections:
   a. "Metal Doors and Frames"
   b. "Flush Wood Doors"
   c. "Interior Aluminum Doors and Frames"
   d. "Aluminum-Framed Entrances and Storefronts"
   e. "Stainless Steel Doors and Frames"
   f. "Special Function Doors"
   g. "Entrances"
   h. 083919 – Watertight Doors
6. Division 26 “Electrical” sections for connections to electrical power system and for low-voltage wiring.
7. Division 28 “Electronic Safety and Security” sections for coordination with other components of electronic access control system and fire alarm system.

1.03 SUBMITTALS

A. General:

1. Submit in accordance with Conditions of Contract and Division 01 Submittal Procedures.
2. Prior to forwarding submittal:
   a. Comply with procedures for verifying existing door and frame compatibility for new hardware, as specified in PART 3, “EXAMINATION” article, herein.
   b. Review drawings and Sections from related trades to verify compatibility with specified hardware.
   c. Highlight, encircle, or otherwise specifically identify on submittals: deviations from Contract Documents, issues of incompatibility or other issues which may detrimentally affect the Work.

B. Action Submittals:

1. Product Data: Submit technical product data for each item of door hardware, installation instructions, maintenance of operating parts and finish, and other information necessary to show compliance with requirements.
2. Riser and Wiring Diagrams: After final approval of hardware schedule, submit details of electrified door hardware, indicating:
   a. Wiring Diagrams: For power, signal, and control wiring and including:
      1) Details of interface of electrified door hardware and building safety and security systems.
      2) Schematic diagram of systems that interface with electrified door hardware.
      3) Point-to-point wiring.
      4) Risers.

3. Samples for Verification: If requested by Architect, submit production sample of requested door hardware unit in finish indicated and tagged with full description for coordination with schedule.
   a. Samples will be returned to supplier. Units that are acceptable to Architect may, after final check of operations, be incorporated into Work, within limitations of key coordination requirements.

4. Door Hardware Schedule:
    a. Submit concurrent with submissions of Product Data, Samples, and Shop Drawings. Coordinate submission of door hardware schedule with scheduling requirements of other work to facilitate fabrication of other work critical in Project construction schedule.
    b. Submit under direct supervision of a Door Hardware Institute (DHI) certified Architectural Hardware Consultant (AHC) or Door Hardware Consultant (DHC) with hardware sets in vertical format as illustrated by Sequence of Format for the Hardware Schedule published by DHI.
    c. Indicate complete designations of each item required for each opening, include:
        1) Door Index: door number, heading number, and Architect's hardware set number.
        2) Quantity, type, style, function, size, and finish of each hardware item.
        3) Name and manufacturer of each item.
        4) Fastenings and other pertinent information.
        5) Location of each hardware set cross-referenced to indications on Drawings.
        6) Explanation of all abbreviations, symbols, and codes contained in schedule.
        7) Mounting locations for hardware.
        8) Door and frame sizes and materials.
        9) Degree of door swing and handing.
        10) Operational Description of openings with electrified hardware covering egress, ingress (access), and fire/smoke alarm connections.

5. Key Schedule:
    a. After Keying Conference, provide keying schedule that includes levels of keying, explanations of key system's function, key symbols used, and door numbers controlled.
    b. Use ANSI/BHMA A156.28 "Recommended Practices for Keying Systems" as guideline for nomenclature, definitions, and approach for selecting optimal keying system.
    c. Provide 3 copies of keying schedule for review prepared and detailed in accordance with referenced DHI publication. Include schematic keying diagram and index each key to unique door designations.
    d. Index keying schedule by door number, keyset, hardware heading number, cross keying instructions, and special key stamping instructions.
    e. Provide one complete bitting list of key cuts and one key system schematic illustrating system usage and expansion. Forward bitting list, key cuts and key system schematic directly to Owner, by means as directed by Owner.
    f. Prepare key schedule by or under supervision of supplier, detailing Owner's final keying instructions for locks.

C. Informational Submittals:

1. Provide Qualification Data for Supplier, Installer and Architectural Hardware Consultant.
2. Provide Product Data:
    a. Certify that door hardware approved for use on types and sizes of labeled fire-rated doors complies with listed fire-rated door assemblies.
    b. Include warranties for specified door hardware.

D. Closeout Submittals:

1. Operations and Maintenance Data: Provide in accordance with Division 01 and include:
    a. Complete information on care, maintenance, and adjustment; data on repair and replacement parts, and information on preservation of finishes.
    b. Catalog pages for each product.
    c. Final approved hardware schedule edited to reflect conditions as installed.

d. Final keying schedule
e. Copy of warranties including appropriate reference numbers for manufacturers to identify project.
f. As-installed wiring diagrams for each opening connected to power, both low voltage and 110 volts.

1.04 QUALITY ASSURANCE

A. Qualifications and Responsibilities:

1. Supplier: Recognized architectural hardware supplier with a minimum of 5 years documented experience supplying both mechanical and electromechanical door hardware similar in quantity, type, and quality to that indicated for this Project. Supplier to be recognized as a factory direct distributor by the manufacturer of the primary materials with a warehousing facility in the Project's vicinity. Supplier to have on staff, a certified Architectural Hardware Consultant (AHC) or Door Hardware Consultant (DHC) available to Owner, Architect, and Contractor, at reasonable times during the Work for consultation.
2. Installer: Qualified tradesperson skilled in the application of commercial grade hardware with experience installing door hardware similar in quantity, type, and quality as indicated for this Project.
3. Architectural Hardware Consultant: Person who is experienced in providing consulting services for door hardware installations that are comparable in material, design, and extent to that indicated for this Project and meets these requirements:
   a. For door hardware: DHI certified AHC or DHC.
   b. Can provide installation and technical data to Architect and other related subcontractors.
   c. Can inspect and verify components are in working order upon completion of installation.
   d. Capable of producing wiring diagram and coordinating installation of electrified hardware with Architect and electrical engineers.

4. Single Source Responsibility: Obtain each type of door hardware from single manufacturer.

B. Certifications:

1. Fire-Rated Door Openings:
   a. Provide door hardware for fire-rated openings that complies with NFPA 80 and requirements of authorities having jurisdiction.
   b. Provide only items of door hardware that are listed products tested by UL LLC, Intertek Testing Services, or other testing and inspecting organizations acceptable to authorities having jurisdiction for use on types and sizes of doors indicated, based on testing at positive pressure and according to NFPA 252 or UL 10C and in compliance with requirements of fire-rated door and door frame labels.

2. Electrified Door Hardware
   a. Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction.

3. Accessibility Requirements:
   a. Comply with governing accessibility regulations cited in "REFERENCES" article 087100, 1.02.D3 herein for door hardware on doors in an accessible route. This project must comply with all Federal Americans with Disability Act regulations and all Local Accessibility Regulations.

C. Pre-Installation Meetings

1. Keying Conference
   a. Incorporate keying conference decisions into final keying schedule after reviewing door hardware keying system including:
      1) Function of building, flow of traffic, purpose of each area, degree of security required, and plans for future expansion.
      2) Preliminary key system schematic diagram.
      3) Requirements for key control system.
      4) Requirements for access control.
      5) Address for delivery of keys.

2. Pre-installation Conference
   a. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
   b. Inspect and discuss preparatory work performed by other trades.
   c. Inspect and discuss electrical roughing-in for electrified door hardware.
   d. Review sequence of operation for each type of electrified door hardware.
   e. Review required testing, inspecting, and certifying procedures.
   f. Review questions or concerns related to proper installation and adjustment of door hardware.

3. Electrified Hardware Coordination Conference:
   a. Prior to ordering electrified hardware, schedule and hold meeting to coordinate door hardware with security, electrical, doors and frames, and other related suppliers.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Inventory door hardware on receipt and provide secure lock-up for hardware delivered to Project site. Promptly replace products damaged during shipping.

B. Tag each item or package separately with identification coordinated with final door hardware schedule, and include installation instructions, templates, and necessary fasteners with each item or package. Deliver each article of hardware in manufacturer's original packaging.

C. Maintain manufacturer-recommended environmental conditions throughout storage and installation periods.

D. Provide secure lock-up for door hardware delivered to Project. Control handling and installation of hardware items so that completion of Work will not be delayed by hardware losses both before and after installation.

E. Handle hardware in manner to avoid damage, marring, or scratching. Correct, replace or repair products damaged during Work. Protect products against malfunction due to paint, solvent, cleanser, or any chemical agent.

1.06 COORDINATION

A. Installation Templates: Distribute for doors, frames, and other work specified to be factory or shop prepared. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing door hardware to comply with indicated requirements.

B. Security: Coordinate installation of door hardware, keying, and access control with Owner's security consultant.

C. Electrical System Roughing-In: Coordinate layout and installation of electrified door hardware with connections to power supplies and building safety and security systems.

D. Existing Openings: Where existing doors, frames and/or hardware are to remain, field verify existing functions, conditions and preparations and coordinate to suit opening conditions and to provide proper door operation.

1.07 WARRANTY

A. Manufacturer's standard form in which manufacturer agrees to repair or replace components of door hardware that fail in materials or workmanship within published warranty period.

1. Warranty does not cover damage or faulty operation due to improper installation, improper use or abuse.
2. Warranty Period: Beginning from date of Substantial Completion, for durations indicated in manufacturer's published listings.

a. Mechanical Warranty
   1) Locks
      a) 10 years
   2) Exit Devices
      a) 5 years
   3) Closers
      a) Surface: 30 years
      b) Concealed: 15 years
   4) Automatic Operators
      a) 2 years
   5) Overhead Stops
      a) 10 years

b. Electrical Warranty
    1) Locks
        a) 3 years
    2) Exit Devices
        a) 3 years
    3) Power Supplies
        a) 3 years

1.08 MAINTENANCE

A. Furnish complete set of special tools required for maintenance and adjustment of hardware, including changing of cylinders.

B. Turn over unused materials to Owner for maintenance purposes.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Approval of alternate manufacturers and/or products other than those listed as “Scheduled Manufacturer” or “Acceptable Manufacturers” in the individual article for the product category are only to be considered by official substitution request in accordance in section 01 25 00.

B. Approval of products from manufacturers indicated in “Acceptable Manufacturers” is contingent upon those products providing all functions and features and meeting all requirements of scheduled manufacturer’s product.

C. Where specified hardware is not adaptable to finished shape or size of members requiring hardware, furnish suitable types having same operation and quality as type specified, subject to Architect's approval.

2.02 MATERIALS

A. Fabrication

1. Provide door hardware manufactured to comply with published templates generally prepared for machine, wood, and sheet metal screws. provide screws according to manufacturer’s recognized installation standards for application intended.
2. Finish exposed screws to match hardware finish, or, if exposed in surfaces of other work, to match finish of this other work including prepared for paint surfaces to receive painted finish.
3. Provide concealed fasteners wherever possible for hardware units exposed when door is closed. Coordinate with “Metal Doors and Frames”, “Flush Wood Doors”, “Stile and Rail Wood Doors” to ensure proper reinforcements. Advise the Architect where visible fasteners, such as thru bolts, are required.

B. Modification and Preparation of Existing Doors: Where existing door hardware is indicated to be removed and reinstalled.

1. Provide necessary fillers, Dutchmen, reinforcements, and fasteners, compatible with existing materials, as required for mounting new opening hardware and to cover existing door and frame preparations.
2. Use materials which match materials of adjacent modified areas.
3. When modifying existing fire-rated openings, provide materials permitted by NFPA 80 as required to maintain fire-rating.

C. Provide screws, bolts, expansion shields, drop plates and other devices necessary for hardware installation.

1. Where fasteners are exposed to view: Finish to match adjacent door hardware material.

D. Cable and Connectors:

1. Where scheduled in the hardware sets, provide each item of electrified hardware and wire harnesses with number and gage of wires enough to accommodate electric function of specified hardware.
2. Provide Molex connectors that plug directly into connectors from harnesses, electric locking and power transfer devices.
3. Provide through-door wire harness for each electrified locking device installed in a door and wire harness for each electrified hinge, electrified continuous hinge, electrified pivot, and electric power transfer for connection to power supplies.

2.03 HINGES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Ives 5BB series

2. Acceptable Manufacturers and Products:
   a. Hager BB1191/1279 series
   b. Best FBB series

B. Requirements:

1. Provide hinges conforming to ANSI/BHMA A156.1.
2. Provide five knuckle, ball bearing hinges.
3. Provide hinge weights and sizes as specified in hardware sets.
4. Adjust hinge width for door, frame, and wall conditions to allow proper degree of opening.
5. Provide three hinges per door leaf for doors 90 inches (2286 mm) or less in height, and one additional hinge for each 30 inches (762 mm) of additional door height.
6. Where new hinges are specified for existing doors or existing frames, provide new hinges of identical size to hinge preparation present in existing door or existing frame.
7. Hinge Pins: Except as otherwise indicated, provide hinge pins as follows:
   a. Steel Hinges: Steel pins
   b. Non-Ferrous Hinges: Stainless steel pins
   c. Out-Swinging Exterior Doors: Non-removable pins
   d. Out-Swinging Interior Lockable Doors: Non-removable pins
   e. Interior Non-lockable Doors: Non-rising pins

8. Provide hinges with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware. Locate electric hinge at second hinge from bottom or nearest to electrified locking component. Provide mortar guard for each electrified hinge specified.

2.04 CONTINUOUS HINGES – ALUMINUM GEARED

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Select
   b. ABH

B. Requirements:

1. Provide aluminum geared continuous hinges conforming to ANSI/BHMA A156.26, Grade 1.
2. Provide aluminum geared continuous hinges, where specified in the hardware sets, fabricated from 6063-T6 aluminum.
3. Provide split nylon bearings at each hinge knuckle for quiet, smooth, self-lubricating operation.
4. Provide hinges capable of supporting door weights up to 450 pounds, and successfully tested for 1,500,000 cycles.
5. On fire-rated doors, provide aluminum geared continuous hinges classified for use on rated doors by testing agency acceptable to authority having jurisdiction.
6. Provide aluminum geared continuous hinges with electrified option scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware.
7. Provide hinges 1 inch (25 mm) shorter in length than nominal height of door, unless otherwise noted or door details require shorter length and with symmetrical hole pattern.

2.05 CONTINUOUS HINGES – STAINLESS STEEL

A. Manufacturers:

1. Scheduled Manufacturer and Product:
   a. Ives 700 series

2. Acceptable Manufacturers:
   a. ABH
   b. Select

B. Requirements:

1. Provide pin and barrel continuous hinges conforming to ANSI/BHMA A156.26., Grade 1.
2. Provide pin and barrel continuous hinges fabricated from 14-gauge, type 304 stainless steel.
3. Provide twin self-lubricated nylon bearings at each hinge knuckle, with 0.25-inch (6 mm) diameter stainless steel pin.
4. Provide hinges capable of supporting door weights up to 600 pounds, and successfully tested for 1,500,000 cycles.
5. On fire-rated doors, provide pin and barrel continuous hinges classified for use on rated doors by testing agency acceptable to authority having jurisdiction.
6. Provide pin and barrel continuous hinges with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware.

7. Provide hinges 1 inch (25 mm) shorter in length than nominal height of door, unless otherwise noted or door details require shorter length and with symmetrical hole pattern.

2.06 ELECTRIC POWER TRANSFER

A. Manufacturers:

1. Scheduled Manufacturer and Product:
   a. Von Duprin EPT-10

2. Acceptable Manufacturers and Products:
   a. ABH PT1000
   b. Security Door Controls PTM

B. Requirements:

1. Provide power transfer with electrified options as scheduled in the hardware sets. Provide with number and gage of wires enough to accommodate electric function of specified hardware.
2. Locate electric power transfer per manufacturer's template and UL requirements, unless interference with operation of door or other hardware items.

2.07 FLUSH BOLTS

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Burns
   b. DCI

B. Requirements:

1. Provide automatic, constant latching, and manual flush bolts with forged bronze or stainless-steel face plates, extruded brass levers, and with wrought brass guides and strikes. Provide 12 inch (305 mm) steel or brass rods at doors up to 90 inches (2286 mm) in height. For doors over 90 inches (2286 mm) in height increase top rods by 6 inches (152 mm) for each additional 6 inches (152 mm) of door height. Provide dust-proof strikes at each bottom flush bolt.

2.08 COORDINATORS

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Trimco
   b. DCI

B. Requirements:

1. Where pairs of doors are equipped with automatic flush bolts, an astragal, or other hardware that requires synchronized closing of the doors, provide bar-type coordinating device, surface applied to underside of stop at frame head.
2. Provide filler bar of correct length for unit to span entire width of opening, and appropriate brackets for parallel arm door closers, surface vertical rod exit device strikes, or other stop mounted hardware. Factory-prepared coordinators for vertical rod devices as specified.

2.09 MORTISE LOCKS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Schlage L9000 series

2. Acceptable Manufacturers and Products:
   a. Sargent 8200 series
   b. Best 45H series

B. Requirements:

1. Provide mortise locks conforming to ANSI/BHMA A156.13 Series 1000, Grade 1, and UL Listed for 3-hour fire doors.
2. Indicators: Where specified, provide indicator window measuring a minimum 2-inch x 1/2 inch with 180-degree visibility. Provide messages color-coded with full text and/or symbols, as scheduled, for easy visibility.
3. Provide locks manufactured from heavy gauge steel, containing components of steel with a zinc dichromate plating for corrosion resistance.
4. Provide lock case that is multi-function and field reversible for handing without opening case. Cylinders: Refer to “KEYING” article, herein.
5. Provide locks with standard 2-3/4 inches (70 mm) backset with full 3/4 inch (19 mm) throw stainless steel mechanical anti-friction latchbolt. Provide deadbolt with full 1-inch (25 mm) throw, constructed of stainless steel.
6. Provide standard ASA strikes unless extended lip strikes are necessary to protect trim.
7. Provide electrified options as scheduled in the hardware sets. Where scheduled, provide switches and sensors integrated into the locks and latches. Provide motor based electrified and motor-based latch retraction locksets that comply with the following requirements:
   a. Universal input voltage – single chassis accepts 12 or 24VDC to allow for changes in the field without changing lock chassis.
   b. Fail Safe/Fail Secure – changing mode between electrically locked (fail safe) and electrically unlocked (fail secure) is field selectable without opening the lock case
   c. Low maximum current draw – maximum 0.4 amps (Lever control) and maximum 2.0 amps (Latch retraction) to allow for multiple locks on a single power supply.
   d. Low holding current (Lever control or latch retraction) – maximum 0.01 amps to produce minimal heat, eliminate “hot levers” in electrically locked applications and motorized latch retraction applications, and to provide reliable operation in wood doors that provide minimal ventilation and air flow.
   e. Connections – provide quick-connect Molex system standard.

8. Lever Trim: Solid brass, bronze, or stainless steel, cast or forged in design specified, with wrought roses and external lever spring cages. Provide thru-bolted levers with 2-piece spindles.
   a. Lever Design: 03A.

2.10 EXIT DEVICES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Von Duprin 78/75A series

2. Acceptable Manufacturers and Products:
   a. Precision 2100 Series
   b. Falcon 25/24 Series

B. Requirements

1. Provide exit devices tested to ANSI/BHMA A156.3 Grade 1 and UL listed for Panic Exit or Fire Exit Hardware with manufacturer's approved strikes.
2. Cylinders: Refer to "KEYING" article, herein.
3. Provide exit devices with deadlatching feature for security and for future addition of alarm kits and/or other electrified requirements. No plastic inserts are allowed in touchpads.
4. Provide exit devices cut to door width and height. Install exit devices at height recommended by exit device manufacturer, allowable by governing building codes, and approved by Architect. Touchpad must extend a minimum of one half of door width.
5. Mount mechanism case flush on face of doors or provide spacers to fill gaps behind devices. Where glass trim or molding projects off face of door, provide glass bead kits.
6. Removable Mullions: 2 inches (51 mm) x 3 inches (76 mm) steel tube. Where scheduled as keyed removable mullion, provide type that can be removed by use of a keyed cylinder, which is self-locking when re-installed.
7. Provide factory drilled weep holes for exit devices used in full exterior application, highly corrosive areas, and where noted in hardware sets.
8. Provide electrified options as scheduled.
9. Top latch mounting: double- or single-tab mount for steel doors, face mount for aluminum doors eliminating requirement of tabs, and double tab mount for wood doors.
10. Provide exit devices with optional trim designs to match other lever and pull designs used on the project.

2.11 EXIT DEVICES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Von Duprin 98 series

2. Acceptable Manufacturers and Products:
   a. No Substitute

B. Requirements:

1. Provide exit devices tested to ANSI/BHMA A156.3 Grade 1 and UL listed for Panic Exit or Fire Exit Hardware.
2. Cylinders: Refer to "KEYING" article, herein.
3. Provide smooth touchpad type exit devices, fabricated of brass, bronze, stainless steel, or aluminum, plated to standard architectural finishes to match balance of door hardware.
4. Touchpad must extend a minimum of one half of door width. No plastic inserts are allowed in touchpads.
5. Provide exit devices with deadlatching feature for security and for future addition of alarm kits and/or other electrified requirements.
6. Provide exit devices with weather resistant components that can withstand harsh conditions of various climates and corrosive cleaners used in outdoor pool environments.
7. Provide flush end caps for exit devices.
8. Provide exit devices with manufacturer's approved strikes.

9. Provide exit devices cut to door width and height. Install exit devices at height recommended by exit device manufacturer, allowable by governing building codes, and approved by Architect.
10. Mount mechanism case flush on face of doors or provide spacers to fill gaps behind devices. Where glass trim or molding projects off face of door, provide glass bead kits.
11. Provide cylinder dogging as specified at non fire-rated openings.
12. Provide electrified options as scheduled.
13. Provide exit devices with optional trim designs to match other lever and pull designs used on the project.
14. Provide exit devices with PA filler.

2.12 ELECTRONIC ACCESS CONTROL WIRELESS MORTISE LOCK

A. Manufacturer and Products:

1. Scheduled Manufacturer and Product:
   a. Salto XS4 Original+

2. Acceptable Manufacturers and Products:
   a. No Substitute

B. Requirements: Provide wireless electronic locksets that comply with the following requirements.

1. Provide mortise locks conforming to ANSI/BHMA A156.13 Series 1000, Grade 1 Operational, Grade 1 Security at locks with interchangeable cores, and manufactured from heavy gauge steel, containing components of steel with a zinc dichromate plating for corrosion resistance. Cylinders: Refer to “KEYING” article, herein.
2. Provide heavy-duty, handed, field-reversible mortise locks.
3. Backset: 2-3/4-inch (70 mm).
4. Latchbolt: 3/4-inch (19 mm) throw stainless steel latch bolt with anti-friction tongue.
5. Deadbolt: 1” throw stainless steel deadbolt to support Privacy and Apartment functions.
6. Chassis: Provide standard A115.1 preparation for mortise locks for 1-3/4-inch (44 mm) doors.
7. Applicable Standards:
   a. Listed, UL 294 - Standard of Safety for Access Control System Units.
   b. Compliant with ANSI Standard A156.25 and A156.13 Series 1000, Grade 1 strength and operational requirements.
   c. Compliant with ANSI/BHMA A156.25 Grade 1 Operation and Security Requirement.
   d. Certified to UL10C, FCC Part15, IC RSS-210, ADA, RoHS, ICC ANSI A117.1
   e. Compliant with FBC TAS 201, TAS 202, TAS 203 for door assemblies.
   f. Certified to FBC 3905, 12400 and 14482
8. Lockset Functions: Provide locks in functions as specified in hardware groups.
9. Emergency Override: Provide mechanical key override; cylinders: Refer to “KEYING” article, herein.
10. Levers:
    a. Provide levers operating independently of each other.
    b. Lever Design: Salto ‘U’.
11. Power Supply:
    a. Provide lockset powered by four AA batteries

C. Provide Design XS ANSI wall readers at doors with electrified panic hardware.

1. Provide Salto smart access controllers with wall readers for complete installation.

2.13 POWER SUPPLIES

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. Schlage/Von Duprin PS900 Series

2. Acceptable Manufacturers and Products:
   a. Dynalock 5000 series
   b. Security Door Controls 600 series

B. Requirements:

1. Provide power supplies approved by manufacturer of supplied electrified hardware.
2. Provide appropriate quantity of power supplies necessary for proper operation of electrified locking components as recommended by manufacturer of electrified locking components with consideration for each electrified component using power supply, location of power supply, and approved wiring diagrams. Locate power supplies as directed by Architect.
3. Provide regulated and filtered 24 VDC power supply, and UL class 2 listed.
4. Provide power supplies with the following features:
   a. 12/24 VDC Output, field selectable.
   b. Class 2 Rated power limited output.
   c. Universal 120-240 VAC input.
   d. Low voltage DC, regulated and filtered.
   e. Polarized connector for distribution boards.
   f. Fused primary input.
   g. AC input and DC output monitoring circuit w/LED indicators.
   h. Cover mounted AC Input indication.
   i. Tested and certified to meet UL294.
   j. NEMA 1 enclosure.
   k. Hinged cover w/lock down screws.
   l. High voltage protective cover.

2.14 CYLINDERS

A. Manufacturers:

1. Scheduled Manufacturer and Product:
   a. Corbin-Russwin
   b. Acceptable Manufacturers and Products:
   c. No Substitute

B. Requirements:

1. Provide cylinders for locking devices, whether called out in hardware sets or not.
2. Provide large-format interchangeable cylinders/cores (LFIC) to match Owner’s existing Corbin-Russwin key system, with ‘L4’ keyway, compliant with ANSI/BHMA A156.5; latest revision; cylinder face finished to match lockset, manufacturer’s series as indicated. Refer to “KEYING” article, herein.

2.15 KEYING

A. Scheduled System:

1. Existing factory registered system:
   a. Provide cylinders/cores keyed into Owner's existing factory registered keying system. Comply with guidelines in ANSI/BHMA A156.28, incorporating decisions made at keying conference.

B. Requirements:

1. Construction Keying:
   a. Replaceable Construction Cores.
      1) Provide temporary construction cores replaceable by permanent cores, furnished in accordance with the following requirements.
         a) 3 construction control keys
         b) 12 construction change (day) keys.
      2) Owner or Owner's Representative will replace temporary construction cores with permanent cores.

2. Permanent Keying:
   a. Provide permanent cylinders/cores keyed by the manufacturer according to the following key system.
      1) Master Keying system as directed by the Owner.
   b. Forward bitting list and keys separately from cylinders, by means as directed by Owner. Failure to comply with forwarding requirements will be cause for replacement of cylinders/cores involved at no additional cost to Owner.
   c. Provide keys with the following features:
      1) Material: Nickel silver; minimum thickness of .107-inch (2.3mm)
      2) Patent Protection: Keys and blanks protected by one or more utility patent(s).
   d. Identification:
      1) Mark permanent cylinders/cores and keys with applicable blind code for identification. Do not provide blind code marks with actual key cuts.
      2) Identification stamping provisions must be approved by the Architect and Owner.
      3) Stamp cylinders/cores and keys with Owner's unique key system facility code as established by the manufacturer; key symbol and embossed or stamped with "DO NOT DUPLICATE".
      4) Failure to comply with stamping requirements will be cause for replacement of keys involved at no additional cost to Owner.
      5) Forward permanent cylinders/cores to Owner, separately from keys, by means as directed by Owner.
   e. Quantity: Furnish in the following quantities.
      1) Change (Day) Keys: 3 per cylinder/core.
      2) Permanent Control Keys: 3.
      3) Master Keys: 6.

2.16 KEY CONTROL SYSTEM

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Telkee

2. Acceptable Manufacturers:

a. HPC
b. Lund

B. Requirements:

1. Provide key control system, including envelopes, labels, tags with self-locking key clips, receipt forms, 3-way visible card index, temporary markers, permanent markers, and standard metal cabinet, all as recommended by system manufacturer, with capacity for 150% of number of locks required for Project.
   a. Provide complete cross index system set up by hardware supplier, and place keys on markers and hooks in cabinet as determined by final key schedule.
   b. Provide hinged-panel type cabinet for wall mounting.

2.17 DOOR CLOSERS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. LCN 4040XP series

2. Acceptable Manufacturers and Products:
   a. Corbin-Russwin DC8000 series
   b. Sargent 281 series

B. Requirements:

1. Provide door closers conforming to ANSI/BHMA A156.4 Grade 1 requirements by BHMA certified independent testing laboratory. ISO 9000 certify closers. Stamp units with date of manufacture code.
2. Provide door closers with fully hydraulic, full rack and pinion action with high strength cast iron cylinder, and full complement bearings at shaft.
3. Cylinder Body: 1-1/2-inch (38 mm) diameter piston with 5/8-inch (16 mm) diameter double heat-treated pinion journal. QR code with a direct link to maintenance instructions.
4. Hydraulic Fluid: Fireproof, passing requirements of UL10C, and requiring no seasonal closer adjustment for temperatures ranging from 120 degrees F to -30 degrees F.
5. Spring Power: Continuously adjustable over full range of closer sizes, and providing reduced opening force as required by accessibility codes and standards. Provide snap-on cover clip, with plastic covers, that secures cover to spring tube.
6. Hydraulic Regulation: By tamper-proof, non-critical valves, with separate adjustment for latch speed, general speed, and backcheck. Provide graphically labelled instructions on the closer body adjacent to each adjustment valve. Provide positive stop on reg valve that prevents reg screw from being backed out.
7. Provide closers with solid forged steel main arms and factory assembled heavy-duty forged forearms for parallel arm closers.
8. Pressure Relief Valve (PRV) Technology: Not permitted.
9. Finish for Closer Cylinders, Arms, Adapter Plates, and Metal Covers: Powder coating finish which has been certified to exceed 100 hours salt spray testing as described in ANSI Standard A156.4 and ASTM B117, and has special rust inhibitor (SRI).
10. Provide special templates, drop plates, mounting brackets, or adapters for arms as required for details, overhead stops, and other door hardware items interfering with closer mounting.

11. Provide closers capable of being upgraded by adding modular mechanical or electronic components in the field.

2.18 CONCEALED DOOR CLOSERS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. LCN 2030 series

B. Requirements:

1. Provide concealed door closers at doors conforming to ANSI/BHMA A156.4 Grade 1 requirements by BHMA certified independent testing laboratory.
2. Provide heavy duty, single-acting closers with single lever arm and roller assembly.
3. Provide closers capable of being mounted in a minimum 1-3/4-inch header.
4. Provide concealed door closers with fully hydraulic, full rack and pinion action with high strength cast iron cylinder, and full complement bearings at shaft.
5. Cylinder Body: 1-1/8-inch (29 mm) piston diameter, with 5/8-inch (16 mm) diameter heat-treated pinion journal.
6. Provide all-weather hydraulic fluid, fireproof, passing requirements of UL10C.
7. Pressure Relief Valve (PRV) Technology: Not permitted.
8. Provide special template, drop plates, mounting brackets, or adapters for arms as required for details, overhead stops, and other door hardware items interfering with closer mounting.

2.19 ELECTRO-HYDRAULIC AUTOMATIC OPERATORS

A. Manufacturers and Products:

1. Scheduled Manufacturer and Product:
   a. LCN 4600 series

2. Acceptable Manufacturers and Products:
   a. Precision D4990 series
   b. Besam Power Swing

B. Requirements:

1. Provide low energy automatic operator units with hydraulic closer complying with ANSI/BHMA A156.19.
2. Hydraulic Fluid: Fireproof, passing requirements of UL10C, and requiring no seasonal closer adjustment for temperatures ranging from 120 degrees F to -30 degrees F.
3. Provide units with conventional door closer opening and closing forces unless power operator motor is activated. Provide door closer assembly with adjustable spring size, back-check, and opening and closing speed adjustment valves to control door
4. Provide units with on/off switch for manual operation, motor start up delay, vestibule interface delay, electric lock delay, and door hold open delay.
5. Provide drop plates, brackets, and adapters for arms as required for details.
6. Provide hard-wired actuator switches and receivers for operation as specified.
7. Provide weather-resistant actuators at exterior applications.

8. Provide key switches with LED's, recommended and approved by manufacturer of automatic operator as required for function described in operation description of hardware group below. Cylinders: Refer to "KEYING" article, herein.
9. Provide complete assemblies of controls, switches, power supplies, relays, and parts/material recommended and approved by manufacturer of automatic operator for each individual leaf. Actuators control both doors simultaneously at pairs. Sequence operation of exterior and vestibule doors with automatic operators to allow ingress or egress through both sets of openings as directed by Architect. Locate actuators, key switches, and other controls as directed by Architect.
10. Provide units with vestibule inputs that allow sequencing operation of two units, and SPDT relay for interfacing with latching or locking devices.

2.20 DOOR TRIM

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives.

2. Acceptable Manufacturers:
   a. Trimco
   b. Burns

B. Requirements:

1. Provide push plates, push bars, pull plates, pulls, and hands-free reversible door pulls with diameter and length as scheduled.

2.21 PROTECTION PLATES

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Burns
   b. Trimco

B. Requirements:

1. Provide protection plates with a minimum of 0.050 inch (1 mm) thick, beveled four edges as scheduled. Furnish with sheet metal or wood screws, finished to match plates.
2. Provide protection plates with countersunk screw holes.
3. Sizes plates 2 inches (51 mm) less width of door on single doors, pairs of doors with a mullion, and doors with edge guards. Size plates 1 inch (25 mm) less width of door on pairs without a mullion or edge guards.
4. At fire rated doors, provide protection plates over 16 inches high with UL label.

2.22 OVERHEAD STOPS AND OVERHEAD STOP/HOLDERS

A. Manufacturers:

1. Scheduled Manufacturers:
   a. Glynn-Johnson

2. Acceptable Manufacturers:
   a. Rixson
   b. ABH

B. Requirements:

1. Provide overhead stop at any door where conditions do not allow for a wall stop or floor stop presents tripping hazard.
2. Provide friction type at doors without closer and positive type at doors with closer.

2.23 DOOR STOPS AND HOLDERS

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Trimco
   b. Burns

B. Provide door stops at each door leaf:

1. Provide wall stops wherever possible. Provide concave type where lockset has a push button or thumbturn.
2. Where a wall stop cannot be used, provide an overhead stop.
3. Where wall or overhead stop cannot be used, provide floor stop.
4. Provide roller bumper where doors open into each other and overhead stop cannot be used.

2.24 THRESHOLDS, SEALS, DOOR SWEEPS, AUTOMATIC DOOR BOTTOMS, AND GASKETING

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Zero International

2. Acceptable Manufacturers:
   a. National Guard
   b. Reese

B. Requirements:

1. Provide thresholds, weather-stripping, and gasketing systems as specified and per architectural details. Match finish of other items.
2. Provide door sweeps, seals, astragals, and auto door bottoms only of type where resilient or flexible seal strip is easily replaceable and readily available.
3. Size thresholds 1/2 inch (13 mm) high by 5 inches (127 mm) wide by door width unless otherwise specified in the hardware sets or detailed in the drawings.

4. At doors indicated to receive thermally-broken door frames, provide thermally-broken type thresholds.

2.25 ROLLER LATCHES

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Burns
   b. Trimco

B. Requirements:

1. Provide roller latches with 4-7/8 inches (124 mm) strike at single doors to fit ANSI frame prep. If dummy levers are used in conjunction with roller latch mount roller latch at a height as to not interfere with proper mounting and height of dummy lever.
2. Provide roller latches with 2-1/4 inches (57 mm) full lip strike at pair doors. Mount roller in top rail of each leaf per manufacturer's template.

2.26 DOOR POSITION SWITCHES

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Schlage

2. Acceptable Manufacturers:
   a. GE-Interlogix
   b. Sentrol

B. Requirements:

1. Provide recessed or surface mounted type door position switches as specified.
2. Coordinate door and frame preparations with door and frame suppliers. If switches are being used with magnetic locking device, provide minimum of 4 inches (102 mm) between switch and magnetic locking device.

2.27 COAT HOOKS

A. Manufacturers:

1. Scheduled Manufacturer:
   a. Ives

2. Acceptable Manufacturers:
   a. Burns
   b. Trimco

B. Provide coat hooks as specified.

2.28 FINISHES

A. Finish: Standard: Designations used in the Hardware Sets and elsewhere indicate hardware finishes complying with ANSI/BHMA A156.18, including coordination with traditional U.S. finishes indicated by certain manufacturers for their products.

B. Provide quality of finish, including thickness of plating or coating (if any), composition, hardness, and other qualities complying with manufacturer's standards, but in no case less than specified by referenced standards for the applicable units of hardware.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Prior to installation of hardware, examine doors and frames, with Installer present, for compliance with requirements for installation tolerances, labeled fire-rated door assembly construction, wall and floor construction, and other conditions affecting performance. Verify doors, frames, and walls have been properly reinforced for hardware installation.

B. Field verify existing doors and frames receiving new hardware and existing conditions receiving new openings. Verify that new hardware is compatible with existing door and frame preparation and existing conditions.

C. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.

D. Submit a list of deficiencies in writing and proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

A. Where on-site modification of doors and frames is required:

1. Carefully remove existing door hardware and components being reused. Clean, protect, tag, and store in accordance with storage and handling requirements specified herein.
2. Field modify and prepare existing doors and frames for new hardware being installed.
3. When modifications are exposed to view, use concealed fasteners, when possible.
4. Prepare hardware locations and reinstall in accordance with installation requirements for new door hardware and with:
    a. Steel Doors and Frames: For surface applied door hardware, drill and tap doors and frames according to ANSI/SDI A250.6.
    b. Wood Doors: DHI WDHS.5 "Recommended Hardware Reinforcement Locations for Mineral Core Wood Flush Doors."
    c. Doors in rated assemblies: Comply with NFPA 80 for restrictions regarding on-site door hardware preparation.

3.03 INSTALLATION

A. Mount door hardware units at heights to comply with the following, unless otherwise indicated or required to comply with governing regulations.

1. Standard Steel Doors and Frames: ANSI/SDI A250.8.
2. Custom Steel Doors and Frames: HMMA 831.
3. Interior Architectural Wood Flush Doors: ANSI/WDMA I.S. 1A
4. Installation Guide for Doors and Hardware: DHI TDH-007-20

B. Install door hardware in accordance with NFPA 80, NFPA 101 and provide post-install inspection, testing as specified in section 1.03.E unless otherwise required to comply with governing regulations.

C. Install each hardware item in compliance with manufacturer's instructions and recommendations, using only fasteners provided by manufacturer.

D. Do not install surface mounted items until finishes have been completed on substrate. Protect all installed hardware during painting.

E. Set units level, plumb and true to line and location. Adjust and reinforce attachment substrate as necessary for proper installation and operation.

F. Drill and countersink units that are not factory prepared for anchorage fasteners. Space fasteners and anchors according to industry standards.

G. Install operating parts so they move freely and smoothly without binding, sticking, or excessive clearance.

H. Hinges: Install types and in quantities indicated in door hardware schedule but not fewer than quantity recommended by manufacturer for application indicated.

I. Lock Cylinders:

1. Install construction cores to secure building and areas during construction period.
2. Replace construction cores with permanent cores as indicated in keying section.
3. Furnish permanent cores to Owner for installation.

J. Wiring: Coordinate with Division 26, ELECTRICAL and Division 28 ELECTRONIC SAFETY AND SECURITY sections for:

1. Conduit, junction boxes and wire pulls.
2. Connections to and from power supplies to electrified hardware.
3. Connections to fire/smoke alarm system and smoke evacuation system.
4. Connection of wire to door position switches and wire runs to central room or area, as directed by Architect.
5. Connections to panel interface modules, controllers, and gateways.
6. Testing and labeling wires with Architect's opening number.

K. Key Control System: Tag keys and place them on markers and hooks in key control system cabinet, as determined by final keying schedule.

L. Continuous Hinges: Re-locate the door and frame fire rating labels where they will remain visible so that the hinge does not cover the label once installed.

M. Door Closers & Auto Operators: Mount closers/operators on room side of corridor doors, inside of exterior doors, and stair side of stairway doors from corridors. Mount closers/operators so they are not visible in corridors, lobbies and other public spaces unless approved by Architect.

N. Overhead Stops/Holders: Mount overhead stops/holders on room side of corridor doors, inside of exterior doors, and stair side of stairway doors.

O. Power Supplies: Locate power supplies as indicated or, if not indicated, above accessible ceilings or in equipment room, or alternate location as directed by Architect.

P. Thresholds: Set thresholds in full bed of sealant complying with requirements specified in Division 07 Section "Joint Sealants."

Q. Stops: Do not mount floor stops where they may impede traffic or present tripping hazard.

R. Perimeter Gasketing: Apply to head and jamb, forming seal between door and frame.

S. Meeting Stile Gasketing: Fasten to meeting stiles, forming seal when doors are closed.

T. Door Bottoms and Sweeps: Apply to bottom of door, forming seal with threshold when door is closed.

3.04 ADJUSTING

A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.

1. Door Closers: Adjust sweep period to comply with accessibility requirements and requirements of authorities having jurisdiction.

B. Occupancy Adjustment: Approximately three to six months after date of Substantial Completion, examine and readjust each item of door hardware, including adjusting operating forces, as necessary to ensure function of doors and door hardware.

3.05 CLEANING AND PROTECTION

A. Clean adjacent surfaces soiled by door hardware installation.

B. Clean operating items per manufacturer’s instructions to restore proper function and finish.

C. Provide final protection and maintain conditions that ensure door hardware is without damage or deterioration at time of Substantial Completion.

3.06 DOOR HARDWARE SCHEDULE

A. The intent of the hardware specification is to specify the hardware for interior and exterior doors, and to establish a type, continuity, and standard of quality. However, it is the door hardware supplier's responsibility to thoroughly review existing conditions, schedules, specifications, drawings, and other Contract Documents to verify the suitability of the hardware specified.

B. Discrepancies, conflicting hardware, and missing items are to be brought to the attention of the architect with corrections made prior to the bidding process. Omitted items not included in a hardware set should be scheduled with the appropriate additional hardware required for proper application.

C. Hardware items are referenced in the following hardware schedule. Refer to the above specifications for special features, options, cylinders/keying, and other requirements.

D. Hardware Sets:

HARDWARE GROUP NO. 01

Provide each SGL door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
1		EXISTING DOOR	EXISTING HARDWARE TO REMAIN.		

HARDWARE GROUP NO. 02

Provide each SL door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
1	EA	MORTISE CYLINDER	AS REQUIRED x 'L4' KWY	626	C-R
		NOTE	BALANCE OF HARDWARE BY DOOR SUPPLIER		

HARDWARE GROUP NO. 03

Provide each RU door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
		NOTE	HARDWARE BY DOOR SUPPLIER		

HARDWARE GROUP NO. 04

Provide each PR door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
2	EA	CONT. HINGE	224XY	628	IVE
2	EA	ROLLER LATCH	RL32	626	IVE
2	EA	HALF DUMMY TRIM	L0170 03A	630	SCH
2	EA	WALL STOP	WS406/407CVX	630	IVE
1	EA	NOTE	SEALS BY FRAME SUPPLIER.		

HARDWARE GROUP NO. 05

Provide each SGL door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
3	EA	HINGE	5BB1 4.5 X 4.5	630	IVE
1	EA	PASSAGE SET	L9010 03A	630	SCH
1	EA	WALL STOP	WS406/407CVX	630	IVE
1	EA	NOTE	SEALS BY FRAME SUPPLIER.		

HARDWARE GROUP NO. 06

Provide each SGL door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
1	EA	CONT. HINGE	041XY	628	IVE
1	EA	CLASSROOM LOCK	L9070L 03A	630	SCH
1	EA	MORTISE CYLINDER	AS REQUIRED x 'L4' KWY	626	C-R
1	EA	WALL STOP	WS406/407CVX	630	IVE
1	EA	NOTE	SEALS BY FRAME SUPPLIER.		

HARDWARE GROUP NO. 07

Provide each SGL door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
3	EA	HINGE	5BB1 4.5 X 4.5	630	IVE
1	EA	STOREROOM LOCK	L9080L 03A	630	SCH
1	EA	MORTISE CYLINDER	AS REQUIRED x 'L4' KWY	626	C-R
1	EA	WALL STOP	WS406/407CVX	630	IVE
1	EA	NOTE	SEALS BY FRAME SUPPLIER.		

HARDWARE GROUP NO. 08

Provide each SGL door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
1	EA	CONT. HINGE	224XY	628	IVE
1	EA	PUSH/PULL BAR	9190EZHD-10"-NS	US32D-316	IVE
1	EA	SURF. AUTO OPERATOR	4642 WMS 120 VAC	689	LCN
2	EA	ACTUATOR, TOUCHLESS	8310-813		LCN
1	EA	WALL STOP	WS406/407CVX	630	IVE
1	EA	NOTE	SEALS BY FRAME SUPPLIER.		

OPERATIONAL DESCRIPTION: DOOR NORMALLY CLOSED AND UNLOCKED. PUSH/PULL OPERATION, EITHER MANUALLY, OR AUTOMATICALLY USING WALL-MOUNTED WAVE ACTUATOR FROM INSIDE OR OUTSIDE.

HARDWARE GROUP NO. 09

Provide each SGL door(s) with the following:

QTY		DESCRIPTION	CATALOG NUMBER	FINISH	MFR
3	EA	HINGE	5BB1 4.5 X 4.5 NRP	630	IVE
1	EA	STOREROOM LOCK	L9080L 03A	630	SCH

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 088000 - GLAZING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes glazing for the following products and applications, including those specified in other Sections where glazing requirements are specified by reference to this Section:

1. Exterior storefront framing.
2. Curtainwall.
3. Glazed entrances.
4. Interior storefront framing.

B. Related Sections:

1. 081416, Flush Wood Doors.
2. 084113, Aluminum FRP Flush Doors and Frames.
3. 084113, Aluminum-Framed Entrances and Storefronts.

1.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design glass, including comprehensive engineering analysis according to ASTM E 1300 by a qualified professional engineer, using the following design criteria:

1. Design Wind Pressures: Minimum are to be those associated with a 121 mph Basic Wind Speed, per requirements in Chapters 16 and 17 of the NC Building Code.
2. Vertical Glazing: For glass surfaces sloped 15 degrees or less from vertical, design glass to resist design wind pressure based on glass type factors for short-duration load.

1.3 ACTION SUBMITTALS

A. Product Data: For each glass product and glazing material indicated.

B. Glass Samples: For each type of glass product other than clear monolithic vision glass; 12 inches (300 mm) square.

C. Glazing Schedule: List glass types and thicknesses for each size opening and location. Use same designations indicated on Drawings.

D. Delegated-Design Submittal: For glass indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 QUALITY ASSURANCE

A. Glazing Publications: Comply with published recommendations of glass product manufacturers and organizations below, unless more stringent requirements are indicated. Refer to these publications for glazing terms not otherwise defined in this Section or in referenced standards.

1. GANA Publications: GANA's "Glazing Manual."
2. IGMA Publication for Insulating Glass: SIGMA TM-3000, "North American Glazing Guidelines for Sealed Insulating Glass Units for Commercial and Residential Use."

B. Safety Glazing Labeling: Where safety glazing labeling is indicated, permanently mark glazing with certification label of the SGCC or another certification agency acceptable to authorities having

jurisdiction. Label shall indicate manufacturer's name, type of glass, thickness, and safety glazing standard with which glass complies.

C. Fire-Protection-Rated Glazing Labeling: Permanently mark fire-protection-rated glazing with certification label of a testing agency acceptable to authorities having jurisdiction. Label shall indicate manufacturer's name, test standard, whether glazing is for use in fire doors or other openings, whether or not glazing passes hose-stream test, whether or not glazing has a temperature rise rating of 450 deg F (250 deg C), and the fire-resistance rating in minutes.

D. Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of IGCC.

1.5 WARRANTY

A. Manufacturer's Special Warranty for Coated-Glass Products: Manufacturer's standard form in which coated-glass manufacturer agrees to replace coated-glass units that deteriorate within specified warranty period. Deterioration of coated glass is defined as defects developed from normal use that are not attributed to glass breakage or to maintaining and cleaning coated glass contrary to manufacturer's written instructions. Defects include peeling, cracking, and other indications of deterioration in coating.

1. Warranty Period: 10 years from date of acceptance by Owner.

B. Manufacturer's Special Warranty on Insulating Glass: Manufacturer's standard form in which insulating-glass manufacturer agrees to replace insulating-glass units that deteriorate within specified warranty period. Deterioration of insulating glass is defined as failure of hermetic seal under normal use that is not attributed to glass breakage or to maintaining and cleaning insulating glass contrary to manufacturer's written instructions. Evidence of failure is the obstruction of vision by dust, moisture, or film on interior surfaces of glass.

1. Warranty Period: 10 years from date of acceptance by Owner.

PART 2 - PRODUCTS

2.1 GLASS PRODUCTS, GENERAL

A. Thickness: Where glass thickness is indicated, it is a minimum. Provide glass lites in thicknesses as needed to comply with requirements indicated.

B. Strength: Provide annealed float glass, Kind FT heat-treated float glass in all locations.

C. Thermal and Optical Performance Properties: Provide glass with performance properties specified, as indicated in manufacturer's published test data, based on procedures indicated below:

1. U-Factors: Center-of-glazing values, according to NFRC 100 and based on LBL's WINDOW 5.2 computer program, expressed as Btu/sq. ft. x h x deg F (W/sq. m x K).
2. Solar Heat-Gain Coefficient and Visible Transmittance: Center-of-glazing values, according to NFRC 200 and based on LBL's WINDOW 5.2 computer program.
3. Visible Reflectance: Center-of-glazing values, according to NFRC 300.
4. Viracon Product, used below, is “Opti-White”.

D. Glass and Fabricated Glazing Products by the following manufacturers will be acceptable:

1. Viracon (Basis of Design)
2. Pilkington
3. Cardinal
4. Vitro

2.2 MATERIALS

A. Float Glass: ASTM C 1036, Type I, Quality-Q3, Class I, for interior single-pane applications.

B. Float Glass: ASTM C 1036, Type I, Quality-Q5, Class I (ultra-clear, low-iron) unless otherwise indicated.

C. Patterned Glass: ASTM C 1036, Type I, Quality-Q5, Form 3, Finish I (ultra-clear, low-iron) unless otherwise indicated.

D. Glazing Gaskets: Dense compression, grey.

E. All float glass is ¼-inch thickness, fully-tempered.

2.3 MONOLITHIC-GLASS TYPES

A. Glass Type GL-1: Clear, tempered, ¼-inch.

2.4 INSULATING-GLASS TYPES

A. Glass Type GL-2: Clear, fully tempered, low-e, insulating vision glass.

1. Outdoor Lite: GL-1, with VE85 on surface #2.
2. Indoor Lite: GL-1.

2.5 GLAZING GASKETS

A. Dense Compression Gaskets: Molded or extruded gaskets of profile and hardness required to maintain watertight seal, made from the following:

1. Neoprene complying with ASTM C 864. Color: Gray.

2.6 MISCELLANEOUS GLAZING MATERIALS

A. Cleaners: Types recommended by gasket manufacturer.

B. Setting Blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.

C. Spacers: Elastomeric blocks or continuous extrusions of hardness required by glass manufacturer to maintain glass lites in place for installation indicated.

D. Edge Blocks: Elastomeric material of hardness needed to limit glass lateral movement (side walk).

PART 3 - EXECUTION

3.1 GLAZING, GENERAL

A. Comply with combined written instructions of manufacturers of glass, sealants, gaskets, and other glazing materials, unless more stringent requirements are indicated, including those in referenced glazing publications.

B. Adjust glazing channel dimensions as required by Project conditions during installation to provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances.

C. Protect glass edges from damage during handling and installation. Remove damaged glass from Project site and legally dispose of off Project site. Damaged glass is glass with edge damage or other imperfections that, when installed, could weaken glass and impair performance and appearance.

D. Install setting blocks in sill rabbets, sized and located to comply with referenced glazing publications, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.

E. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.

F. Provide spacers for glass lites where length plus width is larger than 50 inches (1270 mm).

G. Provide edge blocking where indicated or needed to prevent glass lites from moving sideways in glazing channel, as recommended in writing by glass manufacturer and according to requirements in referenced glazing publications.

3.2 GASKET GLAZING (DRY)

A. Cut compression gaskets to lengths recommended by gasket manufacturer to fit openings exactly, with allowance for stretch during installation.

B. Installation with Drive-in Wedge Gaskets: Center glass lites in openings on setting blocks and press firmly against soft compression gasket by inserting dense compression gaskets formed and installed to lock in place against faces of removable stops. Start gasket applications at corners and work toward centers of openings. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer.

C. Installation with Pressure-Glazing Stops: Center glass lites in openings on setting blocks and press firmly against soft compression gasket. Install dense compression gaskets and pressure-glazing stops, applying pressure uniformly to compression gaskets. Compress gaskets to produce a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer.

D. Install gaskets so they protrude past face of glazing stops.

3.3 CLEANING AND PROTECTION

A. Protect exterior glass from damage immediately after installation by attaching crossed streamers to framing held away from glass. Do not apply markers to glass surface. Remove nonpermanent labels and clean surfaces.

B. Protect glass from contact with contaminating substances resulting from construction operations. If, despite such protection, contaminating substances do come into contact with glass, remove substances immediately as recommended in writing by glass manufacturer.

C. Examine glass surfaces adjacent to or below exterior concrete and other masonry surfaces at frequent intervals during construction, but not less than once a month, for buildup of dirt, scum, alkaline deposits, or stains; remove as recommended in writing by glass manufacturer.

D. Remove and replace glass that is broken, chipped, cracked, or abraded or that is damaged from natural causes, accidents, and vandalism, during construction period.

END OF SECTION 088000

SECTION 088400 - EXHIBIT TANK GLAZING

PART 1 – GENERAL

1.1 DESCRIPTION

A. This Section includes the following:

1. Furnish and install acrylic glazing panels at tank including all items listed below and all other materials and services required to install and seal the glazing panels.

2. Supplementary sheet neoprene rubber, polyethylene foam back-up, acrylic setting blocks, filler strips. Protective blocks, and cap rings in amounts required for glazing conditions shown.

3. Fiberglass reinforced plastic (FRP) clips and bolts.

4. Factory chemical bonding of panels.

5. High-speed, non-shrink grout as required.

6. 1 or 2-part, silicone sealant. – Grey or Black as selected by the Architect/Designer.

7. Epoxy coating of window recesses

8. Testing of epoxy coating for compatibility with sealant system.

B. Related Sections include the following:

1. Exhibit Tank Coating is specified in Section 099800.

1.2 SYSTEM DESCRIPTION

A. Design Requirements:

1. Provide engineering design for panel thickness and installation anchorage system.

2. Safety factor for acrylic panel shall be based on the minimum allowable physical properties as defined by the latest revision of ASME PVHO-1 Standards and shall be not less than 11.25 for monolithic casting, and not less than 12.8 for bonded assemblies.

3. Fire Hazard Classification: Class III when tested in accordance with ASTM E84.

4. Panel identification numbers, visible horizontal and vertical vision dimensions and water depth are indicated on the Drawings.

5. Ambient design temperature of tanks varies by tank, refer to LSS drawings, plus or minus 3 degrees.

6. Design panels to comply with the 2018 NC State Building Code (2015 IBC) and all other applicable requirements regarding seismic design and incorporating slosh surge effect on water pressure, with initial maximum deflection of panels in long span direction of L/360 when tank is full as minimal design criteria.

Where panels are supported on 3 sides or cantilevered and the top edge is below 6'-0" above finished floor, design panels to not exceed L/600 in the long span direction.

a. Deflection over a long period of time shall not be visually perceptible and shall not be detrimental to reflection refraction and/or diffraction.

B. Performance Requirements: Provide watertight acrylic window panels when installed in manufacturer approved concrete openings meeting manufacturer's approved tolerances.

1.3 SUBMITTALS

A. Product Data: For each type of product specified.

B. Shop Drawings:

1. Submit shop drawings for fabrication and installation of acrylic panels and associated components, including elevations, bonded seam location and detail sections of all panels.

2. Identify full dimensions of all panels.

3. Clearly identify the location of all chemical bonds for all panels

C. Samples:

1. Joint Sealants: Submit for approval 12-inch-long samples of each color required for each type of sealant or caulking compounds.

2. Acrylic Panels: Submit 2 samples of plastic panel 12 inches by 12 inches of each panel thickness required. Samples to include butt or mitered joints where proposed.

D. Quality Control Submittals:

1. Design Data:

a. Furnish calculations signed by Structural engineer to satisfaction of local code jurisdictions to substantiate compliance with design requirements including seismic design.

b. Provide panel thickness definition within plus or minus 1/2 inch of final calculated thickness to the Designer not more than 14 calendar days after receipt of Notice to Proceed.

c. Provide calculation of initial and long-term deflection of all panels and identify point of maximum deflection in shop drawings

2. Test Reports:

a. Submit product test reports for each type of joint sealant indicated, evidencing compliance with requirements specified.

b. Joint Sealant Manufacturer: Submit statement indicating that acrylic and glazing materials have been tested for compatibility and adhesion with glazing sealants.

c. Include interpretation of test results relative to sealant performance and recommendations for primers and substrate preparation needed to

obtain adhesion.

d. Preconstruction Field Test Reports: Submit test reports indicating which products and joint preparation methods demonstrate acceptable adhesion to joint substrate.

3. Certificates:

a. Joint Sealant Manufacturer: Submit certification that sealants plus the primers and cleaners required for sealant installation comply with local regulations controlling use of volatile organic compounds. Also, submit certification attesting that products comply with specification requirements and are suitable for the use indicated. Sealants not certified by the manufacturer for use as aquarium glazing sealant shall not be accepted.

b. Acrylic Panel Manufacturer: Provide written certificates that panel thickness provided will withstand water pressures indicated and seismic loads. Submit documentation of compliance with ASME PVHO-1 requirements.

4. Manufacturer's Instructions: Submit acrylic panel manufacturer's installation and maintenance instructions.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain acrylic panels and joint setting and sealing materials through one source from a single manufacturer.

B. Qualifications:

1. Manufacturer and installer shall have successfully completed within the last 5 years at least 3 acrylic panel production and installations similar in type and size to that of this Project. Include list of completed projects with project names, addresses, name of architects and owners, plus other information specified.

2. Manufacturer shall provide technical supervisors to be present at time of panel unloading, installation and sealant application by manufacturer's personnel.

C. Preconstruction Field Testing:

1. Prior to installation of joint sealants, field test at jobsite their adhesion to joint substrates as follows:

a. Locate test joints where indicated or, if not indicated, as directed by the Architect.

b. Conduct field tests for each type of elastomeric sealant and joint substrate indicated.

c. Arrange for tests to take place with joint sealant manufacturer's technical representative present.

d. Test Method: Test joint sealants by hand pull method described below:
1) Install joint sealants in 5-foot joint lengths using same materials and methods for joint preparation and joint Sealant installation required for completed work. Allow sealants to cure

fully before testing.

2) Make knife cuts horizontally from one side of joint to the other followed by 2 vertical cuts approximately 2 inches long at side of joint and meeting horizontal cut at top of 2 inch cuts. Place a mark 1 inch from top of inch piece.

3) Use fingers to grasp 2-inch piece of sealant just above - inch mark; pull firmly down at a 90 degree angle or more while holding a ruler along the side of sealant. Pull sealant out of joint to the distance recommended by sealant

manufacturer for testing adhesive capability, but not less than that equaling specified maximum movement capability in extension; hold this position for 10 seconds.

4) Report whether or not sealant in joint connected to pulled-out portion failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each type of product and joint substrate.

e. Evaluation of Field Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint substrates during testing.

D. Pre-Installation Conference: Contractor, installer, sealant, waterproofing and acrylic manufacturers' technical representatives, Architect and other trades whose work affects glazing shall meet at Project site to review procedures and time schedule proposed for glazing and coordination with other work,

1.5 DELIVERY, STORAGE AND HANDLING

A. Storage and Protection: Protect acrylic panel material during transport, delivery to job site, storage and handling to comply with manufacturer's directions and as required to prevent edge damage to acrylic panel and damage to acrylic material from effects of moisture, including condensation, temperature changes, direct exposure to sun and from other causes.

1.6 PROJECT CONDITIONS

A. Environmental Requirements: Provide climate control during installation of acrylic panels, to include temporary facilities if required.

B. Field Measurements: Take field measurements before fabrication. Verify openings are acceptable prior to application of waterproofing. Where necessary, proceed with fabrications without field measurements and coordinate fabrication tolerances to ensure proper fit of acrylic panel units. Show recorded measurement on final shop drawings.

C. Coordinate fabrications schedule with construction progress to avoid delay.

D. Delivery and installation on site will require coordination and confirmation with the construction managers and Owner’s project manager’s sufficient to assure that the delivery routes in and to the final locations for acrylic panels are free and clear of any obstructions that would otherwise prevent the installation to occur.

1.7 SEQUENCING AND SCHEDULING

A. Acrylic panels must be delivered to the site by specific dates in order for the project to remain on schedule. For this project, acrylic panels must be delivered to the site and into their general position no later than the CMR Project Schedule requires unless otherwise instructed. This schedule will be available upon request by the fabricator.

1.8 WARRANTY

A. Warranty period for this work is for a 1-year duration from time of acceptance (post hydrotest).

B. Written warranty, signed by the authorized representative of acrylic panel manufacturer and installer and countersigned by the Contractor, warranting that portions of the work involving tank glazing is of good quality, free from defects and conformance with the requirements of the Contract Documents and shall repair or replace defective work during the 1-year period following Acceptance of the Project by the Owner. Warranty shall include removal and replacement of other work that conceals acrylic or sealant and repair and/or replacement of other materials damaged by leakage

1. Defective work is defined to include the following:

a. Structural failure.
b. Noticeable yellowing or change of color.
c. Loss of impact or abrasion resistance.
d. Penetration of water through acrylic or sealant.
e. Adhesion or cohesive failure of sealant.
f. Crazing of acrylic surface or joints.
g. Excessive deflection
h. Failure to fulfill other specified performance requirements.
i. Appearance of void spaces, "bubbles", in bond joints and/or evidence of bond joint separation.

PART 2 – PRODUCTS

2.1 APPROVED MANUFACTURERS

A. Provide Acrylic products by one of the following or by manufacturers with demonstrated experience of 10 years or greater and expertise with providing acrylic viewing windows for live animal exhibits:

1. Nippura Co. Ltd. 3611 Tryclan Dr..Charlotte, NC 28217 - USA
ph: 704.561.9191 FAX: 704.561.9196 http://www.nippura.com/en/index.html

2. Reynolds Polymer Technology, Inc. 607 Hollingsworth St. Grand Junction, CO 81505 – USA ph: 970.241.4700 Fax: 1970.241.4747
CustomerService@ReynoldsPolymer.com

3. Advanced Aquarium Technologies 610 Lockhaven Dr Houston, TX 77073 – USA ph:281.645.4004 https://www.advanced-aquariums.com/

2.2 MATERIALS

A. Acrylic Panel Glazing:

1. Monolithic cast or laminated from commercial grade polymethyl methacrylate resin, colorless and clear, with minimum haze and minimum 90 percent total light transmittance in accordance with ASTM D1003.

2. Casting process used in the production shall be capable of producing materials with the minimum physical properties shown in ASME PVHO-1 Standards with exception of the following:

   a. Acrylic panel glazing shall meet or exceed the following criteria:
      1) Flexural Strength (kgf/cm2):
         a) Parent Material: 1100.
         b) Joint Bond: 836.

      2) Flexural Rigidity (x 104 kfg/cm2) when tested in accordance with ASTM D79OM:
         a) Parent Material: 3.21.
         b) Joint Bond: 3.4.

      3) Tensile Strength (kgf/cm2) when tested in accordance with ASTM D638M:
         a) Parent Material: 823.
         b) Joint Bond: 646.

B. Sealant: 2 -component silicon as recommended by acrylic manufacturer and approved by sealant manufacturer. Primers as recommended by the sealant manufacturer.

C. Bond Breaker: As recommended by sealant manufacturer.

D. Spacers: Neoprene, ASTM C864, hardness as required by acrylic panel manufacturer.

E. Grout: Cementitious based, non-metallic, non-shrink, as recommended by acrylic panel manufacturer.

F. Painted Rebate Surfaces: Paint all rebate surfaces of acrylic – color to be determined.

G. Epoxy coating at window recesses:

1. Two component, 100% solids epoxy coating meeting:
   a. ANSI/NSF Standard 61 - drinking water components - health effects.
   b. EPA - potable water applications.
   c. FDA - 21 CFR 175.00 for food service contact
   d. USDA - direct food contact areas.

2. Primer: As recommended by coating manufacturer

3. Solvent: As recommended by coating manufacturer.

4. Patching Material: Epoxy patching compound as recommended by coating manufacturer

4. Color: gray or black, to match selected sealant color. Final color to be selected by Designer.

5. Manufacturers
   a. Madewell 1312S Epoxy Madewell Products Corporation, 7561A Industrial Court, Alpharetta, Georgia 30004. Phone (770) 475-8199. Fax (770) 475-8167. www.madewell.com.
   b. Sta-Crete SS1500"; Epmar Corporation, 13210 E. Barton Circle, Santa Fe Springs, CA 90670 (310) 946-8781.

2.3 ACCESSORIES

A. Provide accessory items including, but not limited to, the following as required by the acrylic panel manufacturer for a complete installation capable of meeting the performance requirements specified:

1. Neoprene bearing pads.
2. Installation clamps.
3. Backer rod.
4. Backer blocks.
5. Setting blocks.
6. Shims.
7. Paint for back coating of acrylic in recesses where required to prevent view through acrylic of inside of bearing area.
8. FRP clips and bolts (to be completely removed after sealant installation, unless otherwise noted in Drawings)
9. Surface primers as required for sealant adhesion.

2.4 FABRICATION

A. Laminate or monolithic cast plastic glazing unit monolithic, free from inclusions, which could decrease its structural performance or mar its optical characteristics or appearance.

B. Polished Surfaces: Provide surfaces with minimum of surface irregularities including waviness, ridges, dimples, and bumps.

C. Chamfer edges, except at field-bonded joints, per manufacturer to prevent chipping during shipping and installation.

D. Back-paint acrylic in bearing recesses where required to prevent view of inside of bearing areas from other windows. Acceptable exterior flat latex house paint manufacturers include:

1. Benjamin Moore
2. Sherwin Williams
3. Approved equivalent paint manufacturers to be reviewed and approved by

Owner and Exhibit Designer.

E. Chemical Bonds (seams):

1. Chemical bonds within the rebate areas and not exposed to view on the dry side may be used at the manufacturer's discretion.

2. Chemical bonds exposed to view on the dry side shall not occur in any panel less than 10'x20', regardless of panel orientation.

3. For this project, no horizontal chemical bonds will be allowed. All bonds to be in vertical orientation unless otherwise reviewed and authorized by the Owner's representatives and the Exhibit Designer.

4. On panels greater than 10'x20' and requiring chemical bonds:
   a. Exposed to view vertical bonds shall only be allowed where centered on the panel and/or equally spaced about the panel center
      i. Not less than 10' on center for panel greater than 10' high.
      ii. Not less than 20' on center for panels less than 10' high.

   b. Alternate chemical bond layout to minimize bonds within the prime viewing area to 10' above the floor of the viewer may be proposed for panels greater than 15' in both dimensions, subject to specific approval.

F. Inclusion Tolerances:

1. Each acrylic panel casting must be free of inclusions, which significantly decrease its structural performance or mar its optical appearance. The inclusion may take form of a void, a grain of sand, pebble, or any other form of foreign matter.
   a. Inclusions in excess of 0.25-inch combined dimensions are considered unacceptable.
   b. The number of allowable inclusions per panel is limited to 1 per 25 square feet in the general portion of the panel. Inclusions in the area from the bottom of the net panel opening to a height of 79 inches (eye level) are limited to 0.25-inch combined dimensions and number to 1 inclusion of this size maximum per 50 square feet.

2. Bonded joints of 2 structural components is acceptable for large flat sheets provided joint location is approved by the Owner, and the following criteria is met:

   a. Inclusions at area of bond:
      1) Maximum Size: 0.125-inch in combined dimensions.
      2) Quantity: Maximum of 1 per 6 feet of length.
      3) Inclusions in field chemical joints above the allowable limits will be reviewed and accepted at the sole discretion of the Owner's Representative.
   b. Bond joint physical properties shall meet the criteria specified above in "Acrylic Panel Glazing."

3. Flexural Strength: 7,000 psi ultimate strength, when tested in accordance with ASTM D790.

4. Residual Monomer: Less than 1.6 percent methyl methacrylate, less than 1.6

percent ethyl acrylate in accordance with ASME PVHO-1.

E. Fabrication Tolerances:

1. General: Tolerances to occur at design temperature and are based on fully assembled panel dimensions.

2. Thickness: Plus 0.50-inch, minus 0.00 inch from specified thickness, measured at any point.

3. Flatness: Plus or minus 0.25 by panel length in inches.

4. Deflection: Once installed and water is added to the exhibit, panel deflection cannot exceed 1/16" per linear foot (1/2" per 10 linear feet of panel length).

5. Width of Edge Chamfers: Typically, not to exceed 1/8 of panel thickness or 3/4-inch, whichever is less. At edges to be sealant joined, 1/8-inch maximum. No chamfers at edges to be field chemically bonded.

6. Width of Corner Chamfer: Not to exceed 0.0125 by panel thickness, not to exceed 3/4-inch.

7. Warp and twist shall not exceed 0.002 of the length when measured unrestrained on a flat surface, 3 corners relative to the fourth.

F. Optical Performances Prior to Shipment of Panels:

1. Equipment:
   a. Grid board consisting of 1 inch by 1 inch squares by 0.060-inch diameter white coated wire on flat black background; minimum height to be same height as the top of viewing area of panel (height minus rebate).
   b. Lighting of grid board consisting of 2 flood lamps of sufficient intensity to produce even, shadow-less illumination over board surface.

2. Procedure:
   a. Position grid board 24 to 48 inches from wet side of plastic glazing unit, with shortest edges in vertical position, parallel to glazing unit.
   b. Position lights on both sides of grid board between glazing unit and board, outside viewing areas, equidistant from center of grid board.
   c. Inspector will inspect glazing units from dry side, at distance of 24 to 36 inches from surface. Move grid board and lighting to allow inspection of entire panel surface.
   d. Inspection: Conducted by the Owner prior to shipment of panels to jobsite.

3. Acceptance Criteria: Surface is acceptable if image on grid board lines is clearly defined without distortion or breaks in lines exceeding 1/4 of grid square.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine openings to receive acrylic panel glazing and verify the following:

1. Perform bond and moisture tests on concrete substrates to determine that concrete is sufficiently cured and dry or if curing compounds are present.

2. Verify that crystalline capillary waterproofing has been installed and construction joints and shrinkage cracks in concrete that intersect window recesses have been epoxy injected.

3. That concrete surfaces are smooth, free from cracks, holes, protrusions, coatings or other unsatisfactory conditions that can impair performances.

4. That the area of overlap of epoxy with crystalline capillary waterproofing has been acid etched and neutralized in accordance with Section 09 98 00 – Exhibit Tank Coatings.

5. Size of concrete tanks and their openings are within tolerances specified.

B. Provide Glazier's written report listing conditions detrimental to performance of glazing work.

C. Do not allow glazing work to proceed until unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean substrate, removing projections and substances detrimental to the work; comply with recommendations of manufacturers of products to be installed for proper preparation procedures.

B. Patch surface defects in areas to receive sealant, using epoxy patching compound per epoxy manufacturer's instructions.

C. Mix and apply a minimum of two coats of epoxy to window recesses for the extent shown on Drawings as per epoxy manufacturer's instructions. Coordinate application to not be visible from other windows. Ensure that application is flat, smooth, and free of cracks and pinholes and protect from wind-blown debris or water. Allow epoxy to cure for a minimum of 3 days prior to proceeding with installation of acrylic.

D. Construct suitable scaffolding both inside and outside each opening.

E. Comply with combined printed recommendations of acrylic manufacturers, of manufacturers of sealants, and other glazing materials, except where more stringent requirements are indicated.

F. Protect acrylic panels from edge damage during handling and installation. Remove from Project and dispose of acrylic units with edge damage or other imperfections of kind that, when installed, weakens acrylic and impairs performance and appearance.

3.3 INSTALLATION

A. General: Provide a complete and fully supervised panel installation, including provision of rigging and equipment required for unpacking, moving and setting panels. Comply with manufacturer's instructions, except where more stringent requirements are shown or specified, and except where Project conditions require extra precautions or provisions to ensure satisfactory performance of the work.

B. Apply surface primers to joint surfaces where required for adhesion of sealants, as

determined by preconstruction sealant substrate testing.

C. Apply neoprene bearing pads and set panels into openings in accordance with acrylic panel manufacturer's recommended procedure.

D. Provide edge blocking to comply with requirements of specifications, except where otherwise required by acrylic panel manufacturer.

E. Mix grout in accordance with packaged instructions and place into glazing channels as required for secure installation. Where acceptable to the acrylic manufacturer, provide continuous neoprene bearing pads in lieu of grout at openings smaller than 100 square feet.

1. Provide spaces, or similar means, at both ends of window to maintain space between concrete and panel edges free from grout in order to permit expansion.

2. Mask surfaces of panel and epoxy coated concrete above grouting level to prevent their soiling with grout.

3. Do not install dry side sealant until after window has been accepted as watertight. Provide other means to retain grout in recess and prevent contamination of window or areas to receive sealant.

3. Apply grout at sill and level evenly with lower edge of bevel as shown.

4. Grout jambs and head of window in stages as required to prevent boil-out of grout at lower elevations.

4. When surface moisture has disappeared, remove masking tapes.

F. Provide compressible filler rods or equivalent back-up material, as recommended by sealant and acrylic panel manufacturers, to prevent sealant from adhering to joint's back surface as well as to control depth of sealant for optimum performance, unless otherwise indicated.

G. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant substrate testing.

H. Mix and apply sealant at interior (wet) side of window. Comply with combined printed recommendations of manufacturers of glazing plastic and of sealants, and other glazing materials, except where more stringent requirements are indicated, including those of referenced glazing standards. Force sealant into glazing channels to eliminate voids and to ensure complete “wetting" or bond of sealant glazing plastic and channel surfaces. Tool exposed surfaces of sealants to provide a substantial "wash" away from glazing plastics.

I. Do not install dry side sealant until windows have been accepted as watertight.

J. All on-site assemblies of bonded joints (acrylic to acrylic) must be performed under dust-free, climate controlled temporary environments, and all such environments must be designed and approved by the Owner prior to their erection.

3.4 TOLERANCES

A. Install products of this Section to within the tolerances as stated above.

3.5 FIELD QUALITY CONTROL

A. Tests:

1. Fill tank to capacity with water after wet side sealant has cured (minimum 1-week duration or minimum recommended by sealant manufacturer) and after completion of all related work. Leak testing of acrylic may be concurrent with tests specified under 09 98 00 – Exhibit Tank Coating.

2. Verify initial deflection of acrylic meets specification requirements using dial indicator mounted to rigid test stand located on dry side at maximum deflection point of panel as indicated by shop drawings. Glazing Manufacturer shall responsible for correction of excessive deflection exceeding specifications.

3. Observe any leaks. If leakage is not evident, maintain tank full as per Item 4 below.

4. If leaks are present, empty tank and repair.
   a. Installer: Be responsible for repairing leaks at the perimeter of the glazing.
   b. Glazing Manufacturer: Be responsible for any problems with bonded joints deflection.

5. After apparent elimination of all leakage, but before installation of materials that might impede access to acrylic and sealant, fill tank and allow to stand full for a period of not less than 1 month to identify any slow leakage. Should leakage develop during this period, notify Architect prior to draining tank and receive approval for proposed repair methods.

6. Receive approval of Owner and Exhibit Designer before concluding water testing. Acceptance of installation shall be based upon 1-month continuous water testing without visible moisture present on the dry side of the acrylic or within window recesses. Dry side sealant shall be installed only after conclusion of water testing and approval of installation.

3.6 PROTECTION

A. Protect panels against damage from other construction, weather, direct exposure to sun, corrosion and other hazards as required to ensure that work of this Section will be without damage or deterioration at date of Substantial Completion. Minimum acceptable protection shall be plastic film approved by the acrylic manufacturer, followed by application of inner layer of 2” thick rigid insulation board and an outer layer of 1/8" plywood door skin or cellular plastic sheet.

END OF SECTION 088400

SECTION 089000 - LOUVERS AND VENTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Fixed, extruded-aluminum louvers.

B. Related Sections:

1. Refer to Drawings A – X Series for louver locations and dimensions.
2. Refer to Drawings M-X – X for louver requirements.

1.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design louvers, including comprehensive engineering analysis by a qualified professional engineer, using structural performance requirements and design criteria indicated.

B. Structural Performance: Louvers shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver blade rattle or flutter, or permanent damage to fasteners and anchors.

1. Wind Loads: Determine loads based on pressures associated with a Basic Wind Speed per requirements in Chapter 16 of the NC Building Code for Kure Beach, NC.

C. Seismic Performance: Louvers, including attachments to other construction, shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.

1. Design earthquake loads based on pressures as indicated on Drawings.

D. Louver Performance Ratings: Provide louvers complying with requirements specified, as demonstrated by testing manufacturer's stock units identical to those provided, except for length and width according to AMCA 500-L.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1. For louvers specified to bear AMCA seal, include printed catalog pages showing specified models with appropriate AMCA Certified Ratings Seals.

B. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.

C. Samples: For each type of metal finish required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aluminum Extrusions: ASTM B 221 (ASTM B 221M), Alloy 6063-T5, T-52, or T6.

B. Aluminum Sheet: ASTM B 209 (ASTM B 209M), Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.

C. Fasteners: Use types and sizes to suit unit installation conditions.

1. For fastening aluminum, use aluminum or 300 series stainless-steel fasteners.

D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.2 FABRICATION, GENERAL

A. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

B. Join frame members to each other and to fixed louver blades with fillet welds, concealed from view, unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

2.3 FIXED, EXTRUDED-ALUMINUM LOUVERS

A. Horizontal Storm-Resistant Louver:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. All-Lite Architectural Products, Inc, ECD 445 is Basis of Design Product.
b. Air Balance Inc.; a Mestek company.
c. Air Flow Company, Inc.
d. Airolite Company, LLC (The).
e. Construction Specialties, Inc.
f. Ruskin Company; Tomkins PLC.

B. Construction:

Material: Mill Finish 6063-T5 extruded aluminum.
Frame: 4” deep x 0.081” thick (102 x 2) channel.
Blades: 45° x 0.063” (1.7) thick horizontal drainable chevron style.
Screen: ½” x 0.063” (12.7 x 1.6) expanded and flattened aluminum.
18-by-16 (1.4-by-1.6mm) mesh aluminum insect screen.
Mullion: Visible.

C. Performance Data:

1. Based on testing 48 inch x 48 inch (1219mm x 1219mm) size unit in accordance with AMCA 500.
2. Free Area: 42.7% nominal
3. Free Area Size: 6.8 ft² (0.63 m²)
4. Maximum Recommended Air Flow thru Free Area: 1,250 fpm (6.35m/s).
5. Air Flow: 8,538 cfm (4.03m³/s).
6. Maximum Pressure Drop: 0.32in.wg. (79 Pa).
7. Water Penetration: Maximum of 0.01 ounces per square foot (3.1 g/m²) of free area at an air flow of 1,250 fpm (6.35m/s) free area velocity when tested for 15 minutes.
8. Minimum Wind Driven Rain performance @ 3 in/hr (75 mm/hr) rainfall rate and 29 mph (13 m/s) wind speed based on testing 39.375 inch x 39.375 inch (1 m x1 m) core area louver:

    a. Core Velocity: 397 fpm (2.15m/s)
    b. Effectiveness Ratio: 99%
    c. Wind Class: A
    d. Discharge Class: 3

9. AMCA Seal: Product must be licensed to bear the AMCA Certified Ratings Seal for Water, Air, and Wind Performance.

D. Design Load:

1. Wind Load: Louver designs shall withstand the effects of 30 psf (1.78 kPa) of uniform pressure acting inward or outward.
2. Seismic Performance: Louvers, including attachments to other construction, shall withstand seismic effects determined by ASCE-7.

E. Finish : Match clear anodized aluminum storefront.

2.4 ACCESSORIES

A. Blank-Off Panels

1. Insulated, aluminum skin with 2-Inch (51mm) insulated core, closure frame with perimeter gasket, black finish, and factory installed.

B. Extended sills, aluminum, 0.050-inch (1.27mm) nominal thickness, finished to match louver.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Locate and place louvers and vents level, plumb, and at indicated alignment with adjacent work.

B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

C. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

D. Repair damaged finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory and refinish entire unit or provide new units.

E. Protect galvanized and nonferrous-metal surfaces that will be in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint.

END OF SECTION 089000

SECTION 092216 - NON-STRUCTURAL METAL FRAMING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Non-load-bearing steel framing systems for interior gypsum board assemblies.
2. Suspension systems for interior gypsum ceilings and soffits.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics: Provide materials and construction identical to those tested according to ASTM E 119.

B. STC-Rated Assemblies: Provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413.

2.2 FRAMING SYSTEMS

A. Steel Studs and Runners: ASTM C 645.

1. Minimum Base-Metal Thickness: 0.018 inch (0.45 mm) for stud lengths less than 9 feet. 0.027 inch (0.68 mm) for stud lengths over 9 feet.
2. Depth: As indicated on Drawings.

B. Slip-Type Head Joints: Where indicated, provide the following in thickness not less than indicated for studs and in width to accommodate depth of studs:

1. Deflection Track: Steel sheet top runner manufactured to prevent cracking of finishes due to deflection of structure above.

a. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following]:

1) Dietrich Metal Framing; SLP-TRK Slotted Deflection Track.
2) MBA Building Supplies; Slotted Deflecto Track.
3) Superior Metal Trim; Superior Flex Track System (SFT).
4) Telling Industries; Vertical Slip Track.

C. Cold-Rolled Channel Bridging: Steel, 0.053-inch (1.34-mm) minimum base-metal thickness, with minimum 1/2-inch- (13-mm-) wide flanges.

1. Depth: As required for assembly.
2. Clip Angle: Not less than 1-1/2 by 1-1/2 inches (38 by 38 mm), 0.068-inch- (1.72-mm-) thick, galvanized steel.

D. Cold-Rolled Furring Channels: 0.053-inch (1.34-mm) uncoated-steel thickness, with minimum 1/2-inch- (13-mm-) wide flanges.

1. Depth: As required for assembly.
2. Furring Brackets: Adjustable, corrugated-edge type of steel sheet with minimum uncoated-steel thickness of 0.033 inch (0.8 mm).
3. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.062-inch- (1.59-mm) diameter wire, or double strand of 0.048-inch- (1.21-mm-) diameter wire.

E. All items shall be G90 hot-dip galvanized, in accordance with ASTM C645 and A653.

2.3 SUSPENSION SYSTEMS

A. Tie Wire: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.062-inch- (1.59-mm-) diameter wire, or double strand of 0.048-inch- (1.21-mm-) diameter wire.

B. Wire Hangers: ASTM A 641/A 641M, Class 1 zinc coating, soft temper, 0.16 inch (4.12 mm) in diameter.

C. Carrying Channels: Cold-rolled, commercial-steel sheet with a base-metal thickness of 0.053 inch (1.34 mm) and minimum 1/2-inch- (13-mm-) wide flanges.

1. Depth: As required for assembly.

2.4 AUXILIARY MATERIALS

A. Fasteners for Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates.

B. Isolation Strip at floor slabs: Provide 30# Class A asphalt saturated organic felt at all runners on slabs.

C. Provide 18 Gauge galvanized steel flat strapping, 8 to 10-inches wide, in lieu of wood blocking to support millwork, toilet partitions, toilet accessories, et cetera, in metal stud walls.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Installation Standard: ASTM C 754.

1. Gypsum Board Assemblies: Also comply with requirements in ASTM C 840 that apply to framing installation.

B. Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction.

C. Install bracing at terminations in assemblies.

D. Do not bridge building control and expansion joints with non-load-bearing steel framing members. Frame both sides of joints independently.

3.2 INSTALLING FRAMED ASSEMBLIES

A. Install framing system components according to spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.

B. Where studs are installed directly against exterior masonry walls or dissimilar metals at exterior walls, install isolation strip between studs and exterior wall.

C. Install studs so flanges within framing system point in same direction.

D. Install tracks (runners) at floors and overhead supports. Extend framing full height to structural supports or substrates above suspended ceilings, except where partitions are indicated to terminate at suspended ceilings. Continue framing around ducts penetrating partitions above ceiling.

1. Slip-Type Head Joints: Where framing extends to overhead structural supports, install to produce joints at tops of framing systems that prevent axial loading of finished assemblies.
2. Door Openings: Screw vertical studs at jambs to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.
    a. Install two studs at each jamb unless otherwise indicated.
    b. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch (13-mm) clearance from jamb stud to allow for installation of control joint in finished assembly.
    c. Extend jamb studs through suspended ceilings and attach to underside of overhead structure.
3. Other Framed Openings: Frame openings other than door openings the same as required for door openings unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.
4. Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-rated assembly indicated and support closures and to make partitions continuous from floor to underside of solid structure.

E. Installation Tolerance: Install each framing member so fastening surfaces vary not more than 1/8 inch (3 mm) from the plane formed by faces of adjacent framing.

3.3 INSTALLING SUSPENSION SYSTEMS

A. Install suspension system components according to spacings indicated, but not greater than spacings required by referenced installation standards for assembly types.

B. Isolate suspension systems from building structure where they abut or are penetrated by building structure to prevent transfer of loading imposed by structural movement.

C. Suspend hangers from building structure as follows:

1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system.

    a. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.

2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with locations of hangers, install supplemental suspension members and hangers in the form of trapezes or equivalent devices.
3. Do not attach hangers to steel roof deck.
4. Do not attach hangers to permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.
5. Do not attach hangers to rolled-in hanger tabs of composite steel floor deck.
6. Do not connect or suspend steel framing from ducts, pipes, or conduit.

D. Fire-Resistance-Rated Assemblies: Wire tie furring channels to supports.

E. Seismic Bracing: Sway-brace suspension systems with hangers used for support.

F. Installation Tolerances: Install suspension systems that are level to within 1/8 inch in 12 feet (3 mm in 3.6 m) measured lengthwise on each member that will receive finishes and transversely between parallel members that will receive finishes.

END OF SECTION 092216

SECTION 092713 - CASTWORKS GLASS FIBER REINFORCED GYPSUM (GRG/GFRG) ARCHITECTURAL COLUMNS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

This specification is a general outline the CastWorks Glass Fiber Reinforced Gypsum (GRG/GFRG) requirements, as they pertain to the overall project design. In all cases, the Manufacturer's printed specifications shall govern the work of this section.

1.2 SUMMARY

A. Section Includes:

1. Furnish all materials, labor, equipment, and services necessary for the supply and installation of CastWorks GRG components as indicated on the drawings and contract documents, all in compliance with local codes and/or ordinances.
2. Work shall include supply of GRG components, installation, and finishing guidance.

B. Related Sections:

1. Section 051200 Structural Metal Framing
2. Section 054000 Cold-Formed Metal Framing
3. Section 061053 Miscellaneous Rough Carpentry
4. Section 092900 Gypsum Board
5. Section 099123 Painting and Coating

1.3 References

A. American Society for Testing and Materials (ASTM):

1. ASTM C1355/C1355M Standard Specification for Glass Fiber Reinforced Gypsum Composites
2. ASTM C1381 Standard Specification for Molded Glass Fiber Reinforced Gypsum Parts
3. ASTM D638 Standard Test Method for Tensile Properties of Plastics
4. ASTM E84 Standard Test Method for Surface Burning Characteristics of Building Materials
5. ASTM C947 Standard Test Method for Flexural Properties of Thin-Section Glass-Fiber-Reinforced Concrete (Using Simple Beam with Third-Point Loading)
6. ASTM D256 Standard Test Methods for Determining the Izod Pendulum Impact Resistance of Plastics
7. ASTM D696 Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics Between −30°C and 30°C with a Vitreous Silica Dilatometer
8. ASTM E136 Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750°C
9. ASTM C472 Standard Test Methods for Physical Testing of Gypsum, Gypsum Plasters and Gypsum Concrete

10. ASTM C473 Standard Test Methods for Physical Testing of Gypsum Panel Products
11. ASTM D2583 Standard Test Method for Indentation Hardness of Rigid Plastics by Means of a Barcol Impressor
12. ASTM C840 Standard Specification for Application and Finishing of Gypsum Board

1.4 SUBMITTALS

A. Submit a minimum of three 3" x 3" or 8" x 8" CastWorks GRG flat samples to the Finishing Contractor for paint selection.

B. Submit shop drawings for approval showing plans, sections, details, joint treatment, reinforcing, fastening devices and the relation of the CastWorks GRG components to the surrounding construction.

C. Product Data: Submit manufacturer's technical data.

1.5 RESPONSIBILITY

A. The Gypsum Board Contractor shall install and tape the work under this section and he will be responsible for coordinating the installation with drywall work and other trades.

1.6 MOCK-UP

A. Prior to production, erect one proto-type component on-site or at the Armstrong CastWorks plant, for review by the Architect.

1.7 DELIVERY, STORAGE, HANDLING AND PROTECTION

A. Transport and handle units in a manner that avoids excessive stresses or damage.

B. Components displaying obvious damage must be rejected at site at time of delivery.

C. Store the components in a controlled environment, weather protected, on level surfaces, with temporary supports as required. Do not stack or lean.

1.8 Warranty

A. One year from Acceptance by Owner.

PART 2. – PRODUCTS

2.1 MANUFACTURER

A. CastWorks by Armstrong World Industries, Inc. (Basis-of-Design product)

B. Subject to compliance with these Specifications, equivalent products by Formglas, GC Products and other manufacturers will be acceptable.

2.2 MATERIALS (Basis-of-Design product terminology used below, for consistency.)

A. CastWorks GRG components shall be prefabricated with high-density gypsum, free of resin and asbestos, reinforced with chopped strand fiber or continuous filament mat.

B. CastWorks GRG components shall be reinforced with steel or wood as needed.

C. Fabrication will be as per approved shop drawings and will not include assembly. If multiple components are required to complete design criteria as per contract drawings, additional site work under related section, installation or finishing may be required.

D. Furnish Columns in two halves, to be fitted around existing 16-inch square posts.

E. CastWorks GRG components shall be ready to receive primer and paint as specified under Section 099123.

2.3 TOLERANCES (FABRICATION)

A. Dimensional - all directions +/- 1/8"
B. Thickness - skin +/- 1/16"
C. Warpage or Bowing +/- 1/16"/foot
D. Site conditions and normal manufacturing variations may require additional site work to maintain these tolerances.

2.4 PHYSICAL PROPERTIES

A. Shell Thickness 3/16"
B. Weight (depending on reinforcing) 2 - 3 lbs/sq.ft
C. Density 103 - 112 lbs/cu.ft
D. Flexural Strength (ASTM C-947) Not less than 2500 psi.
E. Modulus of Elasticity - In flexure (ASTM C-947-89 MOD.) 3.38 x 10^6 psi.
F. Tensile Strength (ASTM D-638-94 b MOD.) 1,810 psi.
G. Impact Strength (ASTM D-256 notched) 3.26 ft.lb/ in. of notch
H. Impact Strength (ASTM D-256 unnotched) 8.0 ft.lb/ in^2.
I. Hardness – Barcol (ASTM D-2583-93) <50
J. Fiber Content 4 - 6% by weight
K. Humidified Deflection (ASTM C-473-95) 1/32" to 1/8" deflection
L. Coefficient of Expansion (ASTM D-696-91) 0.98 x 10^{-5} in./in./ ˚F
M. Fuel Contribution (ASTM E-136-98a) Pass
N. Flame Spread (ASTM E-84-94) 0, Class A
O. Smoke Index (ASTM E-84-94) 0, Class A
P. Fastener Withdrawal – Not less than 110 lbs

2.5 INSPECTION

A. The Architect or representative shall have access to the manufacturing facilities, either prior to contract award or thereafter, to inspect or verify compliance with the above specifications.

PART 3 - EXECUTION

3.1 PRE-INSTALLATION RESPONSIBILITY

A. Field Measurements: Prior to manufacturing, the Installer will be responsible for obtaining all field dimensions for inclusion on the Manufacturer’s shop drawings.

B. Coordination: The Installer will be responsible for the coordination of the installation with related sections, within the tolerances specified in the respective articles.

C. Discrepancies: Prior to installation, the Installer shall check job site dimensions and conditions. Any discrepancies between design and field dimensions shall be brought to the attention of the General Contractor and the Architect.

3.2 INSTALLATION

A. Components shall be lifted/handled with suitable devices.

B. Components shall be installed plum and true. Shim where necessary.

C. Fasten components with self-drilling, self-tapping bugle head screws through face or back as indicated on shop drawings.

D. Where components are suspended, use as a minimum 12-gauge galvanized steel wire and the suspension points indicated on the shop drawings.

E. Framing, hangers, etc. as specified for Gypsum Board.

F. Butt joints are to be adhered together using high grade polyurethane construction adhesive.

3.3 FINISHING

A. Refer to Painting Section of the Specifications.

B. The Paint Contractor shall comply with ASTM C 840-79 Specifications.

C. For joint finishing, tape, fill and sand all joints as required under Section 092900 of the Specifications and as outlined in U.S.G. or C.G.C. Gypsum Construction Handbook. Patch countersunk fasteners and any damage to match component texture.

3.4 NOTES

A. CastWorks GRG components shall be used for Interior Applications only.

B. Unfinished GRG may exhibit slight imperfections, normally hidden by textured or matte finishes. To obtain satisfactory results with joints and high sheens, additional filling, sanding, level 5 priming and painting may be required.

C. Improper sealing can cause tape joint read-through after painting. This is due to the difference in porosity between joint compounds and GRG therefore, ensure that the Painting Contractor seals all surfaces properly prior to finishing.

D. GRG components subject to critical lighting may require a level 5 finish by others.

END SECTION 092713

SECTION 092900 - GYPSUM BOARD

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Paperless (glass mat) gypsum board.
2. Paperless (glass mat) gypsum board for exterior soffits.
3. Paperless (glass mat) gypsum sheathing.
4. Water-resistant Gypsum Board for Interior Curved Walls.

B. Related Sections:

042000, Unit Masonry.
061053, Miscellaneous Rough Carpentry.
061600, Wall Sheathing at EIFS.
064023, Interior Architectural Woodwork.
079200, Joint Sealants.
081213, Hollow Metal Frames.
084113, Aluminum-Framed Entrances and Storefronts.
095113, Acoustical Panel Ceilings.
099123, Interior Painting.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Samples:

1. Paperless Gypsum Board: Manufacturer's standard size for each type indicated.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Resistance-Rated Assemblies: For fire-resistance-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 119 by an independent testing agency.

B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

C. Low Emitting Materials: For ceiling and wall assemblies, provide materials and construction identical to those tested in assembly and complying with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.2 INTERIOR GYPSUM BOARD

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. CertainTeed Corp.
2. Georgia-Pacific Gypsum LLC.
3. National Gypsum Company.
4. USG Corporation.

B. Glass-Mat Interior Gypsum Board for walls and ceilings: ASTM C 1658/C 1658M. With fiberglass mat laminated to both sides. Specifically designed for interior use.

1. Products: Subject to compliance with requirements, provide one of the following:

a. Georgia-Pacific Gypsum LLC; DensArmour Plus (Basis-of-Design).
b. USG Sheetrock® Brand Glass-Mat Panels; Mold Tough.
c. Gold Bond® brand; eXP® Interior Extreme® Gypsum Panels
d. CertainTeed; GlasRoc.

2. Long Edges: Tapered.
3. Thickness: 5/8 inch (15.9 mm).
4. Mold Resistance: ASTM D 3273, score of 10 as rated according to ASTM D 3274.

C. Fire-Rated Glass-Mat Interior Gypsum Wall Board, Type X: ASTM C 1658/C 1658M.

1. Thickness: 5/8 inch (15.9 mm).
2. Long Edges: Tapered.

D. Glass-Mat Gypsum Sheathing Board: ASTM C 1177/C 1177M, with fiberglass mat laminated to both sides and with manufacturer's standard edges. Use for tile backer board, exterior soffits and backer to EIFS.

1. Products: Subject to compliance with requirements, provide one of the following:

a. CertainTeed Corp.; GlasRoc Sheathing.
b. Georgia-Pacific Gypsum LLC; Dens-Glass Gold.
c. National Gypsum Company; Gold Bond, e(2)XP.
d. USG Corporation; Securock Glass Mat Sheathing.

2. Core: As is standard for the product; ½" thickness.

E. Bendable Core, Mold, Mildew Moisture Resistant Gypsum Board: ASTM C1396/C1396M.

1. Products: Subject to compliance with requirements, products meeting this specification include the following:

a. CertainTeed Corp..
b. Georgia-Pacific Gypsum LLC.
c. National Gypsum Company; Gold Bond.
d. USG Corporation.

2. Core: As is standard for the product; 5/16" thickness, capable of bending to a 5-foot radius.

2.3 TRIM ACCESSORIES

A. Interior Trim: ASTM C 1047.

1. Material: Paper-faced galvanized steel sheet; L and J beads for mudding-in the flanges.

B. Exterior Trim: ASTM C 1047.

1. Material: Plastic. Provide bendable material at downspout location.

2.4 JOINT TREATMENT MATERIALS

A. General: Comply with ASTM C 475/C 475M.

B. Joint Tape:

1. For Glass-Mat Gypsum Wall Board and Sheathing Board: 10-by-10 glass mesh.

C. Joint Compound for Interior Gypsum Board: For each coat use formulation that is compatible with other compounds applied on previous or for successive coats.

2.5 AUXILIARY MATERIALS

A. Laminating Adhesive: Adhesive or joint compound recommended for directly adhering gypsum panels to continuous substrate.

1. Laminating adhesive shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
2. Laminating adhesive shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

B. Steel Drill Screws: ASTM C 1002, unless otherwise indicated. Screws for wet and exterior locations shall be stainless steel.

C. Sound Attenuation Blankets: ASTM C 665, Type I (blankets without membrane facing).

D. Acoustical Joint Sealant: ASTM C 834. Product effectively reduces airborne sound transmission through perimeter joints and openings as demonstrated by testing according to ASTM E 90.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

a. Accumetric LLC; BOSS 824 Acoustical Sound Sealant.
b. Grabber Construction Products; Acoustical Sealant GSC.
c. Pecora Corporation; AC-20 FTR.
d. Specified Technologies, Inc.; Smoke N Sound Acoustical Sealant.
e. USG Corporation; SHEETROCK Acoustical Sealant.

2. Acoustical joint sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
3. Acoustical joint sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

E. Thermal Insulation: As specified in Section 072100 "Thermal Insulation."

PART 3 - EXECUTION

3.1 APPLYING AND FINISHING PANELS

A. Comply with ASTM C 840.

B. All gypsum wall panels shall be glass mat, level 5 finish.

C. All exterior soffits will be paperless (glass mat) sheathing with EIFS finish.

D. Examine panels before installation. Reject panels that are wet, moisture damaged, and mold damaged.

E. Isolate perimeter of gypsum board applied to non-load-bearing partitions at structural abutments, except floors. Provide 1/4- to 1/2-inch- (6.4- to 12.7-mm-) wide spaces at these locations and **apply edge trim where edges of panels are exposed**. Seal joints between edges and abutting piping, Tectum, and structural surfaces with acoustical sealant.

F. Install trim with back flanges intended for fasteners, attach to framing with same fasteners used for panels. Otherwise, attach trim according to manufacturer's written instructions.

1. Control Joints: Install control joints at locations indicated on Drawings and according to ASTM C 840 and in specific locations approved by Architect for visual effect.

G. Prefill open joints, rounded or beveled edges, and damaged surface areas.

H. Apply joint tape over gypsum board joints, except for trim products specifically indicated as not intended to receive tape.

I. Gypsum Board Finish Levels: Finish panels to levels indicated below and according to ASTM C 840:

1. Level 1: Ceiling plenum areas, concealed areas including side of Mechanical Mezzanine walls that face above-ceiling areas.
2. Level 4: At interior soffits and ceilings.
3. Level 5: At wall panel surfaces that will be exposed to view unless otherwise indicated.

a. Primer and its application to surfaces are specified in Section 099123 "Interior Painting."

J. Protect adjacent surfaces from drywall compound and texture finishes and promptly remove from floors and other non-drywall surfaces. Repair surfaces stained, marred, or otherwise damaged during drywall application.

K. Remove and replace panels that are wet, moisture damaged, and mold damaged.

END OF SECTION 092900

SECTION 093000 – TILING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Ceramic wall tile, and base tile.

B. Related Sections:

042000 Unit Masonry for wall substrate.
079200, Sealants
092900 Gypsum Board for wall substrate.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples:

1. Each type and composition of tile and for each color and finish required.
2. Assembled samples, with grouted joints, for each type and composition of tile and for each color and finish required.

1.3 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match and are from same production runs as products installed and that are packaged with protective covering and identified with labels describing contents.

1. Tile and Trim Units: Furnish quantity of full-size units equal to 3 percent of amount installed for each type, composition, color, pattern, and size indicated.

PART 2 - PRODUCTS

2.1 TILE PRODUCTS

A. ANSI Ceramic Tile Standard: Provide Standard grade tile that complies with ANSI A137.1 for types, compositions, and other characteristics indicated. Refer to Color Schedule 090000 for specific colors.

B. Porcelain interior floor tile.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American Olean; Division of Dal-Tile International Inc.
b. Daltile; Division of Dal-Tile International Inc. (Keystones, Basis of Design Product)
c. Florida Tile Industries, Inc.

2. Module Size: 12 by 24 inches.
3. Thickness: 3/8 inches.
4. Face: Square edges.
5. Finish: Unglazed, matt.
6. Tile Color: Refer to Section 090000 Color Schedule.
7. Grout Color: Grey.

C. Porcelain interior base tile.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American Olean; Division of Dal-Tile International Inc.
b. Daltile; Division of Dal-Tile International Inc. (Keystones, Basis of Design Product)
c. Florida Tile Industries, Inc.

2. Module Size: 2 by 2 inches.
3. Thickness: 5/16 inch (8 mm).
4. Face: Plain with modified cushion edges.
5. Finish: Unglazed, matt.
6. Tile Color: Refer to Section 090000 Color Schedule.
7. Grout Color: Grey.
8. Mounting: Factory, back mounted.
9. Trim Units: Coordinated with sizes and coursing of adjoining flat tile where applicable and matching characteristics of adjoining flat tile. Provide shapes as follows, selected from manufacturer's standard shapes:

a. Base: Daltile #MB-5B built up cove, 5 inches high.
b. External Corners for Thin-Set Mortar Installations: Surface bullnose, same size as adjoining flat tile.

D. Porcelain wall tile.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

a. American Olean; Division of Dal-Tile International Inc.
b. Daltile; Division of Dal-Tile International Inc. (Keystones, Basis of Design Product)
c. Florida Tile Industries, Inc.

2. Module Size: 2 by 2 inches.
3. Thickness: 5/16 inch (8 mm).
4. Face: Plain with modified cushion edges.
5. Finish: Unglazed, matt.
6. Tile Color: Refer to Section 090000 Color Schedule.
7. Grout Color: Grey.
8. Mounting: Factory, back mounted.

9. Trim Units: Coordinated with sizes and coursing of adjoining flat tile where applicable and matching characteristics of adjoining flat tile. Provide shapes as follows, selected from manufacturer's standard shapes:

    a. External Corners for Thin-Set Mortar Installations: Surface bullnose, same size as adjoining flat tile.

10. Description: Uniform, fine- to medium-grained white stone with gray veining.

2.2 SETTING MATERIALS

A. Latex-Portland Cement Mortar (Thin Set): ANSI A118.4.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Boiardi Products; a QEP company.
    b. Bonsal American; an Oldcastle company.
    c. Bostik, Inc.
    d. C-Cure.
    e. Custom Building Products.
    f. Laticrete International, Inc.
    g. MAPEI Corporation.
    h. Southern Grouts & Mortars, Inc.
    i. Summitville Tiles, Inc.
    j. TEC; a subsidiary of H. B. Fuller Company.

2. Prepackaged, dry-mortar mix to which only water must be added.
3. Prepackaged, dry-mortar mix combined with liquid-latex additive.
4. For wall applications, provide non-sagging mortar.

B. Tile over tile floors (ANSI A108.9).

1. Modified Epoxy Emulsion Mortar.

2.3 GROUT MATERIALS

A. Epoxy or Furan Tile Grout: ANSI A118.3, ANSI A118.5, or ISI RG.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Boiardi Products; a QEP company.
    b. Bonsal American; an Oldcastle company.
    c. Bostik, Inc.
    d. C-Cure.
    e. Custom Building Products.
    f. Laticrete International, Inc.
    g. MAPEI Corporation.
    h. Southern Grouts & Mortars, Inc.
    i. Summitville Tiles, Inc.
    j. TEC; a subsidiary of H. B. Fuller Company.

2.4 FLUID-APPLIED WATERPROOFING MEMBRANE

A. Fluid-Applied Membrane: Liquid-latex rubber or elastomeric polymer.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:

a. Boiardi Products; a QEP company; Elastiment 644 Membrane Waterproofing System.
b. Bonsal American; an Oldcastle company; B 6000 Waterproof Membrane.
c. C-Cure; Pro-Red Waterproofing Membrane 63.
d. Custom Building Products; Redgard Waterproofing and Crack Prevention Membrane.
e. Laticrete International, Inc.; Laticrete Watertight Floor N' Wall Waterproofing.
f. MAPEI Corporation; Mapelastic HPG.

2.5 ELASTOMERIC SEALANTS

A. One-Part, Mildew-Resistant Silicone Sealant as Specified in Division 7 Section Joint Sealants.

2.6 MISCELLANEOUS MATERIALS

A. Trowelable Underlayments and Patching Compounds:

1. Where ceramic tile flooring is to be replaced with epoxy coating, use Ardex V 1000 or equivalent product meeting the following performance requirements:
Flow Time: 10 minutes
Compressive Strength (ASTM C109/mod – Air cure only): 4,400 psi (308 kg/sq. cm.) at 28 days.
Flexural Strength (ASTM C348): 1,000 psi (70 kg/sq. cm.) at 28 days
VOC: 0

2. For all other conditions, use latex-modified, portland cement-based formulation provided or approved by manufacturer of tile-setting materials for installations indicated.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.

1. Verify that substrates for setting tile are firm, dry, clean, free of coatings that are incompatible with tile-setting materials including curing compounds and other substances that contain soap, wax, oil, or silicone; and comply with flatness tolerances required by ANSI A108.01 for installations indicated.

3.2 PREPARATION

A. Clean all areas where tile has been removed and make ready to accept setting material for replacement tile.

B. Fill cracks, holes, and depressions in concrete substrates for tile floors and wall installed with thin-set mortar with trowelable leveling and patching compound specifically recommended by tile-setting material manufacturer.

3.3 INSTALLATION

A. Comply with TCNA's "Handbook for Ceramic Tile Installation" for TCNA installation methods specified in tile installation schedules. Comply with parts of the ANSI A108 Series "Specifications for Installation of Ceramic Tile" that are referenced in TCA installation methods, specified in tile installation schedules, and apply to types of setting and grouting materials used.

B. Tile Installation Schedule:

1. Interior Floor Tile over existing ceramic tile floors (TR712). Use narrow (1/16-inch) joints.

2. Interior Wall Base Tile Installation (same as interior floor tile below): Thin-set mortar on masonry.

3. Interior Wall Tile Installation W245 (on glass-mat gypsum backer board); W2021 (thinset mortar over CMU).

    a. Floor Tile.
    b. Thin-Set Mortar: Portland cement mortar.
    c. Grout: Epoxy or Furan grout.

C. Extend tile work into recesses and behind equipment and fixtures to form complete covering without interruptions unless otherwise indicated. Terminate work neatly at obstructions, edges, and corners without disrupting pattern or joint alignments.

D. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, finish, or built-in items for straight aligned joints. Fit tile closely to electrical outlets, piping, fixtures, and other penetrations so plates, collars, or covers overlap tile.

E. Provide manufacturer's standard trim shapes where necessary to eliminate exposed tile edges.

F. Jointing Pattern: Lay tile in grid pattern unless otherwise indicated. Lay out tile work and center tile fields in both directions in each space or on each wall area. Lay out tile work to minimize the use of pieces that are less than half of a tile. Provide uniform joint widths unless otherwise indicated.

G. Joint Widths: Unless otherwise indicated, install tile with the following joint widths:

1. 1/16 inch (1.6 mm).

I. Expansion Joints: Provide expansion joints and other sealant-filled joints, including control, contraction, and isolation joints, where indicated. Form joints during installation of setting materials, mortar beds, and tile. Do not saw-cut joints after installing tiles.

1. Where joints occur in concrete substrates, locate joints in tile surfaces directly above them.
2. Prepare joints and apply sealants to comply with requirements in Section 079200 "Joint Sealants."

J. Install backer units and treat joints according to ANSI A108.11 and manufacturer's written instructions for type of application indicated. Use latex-portland cement mortar for bonding material unless otherwise directed in manufacturer's written instructions.

K. Install waterproofing to comply with ANSI A108.13 and manufacturer's written instructions to produce waterproof membrane of uniform thickness and bonded securely to substrate.

K. Install crack isolation membrane to comply with ANSI A108.17 and manufacturer's written instructions to produce membrane of uniform thickness and bonded securely to substrate.

END OF SECTION 093000

SECTION 095113 - ACOUSTICAL PANEL CEILINGS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes acoustical panels and exposed suspension systems for ceilings.

1.2 ACTION SUBMITTALS (Only required if submitted item is different from Basis of Design).

A. Product Data: For each type of product.

B. Samples: For each exposed product and for each color and texture specified.

1.3 CLOSEOUT SUBMITTALS

A. Maintenance data.

B. Additional materials: Provide ten boxes of ceiling panels and sixty linear feet of track in equal amounts of two foot and four-foot length.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Acoustical ceiling shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

B. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: Comply with ASTM E 1264 for Class A materials.
2. Smoke-Developed Index: 50 or less.

2.2 ACOUSTICAL PANEL CEILINGS, GENERAL

A. Low-Emitting Materials: Acoustical panel ceilings shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

B. Acoustical Panel Standard: Comply with ASTM E 1264.

C. Metal Suspension System Standard: Comply with ASTM C 635.

D. Attachment Devices: Size for five times the design load indicated in ASTM C 635, Table 1, "Direct Hung," unless otherwise indicated. Comply with seismic design requirements.

2.3 ACOUSTICAL PANELS – TYPE 1

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Armstrong World Industries, Inc. Kitchen Zone 673.
2. CertainTeed Corp.
3. Chicago Metallic Corporation.
4. USG Interiors, Inc.; Subsidiary of USG Corporation.

B. Classification: Type XII, Form 2, Pattern E, Fire Class A.

C. Color: White.

D. LR: 0.88.

E. SAG Resistance: HumiGuard Plus with BioBlock (proprietary for Armstrong) or equivalent.

F. Edge/Joint Detail: Square.

G. Thickness: 3/4 inch.

H. Modular Size: 24 by 24 inches (610 by 610 mm).

2.4 METAL SUSPENSION SYSTEM

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Armstrong World Industries, Inc.
2. CertainTeed Corp.
3. Chicago Metallic Corporation.
4. USG Interiors, Inc.; Subsidiary of USG Corporation.

B. Wide-Face, Capped, Double-Web, Steel Suspension System: Main and cross runners roll formed from cold-rolled steel sheet; pre-painted, electrolytically zinc coated, or hot-dip galvanized according to ASTM A 653/A 653M, not less than G30 (Z90) coating designation; with prefinished 15/16-inch- (24-mm-) wide metal caps on flanges.

1. Structural Classification: Heavy-duty system.
2. End Condition of Cross Runners: Butt-edge type.
3. Face Design: Flat, flush.
4. Cap Material: Steel or aluminum cold-rolled sheet.
5. Cap Finish: Painted white.
6. Roll-Formed, Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that comply with seismic design requirements; formed from sheet metal of same material, finish, and color as that used for exposed flanges of suspension-system runners.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install acoustical panel ceilings to comply with ASTM C 636/C 636M and seismic design requirements indicated, according to manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."

B. Measure each ceiling area and establish layout of acoustical panels to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width panels at borders, and comply with layout shown on reflected ceiling plans.

1. Install track as shown on the Reflected Ceiling Plans.
2. Arrange directionally patterned acoustical panels in short direction or as indicated on reflected ceiling plans.
3. Avoid trapping debris on top of panels.

C. Protect track and panels from damage by trades. Replace damaged units prior to Substantial Completion.

END OF SECTION 095113

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 096513 - RESILIENT BASE AND ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Resilient base.
2. Resilient molding accessories.
3. Resilient treads and risers.

1.2 ACTION SUBMITTALS

A. Samples: For each type of product indicated, in manufacturer's standard-size Samples but not less than 12 inches (300 mm) long, of each resilient product color, texture, and pattern required.

1.3 QUALITY ASSURANCE

A. Fire-Test-Response Characteristics: As determined by testing identical products according to ASTM E 648 or NFPA 253 by a qualified testing agency.

1. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm.

1.4 PROJECT CONDITIONS

A. Maintain ambient temperatures within range recommended by manufacturer in spaces to receive resilient products.

B. Until the date of Acceptance by Owner, maintain ambient temperatures within range recommended by manufacturer.

C. Install resilient products after other finishing operations, including painting, have been completed.

1.5 ADDITIONAL MATERIALS

A. Provide 50 linear feet of each specified product.

PART 2 - PRODUCTS

2.1 RESILIENT BASE

A. Resilient Base:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

    a. Armstrong World Industries, Inc.
    b. Burke Mercer Flooring Products; Division of Burke Industries, Inc.
    c. Flexco, Inc.
    d. Johnsonite (Slimline is Basis-of Design).
    e. Roppe Corporation, USA.

B. Resilient Base Standard: ASTM F 1861.

1. Material Requirement: Type TS (rubber, vulcanized thermoset).
2. Manufacturing Method: Group I (solid, homogeneous).
3. Style: Cove (base with toe).

C. Minimum Thickness: 0.125 inch (3.2 mm).

D. Height: 4 inches (102 mm).

E. Lengths: Cut lengths 48 inches (1219 mm) long or coils in manufacturer's standard length.

F. Outside Corners: Preformed, but Job formed will be acceptable when the length of material is more than 3 feet on both sides of the corner.

G. Inside Corners: Preformed.

H. Finish: Satin or Matte.

I. Colors and Patterns: Refer to Color Schedule 090000.

2.2 RESILIENT MOLDING ACCESSORY

A. Resilient Molding Accessory:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

    a. Armstrong World Industries, Inc
    b. Burke Mercer Flooring Products; Division of Burke Industries, Inc.
    c. Flexco, Inc.
    d. Johnsonite (Basis-of Design).
    e. Roppe Corporation, USA.

B. Description: Integral tread and riser for stairs. Reducer strip for resilient floor covering, transition strips between slab or other flooring and VC Tile.

C. Material: Rubber.

D. For tread texture, match Johnsonite “Cubis” for appearance and slip resistance.

E. Profile and Dimensions: Johnsonite “Slimline” CTA Series selected to match thickness of specified materials.

1. For color strips between floor jambs, provide 2-inch-wide strip that matches color and thickness of floor tile.

F. Colors and Patterns: Match the wall base color.

2.3 INSTALLATION MATERIALS

A. Trowelable Leveling and Patching Compounds: Latex-modified, Portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated.

B. Adhesives: Water-resistant type recommended by manufacturer to suit resilient products and substrate conditions indicated.

1. Adhesives shall have a VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
2. Adhesives shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

PART 3 - EXECUTION

3.1 PREPARATION

A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of resilient products.

B. Concrete Substrates for Resilient Accessories: Prepare according to ASTM F 710.

1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
2. Remove substrate coatings and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
3. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer.
4. Moisture Testing: Perform tests as required for the adjacent resilient flooring product.

C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth substrate.

D. Do not install resilient products until they are same temperature as the space where they are to be installed.

1. Move resilient products and installation materials into spaces where they will be installed at least 48 hours in advance of installation.

E. Sweep and vacuum clean substrates to be covered by resilient products immediately before installation.

3.2 RESILIENT BASE INSTALLATION

A. Comply with manufacturer's written instructions for installing resilient base.

B. Apply resilient base to walls, columns, pilasters, casework and cabinets in toe spaces, and other permanent fixtures in rooms and areas where base is required.

C. Install resilient base in lengths as long as practicable without gaps at seams and with tops of adjacent pieces aligned.

D. Tightly adhere resilient base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.

E. Do not stretch resilient base during installation.

3.3 RESILIENT ACCESSORY INSTALLATION

A. Comply with manufacturer's written instructions for installing resilient accessories.

B. Resilient Molding Accessories: Install transition strips to adjacent materials and tightly adhere to substrates throughout length of each piece. Install reducer strips at edges of resilient floor covering that would otherwise be exposed.

C. The Architect will direct the location for each termination and transition. At door frames, the transition will be centered under the door. At masonry openings, the transition will occur such that the outer edge of the transition strip aligns with the edge of the Corridor.

3.4 CLEANING AND PROTECTION

A. Comply with manufacturer's written instructions for cleaning and protection of resilient products.

B. Cover resilient products until date of Acceptance by Owner.

END OF SECTION 096513

SECTION 096816 – TILE CARPETING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes direct glue-down loop carpet and integral backing; and includes stair nosings.

B. Related Sections:

033000, Cast-in-Place Concrete.
096253, Resilient Base and Accessories.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Show the following:

1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts are required in carpet.
2. Carpet type, color, and dye lot.
3. Seam locations, types, and methods.
4. Pile direction.

C. Samples: For each exposed product and for each color and texture specified.

1.3 INFORMATIONAL SUBMITTALS

A. Warrant: Sample of special warranty.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Comply with CRI 104.

1.6 FIELD CONDITIONS

A. Comply with CRI 104 for temperature, humidity, and ventilation limitations.

1.7 WARRANTY

A. Special Warranty for Carpet: Manufacturer agrees to repair or replace components of carpet installation that fail in materials or workmanship within specified warranty period.

1. Warranty does not include deterioration or failure of carpet due to unusual traffic, failure of substrate, vandalism, or abuse.
2. Failures include, but are not limited to, more than 10 percent loss of face fiber, edge raveling, snags, runs, loss of tuft bind strength and delamination.
3. Warranty Period: 5 years from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 CARPET

Carpet 1A – Tile

Size: 24”x24”

Primary Backing: Non-woven synthetic fiber

Construction: Engaged Tufted Pattern Loop

Yarn System: 100% Recycled Content Nylon

Face Weight: 23 oz./sq. yd.

Machine Gauge: 1/10 inch.

Pile Height: 0.18

Stitches Per Inch: 7 stiches/inch

Pile Density: 6,273 oz/cy

Fiber: 100% Solution Dyed Nylon

Installation Method: Monolithic

Carpet Tile Unit Size: 19.69 inches x 9.69 inches.

Location: Per Finish Schedule.

Color and Pattern to be selected from Manufacturer’s full range.

Basis of Design: as manufactured by Interface, 1280 West Peachtree St NW, Atlanta, GA 30309 PRODUCT: NET EFFECT COLLECTION, STYLE B603. Subject to matching the above specifications other manufacturers will be considered.

2.2 INSTALLATION ACCESSORIES

A. Trowelable Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet manufacturer.

B. Seam Adhesive: Hot-melt adhesive tape or similar product recommended by carpet manufacturer for sealing and taping seams and butting cut edges at backing to form secure seams and to prevent pile loss at seams.

2.3 CARPET STAIR NOSINGS

A. Provide Ecoglo C Series, C4171, clear anodized Type II Class I, with black non-slip strip and glow stripe.

1. Brightness shall comply with ASTM E2073, DIN 67510 Part 1, and ISO 17398:2004 Clause 7.1.
2. Slip Resistance shall comply with UL410, AS/NZS 4586-1999 and AS/NZ4586 – 2004.
3. Abrasion Resistance shall comply with ASTM B2044 – 97, ASTM B137-95 (2000) and JIS H8682-1:1999.
4. Flammability Resistance shall pass ASTM E162-02 AND ASTM D635-03.

B. Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work may be offered in substitution for this product.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet performance. Examine carpet for type, color, pattern, and potential defects.

B. Concrete Subfloors: Verify that concrete slabs comply with ASTM F 710.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

D. Preparation: Comply with CRI 104, Section 7.3, "Site Conditions; Floor Preparation," and with carpet manufacturer's written installation instructions for preparing substrates.

E. Installation:

1. Direct-Glue-Down Installation: Comply with CRI 104, Section 9, "Direct Glue-Down Installation."
2. Stair Installation: Comply with CRI 104, Section 13, "Carpet on Stairs" for glue-down installation.

F. Comply with carpet manufacturer's written recommendations and Shop Drawings for seam locations and direction of carpet; maintain uniformity of carpet direction and lay of pile. At doorways, center seams under the door in closed position.

G. Cut and fit carpet to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet manufacturer.

H. Extend carpet into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.

I. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on finish flooring as marked on subfloor. Use nonpermanent, non-staining marking device.

J. Install pattern parallel to walls and borders to comply with CRI 104, Section 15, "Patterned Carpet Installations" and with carpet manufacturer's written recommendations.

K. Perform the following operations immediately after installing carpet:

1. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet manufacturer.
2. Remove yarns that protrude from carpet surface.
3. Vacuum carpet using commercial machine with face-beater element.

L. Protect installed carpet to comply with CRI 104, Section 16, "Protecting Indoor Installations."

END OF SECTION 096816

SECTION 097720 – FIBERGLASS REINFORCED PLASTIC (FRP) WALL PANELS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Prefinished polyester glass reinforced plastic sheets and adhered to unfinished gypsum wallboard.

1. FRP wall panels and fasteners.
2. PVC trim.
3. PVC wall base.

B. Products Not Furnished or Installed under This Section:

1. Substrate.
2. Resilient Base.
3. Glass-mat gypsum wall board.

1.2 SUBMITTALS

A. Product Data: Submit sufficient manufacturer's data to indicate compliance with these specifications, including:

1. Preparation instructions and recommendations.
2. Storage and handling requirements and recommendations.
3. Installation methods.

B. Shop Drawings: Submit elevations of each wall showing location of paneling and trim members with respect to all discontinuities in the wall elevation.

C. Selection Samples: Submit manufacturer’s standard color pattern selection samples representing manufacturer's full range of available colors and patterns.

D. Samples for Verification: Submit appropriate section of panel for each finish selected indicating the color, texture, and pattern required.

1. Submit complete with specified applied finish.
2. For selected patterns show complete pattern repeat.
3. Exposed Molding and Trim: Provide samples of each type, finish, and color.

E. Manufacturers Material Safety Data Sheets (MSDS) for adhesives, sealants and other pertinent materials prior to their delivery to the site (available as downloads for most Marlite’s products at http://www.marlite.com/tech-details.aspx or by contacting Marlite at info@marlite.com).

1.3 QUALITY ASSURANCE

A. Conform to building code requirements for interior finish for smoke and flame spread requirements as tested in accordance with:

1. ASTM E 84 (Method of test for surface burning characteristics of building Materials)
   a. Wall Required Rating – Class [A] [C].

B. Sanitary Standards: System components and finishes to comply with:

1. United States Department of Agriculture (USDA) requirements for food preparation facilities, incidental contact.
2. Food and Drug Administration (FDA) 1999 Food Code 6-101.11.
3. Canadian Food Inspection Agency (CFIA) requirements.

1.4 DELIVERY, STORAGE AND HANDLING

A. Deliver materials factory packaged on strong pallets.

B. Store panels and trim lying flat, under cover and protected from the elements. Allow panels to acclimate to room temperature (range of 60 to 75°F) for 48 hours prior to installation.

1.5 PROJECT CONDITIONS

A. Environmental Limitations: Building are to be fully enclosed prior to installation with sufficient heat (70°) and ventilation consistent with good working conditions for finish work

B. During installation and for not less than 48 hours before, maintain an ambient temperature and relative humidity within limits required by type of adhesive used and recommendation of adhesive manufacturer.

1. Provide ventilation to disperse fumes during application of adhesive as recommended by the adhesive manufacturer.

1.6 WARRANTY

A. Furnish one-year guarantee against defects in material and workmanship from date of Acceptance by Owner.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURER

A. Marlite; 1 Marlite Drive, Dover, OH 44622. 800-377-1221 FAX (330) 343-4668 Email: info@marlite.com www.marlite.com.

B. Products by other manufacturers that meet the requirements of this specification include but are not limited to:

1. Crane Composites (Kemlite).
2. Glasteel.
3. Fiber-Tech Industries

C. Product:

1. Standard FRP

2.2 PANELS

A. Fiberglass reinforced thermosetting polyester resin panel sheets complying with ASTM D 5319.
   1. Coating: Multi-layer print, primer and finish coats or applied over-layer.
   2. Dimensions:
      a. Thickness – 0.090 “ (2.29mm) nominal
      b. Width - 4'-0” (1.22m) nominal
      c. Length – [10’-0” (3.0m)][8’-0” (2.4m)][As indicated on the drawings] nominal
   3. Tolerance:
      a. Length and Width: +/-1/8 “ (3.175mm)
      b. Square - Not to exceed 1/8 “ for 8 foot (2.4m) panels or 5/32 “ (3.96mm) for 10 foot (2.4m) panels

B. Properties: Resistant to rot, corrosion, staining, denting, peeling, and splintering.
   1. Flexural Strength - 1.0 x 10^4 psi per ASTM D 790. (7.0 kilogram-force/square millimeter)
   2. Flexural Modulus - 3.1 x 10^5 psi per ASTM D 790. (217.9 kilogram-force/square millimeter)
   3. Tensile Strength - 7.0 x 10^3 psi per ASTM D 638. (4.9 kilogram-force/square millimeter)
   4. Tensile Modulus - 1.6 x 10^5 psi per ASTM D 638. (112.5 kilogram-force/square millimeter)
   5. Water Absorption - 0.72% per ASTM D 570.
   6. Barcol Hardness (scratch resistance) of 35 55 as per ASTM D 2583.
   7. Izod Impact Strength of 72 ft. lbs./in ASTM D 256

C. Back Surface: Smooth. Imperfections which do not affect functional properties are not cause for rejection.

D. Front Finish:
   1. Color to be selected from full range of manufacturer’s standard colors.
   2. Surface Texture: Pebbled.

E. Size: 120 inches.

F. Fire Rating: Class A.

2.3 BASE

A. Marlite Base Molding for 0.090” (2.29mm) thick FRP Panels
   1. Color: Match the panel color.
   2. Profiles: Select from below, as required:
      a. M 612 FRP Base Molding, 10’ length
      b. M 651 Inside Corner
      c. M 660 Outside Corner

d. M 620 LH End Cap
e. M 625 RH End Cap

2.4 MOLDINGS

A. PVC Trim: Thin-wall semi-rigid extruded PVC.

1. M 360 Outside Corner, [8’ length][10’ length]
2. M 365 Division, [8’ length][10’ length]
3. M 370 Edge, [8’ length][10’ length]
4. Color: Match panel color.

2.5 ACCESSORIES

A. Fasteners: Non-staining nylon drive rivets.

1. Match panel colors.
2. Length to suit project conditions.

B. Adhesive: Either of the following construction adhesives complying with ASTM C 557.

1. Marlite C-551 FRP Adhesive - Water- resistant, non-flammable adhesive.
2. Marlite C-915 Construction Adhesive - Flexible, water-resistant, solvent based adhesive, formulated for fast, easy application.
3. Titebond Advanced Polymer Panel Adhesive – VOC compliant, non-flammable, environmentally safe adhesive.

C. Sealant:

1. Marlite Brand MS-250 Clear Silicone Sealant.
2. Marlite Brand MS-251 White Silicone Sealant.
3. Marlite Brand - Color Match Sealant.

PART 3 - EXECUTION

3.1 PREPARATION

A. Examine backup surfaces to determine that corners are plumb and straight, surfaces are smooth, uniform, clean and free from foreign matter, nails countersunk, joints and cracks filled flush and smooth with the adjoining surface.

1. Verify that stud spacing does not exceed 24” (61cm) on-center.

B. Repair defects prior to installation.

1. Level wall surfaces to panel manufacturer’s requirements. Remove protrusions and fill indentations.

3.2 INSTALLATION

A. Comply with manufacturer's recommended procedures and installation sequence.

B. Cut sheets to meet supports allowing 1/8” (3 mm) clearance for every 8 foot (2.4m) of panel.

1. Cut and drill with carbide tipped saw blades or drill bits or cut with shears.
2. Pre-drill fastener holes 1/8” (3mm) oversize with high speed drill bit.

    a. Space at 8” (200mm) maximum on center at perimeter, approximately 1” from panel edge.
    b. Space at in field in rows 16’ (40.64cm) on center, with fasteners spaced at 12” (30.48 cm) maximum on center.

C. Apply panels to board substrate, above base, vertically oriented with seams plumb and pattern aligned with adjoining panels.

1. Install panels with manufacturer's recommended gap for panel field and corner joints.

    a. Adhesive trowel and application method to conform to adhesive manufacturer’s recommendations.
    b. Drive fasteners for snug fit. Do not over-tighten.

D. Apply panel moldings to all panel edges using silicone sealant providing for required clearances.

1. All moldings must provide for a minimum 1/8 “ (3mm) of panel expansion at joints and edges, to insure proper installation.
2. Apply sealant to all moldings, channels and joints between the system and different materials to assure watertight installation.

3.3 CLEANING

A. Remove excess sealant from panels and moldings. Wipe panel down using a damp cloth and mild soap solution or cleaner.

B. Refer to manufacturer's specific cleaning recommendations Do not use abrasive cleaners.

1

2 END OF SECTION 097720

SECTION 099123 - INTERIOR PAINTING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes surface preparation and the application of paint systems on the following interior substrates:

1. Concrete.
2. Concrete masonry units (CMU).
3. Steel.
4. Wood.
5. Gypsum board.
6. Spray-on Acoustic Insulation

B. Related Sections include:

1. 042000, Unit Masonry.
2. 064023, Interior Architectural Woodwork.
3. 079200, Joint Sealants.
4. 081213, Hollow Metal Frames.
5. 090000, Color Schedule.
6. 092900. Gypsum Board Assemblies.
7. 096253, Resilient Stage Flooring Assemblies (for stage floor coating)

1.2 DEFINITIONS

A. Gloss Level 1: Not more than 5 units at 60 degrees and 10 units at 85 degrees, according to ASTM D 523.

B. Gloss Level 2: Not more than 10 units at 60 degrees and 10 to 35 units at 85 degrees, according to ASTM D 523.

C. Gloss Level 3: 10 to 25 units at 60 degrees and 10 to 35 units at 85 degrees, according to ASTM D 523.

D. Gloss Level 4: 20 to 35 units at 60 degrees and not less than 35 units at 85 degrees, according to ASTM D 523.

E. Gloss Level 5: 35 to 70 units at 60 degrees, according to ASTM D 523.

F. Gloss Level 6: 70 to 85 units at 60 degrees, according to ASTM D 523.

G. Gloss Level 7: More than 85 units at 60 degrees, according to ASTM D 523.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include preparation requirements and application instructions.

B. Samples: For each type of paint system and in each color and gloss of topcoat.

C. Product List: For each product indicated. Include printout of current "MPI Approved Products List" for each product category specified in Part 2, with the proposed product highlighted.

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Paint: 5 percent, but not less than 1 gal. (3.8 L) of each material and color applied.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to products listed in other Part 2 articles for the paint category indicated.

2.2 PAINT, GENERAL

A. MPI Standards: Provide products that comply with MPI standards indicated and that are listed in its "MPI Approved Products List."

B. Material Compatibility:

1. Provide materials for use within each paint system that are compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
2. For each coat in a paint system, provide products recommended in writing by manufacturers of topcoat for use in paint system and on substrate indicated.

C. VOC Content: Products shall comply with VOC limits of authorities having jurisdiction and, for interior paints and coatings applied at Project site, the following VOC limits, exclusive of colorants added to a tint base, when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

1. Flat Paints and Coatings: 50 g/L.
2. Nonflat Paints and Coatings: 150 g/L.
3. Dry-Fog Coatings: 400 g/L.
4. Primers, Sealers, and Undercoaters: 200 g/L.
5. Anticorrosive and Antirust Paints Applied to Ferrous Metals: 250 g/L.
6. Zinc-Rich Industrial Maintenance Primers: 340 g/L.
7. Pretreatment Wash Primers: 420 g/L.
8. Floor Coatings: 100 g/L.
9. Shellacs, Clear: 730 g/L.
10. Shellacs, Pigmented: 550 g/L.

D. Low-Emitting Materials: Interior paints and coatings shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

E. Colors: As indicated in Color Schedule 090000.

2.3 BLOCK FILLERS

A. Block Filler/Surfacer, Latex Acrylic, Interior/Exterior: MPI #4.

1. Sherwin-Williams Acrylic Latex Primer/Surfacer A24W00200/LX01W0200.
2. Benjamin Moore Latex Primer/Filler: 0608/K608.
3. PPG Architectural Surfacer/Filler: 4-100XI.

2.4 CONCRETE/MASONRY PRIMERS/SEALERS

A. Primer Sealer, Latex, Interior: MPI #50.

1. Sherwin-Williams Interior Latex Primer: C162.
2. Benjamin Moore Interior Latex Primer: N534/K534.
3. PPG Architectural, Dulux: 59113.

B. Primer, Alkali Resistant, Water Based: MPI #3.

1. Sherwin-Williams Concrete/Masonry Primer: A24W8300/LX02W0050.
2. Benjamin Moore Concrete/Masonry Primer: K958.
3. PPG Architectural: 17-921XI Series.

2.5 METAL PRIMERS

A. Primer, Rust-Inhibitive, Water Based Acrylic: MPI #107.

1. Sherwin-Williams Latex Primer B66W01310.
2. Benjamin Moore Latex Primer HP04/FP04.
3. PPG Architectural, Pitt-Tech: 90-712.

B. Primer, Galvanized, Water Based Acrylic: MPI #134.

1. Sherwin-Williams Latex Primer B66W00011.
2. Benjamin Moore Latex Primer HP04/FP04.
3. PPG Architectural, Dulux: 1535.

2.6 WOOD/DRYWALL PRIMERS/SEALERS

A. Primer, Latex, for Interior Wood: MPI #39.

1. Sherwin-Williams Latex Primer B51W00450.
2. Benjamin Moore Latex Primer 027.
3. PPG Architectural: 17-921.

B. Primer Sealer, Latex, Interior: MPI #50.

1. Sherwin-Williams Drywall Primer C152.
2. Benjamin Moore Latex Primer N534/K534.
3. PPG Architectural, Dulux: 59113.

2.7 WATER-BASED PAINTS

A. Latex Acrylic, Interior, High Performance Architectural, Semi-Gloss (Gloss Level 5): MPI #141.

1. Sherwin-Williams: K38W00351.
2. Benjamin Moore Acrylic: HP29/FP29.
3. PPG Architectural, Dulux Diamond: 13210.

B. Latex, Interior, Flat (Gloss Level 1): MPI #143.

1. Sherwin-Williams, Emerald: K36W00451.
2. Benjamin Moore Waterborne 547/K547.
3. PPG Architectural: 9-100.

2.8 FLOOR COATINGS

A. Sealer, Water Based, for Concrete Floors: MPI #99.

1. Sherwin-Williams H&C Concrete and Masonry Waterproofing Sealer: 50.048054.
2. PPG Architectural: 4-6200.
3. Behr Paint: 985.

B. Water Based, for Concrete Floors: MPI #60.

1. Sherwin-Williams Armorseal Tread-Plex: B90W111.
2. PPG Architectural, Sico: 261-501.
3. Kelly-Moore, DuraProxy Plus: 1786-122.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Applicator present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.

B. Maximum Moisture Content of Substrates: When measured with an electronic moisture meter as follows:

1. Concrete: 12 percent.
2. Masonry (Clay and CMU): 12 percent.
3. Wood: 15 percent.
4. Gypsum Board: 12 percent.
5. Plaster: 12 percent.

C. Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers.

D. Proceed with coating application only after unsatisfactory conditions have been corrected.

1. Application of coating indicates acceptance of surfaces and conditions.

3.2 PREPARATION

A. Comply with manufacturer's written instructions and recommendations in "MPI Manual" applicable to substrates indicated.

B. Remove hardware, covers, plates, and similar items already in place that are removable and are not to be painted. If removal is impractical or impossible because of size or weight of item, provide surface-applied protection before surface preparation and painting.

1. After completing painting operations, use workers skilled in the trades involved to reinstall items that were removed. Remove surface-applied protection if any.

C. Clean substrates of substances that could impair bond of paints, including dust, dirt, oil, grease, and incompatible paints and encapsulants.

1. Remove incompatible primers and reprime substrate with compatible primers or apply tie coat as required to produce paint systems indicated.

3.3 APPLICATION

A. Apply paints according to manufacturer's written instructions and to recommendations in "MPI Manual."

B. Apply paints to produce surface films without cloudiness, spotting, holidays, laps, brush marks, roller tracking, runs, sags, ropiness, or other surface imperfections. Cut in sharp lines and color breaks.

3.4 CLEANING AND PROTECTION

A. Protect work of other trades against damage from paint application. Correct damage to work of other trades by cleaning, repairing, replacing, and refinishing, as approved by Architect, and leave in an undamaged condition.

B. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.5 INTERIOR PAINTING SCHEDULE

A. Concrete Substrates, Traffic Surfaces:

1. Water-Based Clear Sealer System:

a. First Coat: Sealer, water based, for concrete floors, MPI #99.
b. Topcoat: Sealer, water based, for concrete floors, MPI #99.

B. Steel Substrates:

1. High-Performance Architectural Latex System:

a. Prime Coat: Shop primer specified in Section 051200 "Structural Steel Framing" where substrate is specified.
b. Intermediate Coat: Latex, interior, high performance architectural, matching topcoat.

c. Topcoat: Latex, interior, high performance architectural, semi-gloss (Gloss Level 5), MPI #141.

C. Wood Substrates: Including wood trim, architectural woodwork.

1. High-Performance Architectural Latex System:

a. Prime Coat: Primer, latex, for interior wood, MPI #39.
b. Intermediate Coat: Latex, interior, high performance architectural, matching topcoat.
c. Topcoat: Latex, interior, high performance architectural, semi-gloss (Gloss Level 5), MPI #141.

D. Gypsum Board Substrates:

1. High-Performance Architectural Latex System:

a. Prime Coat: Primer sealer, latex, interior, MPI #50.
b. Intermediate Coat: Latex, interior, high performance architectural, matching topcoat.
c. Topcoat: Latex, interior, high performance architectural, semi-gloss (Gloss Level 5), MPI #141.

E. CMU Substrates:

1. High-Performance Architectural Latex System:

a. Block Filler: Block filler, latex, interior/exterior, MPI #4.
b. Intermediate Coat: Latex, interior, high performance architectural, matching topcoat.
c. Topcoat: Latex, interior, high performance architectural, semi-gloss (Gloss Level 5), MPI #141.

END OF SECTION 099123

SECTION 099600 - HIGH-PERFORMANCE COATINGS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes surface preparation and application of high-performance coating systems on the following substrates:

1. Exterior Substrates:

a. Steel.
b. Galvanized metal.
c. Exterior Insulation and Finish System (EIFS).
d. Concrete.

B. For MPI (Master Painters Institute) product designations go to www.specifyingpaint.com. All acceptable products for each designated number are listed on this website.

1.2 DEFINITIONS

A. Gloss Level 4: 20 to 35 units at 60 degrees and not less than 35 units at 85 degrees, according to ASTM D 523. Also identified as “satin”.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include preparation requirements and application instructions.

B. Samples: For each type of coating system and in each color and gloss of topcoat indicated.

C. Product List: For each product indicated, include printout of current "MPI Approved Products List" for each product category specified in Part 2, with the proposed product highlighted.

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Coatings: 5 percent, but not less than 1 gal. (3.8 L) of each material and color applied.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to products listed in other Part 2 articles for the paint category indicated.

2.2 HIGH-PERFORMANCE COATINGS, GENERAL

A. MPI Standards: Provide products that comply with MPI standards indicated and are listed in "MPI Approved Products List."

B. Material Compatibility:

1. Provide materials for use within each coating system that are compatible with one another and substrates indicated, under conditions of service and application as demonstrated by manufacturer, based on testing and field experience.
2. For each coat in a coating system, provide products recommended in writing by manufacturers of topcoat for use in coating system and on substrate indicated.
3. Provide products of same manufacturer for each coat in a coating system.

C. VOC Content: Products shall comply with VOC limits of authorities having jurisdiction.

1. Flat Paints and Coatings: 50 g/L.
2. Non-flat Paints and Coatings: 150 g/L.
3. Primers, Sealers, and Undercoaters: 200 g/L.
4. Anti-Corrosive and Anti-Rust Paints Applied to Ferrous Metals: 250 g/L.
5. Zinc-Rich Industrial Maintenance Primers: 340 g/L.

D. Colors: Match Architect's samples.

2.3 METAL PRIMERS

A. Primer, Acrylic, for Metal: MPI #107.

1. Pro-Cryl Primer B66A310, by Sherwin-Williams, or equivalent product.

2.4 STEEL COATINGS

A. Acrylic, Satin Gloss: MPI #154.

2.5 EIFS SURFACES

A. As recommended by EIFS Manufacturer.

2.6 CONCRETE

A. Acrylic, same matching EIFS.

2.7 CONCRETE FLOOR SLABS

A. Epoxy-Resin Binder/Matrix:

Provide a clear two-component compatible system epoxy resin binder consisting of: (1) a liquid blend of a biphenyl-based epoxy resin and an aliphatic polyglyceridyl ether, and (2) a liquid blend of two modified amine curing agents, which individually cures the epoxy resin at room temperature to a glossy smooth film.

The aggregate floor system to be Royal Coat's Stone Chip high build flooring system or equivalent product meeting these Specifications.

B. Product Properties:

1. (EPOXY RESIN) Base Coat / Build Coat
   Viscosity (kinematic), at 77 degrees F, centipoises ASTM D445 3000 to 5000
   Weight per epoxide, grams ASTM D1652 205 to 225
   Color (Gardner Color Scale), maximum ASTM D1544 5
   Weight per gallon, pounds ASTM D1475 9.46 - 9.56

2. COMPONENT B (CURING AGENT)
   Viscosity (kinematic), at 77 degrees F, centistokes ASTM D445 75 to 125
   Weight per gallon, pounds ASTM D1475 7.50 to 7.60 SECTION 09 67 23.13 Page 4
   REPLACE POOL DECK SURFACE BLDG 289 6200771 PROPERTY TEST METHOD
   REQUIREMENT Color (Gardner Color Scale), maximum ASTM D1544 8

C. Cured Epoxy Binder

1. Combine components A and B in the proportions specified by the manufacturer to form a clear compatible system immediately on mixing. Cure combined components to a clear film possessing a glossy, nongreasy surface at relative humidities less than 80 percent, having the following properties after curing 24 hours at 77 degrees F, followed by 24 hours at 125 degrees F:

   PROPERTY TEST METHOD REQUIREMENT

   Tensile strength, psi* at test temperature: 77 degrees F ASTM D638 4500 to 6500

   Tensile elongation, percent* at test temperature: 77 degrees F ASTM D638 20 to 40

   Water absorption, percent 24 hours at 77 degrees F, maximum ASTM D570 0.40

   Hardness, Shore D ASTM D2240 74 to 82 Linear shrinkage, inch/inch maximum
   ASTM C881/C881M 0.006

   Shrinkage, glass bow, inch divergence, maximum ASTM A990 0.016

   Coefficient of linear thermal expansion, inch/inch/degree C, maximum

2. Aggregate:

   Provide aggregate in the form of a multi-colored shaved granite flake recommended by the resinous flooring aggregate manufacturer.

3. Surface Sealing Coat:

Provide non-ambering aliphatic Polyaspartic urethane surface sealer. Provide surface with some slip resistance, a 150-grit aluminum oxide aggregate provided only in areas requested.

Select surface texture and slip resistance from samples provided by Applicator.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify suitability of substrates, including surface conditions and compatibility with existing finishes and primers.

B. Proceed with coating application only after unsatisfactory conditions have been corrected.

1. Beginning coating application constitutes CMR's acceptance of substrates and conditions.

3.2 PREPARATION

A. Comply with manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" applicable to substrates indicated.

B. Clean substrates of substances that could impair bond of coatings, including chalking, dust, dirt, rust, oil, grease, loose and incompatible paints and encapsulants.

1. Remove incompatible primers and re-prime substrate with compatible primers or apply tie coat as required to produce coating systems indicated.

3.3 APPLICATION

A. Apply high-performance coatings according to manufacturer's written instructions and recommendations in "MPI Architectural Painting Specification Manual" or manufacturer's printed instructions.

B. Apply coatings to produce surface films without cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness, or other surface imperfections. Produce sharp glass lines and color breaks.

3.4 CLEANING AND PROTECTION

A. Protect work of other trades against damage from coating operation. Correct damage by cleaning, repairing, replacing, and recoating, as approved by Architect, and leave in an undamaged condition.

B. At completion of construction activities of other trades, touch up and restore damaged or defaced coated surfaces.

3.5 HIGH-PERFORMANCE COATING SCHEDULE

A. Steel Substrates:

1. Acrylic System:

a. Prime Coat: Primer, Acrylic, for Metal: MPI #107.
b. Intermediate Coat: Acrylic, Satin Gloss: MPI #154.
c. Topcoat: Acrylic, Satin Gloss: MPI #154.

B. Galvanized-Metal Substrates:

1. Acrylic System:

a. Prime Coat: Primer, Acrylic, for Metal: MPI #107.
b. Intermediate Coat: Acrylic, Satin Gloss: MPI #154.
c. Topcoat: Acrylic, Satin Gloss: MPI #154.

C. EIFS Substrates:

1. As recommended by EIFS manufacturer, subject to the requirements of Section 072419 of this spec, including but not limited to the contact angle of water adhesion exhibited and documented for the Basis-of-Design product (125 degrees), and applied by EIFS subcontractor.

D. Concrete:

1. Acrylic, matching EIFS finish, where noted.

E. Concrete Floor Coating:

1. Epoxy Floor System:

a. Epoxy-Resin Binder/Matrix.
b. Surface Sealing Coat.

END OF SECTION 099600

SECTION 099800 – EXHIBIT TANK COATING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Polymer coating system for coloring & smoothing walls of architectural scale tanks over concrete & crystalline capillary waterproofing where indicated.

1.2 RELATED SECTIONS

A. Cast-in-Place Concrete is specified in Section 033000

B. Exhibit Tank Glazing is specified in Section 08 84 00

1.3 REFERENCES

A. ACI 515.1R – A Guide to the Use of Waterproofing, Damp-proofing, Protective and Decorative Barrier Systems for Concrete.

1.4 SUBMITTALS

A. Comply with project Submittal Procedures.

1. Product substitutions to be submitted by Contractor and approved by Architect at least 10 days before bid date
2. Proposed substitutions shall have not less than 5-years application history in at least 3 similar exterior installations. Provide contact information for the owners of the facilities in which the systems have been installed.

B. Product Data: Submit manufacturer's product data, including physical properties, surface preparation, application instructions, and curing instructions.

C. Test Reports: Submit manufacturer's test reports of in-place testing performed by an independent testing agency

D. CMR shall submit a list of three polymer lining system projects, with at least three years of successful service history, including project name and location, names and telephone numbers of owner and engineer, and description of products used, substrates, and application procedures.

E. CMR shall submit certification letter stating that all products (, primer, flexible underlayment or epoxy void filler, epoxy saturant, epoxy topcoat and urethane sealcoat) are from a single source. Single source is defined as a single entity (person or company) that owns all rights to all system components.

F. Applicator Qualifications: Submit qualifications of applicator.

1. Certification by the manufacturer stating that the applicator is trained and approved in the application of the specified products.
2. Certification of a minimum of three years' experience in successful application of epoxy laminate or tank lining systems similar or identical to the systems specified herein.

G. For interior coatings, documentation including printed statement of VOC content.

1.5 QUALITY ASSURANCE

A. Applicator Qualifications:

1. Applicators must be trained and approved by the manufacturer in the application of the specified products.
2. Contractor must employ persons trained for the application of the specified products.

B. Pre-Application Meeting: Convene a pre-application meeting 2 weeks before the start of application of the Fluid-Applied Waterproofing for Aquarium Tanks (Polymer Lining System). Require attendance of parties directly affecting work of this section, including the Contractor,

Engineer, applicator, and manufacturer's technical service representative. Review surface preparation, application, curing, field quality control, and coordination with other work.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.

B. Storage:

1. Store materials in accordance with manufacturer's instructions.
2. Keep containers sealed until ready for use.
3. Store materials in a cool, dry environment.
4. Storage Temperature of Polymer Lining System Materials: 40 to 80 degrees F.

C. Handling: Protect materials during handling and application to prevent damage.

1.7 ENVIRONMENTAL CONDITIONS

A. Do not apply materials under the following conditions:

1. Temperatures exceeding the manufacturer's recommended maximum or minimum allowable.
2. Dusty or smoke-laden atmosphere.
3. Damp or wet conditions.

B. Provide temporary enclosure and electric heating as required to maintain conditions within Manufacturer’s installation requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Madewell Products Corporation, 7561A Industrial Court, Alpharetta, Georgia 30004. Phone (770) 475- 8199. Fax (770) 475-8167. Internet: www.madewell.net

B. Sta-Crete SS1500"; Epmar Corporation, 13210 E. Barton Circle, Santa Fe Springs, CA 90670 (310) 946-8781.

C. Aquafin, Inc 505 Blue Ball Road, #160. Elkton, MD 21921. Phone (800) 394-1410

D. Alternative manufacturers subject to Owner and Exhibit Designer approval.

2.2 PAINT/COATING SYSTEM FOR AQUARIUM TANKS

A. General

1. Primer, Void filler/surfacer, topcoat and urethane sealcoat shall be procured from a single manufacturer.
2. Materials must be compatible with substrate and with each other. Materials must have a minimum of three years of successful service history in fresh and salt water aquarium and zoo tanks.
3. Materials must be compatible with substrate and with each other. Materials must have a minimum of three years of successful service history in fresh and salt water aquarium and zoo tanks.
4. Alternate products meeting performance criteria will be considered.

B. Epoxy Primer/Sealer: Madewell 927 Penetrating Epoxy Primer/Sealer

1. Composition: 100 percent solids epoxy
2. Thickness: 8 mils at 200 square feet per gallon.
3. Number of Components: 2.

C. Flexible Epoxy Void Filler and Surfacer: Madewell 806 Thixotropic Epoxy Surfacer and Void Filler.

1. Composition: 100 percent solids epoxy paste.
2. Thickness: Minimum of 40 mils.
3. Number of Components: 2.

D. Epoxy Saturated Fiberglass: Madewell 1312E Epoxy Saturant

1. Composition: 1.5 ounce chopped strand mat fiberglass and 100% solids modified epoxy saturant
2. Number of Components: 2.
3. Color: Translucent blue

E. Epoxy Topcoat: Madewell 1312S Epoxy Coating System.

1. Composition: 100% Solids Epoxy Coating
2. Thickness: Two 10 mil coats
3. Number of Components: 2.
4. Finish: Gloss
5. Color: Custom colors to match sealcoat, as selected by architect

F. Urethane Sealcoat (all systems): Madewell 1450 Aliphatic Polyurethane Coating

1. Composition: 60% Solids Aliphatic Polyurethane Coating
2. Thickness: 4 to 6 mils WFT, 2.5 to 3.5 mils DFT
3. Number of Components: 2.
4. Finish: Gloss
5. Color: 2 Custom colors as selected by the Architect

PART 3 - EXECUTION

3.1 EXAMINATION

A. Coordinate Examine surfaces to receive restoration mortar or primer.

1. Check for previously-applied coatings, structural flaws, cracks, voids, honeycombs, grease and oil contamination, salt contamination and pH.
2. Previously applied coatings shall be removed by abrasive or high-pressure water jetting, as specified herein.
3. Structural flaws, cracks, voids and honeycombs shall be repaired to the satisfaction of the Engineer and manufacturer's technical service representative.
4. Grease and oil contamination shall be removed by means of detergents, degreasers, steam and/or chemical agents, followed by rinsing with copious amounts of fresh potable water.
5. All detectable soluble salts shall be removed by means of rinsing with copious amounts of fresh potable water.

B. Notify the Architect in writing if surfaces are not acceptable. Do not begin surface preparation or application until unacceptable conditions have been corrected.

C. Provide the Architect with a minimum of 3-days advance notice of completion of surface preparation and start of application.

D. Before application of each material, surfaces to be lined will be inspected by the Architect and the manufacturer's technical service representative. Correct defects or deficiencies before application of subsequent material.

E. Inspection by the Architect and the manufacturer's technical service representative or the waiver of inspection of any portion of the work shall not relieve the Contractor of responsibility to perform the work as specified.

3.2 SURFACE PREPARATION

A. Prepare surfaces in accordance with manufacturer's instructions.

1. Remove existing liners at concrete tanks using 40,000 psi rotary head water blasting equipment and grinding.
2. Remove existing degraded gelcoat and/or liners at fiberglass tanks using angle grinders with 24 grit pads

    a. Cleaning: Clean surfaces by Low-Pressure Water Cleaning according to the requirements of SSPC-SP 12/NACE 5, unless otherwise directed by the manufacturer in writing, to remove all unsound concrete, contaminants, dirt, debris, and/or existing coatings or detectable soluble salts.

B. Inspection:

1. Inspect cleaned surfaces to identify and mark cracks, and joints.
2. Inspect surfaces for soundness by tapping with a hammer, checking for loose aggregate and soft spots.

C. Prepare surfaces to a minimum CSP 3 per ICRI Technical Guideline 03732.

D. Repair minor defects in concrete such as bug holes, surface cracks and formwork offsets by filling with coating manufacturer's recommended patching material and/or grinding to form a smooth surface.

E. Where cracks, construction joints or other defects have been previously repaired or coated with crystalline capillary waterproofing ensure surface to receive coating is smooth and sound.

3.3 APPLICATION OF EPOXYPRIMER/SEALER

A. Apply epoxy primer/sealer to prepared substrate at a coverage rate of 200 sf/gallon (8 mils).

B. Concrete substrate should have a dark, wet appearance when adequately primed/sealed. If small areas appear to be dry after initial application of epoxy primer/sealer, re-apply epoxy primer/sealer to those areas.

C. Surfaces are ready to be lined when epoxy primer/sealer has completely achieved a dry-to-the-touch condition.

3.4 APPLICATION OF EPOXY SATURATED FIBERGLASS

A. While the primer is still tacky apply the layer of fiberglass to the surface (1.5 ounce chopped strand mat). Lay straight and wrinkle free.

B. Wet wall with epoxy saturant using ½ nap or 3/8 nap rollers area needs to be completely saturated (no white of mat left). The area should be checked and air rollers used to remove any trapped air bubbles.

C. Allow epoxy to cure a minimum of 12 hours.

D. Grind surface with Zek wheels or 24 grit abrasive wheels to remove any voids or rough areas and smooth the seams of the fiberglass.

E. Clean the surface and complete any repairs needed.

3.5 APPLICATION OF EPOXY TOPCOAT and URETHANE SEALCOAT (all systems)

A. Apply first coat of epoxy topcoat by roller or spray to a minimum of 10 mils WFT. Allow first coat to become tack free before application of second coat.

B. Sand first coat after it becomes tack free (with up to 40 grit sandpaper) and/or clean all surfaces as required to achieve desired surface smoothness.

C. Apply second coat of epoxy topcoat by roller or spray to a minimum of 10 mils WFT.

1. At above water horizontal walking surfaces, apply by roller to form “orange peel” texture for slip resistance

D. Inspect second coat, sand (with up to 100 grit sandpaper), and repair as required.

E. Apply urethane sealcoat by roller to a minimum of 4 to 6 mils WFT. Allow epoxy topcoat to become tack free prior to application, but no later than 72 hours after application of epoxy topcoat.

1. At above water horizontal walking surfaces, maintain “orange peel” texture for slip resistance.

F. Allow urethane sealcoat to cure a minimum of 7 days at 72o F before putting into immersion service.

3.6 TERMINATION, PENETRATION, CRACK TREATMENT, TRANSITION AND ATTACHMENT DETAILS FOR TANK COATING

A. For terminations from coating to bare concrete, before surface preparation is begun, sawcut and chip out a shallow key for the Epoxy at the transition line or as recommended by the coating manufacturer and die the coating system into the key.

B. Details for termination of tank waterproofing at pipe penetrations shall be as recommended by the Manufacturer.

C. Termination of tank waterproofing at acrylic tank window rebates shall be as indicated on Sheet A9.70. Where tank coating is used as the epoxy surface within the window rebate, prior to placing the window panels, the laminate surfaces to be sealed with silicone sealant should be sanded smooth and vacuumed clean to ensure that the sealant will adhere properly. The finish coat in this area should be the epoxy topcoat only. Do not apply the Urethane Sealcoat within the window rebates. Coordinate application with the acrylic tank window Installer.

D. Provide fillet of epoxy void filler below the waterproofing system at all inside corner transitions as recommended by the manufacturer.

E. Any changes to or modifications of any of the details listed above shall be requested in writing before the beginning of installation of the tank waterproofing. Approval shall be given only after review and approval by the manufacturer and the architect/engineer. Any increase in the cost of the detail due to the change(s) shall be borne by the contractor.

3.7 FIELD QUALITY CONTROL

A. Field Quality Control Testing: Performed and documented by the Approved Contractor in the presence of the manufacturer's technical representative.

B. Test Patch: The contractor shall install a 4' x 10' test patch to be tested in accordance with C, D and E below before application work begins.

C. Perform Destructive Dry Film Thickness Tests in accordance with the principles of ASTM D 4138:

1. Perform 1 test on finished composite for every 1,000 square feet of surface to be lined. If the thickness is correct, no further testing is required for that area.
2. If the initial thickness test does not indicate correct composite thickness, an additional 4 measurements will be made, the average of which must equal minimum specified thickness, although individual measurements may under run this amount by a maximum of 20 percent.
3. Any area that does not meet the specified thickness as tested in 1. and 2. above, shall receive additional composite waterproofing thickness (depending on the time and environment, additional surface preparation may be required).
4. If the areas tested are of proper thickness, destructive test sites shall be repaired with the composite waterproofing system specified at the contractor's expense prior to placing the system into service.

D. Perform Spot Adhesion Testing of Tank Waterproofing System to Substrate in accordance with the principles of ASTM D 4541 using a Madewell Adhesion Tester in accordance with manufacturer's instructions:

1. Perform minimum of 1 uniaxial pull-off adhesion test for every 1,000 square feet of surface lined. Minimum test value for Systems 1, 2 and 3 shall be equal to or greater than 350 psi. Minimum test value for Systems 4, 5 and 6 shall be equal to or greater than 145 psi.
2. Remove and replace areas not meeting required minimum adhesion requirement.
3. If the condition of the substrate is such that minimum pull-off adhesion requirement cannot be met by removal of the upper 1/4" of the substrate, work shall not proceed until a course of corrective action has been determined that will effectively produce the required adhesion results. When an effective course of remedial action has been determined, the owner's representative and the contractor shall negotiate a mutually agreeable settlement to cover the costs associated with the surface evaluation and remedial action.

E. Visual Inspection for Holidays in Composite Waterproofing System:

1. Visual Inspection: Perform visual inspection for holidays in Composite Waterproofing System.
2. Mark areas identified for repair and reapplication of Composite Waterproofing System.
3. Repair areas marked according to manufacturer's instructions.

END OF SECTION 099800

SECTION 100000 - MISCELLANEOUS SPECIALTIES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division -1 Specification sections, apply to work of this section.

1.2 DESCRIPTION OF WORK:

A. This section includes all miscellaneous specialty items not included by any specific building trade group. Items that follow are the responsibility of the general contractor whether he supplies the labor to install them or lets the work of furnishing and installation to others.

B. Scope: This contractor shall provide all items, articles, materials, operations, or methods listed, mentioned, or scheduled on the drawings, or hereinafter specified, including all labor, materials, equipment and incidentals necessary and required for their completion.

1.3 QUALITY ASSURANCE:

A. Field Measurements: Take field measurements for items to be built-in prior to preparation of shop drawings and fabrication. This is not necessary for manufactured items or free-standing items.

B. Manufacturers as listed shall be used as a guide for design and quality. Other manufacturers' products of equal design and quality may be used upon written approval of the Architect. Where more than one manufacturer is listed for an item in the products schedule, one may be indicated as a guide for specification and for detailing.

1.4 SUBMITTALS:

A. Product Data: Submit manufacturer's specifications, details, and installation instructions for manufactured products.

B. Shop Drawings: Submit for approval specified copies of shop drawings, catalog cuts, and necessary information for each item before work is commenced. Include plans, elevations, details, anchorage and accessory items, as needed for approval, fabrication, and installation.

C. Setting Drawings: Provide setting drawings, templates, instructions, and directions or installation of anchorage devices in other work.

PART 2 – PRODUCTS

2.1 Index of Miscellaneous Specialty Items:

A. Specification for each item follows in Part 4 - Schedule of Miscellaneous Specialty Items:

1. Fire Extinguisher Cabinets (FEC).
2. Toilet Accessories.

3. Roller Shades.
4. Toilet Compartments.
5. Interior Signage.
6. Metal Access Door.
7. Marker Boards and Tack Boards.
8. Expansion Joint Covers.
9. Entrance Floor Mats and Frames (RCM).
10. Dock Bumpers.
11. Folding Partitions.
12. Suspended Curtain Track.
13. Composite Manhole Covers.
14. Coiled Wire Fabric Curtain System.

B. Schedule of Miscellaneous Specialty Items:

1. Fire Extinguisher Cabinets

Locations:

Refer to Sheets A-2.21 A through A-2.23 B.

Mounting Height:

Top of cabinet shall be 5'-4" a.f.f.

Available Manufacturers:

Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include, but are not limited to the following:

Larsen's Manufacturing Company
J.L. Industries
Potter-Roemer

Cabinets:

Heavy gauge, white baked enamel box with clear aluminum trim and door. Hardware to suit cabinet's trim and door style. Mitered corners with extruded or fabricated aluminum trim.

Available Manufacturers:

Subject to compliance with requirements, manufacturers offering products that may be provided include, but are not limited to the following:

Larsen's Manufacturing Co. FS AL 2409-5R with 1 ¼" square trim semi-recessed, vertical duo design (Basis-of-Design).
Guardian Fire Equipment.
Babcock-Davis.

Size:

24” x 9 ½” x 4 ¾”.

Door Finish:

Clear satin anodized.

Installation:

Block-out as required to receive units.
In gypsum board walls, line the interior of the cabinet “cut-out” with 5/8” type “X” gypsum board, level 1 finish.

Fire Extinguishers:

Provide ABC Type fire extinguishers in all cabinets.

2. Toilet and Miscellaneous Accessories

Location:

Shown on Sheets A-4.11 A and B, A-4.12, A-4.13.

Available Manufacturers:

Subject to compliance with requirements, provide toilet accessories by one of the following:

a. Bobrick Corp.
b. Bradley Corp.
c. American Specialties, Inc.

Material:

Stainless steel with satin finish unless otherwise noted. Model numbers based on Bradley., U.O.N.

Schedule of Accessories:

a. Grab Bar: Bradley 812 Series, 1 1/2” inch diameter with peened surface, 36” long, conceal mounting flanges with snap flange covers (flush valve side).
b. Grab Bar: Bradley 812 Series, 1 1/2” inch diameter with peened surface, 42” long, conceal mounting flanges with snap flange covers (partition side, horizontal).
c. Grab Bar: Bradley 812 Series, 1 1/2” inch diameter with peened surface, 48” long, conceal mounting flanges with snap flange covers (corner, horizontal).
d. Grab Bar: Bradley 812 Series, 1 1/2” inch diameter with peened surface, 18” long, conceal mounting flanges with snap flange covers (side, vertical).
e. Hand Dryer: By Owner. GC install.
f. Paper Towel Dispensers: By Owner. GC install.
g. Paper Towel Waste Disposer: Bradley 355
h. Liquid Soap Dispensers: By Owner. GC install.
i. Dual Roll Toilet Paper Dispensers: By Owner. GC install.
j. Coat/Clothes Hook: By Toilet Partition supplier (one per stall door).
k. Feminine Napkin Receptacle: By Owner. GC install (one per stall in Women’s Toilets).
l. Mirror: 24” wide x 36” high, Bradley 747-024360.
m. Mirror: 24” wide x 60” high, Bradley 747 Series.
n. Adult Changing Station: By Owner. GC install.

o. Mop Rack: By Owner. GC install. (one per custodial closet)
p. Shower Seat: Bradley 9562 Series

3. Roller Shades

Locations:

Provide Roller Shades in all designated spaces.

Size:

Units to mount at detailed on Sheet A-7.15. Heights of shades to match the window unit. Widths to be the width of the glass plus one inch.

Available Manufacturers:

Subject to compliance with requirements, manufacturers offering products that may be provided include, but are not limited to the following:

Draper Shade & Screen Co., Inc. (Basis-of-Design).
Hunter Douglas Window Fashions.
Levolor Contract – A Newell Company.

Materials:

a. Fabrics shall be PVC coated polyester similar to Draper Series 2600/2900 by Phifer. Material will be 75% to 90% opaque.
b. Provide all required mounting brackets and a 4-5/8" extruded head box for surface-mounting.
c. Provide stainless steel bead chain clutch operation for all window shades.

Color:

To be selected from manufacturer's full range of fabrics.

Installation:

a. Examine substrates, areas and conditions for compliance with requirements for installation tolerances and operational clearances. Proceed with installation only after unsatisfactory conditions have been corrected.
b. Install roller shades level, plumb, square and true according to the manufacturers written instructions and located so that the shade band is not closer than 2" from the interior face of glass. Allow clearance for window operation hardware.
c. Adjust and balance roller shades to operate smoothly, easily, safely and free from binding or malfunction throughout the entire operational range.
d. Clean roller shade surfaces after installation according to the manufacturers written instructions.
e. Replace damaged roller shades that cannot be repaired in a manner approved by the Architect.
f. Demonstrate and train the Owner's maintenance personnel to adjust, operate and maintain system.

4. Toilet Compartments:

Location and Size:

Refer to Enlarged Plans on sheet A-4.11 A and B, A-4.12, A-4.13.

Materials:

Solid Plastic: High density, solid polymer resin with homogenous color throughout. Provide material not less than 1" thick with seamless construction with edges eased. Provide integral metal heat sinks at the bottom of doors and panels that do not extend to the floor.

Provide Extra Privacy panels; Height: 71-1/2 inches (1816 mm) high and mounted at 4 inches (102 mm) above the finished floor.

Anchorages and Fasteners: Manufacturer's standard exposed fasteners of stainless steel, finish is to match hardware, with theft-resistant-type heads and nuts. For concealed anchors, use stainless steel and seal holes with elastomeric or silicone sealant.

Provide all Floor-Mounted and Overhead-Braced Units. Provide continuous aluminum strikes (length of door panel).

Provide one stainless steel coat hook per stall. Accessible stalls shall have hooks mounted at 46 inches above the floor.

Color:

Refer to Section 090000 "Color Schedule".

Hardware:

Spring-loaded concealed door hinges. Coat hook in each stall, vinyl bumper strips at doors stops and latches. Provide Occupancy Indicator on each door latch.

Installation:

Toilet Partitions: Shall be secured with vandal resistant machine screws with expansion anchors at masonry and tile walls and with toggle bolts at hollow walls and expansion anchors at other walls. Stiles will be secured to floor with a minimum of two 3/8" diameter threaded rods set in expansion anchors. Provide stainless steel base trim to conceal floor anchorage and leveling devices.

Partition Doors: Shall be provided at all toilet compartments.

Available Manufacturers:

Subject to compliance with ADA requirements, manufacturers offering products that may be incorporated in the work include, but are not limited to the following:

Republic
Scranton Products
ASI Group

5. Signage – Interior:

Location:

Refer to Door Schedule on Sheet A-9.3.

Size:

6” square; except Toilet signs are 6” wide by 8” high.

Submittals:

Provide shop drawings showing color selections sign configurations and details. Provide a message list for each sign which shall include large scale details of symbols, wording, lettering, room numbers, and Braille layout for approval by architect and owner.

Materials:

Sign background (to be comprised of two laminate plies of cast acrylic sheet. The face ply to be 1/32" thick non-glare finished optically correct acrylic. Background color is to be applied to the subsurface as well as silk screened graphics when required. The substrate ply shall be 1/8" black acrylic.

a. All edges to be routed smooth and square.

Tactile graphic appliqué to be comprised of 1/32" modified engraving acrylic with the following properties.

a. Color composition incorporated into material.
b. High bond (3M) adhesive backing (see adhesive specs.)
c. Izod impact strength, 2ft. lbs/in.
d. Tensile strength, 7,000 psi before break.
e. Specific gravity, 1.11.
f. Rockwell hardness, R114, M45.
g. Coefficient of thermal expansion, 5.0 x 10-5

Appliqué material to be mechanically engraved (cut) on substrate, to form a 1/32" min. raised letter form with a +/-15-degree beveled profile or draft.

All grade II Braille to be displayed in embedded raster .0625" in dia. of clear acrylic for interior applications and clear glass raster for exterior applications as required. Raster voids are to be precision milled into the substrate material in order to allow the proper raster height and inter-dot spacing as specified above.

Sign types below (Owner to provide numbering):

<u>Type A;</u>

Text Information Sign (Text matches name of room designated on Drawing A-9.1).

Style:

2 ply laminated construction with screen printed message and background color. Provide 2¼” high slot for changeable printed information on vinyl insert. Provide one insert per sign, with copy as directed by the Owner.

Type B;

Same as Type A, without the insert slot.

Type C;

Accessible Toilet Sign Text:

"Women" -- Mount to the right of the masonry opening.
"Men" -- Mount to the left of the masonry opening.
"Toilet".

Available Manufacturers:

Subject to compliance with requirements, manufacturers offering products that may be incorporated in the work include, but are not limited to the following:
Allen Industries, Greensboro, NC (formerly Andco).www.allenindustries.com
Corum Signs, Jamestown, NC.corumsigns@triad.rr.com(email address).
Signage Industries Corporation, Archdale, NC. www.signageindustries.com
AOA Signs, Yadkinville, NC www.AOASigns.com.

Color:

Refer to Section 090000 "Color Schedule".

Mounting:

All sign products shall be mounted or installed in one or combination of the two following methods:

Shim Plate Mounting, this method incorporates an .080 aluminum plate milled 1/8" smaller overall than the corresponding plaque or sign. The mounting shim plate is to be painted to match the plaque. Shim plate and then affixed to the porous wall surface with 2-4 counter sunk fasteners and the appropriate anchors. The corresponding sign or plaque is then fastened to the shim plate with very high bond double faced tape and silicone as required.

Very High Bond Tape Mounting, this method utilizes a neoprene tape product with high bond acrylic adhesive on both sides. This method is only recommended for application of signs to a nonporous surface.

6. Metal Access Door:

Location:

Where shown on the A-2 and A-3 series sheets.

Materials:

Formed steel door panel with flanges on four sides. Concealed hinge; door flange is a perforated taping bead with pre-punched holes.

20 gauge galvanized formed door panel, 26-gauge galvanized frame.
Formed door panel with multiple bends for added strength, flanged on four sides,
Integral perforated taping bead adds rigidity.
Concealed Hinges
Provide for cylinder lock & key, matching to the building lock system

5 stage iron phosphate preparation with white baked-on polyester powder coat on door panel and trim.

Size:

36 inches by 36 inches.

Model:

Subject to compliance with requirements and available sizes, manufacturers offering products that may be incorporated in the work include, but are not limited to the following:

Acudor DW-5040 (Basis of Design).
BabcockDavis
Milcor

7. Marker Boards and Tack Boards

Locations:

Refer to Sheets A-xxxx.

Size:

Sizes noted on drawings. Mount tray at bottom of all units at 2'-10" a.f.f.

Manufacturer:

Aarco Products, Inc.
Best Rite,
Claridge Carolina Chalkboard (Basis-of-Design)
Lemco,
Marsh
or equivalent product meeting the specifications below.

Materials:

Marker boards to be "LCS 24-217-M-24 gauge porcelain steel marker board as manufactured by Claridge; Series 200 trim with chalk tray with end closures. Color: white.

Tack Boards to be "Fabricork" #1380 EW as manufactured by Claridge, Series 200 trim. Color to be selected from manufacturer's full range.

8. Expansion Joint Covers

Locations:

Refer to 1/8-inch scale floor plans, plan details and roof plans.

Materials:

Expansion Joint Cover for 1-inch joints in masonry (interior and exterior).

Description: Impregnated compressible foam block.

Model: Construction Specialties VF-100.

Expansion Joint Cover for 1-inch joints in interior gypsum board.

Description: Extruded clear anodized aluminum and duroflex gaskets (where cover plates contact adjacent surfaces).

Model: Construction Specialties ASM -100 or 200 (as required by joint width) or equivalent.

For masonry surfaces, provide Construction Specialties GSM models or equivalent.

9. Entrance Floor Mats and Frames

Locations:

Refer to A-2 Series Drawings. Set units no closer than 6 inches away from masonry or storefront.

Materials

Stainless steel - Type 316 stainless steel for surface wires and support bars.

Floor Grids

Model and Description - G6 GridLine- Cradle 2 Cradle Silver certified, shall be manufactured from type 304 stainless steel in 1 1/8" (28.57mm), 5/8" (15.97), or 3/8" (9.52mm) depth (Select one, delete others). Wires to be .090" (2.28mm) x.150" (3.81mm) electronically welded and spaced .145 (3.68mm) apart. Unit must withstand 1000 lb./ wheel loads (load applied to a solid 5" x 2" wide polyurethane wheel, 1000 passes without damage).

Slip resistance in accordance with ASTM D-2047-96, Coefficient of Friction, minimum 0.60 for accessible routes.

Grid Frames

SSA - Stainless Steel Angle Frame shall be 1 ¼" (3.81mm) deep recess in Type 316 stainless steel with 1/8" (3.2mm) exposed surface.

Lock Down Mechanism

SL - Surface Lock Down shall be a solid, surface mounted device to secure the Gridline to the concrete surface. Made from Type 304 stainless steel

Available Manufacturers:

Construction Specialties, 3 Werner Way, Lebanon NJ 08833 USA 800-233-8493. email: cet@c-sgroup.com (Basis-of-Design.

Subject to compliance with Basis of Design requirements, ADA Compliance, and Slip Resistance, products from the following manufacturers will be acceptable:

Reese Enterprises, Inc.
Pawling Corp.
J.L. Industries
Kadee Industries

10. Dock Bumpers

Location and Size:

Refer to A-5 Series Drawings.

Manufacturer:

Durable Corporation, Norwalk, OH. or equivalent product meeting the requirements by:

Vestil Manufacturing Corp., Angola, IN.
Porter Industrial Supply, Tumwater, WA.

Molded Dock Bumpers; Molded rubber reinforced with nylon and polyester; minimum durometer reading of 80 plus or minus 5; tensile strength of 950 to 1050 psi (6550 to 7420 kPa). One-year warranty.

i. Profile: Model T; 3 inches (76 mm) thick from wall by 22 inches (559 mm) high by 22 inches (559 mm) wide.

Install per manufacturer instructions.

11. Folding Partitions

Locations:

Refer to drawings 1/A-4.11 B and 2/A-4.12.

Size:

Refer to drawings 1/A-4.11 B and 2/A-4.12, and 17,19/A-6.41

Manufacturers:

Subject to compliance with requirements and available sizes, manufacturers offering products that may be incorporated in the work include, but are not limited to the following:

Kwik-Wall (3030 - Straight Line, Center Stack, Paired Panels are Basis-of-Design)
Modernfold
Moderco

Materials:

Top supported Kwik-Wall Hufcor Series 3000 single panels or equivalent.

1. Panels shall be nominally 4” thick, to 48” maximum, in width, and hinged in pairs.
2. Panel faces shall be vinyl, laminated to steel substrate to meet minimum STC 51.
3. Frames shall be of 16-gauge painted steel with integral factory applied aluminum vertical edge and face protection.
4. Vertical sound seals shall be of tongue and groove configuration, ensure panel-to-panel alignment and prevent sound leaks between panels.
5. Horizontal top seals shall be standard, fixed vinyl; continuous contact.
6. Horizontal automatic bottom seals shall be retractable, provide up to 2” nominal operating clearance, and exert downward force when fully extended.
7. Horizontal trim shall be of aluminum.
8. Low profile hinges on basic panels shall be of steel and project no more than 1/4” beyond panel faces.

Finishes

1. Finishes shall be as selected by the Architect from manufacturer’s full range for:

   a. Factory applied reinforced vinyl fabric with woven backing, weighing not less than 15 oz. per lineal yard.
   b. Exposed metal trim and seal color.

2. Aluminum track shall be Type 850, clear anodized.

Suspension system:

1. Track shall be of clear anodized architectural grade extruded aluminum alloy 6063-T6. Track design shall provide precise alignment at the trolley running surfaces and provide integral support for adjoining ceiling, soffit, or plenum sound barrier. Track shall be connected to the structural support by pairs of minimum 3/8” dia. threaded steel hanger rods. Guide rails and/or track sweep seals shall not be required.

   a. Each panel shall be supported by one 4-wheeled carrier. Wheels to be of hardened steel ball bearings encased with molded polymer tires.

Other Requirements:

1. Provide a 3-foot-wide passage door in each wall, where shown on the drawings.

2. Applied markerboard panels from 32-inchas a.f.f. to 72-inches a.f.f.

12. Suspended Curtain Track (at Touch Tank)

Location:

Refer to drawing 1/A-3.22 B and 3/A-8-11.

Size:

As shown on the drawings. Field measure.

Manufacturers:

Subject to compliance with requirements and available sizes, manufacturers offering products that may be incorporated in the work include, but are not limited to the following:

Automatic Devices Company, Model 132-A, (Basis-of-Design)
2121 South 12th Street,
Allentown, PA 18103
Phone: 610.797.6000

QSD Inc.
6886 South Pitkin Street,
Foxfield, Colorado 80016 USA
Phone: 800.661.5649

Materials:

Provide all components required for a complete installation.

Curtain tracks (Model 1300) shall be of 13 gauge extruded aluminum I-Beam construction consisting of a center rib and top, intermediate and bottom flanges. Each curtain carrier **(Model 1301-A)** shall be spaced on 12" centers and shall be supported from two self-lubricating nylon wheels rolling on two parallel treads. Track shall be rigidly supported from ceiling clamps **(Model 1423)** or hanging clamps **(Model 1308)**. This model track system is for walk-along operation only and does not include pulleys or other operating hardware. 1-1/4" I.D. stiffening pipe or the equivalent shall be used to support both straight and curved areas of all suspended curved tracks.

Finishes

1. All metal components shall be Type 850, clear anodized or stainless steel.

Suspension system:

1. Install the 1308 hanging clamps or 1423 ceiling clamps with manufacturers standard hardware which shall be provided with the system components. Space supports no more than 4-feet on center. Clamps shall also be provided and installed on each side of each track splice or each curve and along the curve of the track if the curve radius is large.

2. Lift the track to its desired location and secure with appropriate hardware and suspension media as needed.

13. Composite Manhole Covers for Life Support System Viewing

Location:

Refer to A-2.22B.

Size:

36” Diameter Clear Opening.

Manufacturer:

EJCO 1006 Investment Blvd., PO Box 186, Apex, NC 27502
or equivalent product meeting the requirements by:

Fibrelite, 3250 US Highway 70 Business West,
Smithfield, North Carolina, NC 27577

Composite Access Products, LP, 5216 N 26th St., McAllen, TX. 78504

Basis-of-Design:

EJCO Model 3800, 5" Tall Composite Gasketed Manhole Assembly, 4 Penta Head Latches, 2 Spring Loaded Handles, Non-Traffic, Medium Duty.

Install per manufacturer instructions.

14. Coiled Wire Fabric Curtain System

Location:

Refer to 1/A-2.22 A and 1/A-3.22 A.

Size:

As shown on the drawings. Field measure.

Manufacturer:

Cascade Architectural, P.O. Box 3707, Tualatin, OR 97062

or equivalent product meeting the requirements by:

GKD GROUP, 825 Chesapeake Drive, Cambridge, MD 21613

Basis-of-Design:

Fabricoil® coiled wire fabric architectural system. Aluminum 5056 – H18 Wire Fabric created by interlocking individual strands of spiraled wire. 3/8-inch weave size, wire gauge as recommended by the manufacturer.

Track: Glide Track System - Manual Operation

Install per manufacturer instructions.

PART 3 - EXECUTION:

Install each item according to manufacturer's printed instructions and/or shop drawings. When complete, each item shall be complete with all accessories for complete operation and free of defects and in first class working condition.

END OF SECTION 100000

SECTION 111600 – HOIST + CRANE EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Electric Telescoping Hoists and Trolleys.

1.2 DEFINITIONS

A. Lifting, Telescoping Monorail: A lifting telescopic monorail is a device made up of two overlapped monorails. The first one is usually anchored under a concrete slab or under an existing steel structure. The second one can be moved by translation on driving manual, electric or air trolleys.

B. Working Range: Amount of travel required for each monorail, including telescoping element on Crane 1. The amount of vertical hoist distance required for each hoist.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: For hoist and crane equipment. Include plans, elevations, sections, details, and attachments to other work.

1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
2. Wiring Diagrams: For power, signal, and control wiring.

C. Hoists and Cranes are considered unitary systems for which the manufacturer will be responsible to engineer the complete operation and provide any required engineering seals and certificates which shall be valid and recognized by the state of North Carolina.

1.4 INFORMATIONAL SUBMITTALS

A. Welding certificates.

B. Product test reports.

C. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.

B. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.3, "Structural Welding Code - Sheet Steel."

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Preinstallation Conference: Conduct conference at Project site.

1.7 PROJECT CONDITIONS

A. Field Measurements: Verify actual dimensions of construction contiguous with hoist and beam equipment, including height above floor(s) and tanks and location relative to doors, by field measurements before fabrication.

1.8 WARRANTY

A. Special Warranty for Hoists: Manufacturer's standard form in which manufacturer agrees to repair or replace dock-leveler components that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Structural failures including cracked or broken structural support members, load-bearing welds.
b. Faulty operation of operators, control system, or hardware.

2. Warranty Period for Structural Assembly: Ten years from date of Acceptance by Owner.
3. Warranty Period for Electric Motor: Five years from date of Acceptance by Owner.
4. Warranty shall be for unlimited usage of hoist and crane for the specified rated capacity over the term of the warranty.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Steel Plates, Shapes, and Bars: ASTM 316/A 316M.

B. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

2.2 HOIST AND CRANE 1

A. General: 2-ton capacity hoist and crane, telescoping, with large height heavy-duty marine environment chain hoist; of type, function, operation, capacity, size, and construction indicated; and complete with controls, safety devices, and accessories required, including swiveling hoist.

1. Basis-of-Design Product: Subject to compliance with requirements, provide products by ADEI, Meyzieu, France or comparable product by one of the following:

a. CMCO (Columbus McKinnon)

b. Washington Crane.
c. AFE Crane.

B. Rated Capacity: Capable of supporting total gross load of two tons without permanent deflection or distortion.

C. Mechanical Operating System: Manual control; counterbalance and spring operation. Spring-operated raising and walk-down lowering of unloaded ramp. Equip leveler with an upward-biased-spring counterbalancing mechanism controlled by a hold-down device. Ramp raises to top limit of operating range by operating recessed control handle in ramp to disengage hold-down device. Ramp lowers below platform level with lip retracted by operating auxiliary, recessed control handle to release support legs.

1. Free-Fall Protection: Manufacturer's standard protection system to limit free fall of loaded ramps with front edge supported by truck bed.

D. Electric Operating System: Electric control shall be radio-operated.

E. Construction:

1. Fabricate all rails from Type 316 Stainless Steel.

2. Fabricate electric steering trolly, chain, hook and roller from Type 316 Stainless Steel

F. Power supply:

1. Assure coordination of main voltage and travelling speed.

G. Finish: Hot-dip galvanize all non-stainless-steel components.

2.3 HOIST AND CRANE 2

A. General: 1.5-ton capacity hoist and crane, with heavy-duty marine environment chain hoist; of type, function, operation, capacity, size, and construction indicated; and complete with controls, safety devices, and accessories required.

1. Basis-of-Design Product: Subject to compliance with requirements, provide products by ADEI, Meyzieu, France or comparable product by one of the following:

a. CMCO (Columbus McKinnon)
b. Washington Crane.

B. Rated Capacity: Capable of supporting total gross load of one and a half tons without permanent deflection or distortion.

C. Mechanical Operating System: Manual control; counterbalance and spring operation. Spring-operated raising and walk-down lowering of unloaded ramp. Equip leveler with an upward-biased-spring counterbalancing mechanism controlled by a hold-down device. Ramp raises to top limit of operating range by operating recessed control handle in ramp to disengage hold-down device. Ramp lowers below platform level with lip retracted by operating auxiliary, recessed control handle to release support legs.

1. Free-Fall Protection: Manufacturer's standard protection system to limit free fall of loaded ramps with front edge supported by truck bed.

D. Electric Operating System: Electric control shall be radio-operated.

E. Construction:

1. Fabricate all rails from Type 316 Stainless Steel.

2. Fabricate electric steering trolly, chain, hook and roller from Type 316 Stainless Steel

F. Power supply:

1. Assure coordination of main voltage and travelling speed.

G. Finish: Hot-dip galvanize all non-stainless-steel components.

2.4 STEEL FINISHES

A. Galvanizing: Hot-dip galvanize components as indicated to comply with the following:

1. ASTM A 123/A 123M for iron and steel loading dock equipment.
2. ASTM A 153/A 153M or ASTM F 2329 for iron and steel hardware for loading dock equipment.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Examine roughing-in for electrical systems for hoist equipment to verify actual locations of connections before equipment installation.

B. Examine structure for suitable conditions where equipment is to be installed. Structure shall be plumb and square and clean to receive integral hoist beam attachments.

C. Place hoist beams straight and level, centered on the pre-set equipment and doors..

D. Install equipment, including motors, control stations, wiring, safety devices and accessories as required for a complete installation.

1. Rough-in electrical connections.

E. Adjust equipment to function smoothly and safely, and lubricate as recommended by manufacturer.

F. Test lifts and motors for vertical travel within operating range indicated.

3.2 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain loading dock equipment.

END OF SECTION 111600

SECTION 111795 - LIFT FLOOR

PART 1 - GENERAL

1.01 USAGE

A. The lift floor shall be a free-standing device, not requiring special connections to the building/pool's structural elements, powered by the facility water pressure, and all exposed materials shall be non-corrosive.

1.02 SUMMARY

A. Work includes furnishing and installing a lift floor in the Isolation Pool of the shark exhibit including all appurtenances indicated on the drawings and/or specified herein. The contractor shall be responsible for providing a fully functioning device to the satisfaction of the Owner. The General Conditions apply to this Section as fully as if repeated herein.

B. Final Geometry: The contractor shall be responsible for both design and fabrication of the product to match the geometry and detailing indicated on the Drawings and as-build dimensions of concrete structures. Any adjustments required for field fit shall be made in the final size of the lift floor elements without modification to completed building or pool structural elements.

C. Reference Drawings: At the minimum, the bidding fabricators will require copies of drawing 5/A-4.13 together with this specification Section.

1.03 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The tank fabricator shall have at least five years' experience in the manufacture of similar items with a record of successful installations at saltwater aquatic animal facilities.

B. Design Requirements: Design shall comply with these Specifications and all OSHA and local safety codes. Use conservative safety factors in the design of all products. Working stresses shall not exceed the lower value of one-third of the yield strength or one-fifth of the ultimate strength of the material.

1.04 SUBMITTAL

A. Submit fully detailed shop drawings of all fabrication work, giving sizes; details of fabrication and construction; methods of assembly; and locations of hardware, anchors, and all accessories.

B. Submit manufacturer's information on major materials or list product references on shop drawings.

C. Submit copy of binding warranty.

D. After fabrication of vessels, but before shipment, submit a manufacturer's certified Final Inspection Report addressing hardness testing of shop fabricated fiberglass resins (does not include manufactured pultruded FRP), finish workmanship, operation of movable elements, and other quality control aspects.

1.05 WARRANTY

A. Manufacturer shall warranty all individual components, and the functionality of the total lift floor system, to be free from defects in manufacturing, workmanship or materials, and

shall repair or replace any fabrication within one (1) year after field setup and calibration and Acceptance by the Owner.

PART 2 - PRODUCTS

2.01 LIFT FLOOR STRUCTURE

A. General: The movable floor shall have a capacity of 4,000 lbs and of dimensions shown on the drawings and verified by field measurements of completed concrete structures. The movable shall be a horizontal, free-standing, cylindrical structure. All materials shall consist of Type 316 or 316L stainless steel, fiberglass reinforced plastic (FRP), PVC plastic, and polyethylene (PE) plastic.

B. Lockout: The product shall include mechanical lockouts for safely diving underneath the movable lift floor.

C. Thickness: The movable lift floor shall not exceed a thickness of 11-inches; however, a lesser thickness is desired if possible. Any supports or other materials required below the movable lift floor shall not exceed 3-inch. The total finished dimension from the bottom of the Isolation pool to the top surface of the movable lift floor shall not exceed 12-inches.

D. Access Hatch: The movable lift floor shall include a hatch to allow access to below the floor when in the raised position.

E. Cylinder Location: The structural design of the movable lift floor, and selected structural elements, shall be such to move the lift cylinders to the extreme corners of the assembly and not intrude into the open area of the Isolation pool. Exact shape of lift platform and location of cylinders to be approved by owners.

2.02 LIFT CYLINDERS

A. Lift cylinders shall have upper sleeves attached to the movable floor with hydraulically actuated stanchions pushing down against the concrete floor of the Isolation pool. One cylinder shall be located in the four corners of the movable lift floor. The bore of each cylinder shall be approximately 8-inch diameter.

B. The lift cylinders shall fully raise the movable lift floor in approximately 60 seconds using 60 psi water pressure.

2.03 LIFT FLOOR FABRICATOR

A. Products meeting the requirements of this specification may include:

Truelove Fabrications Inc.
13 S. 4th St.
Wilmington, NC
910-612-6555

Strongwell; Bristol, Virginia

Aqua-Draulics Marine, Inc
4035 Pines Industrial Ave
Rockledge, FL 32955

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install lift floor per manufacturer's recommendations.

B. The lift floor shall be aligned, calibrated as required, and proven fully functioning by the installing contractor.

END OF SECTION 111795

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 11 59 01

GENERAL EXHIBIT REQUIREMENTS

PART 1 - SUMMARY OF WORK

1.01 GENERAL SCOPE OF WORK

A. The work under the exhibit scope of work consists of the fabrication and installation of exhibit work to be performed as part of the General Contract Work and completed by the time of final completion of General Contract Work.

1.02 DRAWINGS FOR EXHIBIT FABRICATION

A. The Exhibit drawings are those designated with the prefix of "EX," which are bound separately from these specifications and are hereby made a part of the Contract Documents for the Exhibit scope of work.

B. All drawings issued in addition to those designated with an "EX" prefix are considered part of the Contract Documents, as instructed by the Construction Manager for the project.

1.03 SPECIFICATIONS FOR EXHIBIT FABRICATION

A. The specifications for exhibit fabrication consist of the following sections:

Division 11 59 00– Exhibit Fabrication

11 59 01 General Exhibit Requirements

11 59 10 Fiberglass Exhibit Tanks (also refer to section 06 60 50 for all engineering, resins, attachments, acrylic, etc.)

11 59 20 Replicated Habitats (Design Development Level Only)

11 59 30 Interpretive Graphics

11 59 40 Media Software

11 59 50 Media Hardware

11 59 70 Exhibit Furniture & Casework

1.04 RELATED WORK BY GENERAL CONTRACT

A. The following related work will be performed by the General Contractor and their designated sub-contractors, and as such is related to, but not part of the exhibit fabricator's work. Construction, furnishing and installation of, but not limited to, the following:

1. Site preparation, grading, driveways, parking areas, walkways related to gaining access to the site

2. Base-building architectural construction inclusive of all built-in-place concrete tank structures.

3. Base-building and site mechanical, electrical, lighting, plumbing, phone, public address, and life safety systems.

4. The Owner will provide 5 existing jellyfish tanks of various shapes and sizes for inclusion in the project.

5. Supply and installation of all architectural finishes including painted walls, flooring, ceiling treatments, trim details, doors, windows, information desk, and acoustic wall and/or ceiling treatments unless otherwise stated within the contract documents.

B. The General Contractor shall be the general coordinator of interfaces between all work and the work of this Contract. "Interface" is defined to include the scheduling and sequencing of work, sharing of access to work spaces, integration of work placed into spaces available for installation, protection of each other's work, cutting and patching, cleaning, utilization of temporary facilities and similar considerations and activities. The General Contractor shall set up coordination meetings to be attended by all parties involved.

1.05 INSPECTION

A. Carefully inspect all surfaces and conditions, which receive the work of the Contract and notify the General Contractor of any defects, improper materials, workmanship or other conditions, which will affect the satisfactory completion, and permanency of the work. The absence of such notification will be construed as an acceptance by the Exhibit Contractor of all surfaces and conditions, and as a waiver of any subsequent claim to the contrary.

1.06 FIELD MEASUREMENTS

A. The Exhibit Contractor shall perform all work of the Contract from shop drawings or field measurements taken by the Exhibit Contractor at the project site and/or at the of the shop other Contractors as required.

B. Any discrepancies between the field measurements and the shop drawings that affect the fabrication or installation of the work of the Contract shall be reported to the General Contractor, in writing, prior to fabrication or installation of any affected work.

1.07 INSPECTION OF FABRICATED WORK

A. Prior to delivery of fabricated items to the site, complete work shall be inspected by the General Contractor, the Owner, and/or the Exhibit Designer at the place of fabrication.

B. The Exhibit Contractor shall notify the General Contractor when and where such work will be available for inspection. Fabricated work shall not be delivered to the site until approved by the General Contractor at the place of fabrication or authorization to deliver such work to the site is granted for subsequent inspection at the site.

1.08 APPROVAL OF COMPONENTS

A. Where components are indicated to be provided by the Exhibit Contractor but are not mentioned by manufacturer's product name or model number, the construction of all such items shall be subject to approval by the General Contractor and shall conform to approved corresponding submittals, samples, and mock-ups. The Exhibit Designer may submit additional drawings to the Exhibit Contractor for elaboration, clarification or revision of such items at the discretion of the General Contractor. The Exhibit Contractor's work shall conform to such additional drawings without additional cost to the Contract, unless prior written authorization for additional cost items has been properly secured through the General Contractor.

1.09 PROTECTION

A. Adequately protect all work contained within this contract against damage and repair and/or replace all defective or damaged work as directed by the General Contractor as required to leave the work in a condition satisfactory to the General Contractor at the time of completion of the Contract.

B. Protect and be responsible for any disturbance or damage to adjacent construction within the area of operations under this Contract. Any disturbance or damage to the adjacent construction either directly or indirectly from the operations of this Contract shall be promptly restored, repaired, or replaced to the satisfaction of the General Contractor and at no additional cost to the owner.

C. With regards to any work that requires ventilation of fumes and/or dust, coordinate needs and requirements with the General Contractor so that proper systems are in place. Do not assume that a system will be provided for your scope of work, unless otherwise clearly stated by the General Contractor prior to the time of submitting final proposals for the work. Under no circumstances will the requirements for ventilation of fumes be just grounds for closing the facility to the public.

1.10 DELIVERY

A. All deliveries of materials, equipment, and pre-fabricated exhibit elements must be coordinated with the General Contractor.

B. All uses of public areas and circulation pathways must be coordinated with the General Contractor. All weights and sizes must conform to the limitations of these spaces.

PART 2 - SHOP DRAWINGS, PRODUCT DATA, SAMPLES, AND MOCK-UPS

2.01 PROVISIONS INCLUDED

A. The Contract Forms, Conditions of the Contract and Division 1, General Requirements, apply to the work of this Section and other relevant Sections.

2.02 DEFINITIONS

A. “Shop drawings” are fabrication, erection and setting drawings, diagrams, schedules, and other data, specifically prepared for the work under this Contract by the Contractor or any Subcontractor, manufacturer, supplier or distributor, to illustrate some portion of the work.

B. “Product Data” are catalogs, brochures, cuts; manufacturer’s specifications and installation instructions; performance and test data; diagrams and other information submitted by the Contractor to illustrate a material, product or system for some portion of the work.

C. “Samples” are physical examples submitted by the Contractor to illustrate materials, equipment or workmanship, and to establish standards by which the work will be judged.

D. “Mock-ups” are physical simulations of specific exhibit features to demonstrate the functionality of complex exhibit elements from which final design decisions and details maybe determined.

E. “Graphic proofs” are physical examples submitted by the Contractor to illustrate all actual graphic and typographical artwork.

2.03 PRODUCT DATA

A. Product data shall be specific, with all extraneous material deleted and only the information directly pertaining to the project check-marked or boxed. Furnish all supplemental information as may be requested. Data of general nature will not be accepted.

B. Due to the nature of this project and the work of all involved, sustainable design is an important quality that should be maximized wherever possible and affordable. All Exhibit Contractors are expected to provide statements that summarize the extent to which they are able to comply with such standards. Sources, materials, methods of construction, power requirements, etc. that support sustainable practices should all be identified as part of the scope of this work.

2.04 SAMPLES

A. Samples shall be of adequate size to permit proper evaluation of function, physical and visual characteristics of product, material or intended “artistic” treatment required for aspects of the exhibit scope(s) such as: graphics; media hardware systems; media software systems; interpretive and interactive exhibitry; costume millwork, replicated artifacts or artwork etc. Samples must successfully show color, texture, form, durability, and any other feature(s) specified by these specifications, the Owner, and the General Contractor.

2.05 MOCK-UPS

A. Mock-ups (where specified) shall be full size (unless otherwise specified) so as to allow for proper evaluation of the final work. Mock-ups must successfully show the shape, actual materials whenever practical, and the overall color and character of each element as seen within the location where the element is to be installed.

2.06 GRAPHIC PROOFS

A. Proofs shall be made at the appropriate size for each graphic element sufficient for the Exhibit Designer’s review of the proof.

2.07 SUBMISSION OF FULL SIZE PROTOTYPES AND MOCK-UPS

A. All prototypes and mock-ups, especially those not appropriate for shipping, shall be held by the Contractor and will be reviewed by the Owner, General Contractor, Architect and Exhibit Designer at the Contractor’s shop.

B. Refer to the individual specification sections for more specific requirements regarding prototype and mock-up requirements.

END OF SECTION

SECTION 11 59 10

FIBERGLASS EXHIBIT TANKS

PART 1 - GENERAL REQUIREMENTS

1.01 PROVISIONS INCLUDED

A. The Contract Forms, Conditions of the Contract and General Requirements, apply to the Work under this Section.

B. Related sections include:

1. Section 06 60 50 - Fiberglass Tanks
2. Section 08 84 00 - Acrylic Glazing
3. Division 17 – Piping Connections

1.02 SCOPE OF WORK

A. The Work under this Section consists of fabrication, delivery and installation supervision of all fiberglass (FRP) tanks, the acrylic viewing panels for the tanks, and tank bases as indicated on the drawings and as specified herein.

#	Exhibit Name
E-3	Live Coral
E-4	Aquaculture
E-5	Piaba
EX-1	Cuttlefish
EX-2	Spiny Lumpsucker
EX-3	Pacific Rocky Coast
EX-4	Weedy Sea Dragon
H1	Touch Tank Knock-Down
H2	Touch Tank Recovery
H4	Coral Growing
H5	Coral Growing

B. The Work under this Section also consists of the coordination and installation all acrylic viewing panels for these FRP tanks, as well as tank stands and in-tank filter plates (as indicated by drawings).

C. Requirements of this Section are in addition to those specified in Section 06 60 50 – Fiberglass Reinforced Tanks and Section 08 84 00 – Exhibit Tank Glazing, both of which apply to the Work of this Section.

1.03 WORK BY OTHER CONTRACTORS

A. The connection with all Life Support System plumbing, as well as any under-gravel distribution piping will be by the designated LSS Contractor, but all tank penetrations will be integral to the fabricated FRP tank and provided as such.

B. Habitat gravel substrate.

C. All adjacent wall, floor, and ceiling construction and related adjacent surfaces and equipment.

1.04 WRITTEN INFORMATION

A. Quality Control Design Calculations Submittals: All materials of fabrications as shown are schematic and require calculations by FRP Manufacturer/Fabricator; include design loading, structural computations, materials properties, resin formulations and other information needed and used for structural analysis.

B. Product List: List of products to be used in fabrication of FRP tanks. For information only, submit copies of manufacture's detailed technical data and specifications for materials, fabrication, joinery, and installation. Include catalog cuts of hardware, anchors, fastenings and accessories.

1.05 REFERENCE STANDARDS

A. Conform to the requirements of Voluntary Product Standards PS 15-69 "Custom Contract Molded Reinforced Polyester Chemical Resistant Process Equipment" as a minimum standard, except where superseded by more stringent of the specifications.

1.06 SAMPLES

A. Cured sample sections (12"x 12") of each color Gel Coat demonstrating lamination, colors and surface finishes.

B. Acrylic viewing window per the requirements specified by Section 08 84 00 Exhibit Tank Glazing.

C. Sample of sealing and joint assembly proposed for use, indicating color and finish and specification, as well as demonstrating any visible seams that might be required.

D. Sample of full assembly of all elements inclusive of FRP, acrylic and gel coat.

1.07 SHOP DRAWINGS

A. Submit shop drawings for each tank showing the following:

1. Plan, elevation, section views

2. Glazing and tank-related life support system details (penetrations, skimmer boxes, stand pipes, etc.)

3. Wall sections showing lamination details and thickness for inner and outer skins, core material, and reinforcing details at windows and pipe penetrations.

4. Acrylic windows (see specification section for acrylic windows for aquarium tanks).

5. Background color confirmed

1.08 QUALIFICATIONS

A. The fiberglass tank Contractor shall submit at time of Bid Proposal a list of five installations of fiberglass aquarium tanks which have been successfully in place for at least five years and which are similar in construction to those shown on the drawings. At the same time submit tank lay-up methods.

B. Acceptance of the Proposal will be dependent upon review and acceptance by the Owner of the proposal construction techniques.

1.9 QUALITY CONTROL

A. All fiberglass tanks will require the Exhibit Contractor to submit engineering calculation in accordance with Section 06 60 50 – Fiberglass Tanks.

B. Quality craftsmanship - All fiberglass fabrication shall conform to this Section as to materials, drawings and dimensions. All Gel-Coat surfaces shall be solid, smooth and uniformly colored without streaks or blotching. All hand lay-up work shall be smooth to the touch, with all glass fibers and roving completely embedded in resin. Exposed glass fibers and/or edges will be grounds for rejection.

C. Allowable Tolerance:

1. The relationship of the various components shall be such that they prohibit the escape or entrapment of animals contained.

2. Variations in the lines and surfaces of floors: 1/4" per 10 ft.

3. Variations of viewing window head and sill rebates receiving glazing: 1/8" per 10 ft.

4. Variations of sizes and locations of sleeves, floor openings and wall openings: Minus 1/8", Plus 1/8".

5. Flexure at head, jamb and sill of windows shall not exceed 1/8" when filled. Flexure elsewhere shall not exceed L/360 of the measured span.

1.10 COORDINATION

A. The fabrication of fiberglass tanks shall be accomplished in such a manner as to coordinate with other elements such as floors, walls, plumbing, as well as internal habitats.

1.11 DELIVERY, STORAGE AND HANDLING

A. Storage and handling of completed fiberglass tanks at the FRP Manufacturer/ Fabricator's shop shall be accomplished in such a manner as to assure that all components are in new and undamaged condition. All materials are to be stored under cover in a well-ventilated enclosure and protected against extreme changes in temperature.

B. Each tank will be tagged with the manufacturer's drawing and tank number and location plan for ease of identification.

C. Do not deliver materials to the site until notified by the Owner.

D. Scheduling and final placement will be the responsibility of the Building Contractor.

PART 2 - PRODUCTS

2.01 FIBERGLASS TANKS

A. Fiberglass tanks, including exterior and/or internal skimmer, shall be of completely integral construction as shown on the drawings. Interior surfaces shall be smooth and free of projections.

B. Fiberglass tank wall thicknesses to be determined per the specifications found in Section 06 60 50.

C. Integral color shall be impregnated on the interior surfaces only and shall be provided only on those tanks designated to receive color as noted on the drawing.

D. Tank acrylic shall conform to the requirements set forth in Acrylic Tank Glazing specification and in general:

1. The acrylic materials and performance of these materials are considered part of this scope.

2. The installation of the acrylic into the window rebate of the FRP tank is considered part of this scope.

3. All liabilities associated with the acrylic and its interface with the FRP tank materials and construction are the sole responsibility of the FRP Tank Contractor

E. Spacers to be placed around glazing material as determined by FRP Manufacturer. Base shims shall be placed as determined by FRP Manufacturer at quarter points as shown on the drawings.

F. Sub-gravel filter plates are not required for this project

G. Air lift pipes, pipe fittings to be PVC pipe of sizes shown on the drawings.

I. Acrylic joint adhesive shall be clear and bubble-free, equal to PS30 or Weld-On 40.

PART 3 - EXECUTION

3.01 INSPECTION

A. Verify that areas to receive fiberglass tanks are satisfactory to receive tanks. If unsatisfactory conditions exist, do not ship until such conditions have been corrected.

B. Confirm route of delivery from loading dock to final installation location to assure that the route provides sufficient clearances for the tank and any rigging materials that might be required during delivery

3.02 FABRICATION

A. Fiberglass tanks shall be as follows:

1. To be molded over a “male” type mold to obtain a smooth interior finish.

2. All interior surfaces to be of a matte, Gel Coat finish 18-20 mil. in thickness. No visible surface flaws. Colors to match chips provided by Owner will be by Ferro Corporation, Neste Polyester, Inc. or equal.

3. Vertical tank walls to be of a sandwich-type, composite construction with rigid foam core of 1.5” to 2” thickness as required for structure and insulation.

4. First lamination to be hand applied and of a sufficient number of layers of chopped strand mat and woven roving to acquire a minimum of 1/6th of the engineered wall thickness. Both lamination and core material are to be of an appropriate thickness for the tank size/gallonage.

5. A 4-6 lb. per cubic foot core material is to be applied to the first laminate, to gain the thickness engineered for core construction methods.

8. No voids between core and first lamination.

9. A second, outer lamination is to be of the same thickness and quality as the first.

10. The outside finish is to be reasonably smooth and free of exposed fibers, and of an easily cleaned, white polyester finish.

11. No raw fiberglass is to be present in any surface.

12. All window rebates/ledges are to be molded into the tank, and be designed so that the mounted viewing panels, whether glass or acrylic, be flush to the interior surface of the tank.

13. All fittings are to be FRP type and flush with the interior tank surface.

B. Tank reinforcement

1. Window area and wall reinforcing will be used as required by the FRP Manufacturer/Fabricator. Secondary FRP bond to be of equal thickness as reinforcing material and have a minimum of 3" of bonding surface beyond all sides of the reinforcing material.

2. Flanges: Flanges maybe required and will only be allowed with supporting engineering documentation and approval by the General Contractor, Architect, Owner, and Exhibit Designer. Flanges for tanks smaller than 100 gallons to have flanges no greater than 3" and no greater than 6" for tanks in excess of 100 gallongs. Flange thickness is to be determined by the FRP Manufacturer and confirmed with engineering documentation, with no variation in thickness greater than 1/8". Flanges in sides and back of tank are to be outboard. Front flanges maybe outboard provided they do not exceed 3" regardless of the tank volume. Flanges are to be continuous around the tank opening at the top.

3, Lateral bracing is only allowed for supporting long spans of fiberglass formations where specifically indicated on Exhibit Drawings. The engineering and detailing of such braces will be the responsibility of the Fiberglass Tank Contractor, and must be coordinated with the work of the Replicated Habitat Contractor to assure the habitat form(s) can be installed within the tank.

4. Confirm that reinforcement and flange details do not interfere with any adjacencies nor alter the intended design and appearance of the exhibit tanks

C. Weir opening and skimmer box: provide weir opening, as indicated on Exhibit Drawings, Weir to be of a symmetrical and finished nature. Skimmer box to have the same inside/outside finish requirements as tank and the same secondary bonding requirements as the tank reinforcement.

1. Note special design of skimmer boxes with perforated panels, as indicated for the Giant Pacific Octopus Exhibit #11, and consult with Exhibit Designer, Owner, and LSS system designer to assure proper function of the tank with the LSS system.

D. Shop-assemble all FRP Tanks in single units, except where indicated. Provide shop-prepared attachment devices for field connections where necessary. Design attachment devices so that field connections will comply with fastening and joinery construction requirements and tolerances for the specified grade.

3.03 PERFORMANCE

A. Hydro-test all tanks prior to shipping per Section 06 60 50 – Fiberglass Tanks.

B. Fill tanks with water and test water levels over 48 hours for leaks, etc. upon the completed delivery and installation of the tanks to the project site, the hook-up (by others) to the Life Support System, and prior to the installation of the Replicated Habitat Work (unless the Tank Contractor and the Habitat Contractor are one in the same in which case, the tank will be tested with the habitat in place)

C. Repair damaged or defective work as directed.

D. Clean exposed interior and exterior surfaces.

E. All tests to be observed, judged, and approved (or rejected) by the Owner and/or Exhibit Designer.

3.04 DELIVERY

A. Coordinate all logistics of delivery to site and into building with Construction Manager. All routing and clearances into final exhibit location to be confirmed prior to delivery.

B. Use qualified rigging personnel for all delivery tasks.

PART 4 - INSTALLATION

4.01 INSPECTION

A. The FRP Manufacturer/Fabricator will inspect the conditions under which the Work is to be performed and shall report in writing to the Owner any conditions which might adversely affect the installation. Installation shall not be started until conditions are satisfactory.

4.02 INSTALLATION

A. Installation shall be performed by a qualified rigger (approved by the Owner) and under the direction of the Tank Contractor and shall be performed prior to completion of the adjacent wall construction work.

B. Tanks shall be set by the Tank Contractor, and coordinated with the Construction Manager and at location as shown on the drawings and where directed by the Owner.

PART 5 - GUARANTEE

5.01 GUARANTEE

A. Fiberglass tanks and their related acrylic viewing panels (as a complete water-holding assembly) shall be guaranteed for a period of five years from time of delivery to be free of defects of either material or workmanship, and shall be appropriately constructed and engineered for the intended use.

END OF SECTION

SECTION 11 59 20

REPLICATED HABITATS

PART 1 - SUMMARY OF WORK

1.01 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 PROVISIONS INCLUDED

A. The Contractor is expected to be familiar with all other sections of the specifications and drawings as issued for Exhibits and will need to be familiar with specification and drawings as issued for Architecture and Engineering

B. Photographic reference photographs displaying color, form and texture of actual habitat features will be provided upon selection of contractor. Shapes, forms, colors and textures shown in the photographs are intended to supplement the drawings as a means to describe the desired geology and character of rockwork for this project. The drawings will take precedence over the photographs with respect to final layout, overall volumetric massing, dimensions, grade elevations, structural reinforcing and detailing. In no way should the photographic reference material create a change in scope of services, but instead should serve as a means to describe particular color and textures.

1.03 SCOPE OF WORK

A. The work under this Section consists of the furnishing and installing of replicated, naturalistic, habitat features as indicated by the Drawings and Reference Photos and Specifications.

B. Given the unique nature of this work, it is understood that prospective Contractors may vary in their approach to materials, fabrication and installation. These specifications therefore include a variety of materials, processes, and installation requirements that may not be applicable to the final materials and methods determined for this project. It will be the responsibility of each prospective Contractor to review all specifications related to this work and determine and inform all parties of their recommended approach to this work. In doing so, confirm the applicable materials, processes and installation techniques, as part of the scope of this work

1. The habitat construction work shall include all materials, labor, equipment, and related services necessary to provide, furnish, install, and erect the exhibit including the following elements of exhibit construction:

E-1	Touchtank
E-2	Sand Tiger Shark
E-3	Live Coral
E-4	Aquaculture
E-5	Piaba
EX-1	Cuttlefish
EX-2	Spiny Lumpsucker
EX-3	Pacific Rocky Coast
EX-4	Weedy Sea Dragon

1.04 WORK BY OTHER CONTRACTORS

A. Formation of existing concrete tanks inclusive of initial construction, cutting, patching, waterproofing, painting, and glazing.

B. Life support systems inclusive of all in-tank piping features, plenums, filter mesh, etc. that are directly associated with those systems will be provided by the others.

C. Crushed coral, gravel, and rock rubble intended for any exhibit interior will be provided by the Owner.

D. Artificial kelp will be provided by owner.

D. Acid Leaching of Replicated Rockwork Formations will be performed by the Owner.

1.05 SUBMITTALS

A. Submittals will be required for this project. Unless otherwise stated by the Architect or General Contractor, the Contractor will provide the number of copies, as specified by the General Contractor, of each non-digital submittal (such as samples) will be required, and will include:

1. Shop drawings

2. Engineering calculations for all structural elements

3. Weight load calculations for all elements that come in contact with concrete and/or gunite pool structures, as well as confirmation of all attachment points made within aquarium tanks at locations below water.

4. Product data

5. Full size samples and/or mock-ups

6. Work-in-progress photographs and/or video recordings

7. Administrative Submittals

8. Quality Control Program

B. No Work shall be done except from issued Construction Drawings and related Contract Documents, including reviewed submittals, which must be kept at all work locations.

C. Review shall not act to relieve the Contractor from responsibility for accuracy of the fabrication details and placing diagrams. Dimensions and locations to be verified prior to the presentation of Shop Drawings.

D. Shop Drawings and Engineering Calculations:

1. Shop drawings and engineering calculations shall be submitted by the Contractor for review prior to the installation of habitat features described in the Construction Documents.

   a. Any Shop drawings required for reinforcement shall be prepared according to prevailing standards for hand-carved gunite, and/or pre-cast Glass Fiber Reinforced Concrete (GFRC) construction as appropriate.

2. Submit shop drawings of all construction joints, structural elements, attachment points, etc. for approval. Construction joints, structural elements, attachment points, etc. shall be designed and located by Contractor and approved prior to any work proceeding on site.

   a. Within 2 weeks of contract signing, the Contractor will issue a list of all anticipated shop drawings and engineering calculations that will be required based upon the requirements of these specifications and the Contractor's best judgment of the scope of work and any addition requirements that would call for shop drawings.

3. Submit plan diagrams of anticipated weight loads distributed over the footprint of the exhibit for review.

E. Product Data and Written Information

1. Submit proposed chemical and aggregate mix proportions. Include test data histories of proposed chemical mixes.

2. Submit reports for structural reinforcing (FRP, black bar, epoxy bar, etc.)

3. Submit data for proprietary materials and items, including admixtures, patching compounds, curing compounds, and others as requested.

F. Samples

1. The Contractor will be required to submit up to four sample panels of each type of habitat feature to be replicated as part of this project, indicating general character, shape, texture and durability required under this project. Panels shall be no smaller than 1'-6"' x 1'-6". Samples shall represent the finished surfaces, texture, coloring, etching, etc., as shown on the documents or as directed.

   a. Production samples (provided after the award of a contract, but before purchasing and/or fabrication of the final exhibit features) will be required for:

      1. Striated shale rock substrate
      2. Granite-like rock substrate
      3. Tacoma Narrows Bridge formations
      4. Each species of replicated aquatic plant
      5. Touch tank rock formations
      6. Gulf of California seamount substrate
      7. Each species of replicated enhancement coral and/or encrusting organism

   b. No habitat work shaping, fabrication, installation of hand-carved gunite or pre-cast GFRC panels, texture, or coloring of the final habitat Work formation shall begin prior to approval of samples.

   c. Samples shall not be removed from the project site until substantial completion.

   d. Rejected samples shall be resubmitted for approval at no additional cost to the Owner.

2. Furnish representative samples of materials for materials testing, mix proportion testing, and other forms of testing as may be required.

3. Specifically provide samples of materials that accurately represent the density and weight of materials that will be installed as part of this work.

4. Additional photographs displaying color, form and texture of actual landscape features to be replicated may be submitted by the Contractor at the Contractor's discretion, in order to more fully define the results of the Work. These photographs must be reviewed by the Owner (and the Owner's Design Team) and Owner's husbandry staff before any features indicated in the photographs are incorporated in the Work.

5. In the event that texture molds (for hand carved gunite or pre-cast GFRC formations) do not exist for the enhancement corals, rock substrate or other habitat feature described in the Drawings, submit a written summary along with colored photographs describing the process by which new molds are to be taken, or describe through samples or examples of comparable, previous work, methods for creating the appearance of the substrate in question.

G. Digital Progress Photographs and Video Documentation

1. All pre-fabrication (at the fabricator's shop) and on site fabrication/installation will be digitally photographed and/or video recorded for purposes of communicating with the Exhibit Designer as to the progress being made. Failure to comply may result in delayed processing of pay applications.

2. Digital files will be submitted no less than on a weekly basis as long as fabrication work is in progress, and once on site, progress will be submitted at least twice per week.

3. All submittals to be date encoded, unedited (or enhanced), and submitted via email to insure timeliness of the submittal and the subsequent review by the Design Team and the Owner.

H. Administrative Submittals

1. Description of planning, equipment, methods and quality control program.

2. Detailed construction schedule, coordinated with the general construction schedule per General Requirements.

3. Contractor qualifications, as noted below, will be submitted with the bid.

1.06 QUALITY ASSURANCE

A. Qualifications of Contractor:

1. To be considered qualified for this scope of work, it is recommended that the Habitat Contractor be a Commercial Member of the Association of Zoos and Aquariums (AZA), and shall provide evidence and supporting data for the following requirements.

a. Established firm with a minimum of ten (10) years experience in successfully constructing simulated natural rock formations for natural habitat exhibits of similar nature to the project. Established firm with a minimum of five (5) years experience in casting and/or hand laid-up sculpting of FRP and or GFRC rock panels.

b. The Contractor shall submit for review, full documentation of their construction crew, including superintendent and artist personnel, detailing the experience of each person listed, including visual portfolios showing key individuals' prior work, and their ability to perform all phases of the Work. The Owner's Representative reserves the right to request changes in the Contractor's personnel in order to obtain the highest level of talent available from that organization for this project. Submittal shall also detail physical facilities and established quality control procedures, and a management capability sufficient to produce the required units without causing delay of the project.

c. The Contractor shall submit a list of four (4) recent, completed installations of comparable nature. The list shall indicate the project name and location, project budget for the Contractor's portion of the Work, the Architect, and the name, address and phone number of the Exhibit Designer.

d. The Contractor shall submit photographic proof as references of their experience and ability to construct habitat, substrate, and enhancements similar to those shown on the drawings and photographic references. These materials shall be used to evaluate the Contractor's ability and experience to perform this Work.

e. The Contractor shall submit samples of their choosing that demonstrate their skill and experience with comparable habitat formations. These samples will not replace the need for formal submittals, as outlined in paragraph 1.05 – F of these specifications, but instead will serve as further evidence of the Contractor's qualifications for this project.

B. Direction Regarding Habitat Formation Work:

1. It is intended that the finished products of Work in this Section simulate replicated naturalistic habitats as shown in the Construction Drawings, and as specified herein.

2. To achieve these simulations, the Contractor will coordinate and cooperate fully with others as required and directed.

3. All Work in this Section shall be performed under the observation and review of the Owner's Representative

4. The Owner, Contracting Officer, Architect and Exhibit Designer explicitly reserve the right to continuously monitor the Work for aesthetic quality conforming to the Contract Documents.

C. Design Criteria Regarding Habitat Formation Work:

1. The fabrication of replicated habitat elements will be based upon the Construction Document drawings and specification, as well as the scale models that have been identified within these specifications. Note that the Exhibit Designer and Client will take active roles in finalizing the scale models, in part to assure that the massing and overall character of each replicated habitat has been studied and confirmed in model form prior to full-scale production, fabrication and installation occurs.

2. The fabrication of all habitat formation work, placement, installation, and/ or adjustment of enhancements and other finish details and exhibit accessories shall be accomplished in such a manner as to appear as realistic as possible and "read right" to the trained eye.

3. This project is artistic in nature and may require adjustments, reconstruction and or/ minor demolition of completed Work to obtain the desired effect. Minor changes or adjustments to in-place Work shall be made at no increase to the Contract Sum.

4. General plan contours of substrate, as shown, shall be followed to properly convey the desired artistic effect. Deviations from the general plan contours shall be made only upon approval.

5. Prior to applying hand-carved gunite or pre-cast GFRC panels over the top of any structural armature or plumbing element, the Contractor shall ensure that every possible precaution is taken regarding future potential for the escape of all animals (from the visible exhibit area to non-visible and hollow, back-side of exhibit Habitat Work panels) by verifying that all perforations, penetrations, crevices and animal enclosures satisfactory meet the containment requirements established. Such openings should be no greater than 1/2" in any direction, unless prevented otherwise.

6. Prior to applying hand-carved or pre-cast GFRC panels over the top of any fiber grate decking or piping that is part of the life support system, the Contractor shall ensure that every possible precaution is taken to maintain the water flow and in-tank control and access requirements established by the Owner (and the Owner's Design Team) and the Life Support Engineer.

7. The installation of Work related to this Section shall be performed by the Contractor provided they meet the criteria and requirements specified with Section 1.05 of this specification.

8. Due to the complex nature this project, the Habitat Contractor will be required to provide coordination documents that will assure that the work of this contract will be executed as intended and without any conflicts to adjacent work outside of the scope of this work.

9. Prior to commencement of any pre-fabrication or site fabrication work, the Contractor must be given an approval to commence with work based upon, but not limited to, the successful review of the anticipated weight loads of the work.

10. All fabricated rock formations within public reach must be clear of sharp, pointed protrusions.

.

D. Habitat Formation Quality Control:

1. The Contractor shall have an established Quality Control program in effect prior to letting of the contract. A copy of this program shall be submitted for review.

2. Testing of materials and inspection of production techniques shall be the responsibility of the manufacturer and Contractor unless noted otherwise.

3. Routine testing services will be performed by an approved, certified testing agency. The designated testing agency will:

   a. Test the proposed materials, including water, for compliance with specifications.

   b. Review and check proposed mix proportions.

   c. Test pre-construction test specimens

   d. Secure production samples of materials at the Contractor's shop during construction and test for compliance with specifications.

   e. Continuously observe the placement of reinforcement and structural elements.

4. The Contractor will keep quality control records available for two years after final acceptance.

5. Testing Hand-carved Gunite or Pre-cast GFRC Panels:

   a. A quality control program shall be in effect to monitor glass content, concrete mixture, pigments, spray rate, product physical properties, and curing period and conditions. Results of such quality control tests and evaluation of such tests shall be available upon request.

   b. Preparation of the test specimens and test procedures shall be in accordance with industry standards for "Recommended Practice for Glass Fiber-Reinforced Plastic-Formed Panels", or " recommended practice for Glass Fiber-Reinforced Concrete-Formed Panels" especially as it relates to quality control.

1.07 STANDARDS

A. Comply with the provisions of the following codes, specifications and standards. However, in case of conflict, these specifications and drawings shall take precedence.

B. Plastic Resin Materials and Structures:

1. American Society for Testing and Materials (ASTM): The specifications and standards hereinafter referred to, latest edition.

C. Gunite Materials and Testing:

1. The Owner shall employ an independent testing agency to design concrete mixes and to perform material evaluation tests. Provide 7 and 28 days cylinder tests. Comply with ASTM C 143, ASTM C 173, ASTM C 31, and ASTM C 39.

D. All Work:

1. Standard criteria for performance of Contractor require that the following exhibit guidelines be adhered to: RTFD-F1; RTFS-F1; and NC/O-F1.

2. Standard criteria for performance of all parties require that the following exhibit guidelines be adhered to: LHSF-F1.

1.08 PROTECTION OF PROPERTY

A. In addition to normal precautions for the protection of the public, workers and property, take special precautions to prevent contamination of soil or water/sewage systems with cement, paint, dye, resins and other chemical materials.

B. Limit the area for working and storing chemical materials to areas within ten horizontal feet of exhibit structures and other areas specifically approved.

C. Control runoff from mixing and placing operations. Channel runoff directly to an approved collection system, within an on-site location approved.

D. Legally dispose of waste material, chemicals and solvents, and chemical containers off-site unless otherwise specifically allowed by these Specifications. Confirm any allowance for on-site disposal and dispose of waste on-site only upon receipt of written authorization.

E. All chemicals should be removed from construction site prior to hydro testing or any tank filling procedures.

1.09 DELIVERY, HANDLING, AND STORAGE

A. No cold weather work (outside temperature of 35-degrees and falling) will be permitted unless written permission is obtained from the Owner's representative. No wet-weather work will be permitted unless the work area is covered and protected. Protect materials from extreme cooling and rain.

B. Carry out all work in a manner that will prevent damage to the structural integrity of the adjacent exhibits and public areas, the waterproof gunite exhibit tank, window glazing or other physical features on site. Take extreme care in the handling of materials to prevent overloading of on-grade or hidden structures and to prevent physical damage to surrounding surfaces and waterproofing membranes. Protect surrounding surfaces from over-spray, staining, etc. Repair all damage to pre-existing structures, surfaces, and finishes to original conditions at NO COST to the Owner.

C. Delivery and Handling, general: Properly deliver and handle materials to prevent contamination, segregation, or damage to materials. Store materials in fireproof, weather-tight enclosures to protect against combustion, dampness and contamination. Prevent segregation and contamination of aggregates by proper arrangement.

D. Plastic Resins and Related Chemicals:

1. Store all materials in fireproof containers in area approved by the Owner, General Contractor, and local Fire Department.

2. Prevent interference of work by others as caused by fumes from on-site resin-related work. Coordinate all chemical work with the Owner's Project Manager, and if requested, monitor air quality to assure safe levels of resin-based fumes on the project site meeting current OSHA/NFPA requirements

1.10 PROJECT CONDITIONS

A. Examination of the site and general substrate and related conditions: The installer must examine the conditions under which the work under this Section is to be performed. Do not proceed with work under this Section until unsatisfactory conditions have been corrected.

B. Protect installed work from damage by other trades until acceptance of work. Provide required protection procedures.

C. Coordination: Coordinate with other work, and others whose work will be affected by this Section.

D. Work will occur within a facility that is unconditioned against heat, cold, or precipitation, and that it will be the responsibility of the Contractor to work in accordance with those conditions.

1.11 SEQUENCING, SCHEDULING, AND COORDINATING

A. Prior to commencing installation, arrange a job site meeting to be attended by the Contractor, the Owner's Representative and the representatives of other trades associated with the work of this Section and related Sections.

B. The purpose of the meeting shall be to discuss requirements of the Contract Documents, shop drawings, job and surface readiness and material storage and protection, to assure that details are correct, that materials shall be installed properly, and coordination of other trades.

C. Following the meeting, prepare a written report containing:

1. Meeting date, names and affiliations of those present.

2. Written statements from each installer and manufacturers' representative of their acceptance of the requirements of the Contract Documents for the use of their material.

D. The Contractor will be required to provide coordination documents that will assure that the work of this contract will be executed as intended.

E. Coordinate all work with adjacent trades and forms of construction relative to sequencing and compatibility of construction details and materials. Identify all points of coordination with other trades (such as plumbing, electrical, life support) and take all necessary measures to assure that the work of this contract is properly coordinated with the work of those other contracts.

F. Do not commence work of this Section unless documents required herein above have been approved.

1.12 WARRANTY

A. Warranty work listed in this Section for two years from date of Final Acceptance. Guarantees will include at a minimum:

1. Overall structural integrity of the work

2. Cracking of finish surfaces

3. Discoloration and/or the fading of color of finish surfaces

4. Accommodation of the Life Support System elements that placed (by others) within the exhibit tanks

5. Proper formation of rockwork in public areas relative to the prevention of visitor climbing of formations as well as the avoidance of sharp, pointed protrusions.

B. Provide two copies of written statement of warrantee, for Final Acceptance.

PART 2 - PRODUCTS AND INSTALLATION

2.01 DESCRIPTION

A. Substrate and Finished Exhibit Habitat Formations:

1. The exhibit construction for the habitat substrate shall include all materials, labor, equipment, and related services necessary to furnish and erect the exhibit including:

   a. Erecting and finishing of all sculpted and/or cast substrate over all necessary structural armatures.

   b. Placement of enhancements

2. The exhibit construction for the habitat does not include the following work that will be performed as indicated:

   a. Placement and installation of on-floor distribution piping, fiber-grate decking, in-tank piping and associated supports and other materials by Plumbing Contractor.

   b. Waterproofing of the structural tank structure.

   c. Lighting

3. All anchorages to be placed within the exhibit shall be set in place by the Contractor before starting the process of habitat substrate erection. The anchors shall be non-corrosive, and be the size, type, and quantity as indicated on the Contractor's shop drawings and data submittals. No anchors will be permitted below the water line and therefore they are not permitted to pierce waterproofing of the pool structure.

4. All below-water formations shall be grouted, solid-filled material unless otherwise agreed upon in writing by the Client. No metal or other corrosive materials will be allowed.

5. All above-water formations shall be lightweight construction that shall not exceed 120 per cubic foot, while still matching in appearance the adjacent and surrounding solid-grout formations that are within below-water locations.

6. The habitat work of this project has been represented by design drawings, a model and photo reference material. All formations, textures, visual accents, and coloration shall be in accordance with the intent of these documents and references.

2.02 MATERIALS

A. Waterproofing of Hand-carved and Pre-cast GFRC materials:

1. Heavy cement base, Thoro Systems Products Thoroseal, or approved equal, where noted on the Drawings

2. Crystalline capillary waterproofing, where noted on the Drawings, for application to all below-water formations and other formations where standing water or contact with saltwater may require that the materials be waterproofed shall be Vandex, Zypex or equal. The waterproofing system shall be a mix containing chemicals that penetrate with moisture into the capillary tracts and activate to form crystals that close the capillaries to produce the waterproofing effect.

3. Where noted on the Drawings, a cement-based waterproofing system shall be placed between the structural gunite coat and the texture coat. This cement-based waterproofing system shall be non-toxic, inorganic, free of calcium chloride and sodium based compounds. The cement-based waterproofing system shall be HEY'DI K-11, manufactured by HEY'DI American Corp., Norfolk, Virginia, or an equal. Bonding agents, if required, shall be HEY'DI SB Bonding Agent or an equal. Color to be approved by Exhibit Designer

B. Materials for Hand-carved Gunite and Glass Fiber Reinforced Concrete (GFRC):

1. Portland cement:

a. ASTM C 150, Type I, II or III.

b. For surfaces exposed to view in the finished structure use same brand, type, and source of supply throughout the GFRC production.

c. Cement to be rated as low alkali.

2. Aggregates:

a. Sand shall be washed and dried silica or approved equal with a history of successful use in similar formations. All sand shall pass through a No. 20 (850-pm) sieve.

b. Facing aggregates used should conform to ASTM C-33 except for gradation. Aggregates shall be clean, hard, strong, durable, inert, and free of staining or deleterious material.

3. Water: Free from deleterious matter that may interfere with the color, setting, or strength of the concrete.

4. Admixtures: Conforming to ASTM C260, ASTM C494 or ASTM C618.

5. Coloring Agent:

a. Shall be harmless to concrete set and strength.

b. Shall be stable at high temperature.

c. Shall be sunlight fast and alkali-resistant.

6. Glass Fiber:

a. Fibers specifically designed to be compatible with the aggressive alkaline environment of Portland cement based composites or fibers with a history of successful use in a Portland cement based composite that has been modified to be compatible with the fiber.

b. The producers of all Portland cement based composites shall submit evidence that the glass composition, Portland cement matrix, or both have been designed for glass fiber reinforced concrete applications.

7. Sprayed in Anchors and Loose Attachment Hardware:

a. Stainless steel ASTM A 666 Type 316, grade B anchor bolts ASTM A307 or ASTM A 325 for all saltwater exhibit applications.

b. Heavy duty, 100% nylon straps.

8. Cement Plaster: Pneumatically placed wet mixture of sand and Portland cement, minimum compressive strength of 4,000 PSI in 28 days.

9. Molding materials: At contractor's option to meet execution required.

10. Integral Color: Permanent cement colors.

C. GFRC Mixes

1. GFRC Mix: GFRC shall consist of Portland cement, water, glass fibers, sand, and may contain admixtures. The component materials shall be in accordance with Section 2.1.

2. Facing Mix: Thickness shall generally be the minimum possible to achieve the desired finish.

3. Coloring Agent: The amount of coloring agent shall not exceed 10% of cement weight.

D. Reinforcing Materials

1. Reinforcing Bars: Comply with ASTM A 615, Grade 40 or as noted. All reinforcing used in pool bottoms or other water containment area or areas continually exposed to water, shall have epoxy coating, unless otherwise noted. All epoxy coating shall be according to ASTM A775/A77M. Re-coating after installation may be required.

2. Welded Wire Fabric: 6 x 6-W2.1 x W2.1 WWF, comply with ASTM-185 or ASTM A 82. All WWF used in pool bottoms or other water containment area or areas continually exposed to water must have epoxy protective coating. All epoxy coating shall be in accordance with ASTM A775/A77M. Re-coating after installation may be required

3. Steel Lath: Unpainted 1.75 lb. black expanded metal lath, maximum 1/2-inch clear apertures is allowable for all above water applications only.

4. Spacers: Backup forms shall be fastened to reinforcing bars by means of special plastic tie wires.

5. Supporters for Reinforcement: Provide supports for reinforcement, supporting, and fastening plastic reinforcing bars and plastic mesh materials. Use only non-corrosive, non-metallic supports manufactured for that purpose. Corrosive materials and brick, stone and similar materials are unacceptable.

6. Wire: heavy-duty plastic zip-ties.

7. Plastic Reinforcement: Where indicated on the drawings, polypropylene mesh shall be incorporated into the texture coat of horizontal slabs to control freeze - thaw characteristics. The mesh shall be Tenax C-Flex or an approved equal which, when incorporated into cast specimens of concrete, shall demonstrate a modulus of rupture equal to or better than the performance of the same cast concrete specimens incorporating 6" x 6" - 10 Ga. welded wire fabric. The mesh shall be placed horizontally at a depth from the top of 1/3 the total depth of the final pour.

E. Pneumatically Placed Gunite

1. Definition: Pneumatically placed wet mixture of aggregate and Portland cement. Minimum strength of 3,000 PSI in 28 days.

2. Cements

a. Use cement conforming to one of the following:

1. Portland Cement conforming to ASTM C-150. Use only one brand of cement throughout the project.

2. Blended hydraulic cement conforming to ASTM C-595 type IS IS-A, IP or IP-A.

3. Aggregates

a. Standard Aggregates:

1. On gunite on the first floor on grade or on slab on grade shall use normal weight aggregates conforming to ASTM C-33.

2. Aggregates shall be manufactured from natural rock or stone, washed gravel either natural or crushed, clean, and free of deleterious substances.

b. Lightweight Aggregates:

1. All gunite referred to on the drawings as lightweight gunite shall use lightweight aggregates conforming to ASTM C-330-79.

2. Lightweight aggregate shall be either:

a. Clinkerized Clay equal to "Haydite", as manufactured by Hydraulic Press Brick Company, P.O. Box 31330, Cleveland, Ohio 44131, (216) 524-2950.

b. or Vitric Tuff (pumice) equal to “Tufflite”, as manufactured by Arizona Tufflite, Phoenix, Arizona, 85029, (800) 942-6368. Pumice should be pre-wet according to the manufacturer’s recommendations.

3. Total weight of lightweight gunite shall not exceed 118 pounds per cubic foot.

c. Structural Substrate - Gradation limit for combined aggregates conforming to the following:

Sieve Size U.S. Standard Square Mesh	Percent by weight passing individual Sieves
3/4 in.	100
1/2 in.	80-95
3/8 in.	70-90
No. 4	50-70
No. 8	35-55
No. 16	20-40
No. 30	10-30
No. 50	5-17
No.100	2-10

Batch fine and coarse aggregates separately to assure segregation.

d. Texture Coat - Gradation limit for combined aggregates conforming to the following:

Sieve Size U.S. Standard Square Mesh	Percent by weight passing individual Sieves
3/4 in.	------
1/2 in.	------
3/8 in.	100
No. 4	95-100
No. 8	80-100
No. 16	50- 85
No. 30	25- 60
No. 50	10- 30
No.100	2- 10

4. Water:

a. Mixing water: Use fresh, clean and potable mixing water or use non-potable water which produces mortar cubes having 7- and 28-day strengths equal to at least 90 percent of the strength of similar specimens made from water from a municipal supply. Make strength comparison on mortar cubes in accordance with ASTM C109.

b. Curing water: For finish gunite, use curing water that is free from elements that could cause staining.

5. Admixtures:

a. Use accepted admixtures meeting the requirements listed below, if admixtures are required or permitted. Except as otherwise accepted, dissolve soluble admixtures in water before introduction into the mixture. Agitate liquid admixtures that settle.

b. Chemical admixtures conforming to ASTM C494.

c. Air entraining admixtures conforming to ASTM C260.

6. Fly ash and pozzolanic materials conforming to ASTM C618.

7. Plasticizers and other admixtures that are permitted or required.

F. Moisture Retaining Cover

1. Burlap: Cloth made from jute and weighing approximately 9 oz. per sq. yd. For moist curing and conforming to AASHTO M 182.

2. Membrane Forming Curing Compound: ASTM C 309

G. Proportions

1. Submit for acceptance proportioning and test data from prior experience if available. If data from prior experience are not available or accepted, make and have tested specimens from three or more different mix proportions. Submit recommended mix proportions and test results for acceptance.

2. Gunite shall have a compressive strength at 28 days of full cure = 3000 PSI. Proportions shall be selected on the basis of compressive strength tests of specimens continuously moist cured until testing at 28 days. These specimens shall be cut from the gunite test panels not earlier than 5 days after gunite. For mix acceptance purposes, average core strengths shall be at least equal to full cure for cores with L/D of 2.0. For cores with L/D between 1.0 and 2.0, use the correction factors given in ASTM C 42. For cube specimens, average strength shall be at least equal to full cure = 0.85.

2.03 EXECUTION

A. Inspection

1. Verify that surfaces to receive Habitat Work and exhibit accessories materials are satisfactory for the installation. If unsatisfactory conditions exist, do not commence installation until such conditions have been corrected.

B. Preparation

1. Prepare all shop fabricated exhibit components as shown on the Drawings and in the appropriate Section of the Specifications.

2. Natural and Organic components: Collection, transportation and placement or installation shall be effected by the Contractor as shown on the Contract Documents as approved. Provide connections to secure natural materials in place as required by the Drawings.

C. Fabrication of GFRC Panels

1. Forms: Make latex molds (including backs) of natural rocks as submitted for GFRC panel production.

a. Forms for GFRC panels shall be rigid and constructed of materials that will result in finished products conforming to the profiles, dimensions and tolerances indicated by the Contract Documents and on the approved shop drawings.

b. Release agents shall be applied and used according to manufacturer's instructions.

2. Proportioning and Mixing:

a. All measurements of mix constituents shall be carried out in a careful manner to achieve the desired mix proportions.

b. The glass fiber and cement slurry shall be metered to the spray head at rates to achieve the desired mix proportion and glass content. These shall be checked in accordance with standard procedures described in PCI "Recommended Practice for Glass Fiber Reinforced Concrete".

c. Cleanliness of equipment and working procedure shall be maintained at all times.

3. Hand Spray Application:

a. Spray operators shall be trained personnel.

b. A mist coat consisting of the matrix without fiber may, if necessary, be sprayed onto the form. The thickness of this coating shall generally not exceed 1/ 8 in.

c. Spray-up of the main body of material shall proceed before any mist coat has set.

d. Application shall be by spraying such that uniform thickness and distribution of glass fiber and cement matrix is achieved during the application process.

e. Consolidation shall be by rolling or such other techniques as necessary to achieve complete encapsulation of fibers and compaction.

f. Control of thickness shall be achieved by using a pin-gauge or other approved method.

g. All over-spraying or hand forming of intricate details, incorporation of formers, embedment forms, fasteners, or infill material, shall be carried out before the material has achieved its initial set so as to insure complete bonding.

4. Inserts and Embedment:

a. Inserts shall be properly embedded in built up homogeneous GFRC layers to develop their strength.

b. Panel manufacturer shall test inserts to establish test data for use in design.

c. Rigid embedded items bonded to the GFRC shall not create undesirable restraint to volume changes.

d. Cover: Provide embedded anchors, inserts, and other sprayed in items with sufficient anchorage and Embedment for design requirements.

5. Tolerances:

a. Thickness:

1. Skin thickness ranging from +1/4” to +1/8”

2. Panel depth ranging from +1” to +1/4"

6. Finishes: Exposed face of panels to match approved sample. Exposed face of panels shall be manufactured free from joint marks, "grain" or other obvious defects.

7. Curing:

a. Immediately after the completion of spraying of the panel, a curing method shall be used to ensure sufficient strength for removing the units from the form.

b. After initial curing, remove panel from form and place in a controlled curing environment. Panels shall be kept continuously wet for a minimum of 7 days in accordance with manufacturer's standard curing practice. The temperature shall be maintained between 60°F and 90°F during this period.

8. Panel Identification:

a. Mark each panel to correspond to identification mark on shop drawings for panel location.

b. Mark each panel with date cast.

9. Acceptance: GFRC units, which do not meet the color and texture range or the dimensional tolerances may be rejected.

D. Preparation of Surfaces for Structural Substrate

1. Inspection: Examine the substrate, and the conditions upon which reinforcement is to be placed, and correct conditions which would prevent proper and timely completion of the work. Do not proceed with the work until unsatisfactory conditions have been corrected.

2. Existing Tank Structure

a. Remove unsound material before applying substrate.

b. Prepare all structural contact or load-bearing points so as to assure proper contact, loading, or attaching, and to perform such work so as to maintain the structural and waterproof integrity of the tank structure.

3. Removable Forms:

a. Use form-coating material on removable forms to prevent absorption of moisture and to prevent bond with gunite.

b. Use a non-staining material for surfaces exposed to view when construction is completed.

c. The form-coating material shall not interfere with subsequent bonding to the gunite when this is required.

E. Structural FRP Reinforcing

1. Alternate Reinforcing Sizing: All structural FRP reinforcement is shown on the drawings and supplemented in these Specifications. The Contractor may, at their option, develop alternate reinforcement sizing and placement to facilitate their Work provided:

   a. Obtain written approval of the Project Architect/Engineer and the Owner.

   b. All structural calculations for alternate reinforcement are fully and clearly documented by a registered structural engineer, licensed in the State of Washington.

   c. Obtain required permits and approvals of such alternate sizing and placement, in a timely manner, without delaying the progress of the work, and at no additional expense to the Owner or their agents.

2. General:

   a. Clean reinforcement of loose material, mill scale, earth, ice, and other materials, which reduce or destroy bond between the fabricated elements and the existing tank structure.

   b. Touch-up bare exposed structural materials and surfaces of epoxy coated rebar with similar coating approved by manufacturer.

   c. Accurately position, support and secure reinforcement against displacement by construction or concrete placement operations. Locate and support reinforcing by plastic chairs, runners, bolsters, spacers and hangers, as required.

   d. Notify the Owner's Representative upon completion of reinforcing and prior to placing gunite.

3. Minimum Standards: Comply with specified standards for details and methods of reinforcement placement and supports, and as herein specified. The following minimum steel placement standards are supplemental to steel reinforcement schedules and notes on the drawings.

   a. Fabricate plastic bars of size and length indicated and accurately bend or form to the slopes indicated by methods that will not injure the materials. Fabrication shall be in accordance with the manual of Standard Practice for detailing Reinforced Concrete Structures, ACI 315.

   b. Provide sufficient numbers of supports and of strength to carry reinforcement. Do not place reinforcing bars more than 5 cm (2") beyond the last leg of any continuous bar support. Do not use supports as bases for runways for concrete conveying equipment and similar construction loads.

   c. Position, support, and secure reinforcement against displacement by formwork, construction, or concrete placement operations. Locate and support reinforcing by plastic chairs, runners, bolsters, spacers, and hangers, as required.

   d. Place reinforcement to obtain the minimum coverage for concrete protection. Arrange, space, and securely tie bars and bar supports together with 16 gauge wire to hold reinforcement accurately in position during concrete placement operations. Set wire ties so that twisted ends are directed away from exposed concrete surfaces.

   e. Place No. 4 bar as a key rod at intersections of plane surfaces.

   f. Lap bars (30) diameters at splices. With respect to viewing outer surface from a perpendicular viewpoint, lap bars on top of each other rather than side by side.

g. Place and bend bars around circles and curves, openings, corners and angles. Bends are to be permanently shaped, not sprung into place. Follow the outline of the rock formations to eliminate excess non-reinforced gunite outcroppings.

h. Tie reinforcing plastic to wall ties and to extended footing, or wall.

i. The tie bars and tie anchors which are exposed to air and which do not come in contact with any backfill material shall be given a protective covering of epoxy, or equal.

j. Tie bars and tie anchors that come in contact with backfill material will be encased with a coating of gunite. Plastic shall be covered by a minimum of 1" of gunite.

k. Use additional #4 bars diagonally across corners of openings and wherever gunite formations act as beams. Place additional #5 bars at points of maximum stress, i.e., one in top and one in bottom extending 12" into supports.

l. Place mesh on plastic reinforcing on side opposite the backup material and plastic tie securely to the reinforcing bars at not less than 20 inch intervals in both directions. Lap mesh minimum 2 inches at adjacent ends.

m. Install plastic mesh fabric in as long lengths as practicable. Lap adjoining pieces at least one and one-half (1-1/2) meshes plus end extension of wires, but not less than 12 inches in slab on grade. Extend mesh across supporting beams and walls. Provide adequate support for mesh to ensure proper location. Place uniformly 1-1/2" to 2" from finished surface.

n. Installation of reinforcing to be complete in every way by end of working day prior to placement of concrete.

o. Unacceptable Materials: Reinforcement with any of the following defects will not be permitted in the work.

1. Bar lengths, depths, and bends exceeding specified fabrication tolerances.

2. Bend or kinks not indicated on drawings or final shop drawings.

3. Bars with reduced cross-section due to excessive rusting or other cause.

F. Forming Gunite Structures

1. Where gunite is constructed within (or near) the exhibit tanks, use plastic rebar and mesh materials (no metal products will be allowed)

G. Provisions for Other Trades

1. General:

a. Provide openings in gunite formwork to accommodate work of other trades and allow access for husbandry staff. Determine size and location of openings, vents, access holes, recesses, and chases from trades providing such items, as well as the husbandry staff.

H. Batching and Mixing Gunite

1. Mixing Proportions: Control by weight batching, or by volume batching meeting the requirements of ASTM C685.

2. Batching and Mixing Equipment: Use batching and mixing equipment capable of proportioning and mixing ingredients at a rate that will provide adequate production and with an accuracy that will insure uniformity of batches. Weighing equipment shall be capable of batching with the accuracy specified in ASTM C94. Volumetric equipment shall be capable of batching with the accuracy specified in ASTM C685.

3. Ready Mixed Concrete: Ready-mixed concrete shall comply with ASTM C94, except that it may be delivered to the gunite equipment in the dry state if that equipment is capable of adding the water and mixing it satisfactorily with the dry ingredients, or with ASTM C685, in which case the ingredients are delivered dry and proportioned and mixed at the site.

I. Placing Gunite

1. Textured gunite: Gunite shall be placed in two separate applications unless otherwise or indicated on drawings.

a. Structural Substrate: The first application shall be a structural substrate, capable of maintaining the intended shape and supporting live and dead loads as specified or required by codes.

b. Texture Coat: The second application shall produce the intended color and texture, and shall be placed only after bonding agent has been applied. Where applicable, surface conditions must comply with specification requirements.

2. Gunite as a structural base for GFRC panels: Gunite shall be placed in one application.

3. Place gunite using suitable delivery equipment and procedures that will result in gunite in place meeting the requirements of this specification. Refer to ACI Standard 506-66, Recommended Practice for Gunite.

4. When applying any Gunite (or other concrete material) the Contractor must make sure all plumbing and other systems are thoroughly capped.

5. Placement Techniques:

a. Control thickness, method of support, air pressure, and/or water content of gunite to preclude sagging or sloughing off. Discontinue gunite or provide suitable means to screen the nozzle stream if wind or air currents cause separation of the nozzle stream during placement.

b. Dampen absorptive substrate surfaces prior to placement of gunite to facilitate bond and to reduce the possibility of shrinkage cracking developing from premature loss of the mixing water.

c. Broom or scarify the surface of freshly placed gunite to which, after hardening, additional layers of gunite are to be bonded. Dampen surface just prior to application of succeeding layers.

d. First, fill with sound material corners and any area where rebound cannot escape or be blown free. Complete the corners between the web and the flanges of structural steel before application to the flat areas.

e. Provide a supply of clean, dry air adequate for maintaining sufficient nozzle velocity for all parts of the Work and, if required, for simultaneous operation of a suitable blow pipe for clearing away rebound.

f. Protect existing and new supply ports to prevent gunite material from entering any pipe openings.

6. Placement Around Reinforcement:

a. Hold the nozzle at such distance and angle to place material behind reinforcement before any material is allowed to accumulate on its face. In the dry-mix process additional waste may be

added to the mix when encasing reinforcement to facilitate a smooth flow of material behind the bars.

b. Do not place gunite through more than one layer of reinforcing rods or mesh in one application unless demonstrated by pre-construction tests that the reinforcement is properly encased. Test to ascertain if any voids or sand pockets have developed around or behind reinforcement by probing with an awl or other pointed tool; by removal of randomly selected bars; or by coring or other suitable means.

7. Cover of Reinforcement:

a. Place gunite to provide the following minimum cover over reinforcement:

1. For gunite used as lining or coatings: 3/4 in. for fine aggregate gunite and 1-1/2 inc. for coarse aggregate gunite.

2. For reinforcement in slabs and walls: 3/4 inc. for fine aggregate gunite and 1-1/2 in. for coarse aggregate gunite.

3. For principal reinforcement in beams, girders and columns: 1-1/2 in.

b. Minus tolerance on cover shall be 3/8 in., except that it shall not be greater than one-third of the specified cover.

8. Line and Thickness Control: Use adequate ground wires or other accepted means to establish the thickness, surface planes, and finish lines of the gunite. Maintain specified tolerances by keeping ground wires secure and taut.

9. Placement Precautions:

a. Do not place gunite if drying or stiffening of the mix takes place at any time prior to delivery to the nozzle. Do not use rebound or previously expended material in the gunite mix.

b. Remove overspray or rebound prior to final set and before placement of gunite material on such adjacent surfaces.

10. Joints

a. Construction joints shall be designed and located by Contractor and approved. Submit shop drawings of all construction joints.

1. Taper construction joints to a shallow edge form, about 1 in. thick, except where the joint will be subjected to compressive stress. In this case, use non-tapered joints and take special care to avoid or remove trapped rebound at the joint.

2. The entire joint shall be thoroughly cleaned and wetted prior to the application of additional gunite.

3. Make joints perpendicular to the main reinforcement. Continue reinforcement across joints.

b. Control Joints: Install control joints in accordance with the shop drawings. Do not extend reinforcement or other embedded metal items, which are bonded to the gunite, continuously through control joints.

c. Aesthetic Joint Placement: Position construction and control joints to conform to the locations of natural occurring cracks and joints in the simulated rock and earth forms as shown in drawings and photographs.

11. Repair of Surface Defects

a. Remove and replace gunite which lacks uniformity, exhibits segregation, honeycombing, or lamination, or which contains any dry patches, slugs, voids, or sand pockets. Remove and replace damaged in-place gunite.

b. Repair core holes in accordance with Chapter 9 of ACI 301. Do not fill core holes with gunite.

c. Replace any gunite that subsides after placement.

12. Verification of Structural Loads

a. Contractor is responsible for verifying the anticipated weights for all replicated habitat work on a tank-by-tank basis prior to the commencement of any habitat formation work.

J. Preparation of Surfaces for Texture Coat

1. Structural Cracks:

a. Structural sized cracks (appearing after a duration of 2 to 4 days duration) should be opened, cleaned and repaired with a 3:1 mix of sharp sand and Portland cement mixed with a solution of 1 part bonding agent to 5 parts water or a patching material recommended by the cement-based waterproofing manufacturer.

b. Moving or dynamic cracks should be treated as expansion joints with HEY'DI K-11 and an elastic sealant in accordance with sealant manufacturer's instructions.

2. Waterproofing shall be provided for all below-water habitat features. The structure coat should be thoroughly cleaned and dampened. Apply one slurry coat of HEY-DI or equal cement-based waterproofing at the rate of 2.25 lbs. per sq. yd. After it has reached an initial set, dampen if dry and apply a second coat of the cement-based waterproofing at the same rate. Pour concrete while the second coat is still less than 6 hours old to assist in bonding and to form an uninterrupted membrane.

K. Finishes

1. Structural Layer:

a. Provide broom finish on areas to be waterproofed.

b. Do not scrape or cut to remove high spots until the gunite has become stiff enough to withstand pull of the cutting device.

2. Texture Coat:

a. The Contractor will provide an expert(s) to perform texturing, shaping and coloring of the Texture Coat

b. The procedures for applying the texture coat materials and the personnel for this work must be reviewed and approved.

c. Finished product of the Texture coat shall simulate natural formations of sand, rock and mud as described in the specifications and drawings, and photographs.

d. The preserved existing rockwork will be modified by the Contractor whereby they will integrate the appearances of the new construction with that of the existing construction to create a seamless, naturalistic appearance in terms of texture, geological formation, fault lines, and color.

e. Verification of Structural Loads and Strength

1. The Contractor will load test and verify that all formations are structurally sound and allow for the physical weight of staff divers (or others) being set upon any formation by applying 80 pounds per square foot of load on all walking/standing surfaces for a period of no less than twenty-four (24) hours. Do not allow persons in the area during the loading period.

2. In the event of test failure, the Contractor will remove the necessary material until such time as the test is satisfactorily passed.

L. Curing and Protection

1. Initial Curing: Immediately after finishing, keep gunite continuously moist for at least 24 hours. Use one of the following materials or methods.

a. Ponding or continuous sprinkling.

b. Absorptive mat or burlap fabric, sand, or other covering kept continuously wet.

c. Continuous steam (not exceed 150 F) or vapor mist bath.

d. Curing compounds and application. Comply with ASTM C309. On natural gun or flash finishes, use twice the normal application rate recommended by the manufacturer, or 100 S.F. per gal., whichever is less. Do not use curing compounds on any surfaces against which additional gunite or other cement-based finishing materials are to be bonded unless positive measures, such as sandblasting, are taken to remove curing compounds completely prior to the application of such additional materials.

e. Do not use curing compounds on texture coat, structural layer which is to receive texture coat, or any surface against which additional gunite or other cement-based finishing materials are to be bonded.

f. Employ positive measures, such as sandblasting, to remove over-sprayed curing compounds completely prior to the application of such additional materials.

2. Final Curing: Provide additional curing immediately following the initial curing and before the gunite has dried. Use one of the following materials or methods:

a. Continue the method used in initial curing.

b. Materials conforming to "Specifications for Sheet Materials for Curing Concrete", (ASTM C171).

c. Other moisture retaining coverings as accepted.

3. Formed surfaces: If forms are to be removed during curing period, immediately use one of the curing materials or methods listed in Paragraph 3.12 - A. Continue such curing for the remainder of the curing period.

4. Duration of curing: Continue curing for the first 7 days after gunite, or for the first 3 days if high-early-strength is obtained. During the curing period, maintain gunite above 40° F and in a moist condition. Prevent rapid drying at the end of the curing period. Advise and seek approvals from the General Contractor's Project

Manager and Owner (and the Owner's Design Team) for planned curing durations and a back-up schedule should additional curing time be necessary.

5. Natural curing: Natural curing may be allowed when authorized and approved if atmospheric conditions surrounding the gunite are satisfactory, such as, when the relative humidity is at or above 85 percent.

6. Curing will require acid etching with a stabilized ph of 8.0 to 8.2 for a minimum of 24 hours for this closed saltwater system.

M. Erection of GFRC Units

1. Unloading Areas and Access: Clear, well-drained unloading areas and road access around and in the building where possible and appropriate shall be provided and maintained by the Contractor to a degree that the hauling and erection equipment for the GFRC units are able to operate under their own power.

2. Safety Aspects: The erector shall provide adequate barricades, warning lights or signs to safeguard traffic in the immediate areas of hoisting and handling operations.

3. Setting:

a. GFRC units shall be lifted with suitable lifting devices at points provided by the manufacturer. Place cast rock panels into proper position (referring to numbered photographs, molds, and panels) shimmying and bracing as necessary, and wire-tie or weld cast-in steel reinforcing rod anchors to supporting steel reinforcing bar grid work, then shoot seams between panels and vertical or horizontal line for formation.

4. Supports and Bracing: The erector shall provide temporary supports and bracing as required to maintain position, stability and alignment as units are being permanently connected.

5. Secure Panels to structural armature or substrate:

a. Secure GFRC units in place by strapping and grouting, or as shown on approved erection drawings.

6. Finishing and seaming

a. Apply cement plaster with integral color directly to those areas of gunite walls that are to be hand carved mud or dirt banks, dens, floors, or pools that are to be hand carved as to a minimum depth of 1-inch. Increased depth of material will be at no increase in contract sum. Hand-carve these areas to truly approximate the approved photographs and model.

b. Waterproof over smooth cement plaster coat of wall planters.

c. Waterproof all pools integrally watertight as well as water tight at junctures with walls constructed by others as required.

d. Habitat Work shall meet all buildings, walls, doorframes, etc., with no voids.

e. In Habitat Work for underwater locations, no voids are allowed in the finished construction

N. Coloring

1. Paint artificial rock to mimic photographs of natural formations, and approved panels. As this is an artistic endeavor, the finished painting shall be approved by the Owner's Representative at frequencies which allow the work to progress without interruption and which will avoid requiring major repainting effort. Minor adjustment to final product shall be made at no increase in contract sum.

a. Surface Applied Color:

1. Color of rock and sand forms shall match the color (in general and in detail) of natural materials displayed in the photographic samples.

2. Color hand-carved texture coat and pre-cast GFRC panels with integral color agents and by painting after final texturing. Staining and etching may be used in specific circumstances approved by the Owner's Representative. Color shall be approved by the Owner's Representative without exception.

3. Paint shall be flat finish unless otherwise specified.

4. Color mixes and application processes shall be approved by the Owner's Representative prior to beginning of Work.

b. Integral Color of Cementitious Materials

1. Use integral color that matches the base color of the habitat being produced.

2. Integral color(s) to be approved by Owner and the Exhibit Designer prior to commencement of work.

3. Where designated, adhere Owner-supplied crushed coral or loose sand/gravel to tank bottom using clear epoxy resin as the adhering agent, with sand broadcast over tank bottom area sufficient to hid entire tank bottom.

2.04 CLEANING

A. Cleaning methods shall be proposed by Contractor for approval.

B. After Installation: Contractor to provide domestic freshwater wash of entire tank after all exhibitry (includes artificial rockwork, natural rock, etc.) is complete but before substrate (gravel, sand - if applicable) is installed. Intent is that all surfaces of the tank and exhibitry are spray washed and the entire tank is filled prior to draining

2.05 PROTECTION

A. The Contractor shall be responsible for protecting their Work from any damage, and repairing to former quality any damage, occurring during construction.

B. The erector shall be responsible for any chipping, concrete spalling, cracking or other damage to the units after delivery to the jobsite.

2.06 INSPECTION AND ACCEPTANCE

A. Make habitat work and all related scope ready for review of all operational, technical, biological, and aesthetic aspects. Correct all deficiencies as directed.

1. Final inspection and acceptance of completed Habitat Work shall be made to verify conformance with plans and specifications.

2.07 REPLICATED ENHANCEMENT CORALS

A. A schedule of species-specific enhancement corals are attached to this specification.

2.08 PHOTOGRAPHIC REFERENCE MATERIAL

A. Photographic reference photographs are attached to this specification. These photos maybe shown in black and white during the documentation and bid phases of the project, with color versions made available upon the successful award of this scope of work, and upon the commencement of the construction phase of work.

END OF WRITTEN SECTION – ENHANCEMENT CORALS AND PHOTO REFERENCE MATERIALS FOLLOW

SECTION 11 59 30

INTERPRETIVE GRAPHICS

PART 1 - SUMMARY OF WORK

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications, apply to this Section.

1.2 SUMMARY

A. The Contract Forms, Conditions of this Contract, and Section 11 59 01 applies to the work of this section.

B. The Contractor is expected to be familiar with all other sections of the specifications and drawings as issued for Exhibits and may need to familiar with specification and drawings as issued for Architecture and Engineering

C. Related Specification Sections include:

1. 11 59 01 - General Requirements for Exhibits
2. 11 59 40 - Media Software for Exhibits
3. 11 59 70 - Exhibit Casework & Furniture

1.3 SCOPE OF WORK

A. The work under this Section consists of the furnishing and installing of printed interpretive exhibit graphics and wall murals as outlined by the schedule of graphics indicated within the drawing set with the prefix of EX. Interpretive graphics include the following:

1. Non-interactive Wall Graphics
2. Dimensional Letters
3. Interactive Wall Graphics (Wall mural with interpretive text and images built into a series of movable, interactive wall elements.)
   a. Puget Sound Interpretive Wall Graphic
   b. Timeline Interpretive Wall Graphic
4. Photo Mosaic Wall Graphics
5. Conservation Station Graphics

C. Refer to schedule of graphic elements located within the drawings that will identify all graphic elements, their size, material, and corresponding locations.

D. Work includes all mounting structures, themed or otherwise, as these structures will be deemed an integral part of the presentation of graphics within the project.

1.4 WORK BY OTHER CONTRACTORS

A. Work, when noted on the Drawings as “by Owner,” “by other contractors,” or “existing,” potentially including landscape, architectural structures and walls, all cabinetry and casework, graphic backing and mounting systems, exhibit artifacts, painting, architectural finishes, mechanical, electrical, and plumbing equipment, are not in the Scope of Work described in this Section.

1. All on-screen media graphics are part of the media software scope of work, and as such are not part of this specification section, though the Exhibit Designer and/or Client will art direct those on-screen graphics through the provision of typical screen templates and graphic standards provided by the Exhibit Designer.

2. Graphic layouts and their corresponding digital files will be designed and produced by the Exhibit Designer, and supplied to the Interpretive Graphics contractor for output, mounting, delivery and installation.

B. The Exhibit Designer, will continue work past the point of final Construction Documentation phase work, and will in fact deliver all graphic files to the Interpretive Graphics contractor after the award of their contract. It is anticipated that the final delivery of all digital files to the Interpretive Graphic Contractor will occur approximately four to four months after the date that this contract has been awarded. All electronic mechanical artwork inclusive of all text, photography, illustrations, maps, etc. will be delivered to the Interpretive Graphic Contractor in Illustrator CS5 (or equivalent).

1.5 SUBMITTALS

A. Submittals will include Product Data and Written Information, Samples, Proofs, Full Size Mock-ups, Work-In-Progress Photographs, and Administrative Submittals.

B. Make submittals of Product Data and Written Information, Full Size Mock-ups, Samples, Proofs, Work-In-Progress Photographs, and Administrative information in a timely manner as required by the Drawings and in this and related sections of the Specifications.

C. No Work shall be done except from issued digital files and related Contract Documents, unless otherwise approved.

D. Review shall not act to relieve the Graphics Contractor from responsibility for accuracy of the fabrication and installation details and placing diagrams. Dimensions and locations to be verified by the Contractor prior to the presentation of Shop Drawings.

E. Pre-Production Control Drawings:

1. Pre-Production Control Drawings shall be submitted by the Graphics Contractor for review when the Graphics Contractor sees a need to install a component of the Work in a manner which differs from the appearance, character or sizes detailed in the Construction Drawings and/or the shop drawings issued by the Cabinetry Contractor.

2. Review, coordinate and verify all exterior site locations with Construction Manager (and referring to the appropriate documents provide by the Architect and their engineers) in order to assure that all elements are properly accounted for, located, and that all utilities and other general conditions are in accordance with the documents.

F. Product Data and Written Information

1. Submit proposed materials and finishes. Include test data histories of proposed materials and finishes.

2. Submit reports for long-term durability and integrity of any features covered by this scope of work.

3. Submit data for proprietary materials, processes, and items as requested by the Exhibit Designer.

G. Samples

1. Upon the request of the Exhibit Designer and prior to or immediately upon the award of the contract, the Graphics Contractor may be required to submit samples indicating general character, shape,

texture and durability of selected features required under this project. Samples shall be @ 2' x 2'. Samples shall represent the finished surfaces, texture, coloring, etching, etc., as shown on the documents or as directed by the Exhibit Designer.

a. No fabrication of the final Work shall begin prior to approval of samples.
b. Samples shall not be removed until the completion of Work.
c. Rejected samples shall be resubmitted for approval at no additional cost to the Owner until approval is met.

2. Furnish representative samples of finishes and materials for material testing, as may be required by the Exhibit Designer and the Owner's Project Manager.

3. Provide one individual samples of each graphic feature for each exhibit program area or type at 24" x 24" (or actual size if smaller than 24" x 24") showing colors, quality, and resolution for each application.

4. Samples to include:
   a. All materials and processes to be incorporated into the project unless otherwise stated by Interpretive Exhibit Designer.

H. Proofs

1. All work to be produced within this scope will be submitted in paper proof format sufficient for the Owner, Contract Officer, Architect and Exhibit Designer the opportunity to review all graphics prior to going into final production and to assure that all digital files maintain their original content, as given to the fabricator by the Exhibit Designer.

I. Administrative Submittals

1. Description of planning, equipment, methods and quality control program.

2. Construction schedule. Coordinate with the general construction schedule per Contract Requirements.

3. Graphics Contractor qualifications, as noted below, will be submitted with the bid.

1.6 QUALITY ASSURANCE

A. Qualifications an Interpretive Graphic Contractor:

1. A responsive bid will be by an Interpretive Graphic Contractor, including those above, who meet the following qualifications; evidence of which shall be submitted with the bid.
   a. Established firm with a minimum of ten (10) years experience in successfully constructing museum quality exhibits of similar nature to the project.
   b. The Interpretive Graphics Contractor shall submit with their bid full documentation of their personnel, including superintendent and fabrication personnel, detailing to the Owner and Exhibit Designer's satisfaction the experience of each person listed, including visual portfolios showing key individuals' prior work, and their ability to perform all phases of the Work. The Exhibit Designer reserves the right to request changes in the Interpretive Graphic Contractor's personnel in order to obtain the highest level of talent available from that organization for this project. Submittal shall also detail physical facilities and established quality control procedures, and a management capability sufficient to produce the required units without causing delay of the project.
   c. The Interpretive Graphics Contractor shall submit a list of four (4) recent, completed installations. The list shall indicate the project name and location, project budget for the Contractor's portion of the Work, the Architect, and the name, address and phone number of the Exhibit Designer.
   d. The Interpretive Graphics Contractor shall submit photographic proof as references of his/her experience and ability to construct exhibit features similar to those shown on the

drawings and as listed within these specifications. These materials shall be used to evaluate the Contractor's ability and experience to perform this Work.

e. Sustainable Design Best Practices: Provide written statement outlining the sustainable design program(s) practiced by the fabricator and how those programs (inclusive of sources, materials and fabrication) will be utilized for this project.

B. Design Criteria Regarding Graphics Work:

1. It is intended that the finished products of Work in this Section are easy to read, clear, durable, high quality products that are aesthetically pleasing to look at.

2. The graphic Work, while serving as a tool for communication, is also artistic in nature and may require adjustments to obtain the desired effect. The Exhibit Designer and Owner will decide questions of aesthetic effect. The Owner will decide questions of biological and scientific accuracy of all visual and written graphic content.

3. General graphic will include all text copy, final photos, maps and illustrations. The conclusion of Graphic Production phase of work will result in the delivery of final files in CD/DVD format ready for production. Deliverables may occur over several submittals.

a. Photos larger than 12" in length or width will require high resolution scanning in order to achieve an acceptable finish of those images. These images will appear for position only within the graphic files, however, originals (prints, transparencies, negatives, etc) will be supplied to the Contractor in order to have high-resolution scans produced.

4. Prior to producing final exhibit graphics, on-site reviews of selected graphic elements may be required for review with the Owner.

5. The installation of all Work under this Section shall be performed by the Graphic Contractor. No Work shall be executed without the Graphics Contractor being present on the premises.

C. Graphic Production and Materials Source Quality Control:

1. The Graphics Contractor shall have an established Quality Control program in effect prior to letting of the contract. A copy of this program shall be submitted to the Contract Officer.

2. Testing of materials and inspection of production techniques shall be the responsibility of the manufacturer.

3. The Graphics Contractor will keep quality control records available for two years after final acceptance.

4. Testing Graphic Materials:

a. A quality control program shall be in effect to monitor photographic-based materials color quality, stability, and longevity. Results of such quality control tests and evaluation of such tests shall be available to the Exhibit Designer upon request.

b. Preparation of the tests and test procedures shall be in accordance with industry standards for exhibit graphics, especially as it relates to quality control.

c. Testing of materials for ability to withstand extreme UV exposure, heat, and humidity will be required. It is recommended that the Contractor provide 2 sets of samples of all materials for testing, with one sample being placed outdoors with full exposure, and the other kept locked in a safe place as a control set for comparison. Test period to be as long as possible prior to initiating production of final graphics.

D. Exhibit Designer's Direction Regarding Graphics Work:

1. It is intended that the finished products of Work in this Section are high quality, durable, and aesthetically attractive graphics, as shown in the Construction Drawings, and other referenced

materials, as specified herein.

2. To achieve this work, the Interpretive Graphics Contractor will coordinate and cooperate fully with the Exhibit Designer, Architect, and Owner's Project Manager.

3. All Work in this Section shall be performed under the observation and review of the Owner, Contract Officer, Architect and Exhibit Designer.

4. The Exhibit Designer explicitly reserves the right to continuously monitor the Work for aesthetic quality and to assume control of the Work through direction of the Graphic Contractor's job superintendent until specified effects are achieved.

1.7 STANDARDS

A. Quality Standard: Except as otherwise indicated, comply with industry standards for museum quality graphic materials and processes and conform to manufacturers' recommended procedures:

1.8 PROTECTION OF PROPERTY

A. In addition to normal precautions for the protection of the public, workers and property, take special precautions to prevent and damage to adjacent exhibit and/or architectural surfaces within the exhibit galleries that make up this project.

B. Limit the area for working and storing any chemical materials required for installation to areas within ten horizontal feet of exhibit structures and other areas specifically approved by the Owner's Project Manager.

C. Properly use the project site ventilation system (provided by others) in any work area where chemicals are being used. Review the ventilation system to confirm that it will comply with all local, state, and Oklahoma's regulatory agency requirements based upon the work of this contract and prior to use.

D. Legally dispose of waste material, chemicals and solvents, and chemical containers off-site unless otherwise specifically allowed by these Specifications. Confirm any allowance for on-site disposal with the Owner's Project Manager and dispose of waste on-site only upon receipt of written authorization from the Owner's project Manager.

1.9 DELIVERY, HANDLING, AND STORAGE

A. Carry out all work in a manner that will prevent damage to the structural integrity of the building, building finishes, window glazing or other physical features on site. Repair all damage to building structure, surfaces, and finishes to original conditions at no increase in contract sum.

B. Delivery and handling, general: Properly deliver and handle materials to prevent damage to materials. Store materials in fireproof, weather-tight enclosures to protect against combustion, dampness and contamination.

C. Do not deliver the Work of this section until operations and work by other contractors, that could possibly damage or impact the finished quality of the Work, has been completed. If work must be stored in other than installation areas, store only in areas whose environmental conditions are comparable to those of the finished installation location.

1.10 PROJECT CONDITIONS

A. Examination of the exhibit area and general architectural surfaces and related conditions: The installer must examine the conditions under which the work under this Section is to be performed, and notify the Owner's Project Manager of any unsatisfactory conditions. Do not proceed with work under this Section until unsatisfactory conditions have been corrected in a manner acceptable to the installer.

B. Protect installed work from damage by other trades until Exhibit Designer and Owner's acceptance of work. Advise Construction Manager of required protection procedures.

C. Coordination: Coordinate with other work, and other contractors and subcontractors whose work will be affected by the Interpretive Graphics scope of work.

1.11 SEQUENCING, SCHEDULING, AND COORDINATING

A. Prior to commencing installation, arrange a job site meeting to be attended by the Interpretive Graphic Contractor's representative, the Owner, the Exhibit Designer, the Construction Manager and the representatives of other trades associated with the work of this Section and related Sections.

B. The purpose of the meeting shall be to discuss requirements of the Contract Documents, shop drawings, job and surface readiness and material storage and protection, to assure that details are correct, that materials shall be installed properly, and coordination of other trades.

C. Following the meeting, prepare a written report containing:

1. Meeting date, names and affiliations of those present.

2. Written statements from each installer and manufacturers' representative of their acceptance of the requirements of the Contract Documents for the use of their material.

3. Identify all contract-related issues, concerns or questions regarding:
   a. Scope of work and related fee
   b. Project and scope specific schedule
   c. Coordination and sequencing of work
   d. Completeness of documents
   e. Comprehension of all requirements

D. Do not commence work of this Section unless documents required herein above have had their final review by the Exhibit Designer and Owner.

1.12 GUARANTEE

A. Guarantee Work listed in this Section for one year from date of Final Acceptance.

B. Identify products with warrantees greater than one (1) year and provide written confirmation of those warrantees.

C. Provide warrantees against degradation of materials against UV exposure, heat, humidity, and general wear from normal visitor use.

D. Provide two copies of written statement of guarantee, satisfactory to the Exhibit Designer and Construction Manager prior to Final Acceptance.

PART 2 - PRODUCTS AND INSTALLATION

2.1 DESCRIPTION

A. Refer to the schedule of graphics (included within the EX drawing series) for a summary of all Interpretive Graphic scope of work.

2.2 MATERIALS

A. General Description of Materials

1. Chromogenic "C-print" graphics, (Lambda, LightJet or equivalent) mounted to substrate to require that all edges be protected and/or out of reach of the visitor.

2. High pressure laminate imbedded graphics (HPL) mounted to rigid substrate with continuous edge band as noted on drawings and graphic schedule.

3. Exterior grade printing on Tyvek brand (or equivalent) water resistant paper.

4. Digital Wallpaper Mural: inkjet printed on roll adhesive vinyl.

5. Painted Sintra sheet material

6. Dimensional letters mounted and painted.

7. Paint, to be used as direct application of graphic and as required on edges of graphics, dimensional letters, or as in-fill for CRC formed elements.

B. High-resolution Chromeogenic prints (e.g. Lambda, LightJet or eq.):

1. Mounted to rigid substrate and then to wall or exhibit structure. Thickness of substrate to match notes on drawings or graphic schedule. Use MDF board or, Dibond, Sintra or approved equivalent.

2. All applications of this material to require that all edges be protected and effectively kept out of the visitors' reach. All prints to have a protective vinyl overlam, applied without creases, cuts or bubbles.

3. Unless otherwise noted, vinyl surface should be matte and resistant to fingerprinting.

4. Applications to be in accordance with manufacturer's recommendations and industry standards.

5. Graphic medium should conform to requirements of the project and provide the Owner with a robust product suitable for the application within this project.

6. Use graphic medium as appropriate in lieu of HPL, provided it conforms with requirements of the project.

7. Applications to be in accordance with manufacturer's recommendations and industry standards.

8. Unless otherwise stated, C-print graphics and HPL graphics in match appearance and finish and should be mounted so that they finished product conforms to the thicknesses being produced for the HPL graphics.

9. All C-print graphics to be mounted onto rigid wall substrate backing of MDF board or approved equivalent for interior applications and on Sintra, aluminum or approved equivalent.

C. High pressure laminate embedded graphics (HPL)

1. Use Folia, Fossil, I-Zone brand or equivalent HPL as graphic medium as noted in the drawings.

2. Applications to be in accordance with manufacturer's recommendations and industry standards.

3. Unless otherwise stated, HPL graphics to be 1/16".

4. All HPL graphics to be mounted onto rigid wall substrate backing of MDF board or approved equivalent for interior applications and on Sintra, aluminum or approved equivalent for exterior applications.

D. Digital Wallpaper: High-resolution Inkjet prints onto lightly textured self-adhesive calendared vinyl with matte finish, flame retardant.

E. Paint:

1. For general painting use Benjamin Moore brand, Sherwin Williams, brand or equivalent paint applied according to manufacturer's recommendations and industry standards.
   a. Exterior satin finish oil paint on all exterior elements
   b. Interior satin finish oil paint on all interior elements

2. Polane brand paint or equivalent aircraft paint system for aluminum applications.

3. Surfaces to be painted using the colors provided to the fabricator at a later date (as the final colors will have to be coordinated with the graphics and as such will not be available approximately three months after contract signing.

F. Dimensional Lettering:

1. Post-mounted, painted acrylic, metal or wood letters.

2. Custom acrylic dimensional letters to match specified fonts and sizes.

3. Custom hand-crafted letters to match appearances shown in graphic layouts

4. Paint to match specified colors, paint brand and finish.

5. Use metal letters (aluminum or stainless steel) where noted

6. Mount to specified surfaces using manufacturer-recommended adhesives or fasteners. May require adhesive backing and/or silicone adhesive to wall surface. May require post-mounted. Where rusticated appearance is called for, method of fastening may intentionally require additional decorative "theming" to create appearance of non-traditional, culturally accurate graphics. Refer to drawings for further details.

G. Backing Materials

1. Medium Density Fiberboard (MDF - typical unless otherwise specified)

2. Dibond (aluminum composite panel)

3. Sintra (painted)

4. Acrylic panel (color and thickness TBD)

5. Aluminum

6. Masonite (suitable for interior applications only)

H. Photo Mosaic

1. Environmental photographic element in which a macro-image is created using of thousands of micro-image "pixels" (2" square each) arranged into a single output image file by a proprietary software provided by Runaway Technology, Inc. Printed onto self-adhesive calendared vinyl (non-stretching). Installed on wall built by GC.

2.3 EXECUTION

A. Inspection

1. Verify that surfaces to receive graphic materials are satisfactory for the installation. If unsatisfactory conditions exist, do not commence installation until such conditions have been corrected.

2. Review all graphic elements relative to adjacent interactive or media-based exhibit features to assure that all work is coordinated.

3. Field verify the dimensions and geometry of all surfaces upon which graphics are to be applied.

B. Preparation

1. Prepare all shop fabricated exhibit components as shown on the Drawings and in the appropriate Section of the Specifications.

2. For all items covered by this scope of work:
   a. Clean substrate, removing projections and substances detrimental to the work; comply with recommendations of manufacturer of products to be installed for proper preparation procedures.
   b. Comply with combined printed recommendations of all manufacturers, except where more stringent requirements are indicated.
   c. Protect all work from edge damage during handling and installation. Remove from Project and dispose of all work with edge damage or other imperfections, when installed, weakens the intended structural qualities of the exhibit and/or impairs the intended performance and aesthetic appearance of the finished exhibit.
   d. Apply surface primers to substrates and/or joint surfaces where required for adhesion of sealants, as determined by pre-construction sealant substrate testing.

3. Pre-fabricate as much of the scope in advance of installation so to minimize on-site installation time and potential of conflict(s) with other contractors.

4. Confirm all schedules, intended hours of operation, access routes, equipment handling, noise generation, fume generation, etc. with the Owner's Project Manager prior to commencement of installation.

C. Production and Installation of Interpretive Graphic Elements

1. Graphic work shall conform to the approved samples and shall be applied in precise registration. Include a registration system for the proper positioning of all work under this Section. Work not applied level and true shall be removed and replaced by the Contractor.

2. Do not proceed with any production of graphic files until such time as all samples, mock-ups and other required reviews have been satisfactorily completed to the satisfaction of the Owner, Contract Officer, Architect, and Exhibit Designer.

3. Position all graphics as shown on the drawings and as directed in the field by the Exhibit Designer in the shop of at point of installation.

4. All graphic areas shall be evenly produced and have clear, clean and sharply defined in-focus edges.

5. Graphics shall be shop mounted, unless otherwise approved for field application. All other work shall be applied to surfaces as noted.

6. All installed graphics must be plumb, level, in proper alignment, and securely anchored to support as shown.

7. Included in the scope will be the scanning of any images that will (in final presentation format) exceed 24" in any direction and using original photographs as supplied by the Interpretive Exhibit Designer.

2.4 CLEANING

A. Cleaning methods shall be approved by fabricator and should conform to manufacturer's recommended methods and materials for cleaning.

B. After Installation: Graphics Contractor shall clean soiled surfaces with appropriate, non-toxic cleaners and thoroughly rinse with clean water immediately afterward.

C. Use extreme care to prevent damage to any exhibit surfaces and to adjacent surfaces and materials.

2.5 PROTECTION

A. The Graphics Contractor shall be responsible for protecting their Work from any damage, and repairing to former quality any damage, occurring during the course of the installation.

B. After installation is complete and accepted by the Owner, Contract Officer, Architect, and Exhibit Designer, protection and repair of any further damage shall be the responsibility of the General Contractor.

2.6 INSPECTION AND ACCEPTANCE

A. Test all systems for operational and aesthetic review. Review to be made by the Owner, Contract Officer, Architect, and Exhibit Designer. Correct all deficiencies immediately upon notification.

B. Final inspection and acceptance of completed Graphics Work shall be made by the Owner, Contract Officer, Architect, and Exhibit Designer to verify conformance with plans and specifications.

2.7 SCHEDULE OF GRAPHICS

A. Refer to the Schedule of Graphics located within the EX section of the drawing package.

END OF SECTION

SECTION 11 59 40

MEDIA SOFTWARE

PART 1 - SUMMARY OF WORK

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications, apply to this Section.

1.2 SUMMARY

A. The Contract Forms, Conditions of this Contract, and Section 11 59 01 applies to the work of this section.

B. The Contractor is expected to be familiar with all other sections of the specifications and drawings as issued for Exhibits and may need to familiar with specification and drawings as issued for Architecture and Engineering

C. Related Sections and Documents

1. Section 11 59 50 – Media Hardware

2. Section 11 59 30 – Interpretive Graphics

1.3 SCOPE OF WORK

A. The Media Software programs include elements of the following general nature:

1. Non-interactive computer software

2. Interactive computer software

3. Interactive computer and projection software

B. The following is an outline of exhibits that require Media Software. See paragraph 2.1 for the narrative description of the media software that corresponds to this outline:

C. The work under this Section consists of further developing, producing and delivering coordinated, and properly formatted media programs for use in public exhibition.

D. Produce professional quality programs based upon written descriptions found within paragraph 2.4 of this specification section.

E. All research, image acquisitions, permission fees, production equipment, studio time, mastering and final format deliverables are part of this contract.

F. Refer to the media hardware documents and other Exhibit documents as a means to better understand the intent of each system and the nature of the software programming that will be employed with each system.

G. Media Software producers are responsible for providing storyboards, draft scripts, shot lists, sample voice narrations, draft musical scores (recorded – not as sheet music) and any other forms documentation that will convey the nature of the work while in preliminary and developmental stages of the project.

1.4 RELATED WORK

A. The Media Hardware systems are to be provided by the Media Hardware Contractor, but the coordination of hardware and software is the responsibility of this contract specifically as it is related to the compatibility of the Media Hardware systems and the Media Software programs. Similarly, it is required that the Media Hardware

Contractor inform the Media Software Producer of all aspects of the systems the are providing to insure that the hardware and software are compatible with one another.

1.5 SUBMITTALS

A. Submittals will include, but is not limited to, program diagrams, data base performance criteria, program storyboards, rough edit footage, sample narration, final edit footage, coordination and confirmation of the compatibility between Media Hardware and Software, and Administrative Submittals.

B. Make submittals in a timely manner as required by the project schedule and relative to Media Hardware scope as indicated in this and related sections of the Specifications.

C. No Work shall be done except from issued Construction Drawings and related Contract Documents, including reviewed submittals, which must be kept at all work locations.

D. Review shall not act to relieve the Media Software Producer from responsibility for content accuracy of the programs and the format compatibility between the software programs and the hardware systems that will deliver these programs. Equipment systems, configurations and format compatibility must be verified prior to the presentation of final edit submittals.

E. Product Data and Written Information

1. Submit product data of all proposed final software elements.

F. Samples

1. Upon the request of the Interpretive Exhibit Designer and Owner's Project Manager and prior to or immediately upon the award of the contract, the Media Software Producer may be required to submit up to three sample interactive computer software, audio and/or video programs that in some way are comparable to the work of this contract as a means to establish a level of quality and character.
    a. Interactive computer software
    b. Projected text and image software

2. Rejected samples shall be resubmitted by the Media Software Producer for approval at no additional cost to the Owner

3. Furnish representative samples of proposed final format software as required by the Exhibit Designer, Media Hardware Contractor, and Owner.

G. Storyboard, Flow Diagram, and Scripts Submittals

1. All programs covered by this work will require storyboards and flow diagrams to aid in the process of advancing the concepts and informing team members.

2. All storyboards and flow diagrams should be produced with copies being submitted to the Owner and Exhibit Designer.

3. All scripts and on-screen text should be produced with copies being submitted to the Owner and Exhibit Designer.

H. Administrative Submittals

1. Description of planning, equipment, production methods, and quality control program.

2. Construction schedule. Coordinate with the general construction schedule per General Requirements.

3. Producer qualifications, as noted below, will be submitted with the bid.

4. Submit reports for all sources of purchased or limited-use still and/or moving image, the contracts for such purchases or uses, and all related information regarding names, addresses, phone, fax, e-mail numbers, itemization of items purchased or permitted, and the dollar amounts of each.

1.6 QUALITY ASSURANCE

A. Qualifications of Media Software Producer:

1. A responsive bid will be by a Media Software Producer, including those above, who meet the following qualifications; evidence of which shall be submitted with the bid.
   a. Established firm with a minimum of five (5) years experience in successfully producing Media Software programs.
   b. The Producer must have had a minimum of five (5) examples of projects of comparable scope to the work of this project.
   c. The Media Software Producer shall submit with their bid, full documentation of their production crew, including producer, director, computer software programmer, cameraman, sound technician, editor, and artist personnel, detailing to the Owner's Project Manager and Exhibit Designer's satisfaction the experience of each person listed, including visual portfolios showing key individuals' prior work, and their ability to perform all phases of the Work. The Exhibit Designer reserves the right to request changes in the Media Software Producer's personnel in order to obtain the highest level of talent available from that organization for this project. Submittal shall also detail physical facilities and established quality control procedures, and a management capability sufficient to produce the required units without causing delay of the project.
   d. The Media Software Producer shall submit a list of four (4) recent, completed productions. The list shall indicate the project name and location, project budget for the Media Software Producer's portion of the Work, the Architect, and the name, address and phone number of the Exhibit Designer.
   e. The Media Software Producer shall provide a standard digital video disc (DVD) proof as references of his/her experience and ability to produce programs comparable to those shown on the drawings and detailed within these specifications. These materials shall be used to evaluate the Media Software Producer's ability and experience to perform this Work, and will be a major consideration in the selection process.

B. Exhibit Designer and Owner's direction regarding Media Software Work:

1. It is intended that the other Media Software Work will be produced in such a manner that all Media programs will be produced outside of the Project Site.

2. It is the Exhibit Designer and Owner's intention to have an active role during all developmental stages of the Media Software Work.

3. To achieve the desired final effects, the Media Software Producer will coordinate and cooperate fully with other Contractors, the Construction Manager, the Exhibit Designer, and the Owner.

4. All Work in this Section shall be performed under the observation and review of the Exhibit Designer and the Owner's Project Manager.

5. The Exhibit Designer and Owner explicitly reserve the right to continuously monitor the work for aesthetic quality and to assume control of the work through direction of the Media Software Producer's producer and/or director until specified effects are achieved.

1.7 STANDARDS

A. Comply with the project specifications and industry standards for all equipment, materials, methods of production, and final deliverable formatted programs. In case of conflict between this section of specifications and the general requirements and conditions of the general contract, the more stringent of two shall govern.

1.8 PROTECTION OF PROPERTY

A. When working on site, exercise all caution to work within the facility and around the Work of other contracts in such a way as to neither disturb that Work, nor cause any damage to existing conditions.

B. When working with any lighting, electrical, or Media Hardware systems, confirm all procedures with the appropriate designers, engineers, or Contractors so to prevent any damage to these systems.

1.9 DELIVERY, HANDLING, AND STORAGE

A. Properly store and protect all original and master copies of sound, still and moving image materials during the course of the Work.

1.10 PROJECT CONDITIONS

A. Examine the lighting, electrical, or Media Hardware systems and related conditions: The installer must examine the conditions under which the work of this Section is to be performed, and notify the Construction Manager of any unsatisfactory conditions. Do not proceed with work under this Section until unsatisfactory conditions have been corrected in a manner acceptable to the Producer.

B. Protect installed work from damage by other trades until Exhibit Designer and Owner's acceptance of work. Advise Owner's Project Manager of required protection procedures.

C. Coordination: Coordinate with other work, and in particular the Media Hardware Contractor, whose work will be directly related to the production of the scope of the contract.

1.11 SEQUENCING, SCHEDULING, AND COORDINATING

A. Prior to commencing installation, arrange a job site meeting to be attended by the Media Software Producer's representative, the Media Hardware Contractor, the Owner, the Exhibit Designer and any other representatives of other trades associated with the work of this Section and related Sections, as determined by the Exhibit Designer and the Owner's Project Manager.

B. The purpose of the meeting shall be to discuss requirements of the Contract Documents, shop drawings, job and equipment readiness and material storage and protection, to assure that details are correct, that materials shall be installed properly, coordination of other trades, and to review all aspects of on-site production, especially as it relates to the production of the Connectedness theme presentation.

C. Following the meeting, prepare a written report containing:

1. Meeting date, names and affiliations of those present.

2. Written statements from each installer and manufacturers' representative of their acceptance of the requirements of the Contract Documents for the use of their material.

D. Do not commence work of this Section unless documents required herein above have had their final review by the Exhibit Designer.

1.12 GUARANTEE

A. Guarantee Work listed in this Section for one year from date of Final Acceptance.

B. Provide two copies of written statement of guarantee, satisfactory to the Exhibit Designer, Architect, and Construction Manager prior to Final Acceptance.

PART 2 - PRODUCTS AND INSTALLATION

2.1 PROGRAM DESCRIPTIONS

A. The Media Software program formats will conform to the equipment that is specified by the Owner and will be prepared in accordance with industry standards relative to the equipment being specified by that section as well as that which is shown by the related drawings.

B. The software programs that are part of this scope of work are as follows:

1. TBD

2. 2 MATERIALS

A. Materials for Programs

1. Coordinate all software programs with the Media Hardware provider in order to assure compatibility of between both.

2. Provide two copies in format compatible with the final, installed Media Hardware system and produced from original master.

3. Provide one original digital format master

2.3 EXECUTION

A. Pre-Production

1. Verify that all Media Software is compatible with the specified and approved hardware systems. If conflicts exist, do not commence production until such conditions have been corrected and the Owner's Project Manager or the Exhibit Designer has granted approval for commencement of production.

2. Verify that all storyboards, scripts, samples, general treatments and all other submittals have been reviewed and approved prior to commencement with production.

3. Review all graphic layout standards, as provided by the Exhibit Designer, and verify that these standards are appropriate and compatible with the software system(s) that are part of this scope of work.

4. Provide a detailed production schedule sufficient to inform the Owner and Exhibit Designer of all key milestones and otherwise sensitive dates for production.

5. Identify key dates when production may occur in any remote locations and/or countries outside of the U.S. with the understanding some combination of the Owner and/or Exhibit Designer may accompany the production team (at their own expense)

6. Identify key dates for reviews and approvals.

B. Production & Post Production

1. Proceed with production upon receipt of necessary approvals

2. Produce media programs using profession-grade equipment and securing all required permissions, fees, and releases for stock and/or original new material.

3. All permissions, fees, and releases for stock or new material should be for unlimited exhibit use by the Owner.

4. Produce graphic layouts based on graphic standards provided by the Exhibit Designer.

5. Produce rough cuts of all elements for purposes of review of work in progress.

6. Produce refine rough cuts based upon Owner and Exhibit Designer's review and approval.

7. Produce 95% final cuts of all media elements for review of details of each. This review to serve as a final review prior to production of final elements.

8. Produce 100% complete media elements for final-final review. This review should not lead to any changes to the media unless previously requested changes were not integrated into the programs.

2.4 INSTALLATION (at shop and in the field)

A. For all technical aspects of the installation work covered by this scope of work:

1. Work in dust-free conditions (or conditions deemed acceptable by industry standards.)

2. Comply with recommendations of manufacturer of products to be installed for proper preparation procedures. Such compliance extends to include the proper use of related equipment not included within this contract, but integrally related such as the MEDIA hardware.

3. Comply with combined printed recommendations of all manufacturers, except where more stringent requirements are indicated.

4. Confirm that all software is compatible with the media hardware that is being provided for this project.

5. Pre-install as media software at the media hardware provider's shop in advance of installation of that equipment in the field in order to minimize on-site installation time, adverse climate conditions, and/or potential of conflict(s) with other contractors.

6. Confirm all schedules, intended hours of operation, access routes, equipment handling, noise generation, etc. with the Owner's Project Manager prior to commencement of installation.

7. Verify that all Media and related elements are installed and satisfactory for the installation. If unsatisfactory conditions exist, do not commence installation until such conditions have been corrected and the Owner's Project Manager or the Exhibit Designer has granted approval for commencement of installation.

8. Protect all work from damage during handling and installation. Remove from Project and dispose of all materials with damage or other imperfections, when installed, either negatively effects the qualities of the exhibit and/or impairs the intended performance and aesthetic appearance of the finished exhibit, or the related Media Hardware.

9. Run all programs using exhibit Media Hardware Systems with the Media Hardware Contractor and Exhibit Designer present so that all systems can be evaluated and corrections made if necessary.

2.5 INSPECTION

A. Test all systems for operational and aesthetic review. Review to be made by the Owner's Project Manager and Exhibit Designer. Correct all deficiencies immediately upon notification.

B. Final inspection and acceptance of completed Media Software Work shall be made by the Owner's Project Manager and the Exhibit Designer to verify conformance with design criteria and specifications.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 11 59 50

MEDIA HARDWARE

PART 1 - SUMMARY OF WORK

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications, apply to this Section.

1.2 SUMMARY

A. The Contract Forms, Conditions of this Contract, and Section 11 59 01 applies to the work of this section.

B. General provisions of the Contract include an understanding of, and coordination with, the work by the General Contractor who is contracted by the Owner and will be executing work represented in documents created by the Project Architect.

C. Related Sections

1. Section 11 59 01 – General Requirements for Exhibits

2. Section 11 59 30 – Interpretive Graphics

3. Section 11 59 40 – Media Software

1.3 SCOPE OF WORK

A. Work consists of furnishing all labor, material, equipment and controls for all of the Media systems indicated in the flow diagrams and equipment section of this specification. The objective is to provide fully professional, museum-quality audio-visual systems, completely designed, engineered, installed, tested, accepted and ready to use within the exhibits (as designed) and in the environments indicated by the drawings.

B. Provide detailed wire pull schedule of all interconnecting audio, video and control cabling. Coordinate with the site electricians. Supply and pull all necessary Media cables to accomplish the operational objectives of the exhibit.

C. Types of media hardware systems to be incorporated into the project include:

1. Interactive computer and associated text projection systems

2. Interactive “Conservation Station” computer systems

3. Non-interactive animal ID systems

4. Interactive animal ID systems

5. Interactive “Pledge Station” computer system

6. Staff-operated two-way underwater audio communications system

7. Staff-operated wireless Public Address system.

D. Refer to exhibit drawings for information regarding the hardware equipment list, hardware locations, layouts and operational functions of each exhibit element.

E. Refer to Section 11 59 40 Media Software specification for a description of media programs.

F. Coordination with all exhibit cabinetry, and media software production is required and critical to this scope of work.

1.4 GENERAL INFORMATION

A. All media control equipment under this scope will be housed in ordinary public space, with regards to temperature and humidity conditions. All equipment must be able to operate in this environment without degraded life or performance.

B. The media Contractor will be responsible to verify the existing site conditions and coordinate with the exhibit designer and the general contractor all requirements regarding power, signal conduits and any other building related components that may impact the media components in the portion of the building affected by the scope of work. The Media Contractor will be responsible to notify the electrical contractor of the power and signal conduit requirements. The electrical contractor will provide the Media Software Contractor with power as per the contractor's electrical drawings.

C. Equipment specified and shown in the drawings should provide a working, reliable system. It is the responsibility of the Media Hardware Contractor to evaluate and thoroughly understand the intent and goals of each system. If discrepancies are found in the system, the Media Contractor is ultimately responsible to supply and fabricate a working system to meet the original objective. Equipment not mentioned herein nor shown on drawings may be necessary to meet functional requirements and shall be provided without claim for additional payment.

D. Project conditions include exposure to extreme weather and climate conditions. All equipment and related work of this scope of work should conform to industry standards and manufacturer recommendations for the installation and operation of equipment in such an environment.

E. Delivery and installation will require that all systems (to the degree possible) will be pre-fabricated into their kiosk casework, fully tested and labeled prior to delivery on site..

F. Wherever possible, provide equipment and utilize materials and general practices that will provide energy-efficient systems for the project. Identify any equipment or systems that (in the opinion of the contractor) do not provide operational energy-efficiency for the Client.

1.5 MEDIA CONTRACTOR QUALIFICATIONS

A. The bidding media hardware firm shall have relevant experience in the successful completion of the assembly, fabrication and installation of museum projects similar in scope and magnitude to those specified within this document. The bidder must have Media a minimum of ten years of experience in museum installations and having CTS-D and CTS-I certified staff is a requirement to bid. The bidder must be within a reasonable distance of the site as determined by the Owner.

B. Each bidder shall submit with this bid a listing of the key personnel who will be assigned to this project along with a brief job description and resume of their career related backgrounds and experience. If selected, these key personnel must remain directly involved with the project until completion.

C. If the bidder is to use any subcontractors or freelance personnel, the same background and resumes are required. The selected Media vendor is totally responsible for all work performed by his subcontractors or freelance personnel and must supervise in a manner, which ensures proper communication and coordination at the job site.

D. Sustainable Design Best Practices: Provide written statement outlining the sustainable design program(s) practiced by the fabricator and how those programs (inclusive of sources, equipment selection and energy efficiency) will be utilized for this project**.**

1.6 QUALITY, DESIGN AND RELATED DOCUMENTS

A. Furnish detailed equipment schedule for approval. Furnish manufacturer's catalog cut sheets of each different item specified. Approval of the schedule shall not relieve the Contractor of responsibility for errors or omissions.

B. Drawings pertaining to this bid shall be considered a part of this specification and shall be a part of the bidding documents.

C. Flow drawings are detailed to show design intent and signal flow. It is understood and agreed by the successful vendor, that the work herein described shall be complete in every detail, even though every item required for operations may not be specifically mentioned.

1.7 EQUIPMENT SUBSTITUTIONS

A. Due to the potential nature of change within the media equipment industry over any given period of time, it is reasonable to expect that substitutions may be necessary and even in the best interest of the Owner. Some makes and models of equipment may have become out-of-date or replaced by newer and better technology. As a result, the Media Contractor may deem it appropriate to recommend an equipment substitution. For any equipment substitution to be considered by the Exhibit Designer, Architect and Owner, the following information must be provided and conditions met:

1. Specification sheets of equipment.

2. Advantage to the client for substitution such as cost, features, use, reliability, warranty, etc.

3. Assurance that substituted equipment will physically fit in spaces, which may already be designed or fabricated.

4. Assurance that changes will not affect software already produced or planned to be produced. Control systems work with propriety software, which cannot be changed. If equipment is changed to another manufacturer, the Media Contractor is responsible for any additional cost in reprogramming the control software, and any specialized equipment to accomplish the change. Any changes to the control system(s) must be approved (in writing) by the Exhibit Designer and Owner's Project Manager.

5. The substitution of equipment must be initiated in a timely manner so that the change of specifications does not cause any hardship of other contractors, the Exhibit Designer, or the Owner. If in the event such substitutions do cause hardships to others, the recommended equipment will either be rejected or the financial responsibility to correct any hardships to others will become the responsibility of the Media Hardware Contractor.

6. If in the opinion of the Media Hardware Contractor, the equipment specified for this project appears significantly over-specified or under-specified relative to the application intended, it is required that the Contractor make their opinion know as part of their bid proposal. Indicate those items in question and make recommendations for substitutions (along with a brief justification for the substitution)

1.8 COORDINATION WITH THE SOFTWARE PRODUCER

A. The Media Hardware Contractor will be responsible to contact the selected Media Software Producer(s) to coordinate all details. It is imperative that both parties understand each system, its objective and execution. Some of the items that must be addressed are:

1. Exhibit start-up and shut-down procedures.

2. Who installs the program, software and firmware.

3. Timing issues of show starts, intervals, various language versions, etc.

4. The Media Hardware Contractor will be responsible to program the control system, and any other control device with information and guidance supplied by the Exhibit Designer, Owner and Media Software Contractor(s).

5. The Media Hardware Contractor will be expected to supply any and all specialty computers/software to program the controllers specified.

6. Any other items that will assure a system operating as designed.

1.9 COORDINATION WITH GRAPHIC LAYOUTS AND RELATED EXHIBIT COMPONENTS

A. The Media Hardware Contractor will be responsible to contact the selected Graphic producer(s) to coordinate all details. It is imperative that the Media Hardware be coordinated with the graphics in order to maintain the appearance and layout of the graphics relative to the integration of controls, and other elements that might cause a conflict with the graphic layouts.

B. Identify any conflicts between media hardware and any graphic layouts of related exhibit components immediately and contact those affected by the conflict in order to reach an equitable and functional solution.

1.10 SUBMITTALS

A. Shop drawings and product data

1. Required for approval, prior to fabrication and installation:

a. Block diagrams indicating proposed connections of all equipment and indicating equipment types and model numbers.

b. Layout, equipment rack and cabinets (if applicable).

c. Speaker mounting arrangements.

d. Shop drawings of any unit such as control touch panels, switch panels, loudspeaker enclosures or grilles to be fabricated or modified.

e. Submittals as required by specifications.

f. Catalog data sheets of all manufactured items.

2. Submit complete and at one time. Isolated items will not be considered for approval, except by prior written authorization.

3. Rejected items and items requiring correction must be resubmitted at one time, except by prior written authorization.

B. Operations and Maintenance Data

1. Draft Copies: at time of FINAL ADJUSTMENTS AND ACCEPTANCE TESTS specified in PART 3 - EXECUTION, provide draft copies of all specified diagrams, schedules and manuals for inspection during demonstration and acceptance testing. Submit final copies thereafter. All drawings shall be drawn on a computer aided drafting (CAD) system.

2. Block Diagrams: Simplified single line block diagram showing interconnection of all major equipment components and functional relationships. Diagram shall not illustrate terminal or interconnection cable number designations. The function diagram included with these specifications should be modified to exclude details, transformer type, any as built changes, etc. that is suitable for this purpose. Complete on a single sheet of minimum size 8 1/2 in. x 11 in.

3. As-Built Diagrams: Drawings showing all terminal blocks, connectors, switchers, transformers, equipment components and wires. Label all devices with manufacturer, model number and reference number (i.e. SW15, TB 6), reference numbers shall be consistent across all drawings with no repetitions. On wiring diagrams, label all conductors within cables for insulation color or other identifier. Label all connectors, barrier strips, switches, relay sockets, etc. regarding terminal number. If device does not provide terminal designations, provide key diagram for reference. As a minimum, provide an expanded version of the functional diagrams with cables fanned out at termination points and all labeling as specified above; provide additional drawings where complexity does not permit complete information to be shown legibly on an individual sheet no larger than the project sheet size. The intent of the diagrams is to provide sufficiently clear and complete information that a technician of average skill may efficiently and effectively troubleshoot and service the system, even if unfamiliar with the installation.

4. Control Setting Schedule: Fully document the settings of all nonuser adjustable controls. This includes power amplifier gain controls, equalizer settings, etc.

5. Software: Where an external computer or internal computer with CD drive has been used in programming any computer of the system, provide a CD containing the master program for the control system and all programming, communication, or other software required for reprogramming the system.

6. Complete Instruction and Maintenance Manual: Prepare in the form of an instructional manual for use by client personnel.

    a. Format:
        1. Size: 8 1/2 in. x 11 in., 20 lb., minimum weight white paper for word processing.
        2. Drawings: Provide reinforced punch binder tab, bind in with text. Fold larger drawings to size of text pages. Clear plastic binding tape applied to edge of sheet and then punched is acceptable.
        3. Single sheet product literature and Contractor prepared pages: Provide reinforced punched binder tab. Clear plastic binding tape applied to edge of sheet and then punched is acceptable.
        4. Provide indexed tabs and fly leaf for each separate section. Include printed description of product and major component parts of equipment.

    b. Cover:
        1. Identify each volume with typed or printed title. “MEDIA HARDWARE SYSTEMS OPERATING AND MAINTENANCE INSTRUCTIONS”

    c. Binders:
        1. Commercial quality three ring binders with durable and cleanable plastic covers, 1 in. minimum, 2 in. maximum ring size.
        2. When multiple binders are used, collate the data into related consistent groupings.

    d. Content of Manuals:
        1. Neatly typewritten table of contents for each volume, arranged in systematic order. Identify each product-by-product name and other identifying symbols as set forth in Contract Documents.
        2. Contractor, name of responsible principal, address and telephone number.
        3. Certificate of Warranty.
        4. Service Contract: Include a preliminary schedule for the specified semi annual site visits.
        5. Complete as built diagrams for systems.
        6. Functional diagram.
        7. Original copies of manufacturer’s installation, operation and service manuals, including schematic diagrams for each equipment item.
        8. Shop drawings of all custom fabricated items.
        9. Control setting schedule.

1.11 STANDARDS

A. Comply with the provisions of the following codes, specifications and standards. However, in case of conflict, the more stringent specifications shall take precedence. Notify all necessary parties of any such conflicts immediately so that modifications to other work can be identified and assessed.

1.12 DELIVERY, HANDLING, AND STORAGE

A. Protect materials from extreme temperature, UV exposure, humidity and rain.

B. Carry out all work in a manner that will prevent damage to the structural integrity of the building, the steel exhibit tank, window glazing or other physical features on site. Take extreme care in the handling of materials to prevent overloading of on-grade or hidden structures and to prevent physical damage to surrounding surfaces and waterproofing membranes. Protect surrounding surfaces. Repair all damage to building structure, surfaces, and finishes to original conditions at no increase in contract sum.

C. Delivery and Handling, general: Properly deliver and handle materials to prevent loss or damage to materials. Store materials in dust-proof, weather-tight enclosures to protect against dampness and contamination. Prevent against loss of equipment.

D. Secure in lockable containers all pieces of equipment and related materials against theft and damage while on site and during the installation period in general. All equipment and materials are the responsibility of the Media Hardware Contractor until such time as the Owner has approved the components in their final installed, secured, and operational state.

1.13 PROJECT CONDITIONS

A. Examination of the exhibit space and related conditions: The installer must examine the conditions under which the work under this Section is to be performed, and notify the Construction Manager of any unsatisfactory conditions. Do not proceed with work under this Section until unsatisfactory conditions have been corrected in a manner acceptable to the installer.

B. Protect installed work from damage by other trades until Exhibit Designer and Owner's acceptance of work. Advise Owner's Project Manager of required protection procedures.

C. Coordination: Coordinate with other work, contractors and subcontractors for whose work will be affected by the Media Hardware scope. Coordinate with Owner's Project Manager.

D. Project conditions include exposure to extreme weather and climate conditions. All equipment and related work of this scope of work should conform to industry standards and manufacturer recommendations for the installation and operation of equipment in such an environment.

1.14 SEQUENCING, SCHEDULING, AND COORDINATING

A. Prior to commencing installation, arrange a job site meeting to be attended by the Media Hardware Contractor's representative, the Owner, the Exhibit Designer, the Owner's Project Manager and the representatives of other trades associated with the work of this Section and related Sections.

B. The purpose of the meeting shall be to discuss requirements of the Contract Documents, shop drawings, job and surface readiness and material storage and protection, to assure that details are correct, that materials shall be installed properly, and coordination of other trades.

C. Following the meeting, prepare a written report containing:

1. Meeting date, names and affiliations of those present.

2. Written statements from each installer and manufacturers' representative of their acceptance of the requirements of the Contract Documents for the use of their material.

D. Do not commence work of this Section unless documents required herein above have Media had their final review by the Exhibit Designer.

PART 2- PRODUCTS

2.1 GENERAL PRODUCTS

A. Equipment specified in this document is correct at the time of design. By the actual time of actual execution of this work, it is possible that some products will have been modified, improved, or replaced by various manufacturers. It is the Media Hardware Contractor's responsibility to advise the Construction Manager, the Interpretive Exhibit Designer and the Owner of make or model changes and follow the procedures for product substitution in Section 1.07.

2.2 PRICING

A. In preparing the bid, each item should be priced in such as manner as to indicate the cost of all elements required for a functioning media hardware system on a per exhibit basis.

B. It is understood that there are elements that are common to a thematic area and therefore do not apply to a single exhibit. These items should be listed as "common equipment," with all actual items indicated and priced. Include all miscellaneous cables, hardware, racks, etc. required to interconnect the system with all systems and the Media control room. Hardware is to include all hardware items necessary to make a complete working system.

2.3 EQUIPMENT LIST BY EXHIBIT

A. The media equipment list is included within the EX section of the drawing set.

B. Standard commercial-grade equipment racks are to be included.

PART 3 – EXECUTION

3.1 SITE EXECUTION

A. The Media Hardware Contractor shall verify that surfaces, internal wall blocking and ceiling construction are ready to receive work and opening dimensions are as indicated on shop drawings.

B. The Media Hardware Contractor will review all necessary project documents in order to confirm that the work by others is properly accounted for and does not represent any gaps in the scope necessary for the successful execution and completion of this work.

C. The Media Hardware Contractor shall verify that site electrical services are completed and ready for tie-in.

D. Beginning of installation means acceptance of existing conditions and surfaces.

E. It shall be the responsibility of the Media Hardware Contractor to cooperate with all appropriate parties in order to achieve well-coordinated progress and satisfactory final results. He shall watch for conflicts with work of other Contractors on the job and execute moderate moves or changes as are necessary to accommodate other equipment or preserve symmetry or pleasing appearance.

3.2 INSTALLATION

A. Pre-install as many elements as is practical and possible to minimize on-site installation of equipment.

B. Installation includes delivery to the site, terminating all Media connectors and receptacles, necessary hardware, interconnecting components to make a complete working system, using industry accepted standards and quality workmanship.

C. All AC power devices must be properly grounded in accordance with electrical codes. AC power receptacles should be checked for proper ground and wiring prior to installation.

D. The Media Hardware Contractor is responsible for supplying all Media cabling and installing the cabling through the conduits and junction boxes supplied by the Electrical Contractor. Conduits are shown on the attached drawings. The Media Contractor should review all conduits and junction boxes to assure that adjacent conduit sizes and quantities exist for all Media systems. Any discrepancies should be coordinated with the Electrical Contractor prior to pulling cables. Notify the Construction Manager and Interpretive Exhibit Designer immediately upon identifying any conflicts, omissions or other deficiencies that impact the execution of this work.

E. Once all components are in place, the Media Hardware Contractor will optimize system performance by final adjustments and testing of all components. At the completion, the Media Hardware Contractor will demonstrate the performance and capability to the client for their acceptance of the systems. All tests and measurements shall be performed by the Media Hardware Contractor.

F. The Contractor is responsible for all permits and will to adhere to all governing local laws and codes, including Underwriters Laboratories (UL).

G. Review all work with all adjacent scopes of work (such as casework, media software, graphics, etc) to insure that work is coordinated and compatible.

H. All field cable is to be plenum rated and acceptable to local jurisdiction. All cables, regardless of length, shall be marked with printed (no write-on labels will be accepted) wrap-around numbers and shrink-wrap at both ends. There shall be no unmarked cables at any place in the system. Marking codes used on cables shall correspond to codes shown on drawings, run sheets, and patch panels. All inter-rack cabling shall be neatly strapped, dressed, and adequately supported. Terminal blocks and connectors shall be furnished for all cables that interface with racks, cabinets, consoles, or equipment modules. There shall be no inline splices in any cable; all cables are to have service loop. All umbilical cords that will be disconnected often shall be neatly dressed, and protected with a flex harness.

I. As a general practice, on the left side of the rack as viewed from the rear, group in separate harnesses with approximately three inches between each harness: AC power connection; Loudspeaker and high level wiring; Control cables RS-232,RS-422,RS-485,IR, and Relay. On the right side of the rack as viewed from the rear, group in separate harnesses with approximately three inches between each harness: Line level audio cables; Video base band cables; Broadband RF video cables; Ethernet and Fiber Optic Cables.

J. All cables (except video cables, which must be cut to an identical length) shall be cut to the length dictated by the run. For equipment mounted in racks, drawers, or on slides, the interconnecting cables shall be provided with a service loop of appropriate length. No cable shall be installed with a bend radius less than that recommended by the cable manufacturer.

K. All cables (except video cables, which must be cut to an identical length) shall be cut to the length dictated by the run. For equipment mounted in racks, drawers, or on slides, the interconnecting cables shall be provided with a service loop of appropriate length. No cable shall be installed with a bend radius less than that recommended by the cable manufacturer.

L. All wires and cables used in assembling custom panels and equipment racks shall be formed into harnesses which are tied and supported in accordance with accepted engineering practice.

M. Harnessed cables shall be combed straight. Harnesses with intertwined members will be deemed unacceptable. Each cable that breaks out from a harness for termination will be neatly tie wrapped. Harnessed cables shall be found in either a vertical or horizontal relationship to equipment, controls, components or terminations.

N. All system components and related wiring shall be located with due regard for the minimization of induced electromagnetic and electrostatic noise, for the minimization of wiring length, for proper ventilation, and to provide reasonable safety and convenience for the operator.

O. All drain wires will be covered in a sleeve. Over each end of wire, the heat shrink should be a minimum of 1" and shall be brought up against the connector.

P. All equipment racks shall be labeled with the Contractor's full contact information and the date of warranty start and end dates.

3.3 CONNECTION PLATE RECEPTACLES

A. Unless otherwise detailed herein, the following types of panel receptacles (as required) shall be used on all connection boxes, panels, plates, and wire ways:

1. Audio (-10 dBm unbalanced Isolated solder RCA pin type)

2. Audio (microphone or balanced line Audio +4 level - XLR type)

3. Audio (loudspeaker level) – Speak-on connector. Jack shall be insulated from panel type.

4. Video – BNC Receptacles shall be insulated from panel type.

5. RF video - F type connector insulated from panel type

6. Patch Panel Assignments - All patch panels shall be wired so that signal "sources" (outputs from) appear on the upper row of a row pair, and all "loads" (inputs to) appear on the lower row of a row pair.

3.4 PATCH PANEL DESIGNATIONS

A. All patch panels shall be permanently labeled with legible lettering. The designations shall be by the recognized generic name of the equipment device. Horizontal row numbers and vertical patch point must also label each patch panel. Identification of each patch point shall be included on the as-built drawings, as well as on reproductions of these drawings, which shall be mounted in an appropriate location near the equipment racks.

3.5 GROUNDING PROCEDURES

A. In order to minimize problems resulting from improper grounding, and to achieve maximum signal-to-noise ratios, the following grounding procedures shall be adhered to:

1. System Grounds: A single primary "system ground" shall be established for the systems in each particular area. All grounding conductors in that area shall connect to this primary system ground. The system ground shall be provided in the audio equipment rack for the area.

2. The contractor is responsible to insure that the power is on the same electrical phase for all audiovisual equipment, and that a technical ground has been provided. The contractor shall be responsible for determining if the metallic conduit is properly electrically bonded to the building ground system.

3. Under no condition shall the AC neutral conductor, either in the power panel or in a receptacle outlet, be used for a system ground.

4. Verify resistance is less than 1 Ohm from ground buss bar to the chassis of each rack-mounted component. Verify less than 1 Ohm from ground buss bar to audio ground terminal of each rack mounted component's input and output connector.

5. Audio Cable Shields: All audio cable shields shall be grounded at one point only. There are no exceptions. For inter- and intra-rack wiring, this requires that the shield be connected at one end only.

6. Video Receptacles: All video receptacles that are provided and installed by the AV Contractor shall be ground insulated from the mounting panel, outlet box, or wire way. Unless otherwise detailed herein, this shall be accomplished by using insulated-from-panel type receptacles. Video cable and connectors shall be 75 Ohm.

3.6 PERFORMANCE STANDARDS

A. Unless restricted by the published specifications of a particular piece of equipment, or unless otherwise required under the Detailed Specifications, the following performance standards shall be met by each system:

1. Audio:

S/N (including crosstalk and hum)	65 dBm minimum
Total Harmonic Distortion	1% maximum from 30Hz to 15,000 Hz
Frequency Response	– within plus or minus 3.0dB, 30Hz to 15,000 Hz
Hum and noise level	at least 70dB below power amplifier output from 20-20khz

2. Composite Video (signal):

S/N (peak to RMS)	– Less than or equal to 50dB unweighted DC to 70MHz
Crosstalk, unweighted DC to 4.2mHz	– 45dB minimum
Frequency Response	– Within plus or minus 0.5dB to 3.58MHz for NTSC
Line and Field Tilt	– 2% maximum
Differential Gain	– 2% maximum
Differential Phase	– 3 degrees maximum
Signal Gain	1 into 75ohm terminated

3. Video (timing):

System timing	Within 2 degrees at 3.58Mhz
Color timing	Within 2 degrees at 3.58mHz
Minimum desired RGBHV signal bandwidth at display device inputs	– 300 MHz (-3 dB)
RGBHV, YC signal timing	Within 1 nanoseconds between channels

Maximum RGBS cable attenuation	– 300 MHz bandwidth signal at 100 feet (-3dB)
Frequency response for RGBHV	– plus/minus 0.5dB to 70Mhz

All RGBHV signal interfaces to be provided with adjustable peaking controls to reduce cable attenuation losses.

4. RF Systems:

Carrier to noise ratio	> or = to 45dB
Hum and Low frequency disturbance	< or = to.75% peak to peak
Final tab level	– > from 5dBmv to 10dBmv

3.7 CLEANING

A. Cleaning methods shall be recommended to the Owner and Exhibit Designer by the Media Hardware Contractor.

B. After Installation: Media Hardware Contractor shall clean soiled surfaces with appropriate, non-toxic cleaners and thoroughly rinse with clean water immediately afterward.

C. Use extreme care to prevent damage to any exhibit or building surfaces and to adjacent materials.

3.8 PROTECTION

A. The Media Hardware Contractor shall be responsible for protecting their Work from any damage, and repairing to former quality any damage, occurring during the course of the installation.

B. While engaged in the installation of Media Hardware elements, the Contractor will handle and store materials and equipment in such a manner that will prevent loss or damage to these materials and equipment. Store materials in dust-proof, weather-tight enclosures to protect against dampness and contamination.

C. Secure in lockable containers all pieces of equipment and related materials against theft and damage while on site and during the installation period in general. All equipment and materials are the responsibility of the Media Hardware Contractor until such time as the Owner has approved the components in their final installed, secured, and operational state.

D. After installation is complete and accepted by the Owner's Project Manager and Exhibit Designer, protection and repair of any further damage and/or theft shall be the responsibility of the Media Hardware Contractor.

3.9 FINAL ADJUSTMENTS AND SYSTEM ACCEPTANCE TESTS

A. System acceptance tests will not be performed until the Media Hardware Contractor's system checkout has been completed. The system acceptance tests will be supervised by the Owner and their representatives. They will consist of the following:

1. A physical inventory will be taken of all equipment on-site and will be compared with equipment lists in the contract documents.

2. The Media Hardware Contractor shall coordinate this time with the Owner and their representatives so that the room is available for testing. The Owner shall provide free access to all areas, lighting and electrical power as needed. If this testing involves working other than normal hours, it will be accomplished without claim for extra payment.

3. The Media Hardware Contractor is responsible for ensuring that the area in which his work has been performed is completed according to his contract and is in a clean and orderly condition, ready for acceptance.

4. The Media Hardware Contractor shall be prepared to verify the performance of any portions of the system by demonstration.

5. The Media Hardware Contractor shall make additional mechanical and electrical adjustments within the scope of work that are deemed necessary by the Owner and their representatives.

6. In the event further adjustments are required, or defective equipment must be repaired or replaced, tests may be suspended or continued at the discretion of the Owner's Project Manager and/or Exhibit Designer.

7. Three sets of all final "as-built" drawings, run sheets, manuals and other required documents shall be delivered to the Owner and their representatives prior to the scheduling of acceptance tests. One complete set of these documents shall be on hand at the time of testing.

8. The Media Hardware Contractor's personnel performing these tests are to be thoroughly familiar with all details of the system. The tests team is to include the Field Supervisor and Project Engineer who were in charge during the course of the installation work.

9. Test all systems for operational and aesthetic review. Review to be made by the Owner's Project Manager and Exhibit Designer. Correct all deficiencies immediately upon notification.

10. Final inspection and acceptance of completed Media Hardware Work shall be made by the Owner's Project Manager and the Exhibit Designer to verify conformance with design criteria and specifications.

3.10 TRAINING

A. The Media Hardware Contractor will provide complete and comprehensive system training to designated personnel in the proper operation, maintenance and service techniques of the Media systems to achieve optimum performance and utilization. Budgeted time for this activity should be a minimum of 8 hours. Some training usually takes place during final installation, if the user is available.

B. Training will take place immediately following installation, and will be conducted at a time that is mutually satisfactory to the Client's staff as well as the Media Hardware Contractor. Advance notice of not less than 2 weeks shall be given for all training sessions.

3.11 SERVICE AND WARRANTIES

A. All equipment will be new and carry manufacturer's full warranties that will be handled by the Media Hardware Contractor during the first year of operation. In addition, the Media Hardware Contractor will guarantee the entire system as assembled for one year from date of acceptance. During that time, equipment or system problems will be repaired or replacements made at no charge. The Media Hardware Contractor should maintain a 24-hour technical emergency phone service for a period not to exceed 12 months after which time, the Media Hardware Contractor will provide assistance within the framework of their normal daily work schedule. A duplicate set of the system documentation is to be maintained at the Media Hardware Contractor's office to assist in telephone troubleshooting.

B. Local Service: If the Media Hardware Contractor is located too great a distance form the site to promptly service the installation, an arrangement will be made with a local Media service organization who will be engaged and trained by the Media Hardware Contractor to perform local on-site service. Two routine service/maintenance calls by one technician are required during the first year warranty. The local service organization must be capable of performing all on-site requirements and be responsive within 24 hours. The Media Hardware Contractor is ultimately responsible for all service and warranty issues during the warranty period, regardless of the local firm's performance.

C. All materials contained in this specification should come with complete manufacturers' warranties against defects in parts and workmanship. A copy of all available manufacturers' warranties will be included in the user's manual.

D. The Media Hardware Contractor warrants the systems it supplies and installs to be free of defects in parts and workmanship for a period of one year. If during that time the system fails to perform as specified, the Media Hardware Contractor will correct the problem at no additional charge.

E. It is understood that additional charges will be made for the repair or replacement of any piece of equipment that fails due to abuse, carelessness, mishandling, use of a product in an application other than that intended, and attempted repairs performed by anyone other than the Media Hardware Contractor. It is also understood that any problems related to software are to be handled by the Media Software Producer.

3.12 EXHIBIT EQUIPMENT

A. Refer to drawings for equipment list and system flow diagrams.

END OF SECTION

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 11 59 70

EXHIBIT FURNITURE & CASEWORK

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications, apply to this Section.

1.2 SUMMARY

A. The Contract Forms, Conditions of this Contract, and Section 11 59 01 applies to the work of this section.

B. The Contractor is expected to be familiar with all other sections of the specifications and drawings as issued for Exhibits and may need to familiar with specification and drawings as issued for Architecture and Engineering.

C. Related specification sections

1. 05 04 00 Metal Work

2. 11 59 01 General Requirements for Exhibits

3. 11 59 03 Interpretive Graphics

4. 11 59 50 Media Hardware

1.3 SUMMARY OF WORK

A. The scope of work includes:

1. Structures and/or backing material for all graphic and interpretive elements

2. Structures intended to house interpretive and/or mechanical interactive elements (exclusive of graphics, media hardware, and media software which are specified separately).

3. Miscellaneous fabrications, hardware and related elements to support interpretive exhibits

B. General provisions of the Contract include an understanding of, and coordination with, the work by the Construction Manager who is separately contracted by the Owner and will be executing work represented in documents created by the Architect.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's data completely describing products.

B. Shop Drawings: Submit shop drawings showing details of construction and methods of attachment to adjacent Work.

C. Samples: Wood, metal, and plastic fabrications, non-reflective glass, and paint samples in small quantities as may be requested for review and trial application of materials and finishes.

1. Samples of all materials and finishes to be incorporated into the finished work of this project

D. Pre-installation Mock-up Review: Assemble selected exhibit elements for pre-installation review by Owner, Construction Manager, Architect and Exhibit Designer

1.5 QUALITY ASSURANCE

A. Qualifications

1. Fabricator: Equipped for and experienced in doing Work equal to standards specified and be able to provide evidence of such experience to the Owner, Construction Manager, Architect, and Exhibit Designer's satisfaction.

B. Sustainable Design Best Practices

1. Provide written statement outlining the sustainable design program(s) practiced by the fabricator and how those programs (inclusive of sources, materials and fabrication) will be utilized for this project.

1.6 DELIVERY, STORAGE AND HANDLING

A. Storage and Protection:

1. Deliver casework to job site only after proper facilities are available for handling, storing and protecting items; receiving areas are broom cleaned; exterior openings are closed up; wet Work and mechanical and electrical rough-ins are completed.

2. Provide temporary protective covers for items during delivery, installation and until final acceptance of the Project.

1.7 PROJECT CONDITIONS

A. Environmental Requirements: Maintain equilibrium moisture content in wood until job is completed; maximum relative humidity 50 percent to 65 percent at 70 degrees Fahrenheit.

B. During transit from Contractor's place of work to the project site, prevent humidity from causing any undesired effects upon the work of this scope

C. Project site conditions include high levels of: temperature; humidity; UV exposure; and wind. All factors must be accounted for when finalizing the materials, finishes, and details related to the scope of this project.

1.8 SEQUENCING AND SCHEDULING

A. Provide Construction Manager with all information regarding sequencing and scheduling of pre-construction, construction, delivery and installation on site, as well as any critical sequences that involve the work of others.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General – Lumber

1. Lumber and Plywood: Kiln-dried to equilibrium moisture content suitable for fabrication in shop and suitable for use intended; minimum 8 percent, maximum 12 percent.

2. Furnish lumber sanded 4 sides unless otherwise noted.

3. Identification: All lumber shall have grade stamp of governing grading agency. Lumber not stamped or of wrong grade will be rejected.

4. Flame Spread: Class II.

5. Flame Spread Index 25-75.

B. Lumber Material (for interior use only unless approved by the Owner)

1. MDX Plywood 3/4" paper finish on two sides (MDO not allowed)

2. Hardwood Veneer Edging 3/4" for all exposed plywood edges

C. Metal Fabrications:

1. Aluminum sheet stock

2. Aluminum angle stock

3. Galvanized steel angle stock

4. Galvanized steel tube stock

5. Water resistant and non-corrosive hardware as required

D. Hardware, Locks and Fasteners: hardware, hinges, locks, nails, screws and other devices of type, size, material and finish required for application indicated to provide operable, lockage, and secure attachments, visually concealed where possible. Avoid adhesive fasteners that will not be able to withstand humid conditions and the potential for swelling and contraction of wood products

1. For all exhibit casework, provide non-corrosive, exterior grade fasteners and anchors using #316 stainless steel and/or aluminum preferred.

E. Paint:

1. For all wood construction, use Benjamin Moore, Sherwin Williams, Cabot brand or equivalent paint or stain applied according to manufacturer's recommendations and industry standards.
   a. Exterior satin finish acrylic paint on selected interior elements
   b. Exterior stain brush applied and rag rubbed for antiqued, stressed effect on selected exterior elements

2. For all aluminum (or other metal) construction, use catalyzed polyurethane enamel or powder coated paint products that are masked and painted onto all visible surfaces.
   a. Sherwin Williams Powdura Super Durable TGIC Powder Coating products or equivalent
   b. Sherwin Williams Waterbased Acroloon 100 Polyurethane, or equivalent VOC compliant water based polyurethane product.
   c. Fabricator-recommended products to be used only upon approval

3. Surfaces to be painted should match all color listed on the drawings. In the event clarification is required, contact the Interpretive Exhibit Designer for additional information.

4. Use water base clear coat products and avoid use of solvents and airborne products wherever possible and appropriate. Airborne products, when used must be applied with the appropriate level of ventilation and filtration.

F. Acrylic:

1. Lexan non-glare acrylic 1/8" to 1/4" thickness as required per application.

2. Maximum allowable deflection: 1/32" over 1'-0"

3. Museum quality material with durable, (as scratch-resistant as possible) finish required.

4. All joints and visible edges to be polished and bonded without inclusions, bubbles or other unwanted blemishes

G. Electronic Components and Electrical Coordination

1. Miscellaneous hardware, wire and connectors for all internal electrical requirements of each exhibit
   a. Base-building power, conduit and junction boxes provided by the Construction Manager

2. All equipment and materials to be UL approved and to meet with local fire and safety codes

3. Coordinate with Media Hardware Contractor to ensure the size of openings in exhibit casework, mounting holes, ventilation and any wire-chase areas are compatible with the equipment the Media Hardware Contractor will be providing.

4. Coordinate final details of size, materials, and appearance of each element with graphic layouts to insure compatibility. Identify any conflicts immediately so that equitable solutions can be obtained

I. Miscellaneous Hardware and Controls:

1. Use high-quality, non-corrosive hardware in all exterior applications. For interior applications, use museum quality hardware for all elements.

2. Controls such as push buttons, joy sticks, spin browsers, etc. must be commercial, exterior grade

3. Coordinate final details of size, materials, and appearance of each element with graphic layouts to insure compatibility. Identify any conflicts immediately so that equitable solutions can be obtained

2.1 FINISHES

A. Shop Finishing

1. Back Priming of Wood: Back prime all concealed surfaces of lumber.

2. Visible-Side Wood Priming: Prime all surfaces with appropriate sealers and primers prior to application of final finishes

3. Visible-side Wood Finishing: Finish all surfaces as noted by drawings. All paint or graphic materials to be used as finishes will be applied according to manufacturer's recommended procedures and in accordance with industry standards.

4. Finish Painting: For opaque and transparent finish. Touch up painting on site. No visible brush marks, drips or alteration to finish texture and sheen permitted

5. Coat all aluminum framework assemblies and structures with powder coat paint finishes or polyurethane.

6. Finish all visible surfaces as noted on drawings, and when information on drawings is lacking detail, contact the Interpretive Exhibit Designer for more specific instructions. The lack of notation on drawings does not relieve the Contractor from providing finishes to all visible surfaces.

B. Field Finishing

1. Preparation For Final Finishing
   a. Set exposed fasteners. Apply putty in exposed fastener indentations. Sand wood fabrication work smooth. Apply specified finish over finished putty work so to leave no noticeable dimple or pimples.

C. Visible Hardware:

1. US 32, satin finish chrome or approved equivalent

2. 316 Stainless steel

PART 3 - EXECUTION

3.1 EXAMINATION OF CONDITIONS

A. Examine architectural surfaces scheduled to receive exhibit casework for conditions that will adversely affect installation.

B. Do not install work until unsatisfactory conditions have been corrected.

3.2 FABRICATION, DELIVERY AND INSTALLATION

A. Preparation

1. Verify measurements at job site.

2. Verify details and dimensions of fixtures integral with exhibit cabinetry for proper fit and accurate alignment.

3. Coordinate all work with adjacent scopes of work on site and in particular, that scope which is directly connected with the scope of this work.

4. All work to be based upon approved samples, data sheets, shop drawings and other required documents.

5. No fabrication will be allowed without full and proper approvals having been secured in a timely manner.

B. General Fabrication Requirements.

1. Factory-fabricate and assemble Work in complete units insofar as dimensions permit shipment and installation.

2. Kerf backs of solid members more than 5 inches wide or more than 1 inch nominal thickness.

3. Conceal all general hardware, fasteners, hinges, mounts, and other undesirable details from visitor's view

4. All fabrication requires complete approval from Owner, Exhibit Designer and Construction Manager before commencement.

5. No fabrication will be allowed without required approvals and authorization by the Construction Manager and Exhibit Designer

6. Set work square, level, plumb with edges scribed, accurately and secure in place with fastenings, clips, braces, brackets, anchors, shims and blocks.

7. Conceal all fasteners, weld joints, seams, etc. where possible and set nail heads for putty in exposed portion and conceal screws as indicated.

8. Miter inside and outside corners of running trim; bevel end joints together.

9. Touch-up and repair all finish surfaces that become marked or damaged during the installation of this work.

C. Delivery

1. Coordinate and schedule all details of delivery with Construction Manager

2. No delivery of materials or fabricated units will be accepted without approval from the Construction Manager.

3. Provide Interpretive Exhibit Designer with minimum of 2 weeks advance notice prior to making any deliveries to the site

D. General Wood Surfaces

1. Thoroughly hand sand. Take care that cross sanding is removed by final sanding in direction of grain; ease “knife-edge” corners and edges by sanding.

2. Free of dust, glue, stains, and other foreign matter and in proper condition to receive finish.

3. Apply clear sealer over dyed wood in accordance with manufacturer’s instructions.

E. General Metal Surfaces

1. Shop-finish all metal surfaces to the extent possible.
   a. Finish all assembly after fabrication with powder coat paint or catalyzed polyurethane enamel.

2. Protect all visible finished surfaces from damage.

3. Touch up all defects that occur during installation using the same methods of application used in original finish of these surfaces.

F. Graphic Elements

1. Confirm all graphic sizes for each unit and review to assure that all interactive, media, or other non-graphic elements are correct.

2. Confirm locations for exterior graphic elements prior to installing work

3. Confirm that all power and data systems are adequate and appropriate for the work of this scope. Construction to assure weather-tight fit between graphic railings and structural base elements.

4. Provide for all connections to base-building power (brought to each graphic railing location by others) and provide all UL rated labels as required by code.

5. Shim all graphic railings as necessary so that all graphic railings stand plumb and true

6. Confirm that all elements will be sufficient to meet the design criteria for this project and to hold up to visitor impact upon units

7. Secure (structurally) all elements sufficient to meet the design criteria for this project and to hold up to visitor impact upon units

G. Interpretive and Interactive Exhibit Structures

1. All elements to be well secured.

2. Coordinate to assure secure attachment to floor and/or wall

3. Coordinate for all connections to base-building power, HVAC, and other architectural elements (brought to each overhead graphic railing location by others) and do so with qualified, licensed electrician

4. Provide all necessary backing material and supports

5. All hinges to be concealed.

6. No visible means of support or anchoring unless otherwise detailed by the Exhibit Designer.

H. Free-standing Interpretive Exhibits

1. Coordinate all power and data conduit (brought to each location by others) and do so with qualified, licensed electrician

2. Coordinate with Media Hardware contractor and other trades as required

I. Wall-mounted photo-mural exhibit elements

1. Confirm all locations prior to delivery and installation

2. Before installation, confirm that surface (by others) is suitable for installation.

3. Coordinate all final installation with the Interpretive Exhibit Graphics layouts prior to making any permanent attachments

J. Electronic components and Electrical coordination

1. Secure all connections to base-building power (brought to each exhibit location by Construction Manager) and do so with qualified, licensed electrician.

2. Have all work checked by project electrical contractor for compliance with their work and all applicable codes.

3. Coordinate all electrical work with graphics.

4. Secure all connections to base-building power (brought to location by others)

3.3 ADJUSTING AND CLEANING

A. Remove damaged or otherwise disfigured portions and replace with new materials prior to the Owner's acceptance.

3.4 PROTECTION

A. Protect all installed work from damage until accepted by the Exhibit Designer, Architect and the Construction Manager.

3.5 FINAL ADJUSTMENTS AND ACCEPTANCE

A. Conduct final review and secure acceptance approvals:

1. A physical inventory will be taken of all items that comprise this scope of work

2. The Exhibit Casework Contractor shall coordinate a punch-list review of all items and to do so with the Construction Manager, Owner, and Exhibit Designer present.

3. The Exhibit Casework Contractor is responsible for ensuring that the area in which his work has been performed is completed according to his contract and is in a clean and orderly condition, ready for acceptance.

4. The Exhibit Casework Contractor shall be prepared to verify the performance of any portions of the system by demonstration.

5. The Exhibit Casework Contractor shall make additional mechanical and electrical adjustments within the scope of work that are deemed necessary by the Owner and their representatives.

6. In the event further adjustments are required, or defective equipment must be repaired or replaced, tests may be suspended or continued at the discretion of the Owner's Project Manager and/or Exhibit Designer.

7. Three sets of all final "as-built" drawings, manuals, and other required documents shall be delivered to the Owner and their representatives prior to the scheduling of acceptance review.

8. The Exhibit Casework Contractor's personnel performing these tests are to be thoroughly familiar with all details of the exhibits.

9. Review all elements for operational and aesthetic quality. Review to be made by the Owner's Project Manager and Exhibit Designer. Correct all deficiencies immediately upon notification.

10. Final inspection and acceptance of completed work shall be made by the Owner's Project Manager and the Exhibit Designer to verify conformance with design criteria and specifications.

3.6 TRAINING

A. The Exhibit Casework Contractor will provide complete and comprehensive training to designated personnel in the proper operation, maintenance and service techniques of applicable elements that comprise this scope or work. Budgeted time for this activity should be a minimum of 4 hours. Some training usually takes place during final installation, if the user is available. Training will take place immediately following installation.

3.7 SERVICE AND WARRANTIES

A. All equipment will be new and carry manufacturer's full warranties that will be handled by the Media Hardware Contractor during the first year of operation. In addition, the Exhibit Casework Contractor will guarantee the each element as assembled for one year from date of acceptance. During that time, equipment or materials problems will be repaired or replacements made at no charge.

B. All materials contained in this specification should come with complete manufacturers' warranties against defects in materials, parts and workmanship. A copy of all available manufacturers' warranties will be included in the user's manual.

C. The Exhibit Casework Contractor warrants the elements it supplies and installs to be free of defects in parts and workmanship for a period of one year. If during that time any elements fail to perform as specified, the Exhibit Casework Contractor will correct the problem at no additional charge.

E. It is understood that additional charges will be made for the repair or replacement of any piece of equipment that fails due to abuse, carelessness, mishandling, use of a product in an application other than that intended, and attempted repairs performed by anyone other than the Exhibit Casework Contractor.

END OF SECTION

SECTION 133423 - FABRICATED STRUCTURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes design and engineering of factory-assembled modular buildings.

1. Engineer stamped prints for structural approval.
2. Manufacturing of modular buildings.
3. Transporting the buildings to the sites on a flatbed trailer prefabricated steel control booths.

1.2 PERFORMANCE REQUIREMENTS

A. Structural Performance: Meet the requirements listed on the Appendix B document in the contract drawings.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

C. Samples: For factory-applied color finishes.

D. Delegated-Design Submittal: To comply with performance requirements and design criteria, including analysis data signed and sealed with a valid North Carolina seal of a qualified professional engineer responsible for their preparation. The buildings shall have a medallion affixed to each that demonstrates it is acceptable to the State of North Carolina.

1.4 INFORMATIONAL SUBMITTALS

A. Welding certificates.

B. Warranty: Sample of special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
3. AWS D1.3, "Structural Welding Code - Sheet Steel."

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Safety Glazing Products: Category II materials complying with testing requirements in 16 CFR 1201.

D. Preinstallation Conference: Conduct conference at **Project site**.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair finish or replace wall panels that fail in materials or workmanship within specified warranty period.

1. Warranty Period: **Five** years from date of Acceptance by the Owner.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aluminum: Alloy and temper recommended by aluminum producer and manufacturer for type of use and finish indicated, and as follows:

1. Extruded Shapes: ASTM B 221 (ASTM B 221M).
2. Rolled Tread Plate: ASTM B 632/B 632M, Alloy 6061-T4 or Alloy 6061-T6.

B. Zinc-Coated (Galvanized) Steel Sheet: ASTM A 653/A 653M, commercial quality, G90 (Z275) coating designation; mill phosphatized.

C. Galvanized, Rolled Steel Tread Plate: ASTM A 786/A 786M, rolled from steel plate complying with ASTM A 572/A 572M, Grade 55 (380); hot-dip galvanized according to ASTM A 123/A 123M.

D. Steel Structural Tubing: ASTM A 500, Grade B.

E. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.

F. Steel Mechanical Tubing: ASTM A 513, welded steel mechanical tubing.

G. Zinc-Coated (Galvanized) Steel: Hot-dip galvanized according to ASTM A 123/A 123M.

H. Stainless-Steel Sheet: ASTM A 666, Type 304.

I. Plywood: DOC PS 1, Exterior grade.

J. Particleboard: ANSI A208.1, Grade M-2.

K. Roofing: thermoplastic single ply pvc roof system (includes 6" white termination bar & fasteners).

1. Sloped foam 1/4" start; 1/4" slope per foot.
2. Sloped foam barrier slipsheet
3. Roof panels: panels- 4-inch-thick wall and ceiling panels - cam lock mechanism for panel assembly - high density extruded polystyrene foam laminated between sheets of 26-gauge galvanized steel - 2.4 lbs weight per square foot of panel surface - r 32 insulation factor - tan exterior/white interior stucco embossed finish.

L. Floor/Base: 4-inch-thick floor panels - cam lock mechanism for panel assembly.

1. High density extruded polystyrene foam laminated between sheets of: exterior 26 gauge Lightstone steel; interior 26-gauge galvalume steel - 1/2" plywood reinforcement - 3.5 lbs. weight per square foot of panel surface - r 28 insulation factor.
2. Exterior stucco embossed Lightstone 26 gauge - interior stucco embossed galvalume 26 gauge. Treadplate 3003 bright finish 1/8" x 4' x 8' sheet.
3. Diamond Tread.

M. Door: 3’-0” x 7’-0”, 1-1/2 pair stainless steel hinges, lockset and deadbolt matching the Owner’s hardware systems for the main building project.

N. Anchorages: Anchor bolts; **hot-dip galvanized according to ASTM A 153/A 153M.**

O. HVAC: 800cfm Ventilation system: includes shutter-mounted fan, powered intake louver, thermostat, filtered weather hoods, and 4x4 electrical box and blank cover 1 1 Wall Mount Thermostat 4' - 1,000watt baseboard heater (230/1) - 752/1000 Convec Heater 4ft HEATER 24 - MARLY- Catalog # 2544W.

P. Lighting: Eight LED 4' - Kason 1810LCT4000

2.2 PREFABRICATED BUILDINGS, GENERAL

A. General: Provide complete, integrated set of mutually dependent components that form a completely assembled, prefabricated structures, ready for installation on Project site.

2.3 PREFABRICATED STEEL BUILDINGS

Manufacturers: Subject to compliance with requirements, **available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following**:

1. Safespace
   PO Box 1579
   Manchester, MA 01944
   (877) 265-8820
   https://safespacebuildings.com

2. Modular Engineering Co
   1802 Cranberry Street
   Erie PA 16502
   (814) 838-6551
   Modularengineering.com

3. Commercial Structures Corp
   655 N. Tomahawk Trail, Nappanee, IN 46550. United States
   (800) 348-2740
   (574) 773-7931
   jlawrence@comstruc.com

2.4 FABRICATION

A. Fabricate buildoings completely in factory.

B. Preglaze windows and doors at factory.

C. Prewire buildings at factory, ready for connection to service at Project site.

2.5 FINISHES

A. **Galvanized-Steel** Factory Finish: Immediately after cleaning and pretreating, apply manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.

1. Color and Gloss: **As selected by Architect from manufacturer's full range**.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install buildings according to manufacturer's written instructions.

B. Set buildings plumb and aligned. Level baseplates true to plane with full bearing on concrete bases.

C. Fasten buildings securely to **cast-in anchor bolts**.

D. Connect electrical power service to power distribution system.

E. Adjust doors and hardware to operate smoothly, easily, properly, and without binding. Confirm that locks engage accurately and securely without forcing or binding.

F. Lubricate hardware and other moving parts.

G. After completing installation, inspect exposed finishes and repair damaged finishes.

END OF SECTION 133423

SECTION 170010 - LIFE SUPPORT SYSTEM GENERAL PROVISIONS

PART 1 - GENERAL

1.1 SUMMARY

A. Scope of Work: This division covers the furnishing and installation of all saltwater, freshwater and chemical systems indicated on Drawings and as specified herein; including all piping, pipe supports, valves, pumps and motors, filters, automated controls and other miscellaneous work and required material, except those specifically noted otherwise.

B. Automated Controls Supplier (ACS) / Subcontractor is to be procured by the Contractor for installation of indicators, transmitters, and other controls devices associated with the Life Support System (LSS) Piping and Instrumentations Diagrams (P&IDs). The associated work shall be completed by the Contractor.

C. The work shall include furnishing all labor, equipment, tools, shop drawings, freight, appliances, hoisting, scaffolding, rigging, supervision and overhead for the proper execution and completion of the work. Provide necessary labor and material and other items as necessary to leave all exhibit saltwater, freshwater and chemical systems complete, tested, operative and satisfactory to the Owner.

D. Maintain equipment in as new condition until delivery to Owner.

E. Coordination of Work:

1. Contractor shall thoroughly acquaint himself with the work involved and shall verify at the site all measurements necessary for the proper installation of his work.
2. Contractor shall refer to architectural, structural, mechanical and electrical drawings for building construction and other details which affect the life support installation, and shall confer with those trades for finish adjacent to his work and arrange to have visible portions of his work (such as access doors, grilles, sprinkler heads, escutcheons, etc.) fit in and harmonize with the finish in a manner satisfactory to the Owner's Representative.
3. Ceiling heights: Architectural drawings shall be checked for ceiling height requirements.
4. Coordinate location of LSS piping with all other piping, ducts, and conduits that may be installed in certain areas. In cases where LSS piping and other materials conflict in space, refer the matter to the Owner's Representative for decision as to which material shall have control.
5. Pressure Testing: Contractor shall coordinate all pipe pressure testing activities, including written reporting to the Owner and advanced notification to the Owner of proposed testing times and locations.
6. Painting: Notify the General Contractor and other trades as necessary to assure coordination of all life support items requiring painting. The LSS Contractor is responsible for securing completion of painting as specified in Part 3 of these General Provisions.

F. Manufacturer's Directions: Each material for which the Manufacturer issues directions shall be used according to those directions, as approved, and if not at variance with these Specifications. If a variance between the Manufacturer's directions and these Specifications does exist, the Contractor shall bring it to the attention of the Owner's Representative for resolution prior to the commencement of work.

G. Examination of Site and Drawings: Submittal of bid shall indicate the Contractor has examined the site and Drawings and has included all required allowances in his bid. No allowances shall be made for any error resulting from Contractor's failure to visit jobsites and to review Drawings. Bid shall include costs for all required drawings and charges to meet space requirements, code requirements and as necessary to resolve space conflicts, at no additional cost to the Owner.

H. Contractor Prepared Drawings: The Contractor shall secure the service of a professional draftsman to prepare the "Shop" and "Record" drawings described below.

I. Start-up Operations: Provide appropriate craftsmen for startup of all installed equipment. See also Part Three of this Section under "Project Close-Out Requirements - System Start-up Operations." Startup by Contractor shall be the duration from beginning with checking of pump motor rotations and pressure testing of pipes to delivery of the complete operational system to the Owner.

J. Project Manual: The General Conditions of the Project Manual shall apply to this Section as fully as if repeated herein. This Section shall be coordinated with related Sections in Division 15 (such as pipe supporting and points of connection); except where conflict exists between Section 170010 and other Sections of Division 15, Section 170010 shall govern.

K. Technical Seminars: Contractor shall coordinate specified Technical Seminars, presented to the Owner and conducted by equipment suppliers, where specifically called for in the specifications. Technical Seminars shall be presented to the Owner by suppliers of the following equipment:

1. Section 170120 - Centrifugal Process Pumps
2. Section 170140 - Electric Valve Actuators
3. Section 170441 - Flow Meters
4. Section 170455 - ORP Sensors
5. Section 170723 - Ozone Equipment
6. Section 170753 – Calcium Reactors
7. Section 170786 – Reverse Osmosis

1.2 GENERAL ARRANGEMENT DRAWINGS

A. Coordination: The Drawings indicate the general routing of the piping and only critical dimensions and elevations are noted. The Contractor is required to coordinate piping fabrications with the civil and structural drawings. Discrepancies must be immediately brought to the attention of the Owners Representative for resolution. The Contract Drawings may not accurately reflect the actual configuration of materials the Contractor selects. The Contractor shall be responsible for coordination and layout for equipment and piping based on actual material dimensions.

B. Jobsite Conditions: The Contract Drawings show the general arrangements desired for the principal equipment, piping, valves, etc., and shall be followed as closely as possible; however, adjustments must be anticipated by the Contractor to meet field conditions. Proper judgement must be exercised in carrying out the work to secure the best possible headroom and clearances throughout, to secure neat arrangement of piping, valves, fixtures, hangers, etc., and to overcome local difficulties and interference of architectural, structural, and other conditions wherever encountered.

C. Diagrams Preside: The Contractor is to provide all piping necessary to carry out the process indicated on the Process Flow and/or Piping and Instrumentation Diagrams; the actual scale drawings show the general arrangement of equipment but do not show all piping, valves, instrumentation, equipment and points of connection that are required by the process diagrams.

1.3 DEFINITIONS AND STANDARDS

A. The word "provide," as used in these specifications, means "furnish all materials and do all work necessary for a complete installation." In many instances on the Drawings, specified work has been illustrated without annotation; in those cases where the illustration corresponds to either the diagrams or specifications or is a necessary interconnection, the work is to be completely furnished and installed by the Contractor; such items include, but are not limited to: FRP grates, ladders, pipe flanges, concrete pads, mounting brackets, pipe hangers and supports, etc.

B. Where or approved substitute is specified, the Contractor may choose any of the specified brand names or a non-specified brand meeting the specified requirements. Where no substitutes is specified, only the specified brands are acceptable.

C. Where "Typical" or "Typ." is used in the Contract Documents, the Contractor shall apply the reference to all similar applications irrespective of the degree of detailing that may or may not be shown for the similar applications.

D. References: The editions referenced herein of Federal Specifications (Fed. Spec.) and other standards and specifications published by the following organizations apply to the work only to the extent specified by the reference.

ANSI	American National Standards Institute
AISC	American Institute of Steel Construction
ASME	American Society of Mechanical Engineers
ASTM	American Society of Testing Materials
AWWA	American Water Works Association
AWS	American Welding Society
CSA	Canadian Standards Association
CISPI	Cast Iron Soil Pipe Institute
ETL	Edison Testing Laboratories
FM	Factory Mutual Engineering Corporation
IBC	International Building Code
ISO	International Organization for Standardization
NBS	National Bureau of Standards
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association

NFPA	National Fire Protection Association
OSHA	Occupational Safety and Health Administration
PPI	Plastic Piping Institute
SMACNA	Sheet Metal and Air Conditioning Contractors National Association, Inc.
UL	Underwriters Laboratories, Inc.
USASI	USA Standards Institute

1.4 CODES, PERMITS, AND INSPECTIONS

A. Codes: Work shall be installed in conformity with all local, state and federal codes, ordinances and statutes where they apply. Standards and sizes which meet or exceed preceding code requirements shall be installed as drawn or specified. Nothing in the specifications shall be construed to permit deviation from the requirements of governing codes.

B. Permits, Fees and Inspections:

1. Contractor shall arrange and pay for all permits, fees and inspections required in connection with this installation. He shall apply for and pay for all meters or gauges required. The Contractor shall present the Owner with properly signed certificates of final inspection before the work shall be accepted.
2. Contractor shall call for all inspections by the local authorities when they become due and shall not cover any work until approved by these governing authorities.

C. Testing Approvals: Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories.

1.5 WORK INDICATED AS “NIC”

A. The term "NIC" shall be construed to mean construction work not to be furnished, installed or performed by the Contractor. The term shall mean "Not in this Contract" or "Not a Part of the Work to be performed by the Contractor," except that coordination and/or installation of certain NIC items specified shall be the Contractor's responsibility.

B. "NIC" work is indicated on the Drawings and specified herein as an aid to the Contractor in scheduling the amount of time and materials necessary for the completion of the Contract.

C. The following portions of the work will be provided by the Owner under separate contract or other arrangement:

1. (NONE)

1.6 OWNER FURNISHED EQUIPMENT

A. Owner's Responsibilities: The Owner will arrange and pay for product delivery to the site in accordance with the construction schedule. The Owner and the Contractor shall jointly inspect the deliveries for shortages and damaged or defective items. The Owner will arrange for replacement of damaged, defective or missing items.

B. Contractor's Responsibilities: The Contractor shall unload, uncrate, and store the products at the site and shall protect them from exposure to the elements and other damage. Items damaged after acceptance by the Contractor shall be replaced at the Contractor's expense. The products shall be installed, connected, adjusted and finished in accordance with the applicable section of these Specifications and the Manufacturer's instructions.

C. Owner will furnish the following equipment for installation by the Contractor:

1. (NONE)

D. Contractor shall obtain information to include in the *Operation and Maintenance Data Manual* from the Owner.

1.7 QUALITY ASSURANCE

A. Labor and Material: The intent of the Drawings and Specifications is to provide the Contractor with a basis for the construction and completion of every detail of the work described therein for a complete and fully operating mechanical system. Contractor must guarantee that the materials and workmanship supplied under these specifications are new unless otherwise approved by the Engineer and/or Owner in writing. Contractor shall properly store all materials and equipment for protection from physical damage or damage due to corrosion. The Contractor shall take all measurements, verify all drawings and be responsible for the proper installation in the available space of the equipment specified and shown on the Drawings and secure the approval of the Engineer for any variations before making any changes.

B. Drawings and Specifications: The Drawings and Specifications shall be taken together. Provide work specified and not indicated or work indicated and not specified as though mentioned in both.

C. Conflicts Between Drawings and Specifications:

1. Where disagreements occur between the Drawings and the Specifications or within either document itself, the item or arrangement of better quality, greater quantity, or higher cost shall be assumed for the base bid. If, in the opinion of the Contractor, there are omissions or errors in either the Drawings or Specifications, the Contractor shall verify those points and obtain clarification before bidding.
2. The Contractor shall carefully check space requirements to ensure that equipment, ducts, pipes, etc., can be installed in the spaces allotted. Lines that must pitch, or that must have a constant elevation, shall have the right-of-way over lines not so restricted.

D. Product Warrantees: Typically, the product specifications require warrantees starting at the date of startup of the complete system, or starting after Owner acceptance of the units from the installing Contractor, whichever is less. Product warrantees starting at the date that products are delivered to the Contractor is not acceptable and the Contractor shall coordinate with his product suppliers to have warrantees start at the specified times.

1.8 SUBMITTALS, APPROVALS, AND REVIEWS

A. General: Comply with requirements of Division 1, Section 01300.

B. Required Submittals: Submit material as designated in the subsection or otherwise as necessary to properly evaluate the item. Additional non-specified items submitted at the Contractor's option may or may not be reviewed at the discretion of the Engineer.

C. Submittal Review: The intent of this procedure is to have the Engineer review, for the Owner, actual material and equipment proposed to be furnished by the Contractor and to make comments where applicable. This review may serve as a checking process but in no case shall it relieve the Contractor from his responsibility of full compliance with Contract Documents including Drawings and Specifications.

D. Delay Notice: The contractor shall not have any right to file a delay claim based on the review of submittals without first specifically notifying the owner and the engineer and providing a reasonable turnaround time after such notification. The contractor shall confirm the engineer's receipt of submittals for review where a speedy processing time is required. Further, the contractor shall adhere to the submittal schedule, and/or submit material over a prudent time span, and not create a situation where the engineer is overloaded by tardy submittals for review.

1.9 SHOP DRAWINGS

A. Where shop drawings are called for in the specifications, or preparation of shop drawing by the Contractor are required for clarification, they shall be prepared as follows. The drawings shall be drawn by an experienced mechanical designer/draftsman. Use a suitable scale, not less than 1/4" = 1-foot 0-inch, verify all work in progress and field measurements, and draw neatly and accurately to a tolerance no greater than one-inch of actual installation. Prior to installation, submit shop drawings for review in digital or print form.

B. Submittal of shop drawings for review showing overall piping layouts and spool piece dimensions will be reviewed by the Engineer to check if the Contractor is in general conformance with the LSS design concept and the information shown in the Construction Documents; however, the Engineer will not review overall layout for every detail. The Drawings by TJP, Inc. have been prepared to a Level of Design (LOD) 300 and the Contractor shall take responsibility for producing shop drawings of overall piping to a LOD 400. Any changes to the Contract Document Drawings shall be clearly identified by the Contractor. The LODs shall be defined as follows:

1. LOD 300 — Construction Documentation by Engineer: Includes drawing and/or model detail and element that represent how system elements interface with various systems and other building elements with graphics and written definitions.
2. LOD 400 — Fabrication and Assembly by Contractor: Model or shop drawing elements are modeled as specific assemblies, with complete fabrication, assembly, and detailing information in addition to precise quantity, size, shape, location and orientation. Non-geometric information to the model elements can also be attached.

C. Prior to submission of any shop drawing, the Contractor shall thoroughly check each shop drawing to ascertain that it complies with the Contract requirements; that the plumbing, mechanical and electrical systems shown are correct and completely coordinated with the life support work.

D. No changes to Drawings or Specifications shall be made through shop drawings, unless specifically approved in writing by Change Order.

E. Include printed versions of approved shop drawings in the Operation and Maintenance Data Manual.

1.10 RECORD DRAWINGS

A. Comply with the requirements of Division 1. Corrections and changes shall be kept up-to-date at all times. Marked prints shall be kept at the jobsite for review by the Owner's Representative or their representative. Quality of Record Drawings shall be equal to or exceed the original Construction Documents.

B. The Record Drawings shall include the following minimum documentation:

1. Actual location of installed equipment, piping and utilities.
2. Re-define dimensions, or re-create drawings, where work varies from the design Construction Documents.
3. Indicate location of buried piping with dimensions to foundations or other permanent structures.
4. Clearly identify all points of connection ("P.O.C.") to existing equipment and other trades.
5. Show the installed arrangement where an approved substitution of equipment requires changes from the original design arrangement of life support equipment, adjoining work or other trades.
6. Incorporate changes associated with RFI responses, supplemental instructions, proposal requests, change orders, and the like.

C. The Contractor shall only submit Record Drawings which have incorporated dimensions from the pipe supplier's shop drawings.

D. Photographs: Record Documents to include photographs (chemical or electronic) of construction in-progress. Contractor shall take photographs of concealed equipment and buried piping and deliver photos/files to the Owner at the completion of the project. Specifically, photography shall include buried valves, buried connections with changes in materials, major pipe runs, and piping manifolds.

E. Responsibility for Accuracy: The Architect or Engineer will not certify the accuracy of the Record Drawings of construction which is the sole responsibility of the Contractor.

1.11 ELECTRONIC DOCUMENTS

A. Construction Documents: Electronic documents, if prepared by the engineer are for the express use in this single project. The engineer's design is to be bid and constructed from the printed documents and not from electronic files. The design is schematic in nature and electronic files shall not be assumed to carry a degree of precision beyond the information indicated on the printed documents. Electronic files shall not be reproduced or transferred for use beyond this specific project without the express written permission of the Engineer.

1.12 DELIVERY, STORAGE, AND HANDLING

A. Exercise care during loading, transporting, unloading and handling to prevent damage to materials and equipment. Where possible all materials shall be stored at the job site in original manufacturer's packaging. Under no circumstances shall pipe, fittings, or any other material be dropped or dumped.

B. Store materials at the project site in enclosures or under secure protective covers in accordance with manufacturer's recommendations and as directed by the Owner's Representative. Do not store equipment directly on the ground.

C. Caution shall be exercised to avoid compression damage or deformation to ends of the pipe. Pipe shall be stored using methods to prevent sagging or bending and shall be protected from exposure to direct sunlight by covering with an opaque material.

1.13 GUARANTEE OF MATERIALS AND WORKMANSHIP

A. All work performed under this Contract shall be guaranteed against faulty and improper materials and workmanship for a period of 1-year from the date of final acceptance by the Owner, except that where guarantees or warranties for longer terms are specified in the project manual, such longer terms shall apply.

B. At no additional cost to the Owner, Contractor shall promptly correct any deficiencies which occur during the guarantee period, all to the satisfaction of Owner and Architect.

C. All equipment and installation shall be guaranteed by the Contractor to be installed in compliance with OSHA regulations.

D. The Contractor shall require similar guarantees from his subcontractors.

1.14 MAINTENANCE AND OPERATION DATA MANUALS

A. Prepare Instruction Manuals describing the operation, servicing and maintenance requirements of all mechanical equipment provided, and a complete parts list. Include Maintenance and Operation Data where specifically called for in Part 1 of the specified Subsection.

B. Information contained in the Manual: Catalog data on the particular item and not the complete "line" of the Manufacturer. Index all contents listed in an orderly presentation. Provide the following indexed chapters:

1. Valve Identification Chart that correlates M/O data with the tag numbers given on the Process and Instrumentation Diagrams.
2. Test Charts and Test Records.
3. Pressure Vessel Certificates.
4. Operation and Maintenance Data for all specified equipment. Include information, provided by the Owner, on Owner furnished equipment.
5. Guarantee and Warranties.
6. Pump and Equipment Installation Certificates (applies to all long-coupled “Process” type pumps).
7. Instructions for lubricating each piece of equipment installed. Instructions shall state type of lubricant, where and how frequently lubrication is required. Lubrication and lubricants especially shall be detailed separately for all equipment and presented for ready reference.
8. Supplementary Drawings for servicing and maintenance points.
9. A separate Sub-section with an itemized list of component parts with information giving where such parts can be purchased. Typewritten instructions for ordering and stocking spare parts for all equipment installed. The lists shall include catalog numbers of parts and suggested supplier.
10. Certified Operational Test Reports.

C. Delivery: Organize all information for delivery in an electronic PDF document. When assembling the electronic PDF use the “smallest size” possible function on large individual files before collation into the final presentation file. Where necessary, make presentation files no larger than 10MB and deliver multiple files separately. Publish with a front cover with the name of the Project, the Owner, the year of completion, the words "LIFE SUPPORT SYSTEM EQUIPMENT OPERATING AND MAINTENANCE DATA" and the names of the Architect, Engineer, General Contractor, and Mechanical Contractor.

PART 2 - PRODUCTS

2.1 PRODUCTS (SEE APPROPRIATE SUBSECTIONS OF DIVISION 17)

PART 3 - EXECUTION

3.1 GENERAL

A. This Section covers installation of the system in general and specific installation requirements given under individual equipment subsections are to be adhered to.

B. All the equipment shall be installed as recommended by its manufacturer. If any conflict arises between the manufacturer's instructions and any other directions, the Contractor shall bring the discrepancy to the immediate attention of the Owner's Representative.

C. Concrete Equipment Pads: Concrete pads for support and leveling of floor-mounted equipment shall be provided as follows:

1. Contractor shall install concrete equipment pads where shown on the Life Support, Architectural, or Structural Drawings for support of equipment using Structural concrete specified in Division 3.
2. Where floors are sloped, and/or where rooms have floor drains and are intended for routine washdown, concrete leveling pads shall typically be installed.
3. Where installation of equipment pads creates ponding of water, the Contractor shall install concrete “crickets” behind equipment pads to allow for drainage.

3.2 SAFETY AND PROTECTION

A. Safety Measures to be Taken: The Architect and/or Engineer has not been retained or compensated to provide design and construction review services relating to the Contractor's safety precautions or to means, methods, techniques, sequences or procedures required for the Contractor to perform his work. The Contractor will be solely and completely responsible for conditions of the jobsite, including safety of all persons and property during performance of the work. This requirement will apply continuously and not be limited to normal working hours. The Architect's and/or Engineer’s observations of the Contractor's performance are not intended to include review of the adequacy of the Contractor's safety measures in, on, or near the construction site. It shall be the Contractor's responsibility to comply with "Safety and Health Regulations for Construction," Volume 36, No. 75, Part II, of the Federal Register by the U.S. Department of Labor. Contractor shall be responsible for providing all such safety measures and shall consult with the state or federal safety inspector for interpretation whenever in doubt as to whether safe conditions do or do not exist or whether he is or is not in compliance with state or federal regulations.

B. Drive Guards: Provide OSHA approved drive and shaft guards for all exposed, rotating drive shafts and drive connections between motors and driven equipment including fans, pumps, compressors, etc. Guards shall include heavy-duty steel frames securely fastened for easy removal from the equipment frame. Guards, in general, shall be solid sheet metal with tachometer cutout at shafts where applicable. Guards for double-width fans and for air-cooled compressors, etc., shall be heavy mesh or expanded metal to permit air flow. Guards may be provided by the equipment manufacturer or fabricated by the Contractor to the Manufacturer's clearances, configurations, etc.

C. Head Protection: Where duct angles, pipe hangers, equipment support angles, etc., are exposed in walkways or in access ways for any maintenance, head protection must be worn. Cover all such potentially injurious protrusions less than 6-foot 8-inches above the floor with padding. Padding shall be securely and permanently fastened and finished comparable to adjacent finishes. The Owner's Representative shall be notified prior to the installation of any such protrusions

D. Site Observations: The right of the Engineer to conduct jobsite observation of the Contractor's performance is not intended to review the adequacy of the Contractor's safety measures in, on, or near the construction site.

3.3 CUTTING, PATCHING, AND PIPE PENETRATIONS

A. Contractor shall provide permanent seal for pipe penetrations at pools, basins and other hydraulic structures; including, walls and slabs located below the maximum ground water level as determined by the Geotechnical Engineer. Contractor's responsibility shall include, but not limited to, the following:

1. Accurately locate all such openings and coordinate work with General Contractor in order to properly complete this work within the General Contractor's time schedule.
2. Furnish the necessary drawings to trades whose materials must be cut or fitted.
3. Furnish sleeves, inserts, anchor bolts and similar items set into concrete, masonry, or the work of other trades, and be responsible for the exact location of all such items.
4. All drilling and cutting of holes in steel and fiberglass decks required for sleeves and supports. All additional openings required through existing slabs or walls shall be drilled with a diamond tipped core drill and in no case shall any structural member be cut without approval of Structural Engineer.

B. To prevent leakage in new concrete walls, piping with perimeter cast-in-place water-stop flange is generally assumed as the detail of choice with the LSS design. This detail requires pipe penetration through the concrete formwork. The intention of the "Link Seal" specified in Section 170280 is for repair situations in existing concrete and not intended to be a substitute for water-stop flanges in new concrete wall construction.

C. For pipe penetrations through dry, non-hydraulic walls, where required install with fire-stop joint sealant per Architectural specifications. Locations include floor and wall assemblies constructed of concrete, masonry, and drywall materials.

3.4 GENERAL INSTALLATION OF PIPING

A. The Contractor shall install all auxiliary piping and connections to equipment as required for a complete workable system, including equipment furnished by the Owner.

B. Tolerance of buried pipe elevations:

1. Where elevation call-outs indicate a slope in the pipe installation, the pipe shall be sloped continuously between elevation callouts.
2. Where elevation call-outs are identical in a section of pipe, the pipe shall be installed flat and true with no excessive high and low points. The contractor shall take all practical means for installing such piping as level with total variations in the installed piping elevations less than 25% of the pipe internal diameter. The lowest point in flat piping shall not exceed the highest point by more than 25% of the pipe internal diameter.
3. In no case shall buried piping be installed with high points, high loops, high risers over other construction materials, or high swales due to installation methods that may result in air pockets impeding the flow of water.
4. Where point-loaded supports are used with installation of buried pipe, the supports shall be temporary, with an above-grade length, of wooden material, and removed prior to final soil compaction.
5. The Contractor responsible for the installation of buried piping shall be present on site at the time of surrounding soil.

C. Supporting of exposed pipe:

1. Loads: Support all exposed piping with devices of appropriate design for gravity loads.
2. Locations and Submittals: When location and detail of pipe support are shown on the drawing, it shall be considered the minimum number and type required. Regardless of whether shown on the Drawings or not, provide support for all piping to conforming to these Specifications, field requirements, and applicable codes and regulations. *Location of all hangers and supports shall be submitted for approval prior to installation.* Provide lateral bracing at all major elbows, tees and flex connections.
3. Fastening: Anchor pipe supports by means of clamps or other approved means, securely fastened to the pipe and rigidly attached to the building construction. Refer to "Pipe Supports" Section 170310 and "Fasteners" Section 170316 for specific materials.
4. Spacing: The center to center spacing shall not exceed the piping manufacturers recommendations.
5. For insulated piping, reduce spacing of supports by 30% of recommended bare pipe spacing, to allow for the additional weight of the insulation.

D. Welded-on, or integrally-cast waterstops (or "anchor flanges") shall be provided in all pipes passing through concrete walls or slabs required to be watertight; walls and slabs required to be water tight shall include any tanks, pools, basins or other structures intended to hold water at any time and any walls or slabs located below the maximum ground water level as determined by the Geotechnical Engineer. Where piping passes through concrete walls of structures required to be watertight, the pipe shall be installed in the walls prior to placing concrete. All "PE" piping shall have anchor flanges where passing through all concrete structures including walls and slabs. PE anchor flanges may be fabricated by stick-welding and external anchor plate or manufactured by machining down the outside diameter of very thick PE pipe and leaving a raised anchor flange. Where water must be retained, backup wall flange waterstop with a full-circle strip of preformed plastic adhesive waterstop, by *Synko-Flex Products, Inc.* Houston, TX (800) 231-4551; or approved substitute.

E. Diagrams: Piping and Instrumentation Diagrams are schematic only and must not be used for obtaining lineal runs or number and type of fittings and fixtures.

F. Offsets in Piping: All offsets in piping, where needed to correct of field conditions, shall be approved by the Owner’s Representative prior to placement of effected piping.

G. Openings in Pipes: Keep covered at all times during the progress of work to ensure that no dirt or debris enters pipes or equipment.

H. Joints: Joints shall be in compliance with requirements of applicable codes and Manufacturer's recommendations. Threaded joints shall be made with an application of recommended Teflon pipe dope or Teflon tape. Threaded joints of different materials, such as Kynar/PVC or FRP/PVC, shall be made with both a Teflon tape wrap and an application of Teflon pipe dope.

I. Drains and Vents: Drain cocks shall be provided at low points and vent cocks at high points. Vent lines, with ball valves at a maximum height of five-foot above finish floor, shall be installed at all high points and piped to nearest floor drain. Where indicated on the Drawings, automatic air release valves shall be installed in addition to vent lines, with drain lines piped to the nearest floor drain.

J. Connections to Equipment: All piping connections to equipment shall be made with piping offsets and flanged unions or true union couplings as indicated on the Drawings or as required to allow equipment to be serviced or removed with as little dismantling of the immediate piping as possible.

K. Flanged Connections: Make-up joints with flanged faces true and perpendicular to the centerline of the pipe to which the flanges are attached.

1. Face Detailing: Faces of flanges must be flat, and without "O" ring grooves or other undulations, in order to be compatible with installation of valves and other attachments.
2. Flange Reinforcement: Where butterfly valves or other components create a "raised face" condition, it may be necessary to add an appropriate backing ring or shim to prevent bending of the flange. For installations where the operating pressure is less than 30-psi, depending on the flange manufacturer's recommendations, it may be possible to install standard non-metallic companion flanges without additional reinforcement. If the manufacturer recommends additional reinforcement: backing rings shall be constructed of Type 316 stainless steel or totally non-metallic; if shims are used to fill the raised portion of the flange, the shims shall be totally non-metallic.
3. Blind flange plates shall be of the same material as the flange (except where clear material is used). In the case of fiberglass, the plate may be slightly domed to reduce stresses and material thickness. Clear view-ports, or clear manway covers, shall be shall be hard-coated polycarbonate, acrylic, or approved substitute; sized for the pressure requirement by the supplier.
4. Where concentric tapered reducers are shown at pump discharges they shall be as specified herein. Thickness of the FRP flange shall not be less than as shown on Table 5 of NBS-PS15-69 for 150 psi design pressure. PVC bushings will not be considered as an acceptable equal. Typically pump discharges 3-inch diameter and larger shall be installed with 150 lb. concentric flanged reducers by, of FRP composite construction, by *Conley Composites* www.conleyfrp.com ; *Smith Fibercast* Little Rock, AR; *Ram Fiberglass* ramfiberglass@aol.com ; or equal. Pumps with 2-inch discharges may have PVC bushing reducers. If reducing fittings are not installed at pump discharges, a pipe spool shall be installed, for installation of valves, not less than two (2) pipe diameters in length.
5. Flat washers are required under all bolt and nut heads with additional split-ring lock washer on nut side, or as recommended by the fitting manufacturer.

L. Gaskets: Provide appropriate material and matching size for all required applications. Flange gaskets shall be manufactured to meet ANSI B16.1 dimensions. Recommend Durometer A hardness of 50 for plastic fittings and hardness of 65 for metal pipe. Provide ASAHI AV gaskets available from Harrington Plastics; or approved substitute.

1. Not required at booted or O-ring faced valves.
2. Not required at polyethylene-to-polyethylene flange joints.
3. For typical water applications use EPDM; may also substitute with higher grades of rubber such as Viton.

4. Use Nitrile rubber only where EPDM is not available and do not use Nitrile rubber where water is oxidized.
5. For oils and oil containing water use only materials rated to resist degradation from such specific oils.
6. For oxidized water applications use EPDM, Viton, *Teflon*, or PVDF.
7. For ozone gas applications use Teflon, PVDF, manufactured silicone gaskets, or *Gore-Tex* expanded PTFE adhesive-backed joint sealant strip. Material also required downstream of ozone gas fed venturi educators.
8. Do not use gaskets constructed of natural rubber or neoprene material.
9. For special hard-to-seal situations use *Gore-Tex* expanded PTFE adhesive-backed joint sealant strip, manufactured by *W.L. Gore & associates, Inc.* Elkton, MD (410) 392-3200 www.gore.com.

M. Over-Wrap Coating System: All buried metallic components, such as valves and flanges, shall be protected with the following coating system: STAC Coating System by *Central Plastics Company*, Shawnee, OK, (405) 273-6302; Graycoat/Guard-Wrap by *Trenton Corporation* Ann Arbor, MI (313) 426-3955; or approved substitute:

1. Wire-brush and clean all surfaces to be wrapped. If necessary, apply a hydrophobic primer over all metal parts.
2. Fill all voids and contour around irregular shapes with a petroleum filler.
3. Wrap entire component with a petrolatum saturated synthetic fabric.
4. Completely wrap and seal component with a tough self-adhesive PVC plastic over-wrap.

3.5 PIPELINE EXCAVATION AND BACKFILL

A. The Contractor responsible for the installation of buried piping shall be present on site from bedding of the pipe, at the time of installing embedment, and other times when the piping is affected by surrounding construction activities.

B. Required Reference Specifications:

1. PE/HDPE pipe shall be installed, per this specification subsection and, in accordance with AWWA Manual M55.

2. PVC pipe shall be installed, per this specification subsection and, in accordance with AWWA Manual M23 and AWWA C605.

3. FRP pipe shall be installed, per this specification subsection and, in accordance with AWWA Manual M45.

C. Shoring & Bracing: At open-cut excavations, whether by machine or hand excavation, the Contractor shall take all necessary precautions to prevent caving of trenches. Shoring, sheeting and bracing shall meet the requirements of State of North Carolina-OSHA. See other related Sections of the Project Manual and Special Conditions for safety requirements. Provide shoring and bracing where the depth of the excavation, or condition of the ground, require protection for safety, conforming with local and state safety laws and regulations. Either remove shoring before backfilling or, where necessary to ensure against caving, withdraw shoring while backfilling is performed. In no case shall bracing or shoring remain in place after completion of construction without prior written approval of the Owner's Representative.

D. Temporary Pumping Equipment: Furnish and maintain pumping equipment, as required to keep excavations free of water continuously, until backfilling is complete.

E. Final Backfill: Final backfill above the pipe embedment shall be completed per recommendations in the project Geotechnical Report and Civil design documents.

F. Embedment: Buried LSS piping shall either be backfilled with compacted soil or encased in Control Density Fill (CDF) as shown on the Drawings or as recommended by the pipe manufacturer. Soil backfill material may be Class II material for all types of pipe materials. CDF encasement may be used in place of compacted fill, at the discretion of the Contractor, where proper compaction is limited by congested piping situations, with the following exceptions:

1. Where buried PVC piping is located under hydraulic structures, PVC pipe shall be encased in CDF.
2. Buried PE/HDPE piping, located under hydraulic structures, may be installed with properly compacted backfill material or CDF encasement.
3. Buried FRP piping, located under hydraulic structures, shall be installed in structural concrete encasement in a steel reinforcing cage.

G. Backfill General:

1. Compaction: References to the percent compaction are a recommended in ASTM D4253.
2. No backfilling shall occur before hydrostatic pressure testing and all joints have been inspected and are leak-free.
3. Pipe is to be filled with water at a slight pressure (2 to 5 psi) during backfilling.

H. Special Trenching and Backfill for PE/HDPE Pipe per AWWA M55:

1. Trench and Foundation: The width of the trench must be of a sufficient width, to allow for soil compaction equipment, where CDF embedment is not installed. The existing (natural) soil foundation must have a stiffness equal or greater than the compacted backfill embedment. Where the foundation soil is unsuitable, the trench shall be over-excavated in both depth and width and replaced with a suitable stiff material. Where soil stiffness is in question, the value of 4,000 psi Modulus of Soil Reaction (*E'*) minimum shall be used for evaluation. In lieu of determination of Modulus of Soil Reaction (*E'*), soils exceeding 15-blows-per-foot field testing per ASTM D1586 may have sufficient stiffness.
2. Embedment: The embedment includes the bedding, haunch zone, and initial backfill. The embedment shall include the materials listed below or solid CDF encasement. Acceptable embedment materials include Class I (Crushed Rock) Class II (GW, GP, SW, SP) materials; however, in no cases are Class V materials allowed. Clean gravel embedment is recommended for buried PE/HDPE piping. Otherwise, CDF encasement shall be installed specifically where called for on the Drawings.
3. Bedding Below the Pipe: The bedding material shall be suitable for support of the pipe and rock or rock particles larger than those in Table 8-1 of AWWA Manual 55 shall be removed to a depth of 4-inch minimum below the pipe.
4. Haunch Zone: Extends from the bottom of the pipe to the springline (center) of the pipe. Take care to shovel-slice, or rod-in, backfill when placing the first lifts under the haunch of the pipe. Compact backfill embedment in 6-inch layers for 95-percent density.
5. Initial Backfill: The initial backfill for PE/HDPE pipe extends from the top of the haunch zone, to one-half the pipe OD, or 6-inch minimum or 12-inch maximum, above the top of the pipe. Compact the lower layer, adjacent the vertical pipe wall, to 95-percent density. Place the layer over the top of the pipe uncompacted to serve as padding for compacted soil directly above the pipe.
6. Final Backfill: The final backfill extends above the initial backfill and shall be installed per the project Geotechnical Report and Civil requirements.

I. General Trenching and Backfill for PVC (and non-PE non-HDPE) piping for installation in accordance with AWWA Manual M23 and AWWA C605:

1. Trench and Foundation: The width of the trench must be of a sufficient width, to allow for soil compaction equipment, where CDF embedment is not installed. The existing (natural) soil foundation shall meet requirements of Geotechnical and Civil documents.
2. Embedment: The embedment includes the bedding, haunch zone, and initial backfill. The embedment shall include backfill as recommended Geotechnical and Civil documents or solid CDF encasement. PVC piping shall be installed in CDF encasement under hydraulic (water containing) structures.
3. Bedding Below the Pipe: The bedding material shall be suitable for support of the pipe, where rock surfaces and large rock particles are not acceptable. The natural soil may be used where the foundation is graded to a smooth surface found acceptable for setting the pipe.
4. Haunch Zone: Extends from the bottom of the pipe to the springline (center) of the pipe. Where required to fill voids, shovel-slice, or rod backfill in place under the pipe haunch. Tamp backfill soil carefully around the pipe and fill carefully in 6-inch layers taking care not to dislodge the pipe.
5. Initial Backfill: The initial backfill for pipe extends from the top of the haunch zone over the top of the pipe. Compact the lower layer, adjacent the vertical pipe wall, to minimum of 90-percent density. Place the layer over the top of the pipe uncompacted to serve as padding for compacted soil directly above the pipe.
6. Final Backfill: The final backfill extends from above the initial backfill per Geotechnical and Civil requirements.

J. Final Backfill: Refer to the project Geotechnical Report, and Civil documents (specification Division 2), for fill and compaction above specified embedment zone of the LSS pipes.

K. Surplus Earth: Clay, organic materials, large rocks, and other excavated materials not suitable for backfill shall be removed from site and disposed of as directed.

L. Controlled Density Fill (CDF): Provide removable CDF slurry encasement as needed where piping is congested and/or proper soil compaction is not otherwise possible and where field conditions require CDF as directed by the Owner's Representative. CDF may be used in lieu of compacted fill at the contractor discretion. The purpose of the CDF is to eliminate trench settlement, prevent ovaling of flexible pipe walls, and speed construction by avoiding compaction. The CDF shall be designed by the local ready-mix concrete supplier to meet the following criteria.

1. Strength: 28-day compressive strength between 100 and 200 psi. May test with pick in lieu of standard compression testing equipment.
2. Portland Cement: 1.5% to 2.5% by weight (approx. one sack per cubic yard).
3. Fly Ash: 5% to 17% by weight, recommended to prevent segregation of the mix.
4. Aggregate: Coarse sand or 3/8-inch max. gravel.
5. Air Entrainment: 4% to 6% air content mix design to enhance flowability, testing not required.
6. Slump: 8 to 11-inches.
7. Quality Assurance: The CDF supplier shall establish quality control procedures to determine the CDF is adequate for its intended use.

M. Surface Restoration: Where existing pavement is damaged, it shall be neatly replaced with paving of the same specification.

3.6 INSTALLATION OF CONTROL SYSTEM COMPONENTS

A. Contractor (General Contractor or LSS Contractor) is responsible for providing all controls components. Related appurtenances include, but are not limited to *all* installation fittings and

sensing elements, control devices, transmitters, indicator and housings. This includes, but not limited to, the following general field devices and related appurtenances:

1. Motorized Butterfly Valves, per spec Section 170142.
2. Thermocouple and Sensing Wells, per spec Section 170430.
3. Flow Monitoring, per spec Section 170441.
4. ORP Sensors and Transmitters, per spec Sections 170455.
5. Level Sensors, per spec Section 17047.

B. Contractor (General Contractor or LSS Contractor) is responsible for providing all wiring and conduits.

C. All low-voltage control wiring, shall be installed in separate conduit from power wiring that is 30 volt or higher, and otherwise in compliance with the NEC for Class 1 wiring.

D. 4 – 20mA Wiring:

1. Where “2-wire” for low-voltage 4 – 20mA control wiring is not specifically called out on Drawings, or Electrical Documents, provide *Belden* 9802, 2 conductor, 20 AWG, with PP insulation; or equal.
2. Where shielded 3-wire is required, provide *Belden* 8772, 20 AWG, 3-wire; or equal.

E. LSS contractor shall coordinate installation with other trades involved.

F. Installation of ACS components shall be as indicated on the Drawings and component specification Sections. If specific installation instructions are not shown, provide in accordance with the Manufacturer's recommendations. Method of installation shall be similar in construction to those detailed on the Drawings for similar applications.

G. The LSS Automated Controls System (ACS) computer hardware and software shall be provided by the ACS supplier specified in Section 170933.

H. ACS cabinets, shall be provided by the LSS ACS supplier specified in Section 170933.

I. Final termination of LSS controls wiring shall be provided by the LSS ACS supplier specified in Section 170933.

J. Motor Actuated Valves: Provide flanges or other type of pipe fitting for installation of valve. Provide fasteners per Section 170316. Install per Manufacturer's recommendations and per valve specifications.

K. Thermocouple and Sensing Wells: Install per Manufacturer's recommendations. Locate sensing wells such that they are in the path of moving fluid and not positioned in stagnant or dead-end locations. Wells shall not obstruct the flow of the fluid being measured. Pipes one-inch and smaller shall be increased as required, but not less than one pipe size at point of insertion.

L. Flow Monitoring Installation:

1. Saddles for flow sensors shall be provided by the Contractor.
2. Contractor shall provide all separately mounted transmitters, indicators and other electrically powered equipment; including conduit, wiring, and mounting hardware.
3. Install flow indicators in a visible location with a secure mount (in general compliance with "Pipe Support" Specification).

M. Level Sensor and Controller: Install per Manufacturer's recommendations and as detailed on the drawings. Provide all mounting hardware.

N. Contractor shall perform all necessary coordination with the Electrical Contractor and shall ascertain provision of all required work. All conduit and wiring shall not disagree with the Electrical specifications in the Project Manual and shall be in accordance with local Electrical Code.

O. Installation of all ACS field devices, conduits and wiring shall be complete and fully-functioning prior to arrival of ACS supplier for his installation of controls software.

3.7 CLEANING, PROTECTION, AND FLUSHING

A. Cover All Pipe Openings: During construction the Contractor shall cover, cap and protect all pipe openings to prevent entry of debris.

B. Clean Work Area: Promptly remove all waste material and rubbish that may enter piping during construction.

C. Protect Equipment: Keep equipment covered during course of construction. Where this is not practical, clean and/or refinish item to new condition.

D. Protect Metals: Provide corrosion protection for all ferrous metal portions of work exposed to weather or in-service areas.

E. Final Clean-up: At completion of the work, but before painting, clean all dirt and construction debris such as paint, plaster, glue, cement, mastic, tar, paper, tape and dirt from the system components and LSS area.

F. Flushing: Piping shall be cleaned by the Contractor and free of foreign matter to the satisfaction of the Owner or his designated representative. Prior to filling of tanks and Life Support System:

1. Blow through gas piping and ducting with compressed air.
2. Flush all water piping with fire hose, for as long as required to thoroughly clean the system of debris. At each pump, back-flush suction piping with the largest available hose. At each tank, reverse flush all piping.

G. Jet Vacuuming: Where the Owner’s Representative has reason to believe stubborn debris remains in the piping, the Contractor shall scour the suspected pipeline with a jet nozzle/vacuum system. *Vactor Manufacturing, Inc.* (815) 672-3171 www.vactor.com; or substitute.

H. Strainer baskets shall be inspected and cleaned as a last step when cleaning the system.

I. Contractor Certification: Before start-up, the Contractor shall certify that the system has been flushed and cleaned.

J. Damage: Valves or other system components which do not function properly because of imperfect cleaning of any piping system shall be replaced at the Contractor's expense, including all labor costs.

3.8 PIPE PRESSURE TESTING

A. General: Provide all testing and adjusting necessary to place all systems and items of equipment in proper operating condition. All work shall be completely tested prior to backfilling, or covering in any way, of pipes or filling of any structures or exhibits. All equipment and apparatus required for performing tests shall be provided by the Contractor. All defects disclosed by the tests shall be corrected and the tests repeated.

B. Extent: All underground piping and all major transmission shall be pressure tested. Above ground branch piping connecting to life support equipment need only be operationally tested.

C. Piping has been designed for working conditions only. Any devices, restraints, thrust blocks, etc. required for testing shall be the Contractor's responsibility.

D. Notification: Contractor shall provide advanced notification to the Owner of proposed testing times, locations, and summarize test results in a written report.

E. Testing Procedure:

1. After installation is complete, but before piping is buried, encased or before insulation is applied, all piping and equipment shall be tested and proved watertight under the following conditions or as required by governing ordinances. Test pressures given below are not applicable if any temperature exceeds 100 deg F.

SYSTEM	GAUGE PRESSURE OF TEST	TEST WITH	ALLOWABLE LEAKAGE	DURATION
Rigid Saltwater Piping	80 psi	Water[2]	None	3 Hours
Flexible Saltwater Piping	90/80 psi[3]	Water[2]	None	3/1 Hours[3]
Ozone Piping	100 psi	Air	None	3 Hours
All Other Piping[1]	Per Application	Water[2]	None	3 Hours

Notes: [1]This shall include all pressure piping for water but not to exceed test pressures recommended by the pipe and/or fitting manufacturers. [2]Air testing of non-metallic piping is not allowed. [3]Conduct expansion phase and test pressure phase testing as described below.

2. Pressurized Equipment: Contractor shall be responsible for determining the allowable test pressure of all connected equipment. If this pressure is less than the required system test pressure, the Contractor shall isolate the piece of equipment in question from the system for the duration of the test. Isolation shall be achieved by means which does not preclude the testing of any other portion of the system.
3. Test Log: Prepare and maintain records of all piping systems tests; use Dickson or Bristol Recording Gauges on all tests. Records shall show Contractor personnel responsibilities,

dates, test gauge identification numbers, ambient temperatures, pressure ranges, rates of pressure drop and leakage rates. At completion of testing, logs of tests shall be certified, signed by the Contractor and a designated Owner's Representative. The Test Log shall be kept current and be available on site for review by the Owner.

4. Tolerance for Rigid Piping (including PVC, FRP, and metal): The test pressure shall remain for the specified duration within plus/minus 1.0 psi.
5. Tolerance for Flexible Piping (including polyethylene):

    a. Fill all piping with water while venting air at high points.
    b. Conduct 3-hour expansion phase test with pressure at 90 psi. When the water temperature is above 80 deg F, the test pressure shall be reduced as recommended by the pipe manufacturer.
    c. Conduct 1-hour pressure test at 80 psi, for water temperature of 80 deg F or less, where the pressure shall be within plus/minus 4.0 psi of the initial test phase pressure. When the water temperature is above 80 deg F, the test pressure shall be reduced as recommended by the pipe manufacturer. Contractor shall have all joints wipe checked for leakage during pressure test. The barrel of the pipe between joints may be buried to enhance thermal stability and safety.
    d. Depressurize the pipe and do not re-pressurize within an 8-hour time span.

6. Ozone Gas Piping: Single-wall ozone gas piping shall be checked at each fitting by using a "soap bubble" test. Dual-wall ozone gas piping shall be operationally tested.
7. Temporary Piping: It is the Contractor's responsibility to plan for the testing procedure and to provide all necessary plugs, flanges and fittings, or temporarily cap pipes, to perform the tests.
8. Non-Testable Systems: Some piping systems may have non-isolatable components or temporary closures may not be practicable. Such systems shall be carefully inspected upon startup and no leakage is acceptable.
9. Concealment: No plumbing, heating or air distribution system shall be covered, concealed or put into use until it has been tested, inspected and accepted.
10. Equipment: Contractor may need to obtain a special hydrostatic test pump as manufactured by Chern Industries Incorporated, Minneapolis, MN, or equal, should available domestic water pressure fail to meet above requirements.
11. WARNING: Take suitable precautions to eliminate hazards to personnel near piping being tested and stay at a safe distance away from the test section. Piping systems may rupture suddenly and resulting in forceful movement upon failure of pressure test.

3.9 PRELIMINARY OPERATIONS

A. Should the Owner desire that any portion of the life support system be operated in addition to the tests required under the specifications, prior to the final completion and acceptance of such work, the Contractor shall provide necessary labor and supervision for such operation as directed by the Owner's Representative. The costs of this operation, including the necessary fuel, water, electric power and labor (but not including Contractor's supervision), will be paid by the Owner. Such preliminary operation or the payment thereof, shall not be construed as an acceptance of any of the work of the Contract.

B. The pumps, filter piping, basin piping and flow sensors and indicators must be operable prior to the installation of the filter media.

3.10 SYSTEM START-UP OPERATIONS

A. The term "system" shall mean all life support equipment necessary for the normal operation of all exhibit recirculation systems, exhibit filtration and disinfection systems, support systems and any sub-systems.

B. Prior to start-up, obtain approval of schedule and coordinate operational testing with Owner's Representative and Engineer.

C. Contractor shall fill tanks, pools, basins, and other hydraulic structures to the correct full levels, successfully start, operate, stop and secure all mechanical plants under this project for three, 6-hour periods on three consecutive weekdays.

D. Start-up Strainers: Provide temporary in-line strainers in the intake piping upstream of each pump installed per Manufacturer's recommendations, except for pumps already equipped with permanent basket type strainers in the suction lines suction lines. Where strainer is mounted adjacent to a butterfly valve, provide spacer to allow for proper opening of the valve. Do not install strainers that may project into the suction nozzle of the pump. Keep strainers in place during at least the first 72-hours of full operation. Periodically check the strainers for accumulation of debris that may hinder the performance or reliability of the pump operation. In-line strainers shall be as follows:

1. Only cone type or truncated cone (basket) type strainers will be considered acceptable.
2. Strainers shall be constructed as required for operation of the system at peak hydraulic velocities. Strainers 8-inch, 10-inch and 12-inch in diameter shall be constructed of 14-gauge minimum material.
3. Shall be of stainless-steel construction.
4. Percent open area to the pipe cross-section shall be 150% minimum.
5. Minimum perforation size shall be 1/8-inch, recommended perforation size is approximately 1/24 the pipe diameter.
6. Strainers shall have visible identifier tab extension.
7. Provide "conical" type or "basket" type, manufactured by:

    a. *Mueller Steam Specialty* Lumberton, NC (919) 738-8241;
    b. *Process Strainers Inc.* Houston, TX (713) 890-4600;
    c. or approved substitute prior to use.

E. High Point Vents: Evaluate piping for possible blockage of water flow by air trapped at high points and install vent lines, with valves located for operation at floor level, and piping terminated at floor level pointing to floor drain.

3.11 PAINTING

A. General Requirement: The Mechanical Contractor shall notify the General Contractor and other trades as necessary to assure coordination of all items requiring painting. Painting shall be done in accordance with Division 9, "Painting".

B. Items not to be painted are: Stainless steel and aluminum, fiberglass and PVC items inside water containing structures, factory epoxy-coated instrument cases, nor identification tags, plates or labels. Mask pump seals.

C. Owner Furnished Items: The Contractor shall ascertain the type of coating for compatibility prior to painting.

D. Steel Filter Vessels: Finish in accordance with Section 170020.

1. Inorganic Zinc Primer with high solids epoxy and aliphatic acrylic polyurethane topcoasts.
2. Verify color of final topcoat with Owner.
3. Color Schedule (verify exact matches with Owner).
4. Filters & Pressure Vessels: Color selected by Architect or Owner.

E. All Exposed PVC: Clean surfaces as required. Do not paint.

F. Exposed Polyethylene (PE) Pipe: Clean surfaces as required. Do not paint.

G. Pumps:

1. Do not paint shaft, couplings, or seals located on shaft between pump and motor.
2. Metallic Pumps:

    a. Surface Preparation: Remove any rust and clean with *Carboline* Surface Cleaner #3 and thoroughly rinse, or use other recommended cleaner.
    b. Prime Coat: *Carboline* Rustbond PS; or corrosion-resistant coating as recommended by the pump manufacturer.
    c. Intermediate & Topcoats: *Carboline* Carboguard 890; or approved substitute as given in Specification Section 09900 for "Miscellaneous Steel". Apply each coat to a dry film thickness of 4 mils minimum.

3. Non-Metallic Pumps: Do not apply overcoat to non-metallic components. Touch-up manufacturer's coatings if damaged. All metallic components, including power frame, motor and base, are to be painted as described above for metallic pumps.
4. Ferrous Metal Pump Bases: Prime and paint all metal pump bases, including underside, as specified below under "Submerged and Wet-Dry Exposed Ferrous Metal Surfaces" with *Carboline* Carboguard 891 VOC or approved equal.
5. Non-Metallic and Stainless-Steel Pump Bases: Do not paint.

H. Valves: Repair damaged coatings as necessary to restore original finish.

I. Supports:

1. Ferrous Metal: per Specification Section 09900 for "Miscellaneous Steel".
2. Aluminum: Apply epoxy "isolation" coating as specified in Section 170310.
3. Non-Corrosive Materials: Do not paint.

J. Hot Dip Galvanized Repair: Where galvanized surfaces have been damaged, or otherwise missing a portion of the original coating, apply a cold galvanizing compound containing 95% zinc dust by weight in the dried film. Product shall have passed the Preece Test per ASTM A-239 for hot-dip galvanizing and meet or exceed ASTM A-780 standard for repair of damaged hot-dip galvanized coatings. Apply two coats for a total final dry film thickness of 3-mils minimum. The manufacturer shall be registered by Underwriter's Laboratories for ISO 9001 Series Standards for Quality. *Galvilite* by *ZRC Worldwide* Marshfield, MA (800) 831-3275 www.zrcworldwide.com.

K. Submerged and Wet-Dry Exposed Ferrous Metal Surfaces:

1. Surface Preparation: Abrasive blast in accordance with SSPC SP 10, near white metal cleaning and achieve an angular anchor profile of 1 to 3 mm.
2. First Coat (Prime Coat): Inorganic zinc primer with not less than 80% total zinc in the dry film, excellent resistance to saltwater atmospheres, and proven compatibility with topcoat. *Carboline* "Carbozinc 11 HS", *Porter* "Zinc Rich Epoxy Primer" applied at 2.0 - 3.0 mils

DFT; or approved substitute. Must be applied by spraying in a controlled area, and in a manner that does not cause disbondment of the topcoat. Prime Coat is *not* compatible with alkyd paint; topcoat must be high in solids.

3. Second and Third Coats: *Carboline* 891 VOC or approved equal. Spray apply each coat to a dry film thickness of 2-3 mils or manufacturer's recommended DFT.

L. Dry Exposed Ferrous Metal Surfaces Not Exposed to UV or Sunlight:

1. Surface Preparation: Abrasive blast for an anchor profile of 1-3 mils, in accordance with SSPC-SP 10.
2. Prime Coat: As required by coating manufacturer.
3. Second and Third Coats: A high performance, multi-purpose, surface tolerant acrylic or epoxy coating specifically recommended by the manufacturer for exposure to salts and moisture. *Carboline* 890 Series Cycloaliphatic Amine Epoxy; "BAR-RUST 235" Multi-Purpose Epoxy Coating, by *Devoe Paint*, Louisville, Kentucky (502) 897-9861; or approved substitute. Spray apply each coat to a dry film thickness of 4 mils minimum or thicker DFT where recommended by the coating manufacturer.
4. Other Equipment or System Components: Repair damaged coatings as necessary to restore manufacturer's original finish.

M. Dry Exposed Stainless Steel and Aluminum Metal Surfaces:

1. Outdoor: Coat all outdoor exposed bare stainless steel and aluminum surfaces with a penetrating lubricant with a waterproof waxy finish. For locations in possible contact with animal waters, use food grade lubricant specified in next item below. Product: Boeshield T-9 by *PMS Products, Inc*. Holland, MI (800) 962-1732 www.boeshield.com; LPS 3 Premier Rust Inhibitor by *LPS Laboratories* Tucker, GA (800) 241-8334 www.lpslabs.com; or approved substitute.
2. Locations above water tanks or indoor locations in the vicinity of saltwater spray or potentially corrosive locations: Coat all outdoor exposed bare stainless steel and aluminum surfaces with a penetrating lubricant with a waterproof waxy finish. Product: LPS FOODLUBE Penetrating Oil Synthetic Lubricant by *LPS Laboratories* Tucker, GA (800) 241-8334 www.lpslabs.com; or approved substitute.

3.12 IDENTIFICATION OF PIPING AND VALVES

A. Pipe Markers: Identify all pipe with durable vinyl plastic adhesive backed lettered labels in accordance with functions listed in the Piping & Instrumentation Diagrams (P&IDs). Pipe markers shall conform to the requirements of the "Scheme for the Identification of Piping Systems" ASME A13.1 (latest edition) and letter sizes shall be in accordance with the USASI Standard. Straight lines of pipe shall be identified at intervals of 20 feet, and at least once in each room. Piping also shall be identified at points near all turns, valves, at the upstream side of fittings or branches, and each side of wall crossings. Apply black arrows adjacent identification labels to indicate direction of flow.

B. Pipe Markers: Identify all pipe with durable vinyl plastic adhesive backed lettered labels in accordance with functions listed in the Piping & Instrumentation Diagrams (P&IDs). Pipe markers shall conform to the requirements of the "Scheme for the Identification of Piping Systems" ASME A13.1 (latest edition) and letter sizes shall be in accordance with the USASI Standard. See following Color Schedule Matrix and verify exact matches with Owner.

C. Valve Tags: Durable, rigid plastic, or stainless steel tags. All tags shall be of a neat uniform design, with lettering embossed in metal or engraved plastic. Tags shall clearly identify the number of the valve as indicated on the P&IDs or as designated by the OWNER.

D. Proposed Pipe Marker Color Schedule Matrix, Contractor shall select a marker supplier with available colors as close as possible to matching the following list:

PROCESS FLUID DESCRIPTION	Color (Brady Corp)	Pantone ® Color Code (Ref)	COLOR SAMPLE	PROCESS ID
ACID OR BASE	Pink	230		ACID / BASE
SALT BRINE	Tan or Gold	117		BRINE
BACKWASH WATER SUPPLY	Sky Blue	2975 / 544		BWS
BACKWASH WATER DRAIN	Brown	4645		BWD
BYPASS	Grey	444		BYPASS
CHEMICAL PIPING	Pink	230		CHEM
CHILLER PROCESS WATER	Blue	301		CHL
COMPRESSED AIR (GENERAL)	White			CA
CONDENSATE	Grey	444		CND
DEIONIZED WATER	Purple	512		DI
DOMESTIC or CITY or POTABLE WATER	Light Blue	279		CW/POT/PWS
DRAIN	Grey			DRAIN
EQUALIZER	Blue	301		EQ
FRESHWATER BACKWASH SUPPLY	Light Blue	279		FWBWS
FRESHWATER BACKWASH DRAIN	Brown	4645		FWBWD
FRESHWATER MAKEUP	Light Blue	279		FWMU
FRESHWATER SUPPLY TO EXHIBITS	Sky Blue	2975 / 544		FWS
FRESHWATER RETURN FROM EXHIBITS	Green	3278		FWR
HEAT EXCHANGER PROCESS WATER	Blue	301		HEX
HEATING WATER SUPPLY (HOT)	Red	185		HWS
HEATING WATER RETURN	Red	185		HWR
NITRIFICATION/DENITRIFICATION	Orange	1575		DENITE
NON-POTABLE WATER TO LSS	Yellow			NPW
OVERFLOW	Blue	301		O/F
OZONE OFFGAS	Yellow			OFFGAS

PROCESS FLUID DESCRIPTION	Color (Brady Corp)	Pantone ® Color Code (Ref)	COLOR SAMPLE	PROCESS ID
OZONE GAS	Pink	230		OZG
OZONE WATER PROCESS	Orange	1575		OZW
PROTIEN SKIMMER SUPPLY OR RETURN	Tan or Gold	117		PSK (FRR/FRS)
PURGE	Purple	512		PURGE
RECOVERED SALTWATER	Sky Blue	2975 / 544		RSW
RAW SALTWATER SUPPLY	Green	3278		RSWS
RECLAIMED WATER	Purple (must be Pantone 512)	512		RCW
R.O. FRESH (OR PRODUCT)	Sky Blue	2975 / 544		RO
R.O. SALT (OR REJECT)	Brown	4645		REJ / BRINE
SAMPLE WATER	(Match Source Water)		N/A	SMP
SALTWATER BACKWASH SUPPLY	Green	3278		SWBWS
SALTWATER BACKWASH DRAIN	Brown	4645		SWBWD
SALTWATER MAKEUP	Green	3278		SWMU
SALTWATER SUPPLY TO EXHIBITS	Sky Blue	2975 / 544		SWS
SALTWATER RETURN FROM EXHIBITS	Green	3278		SWR
SEAWATER INTAKE	Green	3278		SWI
TRANSFER PIPING	Red	185		TRANS
ULTRAVIOLET STERILIZER PROCESS	Purple	512		UVS / UVR
VACUUM WATER	Grey	444		VAC
VENT (NOT OZONE)	Grey	444		VNT

E. Manufacturers:

1. *Brady Corp, Inc.* Milwaukee, WI (855) 436-9531 www.bradyid.com;
2. *Christy Enterprises, Inc*. Orange, CA (714) 507-3300 www.igin.com;
3. or approved substitute.

F. Ozone Systems Tags:

1. Ozone gas supply lines shall be labeled OZONE GAS & OXYGEN - HIGHLY TOXIC – OXIDIZER.
2. Ozone contactor off-gas lines shall be labeled OZONE OFFGAS & OXYGEN - HIGHLY TOXIC – OXIDIZER.

G. Valve Tags: Identify life support valves with durable rigid plastic, or stainless steel tags. All tags shall be of a neat uniform design, with lettering stamped in metal or engraved in dual color plastic material. Tags shall clearly identify the number of the valve as indicated on the P&IDs or as designated by the Owner. Omit tags on fixture stops of utility plumbing.

H. Submittals: Prior to installation, submit samples of pipe markers and valve tags for review.

I. Manufacturers:

1. *Brimar Industries Inc.* Garfield, NJ (800) 274-6271 www.brimar.com;
2. *Christy Enterprises, Inc.* Orange, CA (714) 507-3300 www.igin.com;
3. *Seton Name Plate Corporation* New Haven, CT (203) 772-2520 www.seton.com;
4. or approved substitute.

3.13 PROJECT CLOSE OUT REQUIREMENTS

A. General Requirement: Completion of each of the following items is conditional to acceptance of the work by the Owner.

1. Guarantee: Submit guarantee of materials and workmanship.
2. System Start-up Operations: Provide materials and labor for system start-up operations. Demonstrate full functionality of all equipment.
3. O&M Data: Submit Life Support Systems Operating and Maintenance Data Manual.
4. Shop Drawings: Include printed versions of approved shop drawings in the Operation and Maintenance Data Manual.
5. Pressure Testing: Submit pressure testing logs.
6. Record Drawings: Submit Record Drawings ("As-Builts") to the Owner. Include "As-Builts" of isometric shop drawings.
7. Samples: Submit to the Owner’s Representative any requested samples.
8. Clean-up: Comply with requirements for cleaning equipment and premises.
9. Detachable Parts: Deliver to the Owner's Representative all special tools required for proper operation and maintenance of the equipment, portable/detachable parts, keys or other devices provided.
10. Technical Seminars: Coordinate delivery of Technical Seminars presented by suppliers of ozonation equipment (Section 170723) and flow meters (Section 170442).

B. Functional Testing of Life Support Systems (LSSs) by Contractor: All systems and components shall be functionally tested by the Contractor. This generally includes initial operational startup of the LSS piping systems and components by the Contractor, including checking pump motors for proper rotation, running of pumps with water, operation of all LSS with water flowing, normal operation of filter and backwashing of filters, LSS components, operation of all piping systems without any apparent leaking, and in general insuring that all LSS are in a fully functional condition when delivered to the Owner.

1. Contractor shall be responsible for familiarizing himself, and the Owner’s staff with his completed work, and understanding all the projects design & construction documentation including piping and instrumentation diagrams (P&IDs), equipment layouts and equipment specifications.

2. Functional testing shall be determined as complete when recorded as “satisfactory” by the Owner’s operational staff.
3. Functional testing may be limited to subsystems, such as a heat exchanger pumping loop; in which case neither the heat exchanger or the pump shall qualify as functionally tested until the entire subsystem is shown to operate to the satisfaction of the Owner; in the case of functional testing of an overall LSS the requirement for retesting of a small subcomponent shall not necessarily require a retest of the entire LSS.
4. Contractor shall be responsible for attending Owner’s startup meetings and other project team and scheduling meetings as appropriate & necessary. The Contractor shall assign the task of functional startup of the LSS to a specific staff member.
5. Contractor will work with the Engineer of Record, product representatives, and the Owner’s staff and representatives to perform operational checks, and start-up routines of the installed equipment.
6. Regarding work site safety, the Contractor shall provide recommend operational procedures, and training, necessary for safely & effectively conduction work at the site.
7. Contractor shall provide all physical operations, powering of equipment, and physical adjustments.
8. Contractor shall ensure the LSSs are hydraulically balanced and all equipment is functioning as designed and specified to his knowledge.
9. Contractor shall document any and all deviations from the Contract Documents and relay to the project team. These deviations shall also be incorporated in Record Drawings prepared by the Contractor.
10. Where Contractor is in possession of instrumentation, or test equipment, for documentation of equipment performance, the Contractor shall provide such equipment and operational staff for data gathering during on site time by the Owner’s staff or designated representatives.
11. Where Technical Seminars are included in the Contract Documents, for startup and calibration of equipment by manufacturer’s representatives, the Contractor shall include reports summarizing the Technical Seminars.
12. Contractor shall prepare written field reports outlining issues and concerns related to start-up including all status and issues occurring during the design professional’s on-site Construction Administration services.

END OF SECTION

SECTION 170024 - CUSTOM FABRICATED PRESSURE FIBERGLASS FILTERS

PART 1 - GENERAL

1.1 USAGE

A. The pressure fiberglass vessels with sand media, or glass media, are used for water filtration

B. The pressure fiberglass vessels with carbon media are used for removal of ozone, which is a very strong oxidant, from solution. A special liner for these vessels is to be provided with an anticipated useful life of no less than 10-years.

C. Port Locations:
   1. Small Vertical Filters: Filters less than 48-inch diameter, may have ports limited to the sidewall, as indicated on the Drawings.
   2. Large Vertical Filters: All vertical style filters, 48-inch diameter and larger, shall have the top inlet pipe port centered on the top dome of the filter vessel — no exceptions. The outlet pipe port shall be on the lower portion of the vertical cylinder of the side shell.

1.2 SUMMARY

A. Filter shells and internals shall be supplied as specified herein. Media shall be supplied by the Contractor per Section 170062. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Summary of design criteria (also as specified elsewhere within):

   1. Positive Design Pressure for 48-inch diameter “Recovery” (REC) filters, and “freshwater makeup” (FMU) filters: 75 psi.
   2. Positive Design Pressure for exhibit recirculation filters: 50 psi.
   3. Test Pressure: 1.1 times Design Pressure for 4-hour duration.
   4. Maximum strain: 0.001 at test pressure.
   5. Minimum Burst Pressure: 4-times the Design Pressure
   6. Negative Pressure Capability: 5-inch mercury

C. General construction detailing, as shown on the Drawings, shall be adhered to. The contractor shall implement all required changes in detailing and bear any additional costs for design, engineering, labor, materials, and product verification for any variations in geometry from what is shown on the Drawings.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The FRP fabricator shall have at least 10-years of experience in the manufacture of similar items with a record of successful installations.

B. Internal Photo Documentation: Prior to filling with media, the Contractor shall make a photo documentation and inspection of the internals for each filter. All delivered filter vessel shall be inspected for any damage including the security and quality of all interior

distribution piping. Of particular interest are the conditions for the attachment of each lower distribution lateral pipe.

1.4 TESTING

A. The supplier shall perform an in-shop hydrostatic pressure test of all sizes of each filter built.

B. Filters shall be tested at 1.1 times the design pressure for a 4-hour duration. No leakage is allowed and vessel shall be within specified strain allowance at the test pressure.

C. The supplier shall log as-tested data for each filter and deliver copies of the test data to the Owner or specifying Engineer for approval before shipment. The test log shall include:

1. Vessel Tag Number and Size.
2. Date & Time.
3. Actual Test Pressures (start, mid and end).
4. Circumferential Strain (vessels 48" diameter and larger).
5. Axial Strain (vessels 48" diameter and larger).
6. Leakage & Comments.
7. Name of individual conducting the test.

D. Strain Measurements: Vessels (48” diameter and larger) shall be measured around the circumferential and longitudinal axis for strain before, during and after testing. Strains are to be measured using the test pressure. Dimensional strains shall not exceed 0.001.

E. Responsibility: Strain measurements shall be certified by the manufacturer, Professional Engineer, or testing company.

F. Verification of Resin Cure: Optimum resin cure shall be checked and confirmed for each vessel by testing surface hardness in accordance with ASTM D 2583 Standard Test Method for Indentation Hardness for Rigid Plastics by Means of a Barcol Impressor. When post-fabrication heat cured, test afterward. Additionally, surfaces shall be carefully inspected for imperfections or holidays. The testing and inspection for each vessel shall be certified by the manufacturer in a Final Inspection Report.

G. Supplier shall notify the purchaser of the testing schedule and permit the Owner or their Representative access to the fabrication facility and witnessing of testing.

1.5 SUBMITTALS

A. Submit the following for review, prior to commencement of any fabrication:

B. Shop drawings with filter dimensions and list of materials.

C. Photographs of similar vessels produced by same fabrication shop of sufficient detail to determine quality of work.

D. Complete set of scale shop drawings indicating all dimensions and laminate and "weld" design, along with a complete material take off. Shall include detailed drawings for proposed connecting of lower lateral distributors to the lower manifold.

E. Calculations verifying basic stress and strain of the pressure vessel, external loading of attachments, and lateral loading. Include references to Codes where applicable.

F. Samples, or color photographs, of lower slotted distributor laterals and upper distributor piping (upper only if not integral with vessel shell).

G. Submit information from resin manufacture giving finished Barcol hardness values.

H. Example, sample, or photo of proposed exterior coating (standard light grey).

I. After fabrication of vessels, but before shipment, submit the following:

1. Copies of pressure testing log for each individual vessel.
2. Pressure testing report signed by corporate principal on vessel manufacture's letterhead or signed by Professional Engineer (individual or as member or testing company).
3. Certificate of heat curing, where vessels are specified with an ozone-resistant vinyl ester resin liner.
4. Manufacturer's certified Final Inspection Report addressing hardness testing, finish workmanship, quality of lower lateral connections, security of lower laterals for shipping, and other quality control aspects.

J. Warranty (described below).

K. Contractor shall submit report for inspection, with photo documentation of the internals, for each filter prior to filling with media.

1.6 WARRANTY

A. Supplier shall warranty each vessel to be free from defects in manufacturing, workmanship or materials and agree to repair or replace any fabrication within 5-years from date of delivery on a non-prorated basis and not less than 15-years on a pro-rated basis.

B. Specific "defects," include: Any outright failure of bonds, any evidence of leaking through laminate layers, leaking past gasketed mating surfaces as a result of tolerances in excess of those specified by NBS, radial hoop cracking (superficial or structural) in excess of 10-percent circumference of vessel or attachment, delamination or crazing or other deterioration of the exterior coating as a result of exposure to sunlight or saltwater spray or normal weather conditions. Any defects in workmanship such as dry windings, insufficient bonds or uncatalyzed resins.

PART 2 - PRODUCTS

2.1 FABRICATIONS

A. Usage:

1. Sand-media vessels are used for filtering animal exhibit water containing debris and large particles of uneaten food.
2. Carbon-media vessels are used to remove ozone from solution must be constructed of ozone resistant materials.

B. General Dimensions: The vessels shall be of the capacity and dimensions shown on the Drawings. The heads must be elliptical domes; ASME flanged and dished style heads are not an acceptable substitute. The Fabricator shall be responsible for the design of all shell thicknesses, lap joints, joint details and all other structural detailing.

C. Design Methods:

1. Method 1: The vessel liner, including both heads and side shell, shall be wound with continuous fiber strands.
2. Method 2: Joining multiple subcomponents together by use of the secondary overlay method permitted with the following conditions. Components shall be fabricated over molds. The fabricator shall use special techniques to insure a uniform exterior appearance without excessive undulations.
3. The structural design and construction shall limit strains in any direction to less than 0.001; this strain limitation shall not be exceeded at the specified test pressure. Calculated size and thicknesses of vessel components shall be such that the imposed strain does not exceed the allowable strain for the laminate in the direction of the applied stress with 1.1 times the design pressure.
4. Miscellaneous: For specific methods not covered in this specification, the manufacture shall refer to Section X, ASME Boiler and Pressure Vessel Code, "Fiberglass-Reinforced Plastic Pressure Vessels." Where pressure requirements do not govern, the following references shall be used for design: National Bureau of Standards, Voluntary Product Standard PS 15-69; ASTM Standard Specification D 4097-88; and ANSI/NSF International Standard 50.

D. Positive Design Pressure: The working stress design for the vessels shall be no less than the scheduled pressure and/or the positive pressures specified above for working stress. Design temperature shall be 100 deg F. Vessels shall be designed with a minimum burst pressure factor of safety of 4 to 1. Where the Supplier determines that greater or lesser lap-lengths, or lap-thicknesses, than those indicated on the Drawings are necessary, the larger dimension shall be used. Design pressure shall be 50 psi or 75 psi, as listed on the Filter Schedule on the Drawings, and/or as specified elsewhere.

E. Vacuum Design Pressure: The filter vessel shall be capable of withstanding a negative design pressure of 5" mercury.

F. Environmental Loads: The filter vessels shall be designed to resist toppling from out of plumb loading, piping dynamics, and other probable lateral loads including small area loads of 250 psf for maintenance personnel, ladder loads, or loads when loading sand and gravel.

G. Structural Layer:

1. Typical Water Filtration Vessels: Composite layers required to limit stress and strain shall be fabricated with a premium grade isopthalic polyester or vinyl ester resins. Resins with tensile elongation values greater than six-percent are recommended to limit superficial cracking.
2. Vessels for Oxidized Solutions: Composite layers required to limit stress and strain shall be fabricated with resilient resins, such as Hetron 922 vinyl ester by Ashland Chemical Company, or approved substitute by Dow. Resins with tensile elongation values greater than six-percent are recommended to limit superficial cracking.
3. Material properties shall be in accordance with Article RM-1 of ASME Boiler and Pressure Vessel Code, Section X. In every case, the "actual" properties of the vessel materials shall exceed the "design" values.
4. Corrosion Barrier for Exhibit Filters: The interior vessel surface shall have a non-structural corrosion barrier as follows. Glass reinforced isophthalic or vinyl ester resin, not less than

100 mils thick, consisting of two components. The inner component shall consist of two resin-rich layers reinforced with C veil glass. Do not substitute with Nexus veil glass reinforcing. The two inner layers shall have a total thickness of 10 to 20 mils. The inner component shall be followed by a 90 to 100 mil layer reinforced with chopped-strand mat fibers. Alternately, the manufacturer may offer and equal or superior proven method of liner construction subject to review by the specifying Engineer.

5. Ozone-Resistant Resin Corrosion Barrier Liner for Carbon Media Filters: The interior vessel surface shall have a non-structural corrosion barrier, using a special glass reinforced vinyl ester resin not less than 120 mils thick, as follows. Resin shall be specially formulated and recommended by the resin manufacturer for resistance to oxidation by ozone. The liner may consist of an inner 20 mil thick, resin-rich, C veil, surfacing veil of not less than two laminate layers followed by an interior 100 mil layer reinforced with chopped-strand mat fibers; alternately, the manufacturer may offer and equal or superior proven method of liner construction. The inner surface shall receive special attention to assure optimum performance of the finished laminate. Each vessel shall conform to fabricators quality control procedures for a complete sure and if required shall be heat cured immediately following the fabrication process. The post-fabrication resin cure shall follow the specific recommendations of the resin manufacturer for achieving complete cure for maximum corrosion resistance. The manufacturer shall provide a Certificate of Compliance of Curing for each vessel used for quenching of ozone with carbon media.

H. Attachments: The orientation of attachments must be configured as shown on the Drawings. Securing of ports may be one of the following methods selected by the manufacturer:

1. FRP Lap-Weld: Nozzles attached to the vessel using permanent FRP lap-welds. Attachments to the vessel shall be fabricated with compatible resins or bonded using a mutually compatible resin overlaid with a fiberglass veil prior to joining the assembly to the main vessel.
2. Mechanical Connection: Nozzles attached to the vessel using a mechanical connection with a gasket. This method is only allowed where the thickness of the shell of the vessel is increased, a flat mating surface is provided at the thickened shell, and the design has a proven record of success.

I. Process Port Locations: All vertical style filters 48-inch diameter and larger, shall have the top inlet pipe port centered on the top dome of the filter vessel — no exceptions. Filters less than 48-inch diameter may have all ports located on the side-shell, per the Contract Drawing, or per approved review. The outlet pipe port shall be on the lower portion of the vertical cylinder of the side-shell.

J. Exterior Finish:

1. Quality Requirement: Vessels must have a high-quality exterior finish and overall appearance--irregularities and undulations resulting from hand-laid-up techniques are unacceptable. A resin-rich layer shall be applied over the final structural layer of reinforcement. The minimum acceptable level of workmanship and finish shall conform to requirements of ASTM C 582 "Specification for Contact-Molded RPT Laminates for Corrosion Resistant Equipment." Superficial cracks exceeding 0.010-inch in non-structural fillers are not acceptable. Overspray on finished surfaces is not acceptable. Foreign materials and fabrication debris is not acceptable. Exposed glass and/or frayed ends are not acceptable.
2. Indoor Installations: Indoor installation may be finished with the fabricators selected final finish or topcoat product.
3. Outdoor Installations: Exterior of all filters, at outdoor installations, shall be painted for ultraviolet light protection. Prime with *Carboline* – Sanitile 120, or equal. Finish with a topcoat of *Carboline* "3359 DTMC" Modified Acrylic Terpolmer; or approved water-borne acrylic enamel substitute.

K. Required Appurtenances:

1. Minimum FRP nozzle flange thickness shall be per Table 5, of NBS PS15-69, for the 150 PSI rating. Flange drilling shall be per ANSI 125/150 lb. pattern.
2. Manway(s): The preferred access port is a design using internal pressure to seat the seal of an elliptical port sized for human entry. Bolts nuts and washers shall be of Type 316 stainless steel. Typical gaskets shall be of EPDM rubber.
3. Drain nozzles; with gaskets, and Type 316 stainless steel bolts, nuts, and washers.
4. All other appurtenances indicated on the Drawings.

L. Base Supports:

1. Provide manufactured base supports designed for securing to floor slab, or concrete equipment pad, with anchor bolts.
2. Base shall have a minimum clear dimension between floor slab and face of bottom flange to allow for installation and service of piping beneath the vessel as shown on the project's scale drawings.
3. Base supports may be a tripod design or a cylinder with necessary access ports and shall be of non-metallic construction.

M. Filter Internals:

1. Construction: The internals shall be of a proven design to provide the necessary hydraulic conditions and keep the media in place and stable. Internals shall be made in accordance with the Drawings or reviewed shop drawings.
2. Differential Pressure: Total pressure drop through the filter at maximum backwash flow rate shall not exceed 5 psi when performed in a clean vessel without media installed.
3. Top Openings: Top distributor shall allow passage of one-inch solids.
4. Materials: The top distributor and under drain collector system shall be constructed of FRP and Schedule 80 PVC (or heavier duty). As required for structural strength in areas of increased stress fittings shall be fiberglass wrapped or flocked.
5. Bottom Distribution: Bottom laterals shall consist of slotted piping with machined or precisely molded openings designed to retain all media particles as small as 0.30 mm particle size. Drilled hole openings or retainer screens are not acceptable. Threaded connections shall be cut with a special tap manufactured specifically for machining plastic. Silicone lubricant shall be used when making the tap to prevent laminar tearing of plastic threads. Tapping shall be performed at slow speeds to prevent melting. Alternately, threaded connections for laterals in the lower manifold may be made by bonding or mechanically attaching threaded couplings. The threaded fittings will require the application of Teflon tape and/or PTFE paste when assembled. The connection of the laterals to the main distribution header shall be one of the following options:

    a. Connection Option 1 — Preferred: A structural "truss type" connection pipe through the manifold, with openings for water movement, design to carry bending forces with a truss action, with female couplings at each end for threaded male lateral fittings.
    b. Connection Option 2: A saddle or saddle block fastened to the manifold at each lateral connection to allow for additional threaded grip length. If fabricated with drilled and tapped threads, threaded connections shall be cut as specified above.
    c. Connection Option 3: Where the wall thickness of the manifold can provide a sufficient grip length for drilled and tapped threads, the manifold may be drilled and tapped as described above, and the lateral couplings shall have Type 316 SS male ends with PVC slip-fit female end.

N. Manufacturers: This listing of potential manufacturers shall not compromise the above specified requirements. Regardless of the listing of potential manufactures below, all filter vessels shall

conform to the minimum internal diameters, and vertical straight shell lengths, listed in this specification Section and indicated on the Drawings. See Drawings LS9.03 and LS9.02 and others.

1. *Miami Filter*, Fort Pierce, FL (888) 642-6482 www.miamifilter.com;
2. *Neptune-Benson, Inc.,* Coventry, RI (800) 832-8002 www.neptunebenson.com;
3. *Waterco*, Augusta, GA (706) 793-7291 www.waterco.us.
4. No substitutes.

PART 3 - EXECUTION

3.1 DELIVERY AND CLOSE-OUT PROCEDURES - MANUFACTURER

A. As may be necessary to prevent damage during shipping, the internals shall be shipped from the factory separately of the pressure vessels.

B. The manufacturer shall recommend protection and maintenance required for storage prior to placing in service.

3.2 INSTALLATION – CONTRACTOR

A. Contractor shall not release filter vessels for shipment until pressure testing logs and manufacturer's certified Final Inspection Report has been submitted and reviewed by the specifying engineer.

B. Provide or coordinate with Structural for provision of concrete house-keeping pads, or concrete support piers, as required for leveling.

C. Filter vessels shall be aligned with matching centerlines as shown on the Drawings.

D. Before installation of filter media, filter shall be leveled and bearing support surfaces packed with cement grout.

E. Level vessels with jam nuts off the concrete pad or structural slab. Fill gap between the vessel's base support and the concrete pad/slab with high-strength, non-shrink, dry-packed concrete grout. Torque the anchor bolts as required.

F. If required, install internal piping as shown on the manufacturer's approved shop drawings. Alternately, verify the quantity of laterals provided and installed is correct.

G. Contractor shall inspect and photo document the internals of each filter prior to filling with media.

H. Connect piping after setting and leveling of the filters. Filter face piping shall be supported to prevent any sagging, breakage, or unacceptable loading on the filter connection flanges.

I. Install filter media as specified in Sections 170062, 170063 or 170072 and as indicated on the drawings. Cautiously install gravel and gently work-in around lower distributors taking care to avoid stressing or breaking the internal distributor piping. Carefully install media so as not to damage the integrity of the corrosion barrier.

J. Provide hydraulic startup and functional testing of all filters, including backwashing, and demonstration of normal forward-flow rates as shown on the Drawings, to the Owner's satisfaction.

END OF SECTION

SECTION 170028 - DRUM FILTERS

PART 1 - GENERAL

1.1 USAGE

A. The self-backwashing drum filters, delivered in a modular self-standing housing, are used for particulate filtration of saltwater backwash water from backwashing of sand media filters. Particulates will include animal excrement, organic material, animal hair, feathers, grit, and uneaten food.

1.2 GENERAL

A. Filter drum assembly, tank and all accessories for a completely functional, built with options for saltwater service, and packaged system shall be supplied by the filter manufacturer as specified herein. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Provide filters as indicated on the drawings.

C. Filter performance shall meet or exceed the following:

1. Operational Flow: as scheduled on the Drawings.
2. Designed for high total suspended solids (TSS) loading.
3. Mesh Openings: 30 micron.
4. Minimum Filtration Area: 0.92 m2
5. Hydraulic loading not greater than 5.7 gpm per sq ft of filter screen area.

D. Each filter shall be delivered with a locally installed programable controller. See Part 2 below for controller requirements.

E. In addition to the packaged drum filter, deliver a portable pressure washer as specified below.

F. Package shall include the drum filter and housing with a separate skid-mount for the controller, VFD, and booster pump and associated piping.

1.3 QUALITY ASSURANCE

A. The supplier shall preassemble all components at the factory to ensure proper fit and verify proper operation of mechanical and control components.

B. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The supplier shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.4 COORDINATION

A. The Contractor shall measure and verify all applicable structural dimensions before authorizing shipment from the factory.

B. Contractor shall verify all electrical, plumbing, life support and other trades requiring that interface with the filter screen.

C. Contractor shall verify with the supplier of the drum filter that the water source pressure (City water pressure) is coordinated with the drum filter package requirements. The TDH of the booster pump needs to the City water pressure subtracted from the water-spray pressure requirement of the filter.

D. Coordinate with automated controls system.

E. Contractor shall install piping from sprayer booster pumps, supplied separate of drum filter package, to connection at drum filter. Contractor shall install field wiring from drum filter control panel to level switches

F. The drum filter package is not factory-equipped with a main disconnect switch which must be provided per electrical plans and specifications. Where 120 VAC power is scheduled on the Filter Schedule, a special order may be required for 120 VAC power.

G. Coordinate electrical grounding with grounding requirements defined by the Electrical Engineer for the project. Typically, a ground rod needs to be installed next to the main filter housing.

1.5 FACTORY START-UP ASSISTANCE AND TRAINING

A. Technical Start-Up: Supplier shall provide a minimum of one working day of factory trained technician, to assist in the installation and start-up, and to inspect, calibration and start-up the equipment.

B. Training Seminar: Manufacturer's/supplier’s senior personnel to give complete formal seminar on the fundamentals, routine operation, standard maintenance, and rebuilding instruction demonstrations for the drum filters to the Owner’s operational staff. This seminar shall be separate of the Technical Start-Up assistance. Seminar shall be no less than 6-hours of instruction over a one-day period. Include educational material for six trainees, demonstration of actual components and visual aides. Supplier to contact the specifying engineer, the General Contractor and the Owner prior to arranging dates and times of this seminar.

C. This factory startup assistance and training shall be performed as outlined above. Substitution of training by installing contractor, general contractor, or any non-factory representative is strictly prohibited.

1.6 SUBMITTAL

A. Submit manufacturer’s general information and description of drum filters.

B. Submit operational data for maximum flow, pressure losses, and loading capacity. Submit water flow and pressure requirements for backwashing with a description of automated sequencing, including coordination with other electrical control devices.

C. Dimensional drawing of packaged equipment and list of materials.

D. Electrical power and connection requirements.

E. Submit proof that installed materials will bear approved testing agency listing mark or classification markings.

F. Submit manufacturer's warranty covering items described below.

G. Submit manufacturer's brochure for compact wheeled pressure washer.

H. Factory Affidavit: After completion of the technical startup assistance, and the separate training seminar by the factory representative, the contractor shall submit a letter from the equipment manufacturer/supplier or factory representative summarizing the training and startup. The letter shall state the name of the factory representative who performed the training, the Owners staff in attendance, the duration of technical startup assistance, the duration of training seminar, initial set points for drum filter operations (level, spin speed, spray durations, etc.), and a summary of observations made during review of installation. The letter shall state that the supplier has reviewed all installation requirements, and the drum filter is operating per factory recommendations. This shall be signed by the manufacturer/suppliers senior personnel, and be printed on the company's letterhead.

1.7 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.8 WARRANTY

A. The manufacture shall warranty the HDPE body, and screen frame, of the drum filter to be free of defects in material and workmanship for 2-years after startup in the water treatment system, or 2-years after Owner acceptance of the units from the installing Contractor, whichever is less.

B. The manufacture shall warranty all components external to the body, filter screens, replicable internal components of the drum filter, booster pump and accessories, to be free of defects in material and workmanship for 1-year after startup in the water treatment system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever is less. The manufacture shall replace any components found defective within the 1-year warranty period.

1.9 SERVICE MANUALS

A. Provide two sets of Operation and Maintenance Manuals for all the supplied equipment. These manuals, at a minimum, shall contain the following:

1. As-Built Drawings as described in the Submittal Package (above).
2. Bill of Materials (Parts Book) with all applicable part numbers listed.
3. Operator's Guide Book detailing operation and maintenance procedures required, including a lubrication and maintenance chart, testing, safety procedures, and adjusting guide.
4. Manufacturers data for all major components, electrical schematic and trouble-shooting guides.

PART 2 - PRODUCTS

2.1 COMPLETE PACKAGE DESIGN & PROCESS DESIGN

A. Project has “Tank Type” filters, which is where the drum is built in a modular water-retaining tank .

B. The manufacture shall furnish the drum filter as a complete package including screen assembly, modular tank and cover, level controls, and all other equipment necessary for a complete functioning filter system.

C. Water filtering by means of straining through a series of micron filter plates attached to a rotating drum frame contained within a water holding tank.

D. As the filter plates collect solids, the drum assembly shall rotate to transport the fouled filter plates out of the fluid stream where spray nozzles located above the rotating drum dislodge the solids to a waste trough. Include a fiberglass or HDPE cover over the drum and tank to completely eliminate loss of water. Include liquid level control, actuated valve, and circuitry for a completely functional automatic backwashing system.

2.2 SYSTEM COMPONENTS

A. Drum Construction: Metal components of the drum, drum plates, and hardware shall be of Type 2205 stainless steel. The sludge tray shall be constructed of HDPE, fiberglass, PVC, or Type 2205 stainless steel. Cast metal parts may be CD4M-Cu stainless steel, or similar duplex stainless steel; if not non-metallic. The rotating drum shall be sealed to prevent bypassing of influent into the filtered water chamber prior to straining through the screens. Provide wheels, with closed bearing housings or a central greasing system, to support the drum for smooth operation with serviceable components for a long-lasting and durable design. The filter drum shall not be less than 16-inch diameter.

B. Tank Housing: The water-containing housing tank shall be self-supporting, HDPE, constructed of non-metallic materials, with matching cover finished in a smooth UV resistant coating.

C. Drum Construction: The rotating drum shall be sealed to prevent bypassing of influent into the filtered water chamber prior to straining through the screens. The drum shall run on wheels, with closed bearing housings, or a central greasing system, to support the drum for smooth operation with serviceable components for a long-lasting and durable design.

D. Materials: All materials shall be selected for warm saltwater service. Where there are options for available materials selections, material with the higher resistance to corrosion by saltwater exposure shall be selected.

1. Tank Housing: The water-containing housing tank shall be self-supporting, HDPE, fiberglass, or other non-metallic materials, with matching cover finished in a smooth UV resistant coating. All fastenings and straps shall be Type 316 stainless steel or better.
2. Internal Drum Frame: The cylindrical drum frame, and end plates, shall be reinforced POM (Polyoxymethylene) / PE with no metal straps. Supports, bearing housings, and internal wetted metal brackets and fasteners shall be Type 2205 SS, Type 316L SS, or Type 316L.
3. Wetted Cast Alloys: Cast metal parts shall be CD4M-Cu stainless steel, or similar duplex stainless steel; if not non-metallic.
4. Internal Wetted Hardware: Cap screws, nuts, washers, jack-screws, and all hardware shall be Type 2205 SS, Titanium, or non-metallic.

5. External Dry Hardware: External dry brackets and fasteners may be Type 316L SS if not the higher alloys specified above for wetted components.
6. Skid-mount: The skid mount for the booster pump and controller shall be of FRP construction with Type 316L fasteners.

E. Coatings: All internal wetted metal parts shall be coated with a clear or translucent corrosion protectant, such as “Prolan Protective Lanolin,” intended by the manufacture for rust prevention on metals in direct contact with marine environments.

F. Sludge Trays: The sludge tray shall be constructed of HDPE, fiberglass, PVC, or Type 2205 stainless steel.

G. Filter Screens: Woven polyester fabric screens shall have 30 micron mesh opening size contained within a molded injected polypropylene grid. Furnish screens in complete preformed panels, which can be individually repaired or replaced. Drum filter panels shall allow for field repair, using patching plugs, without having to replace the entire panel.

H. Motor and Drive: TEFC electric motor. Provide speed reducer to rotate the drum at the proper speed. The drivetrain shall consist of a heavy-duty corrosion resistant chain drive or plastic gear wheels. Finish the motor, motor drive, and other exposed carbon steel components, a superior corrosion-resistant paint followed by a over-coat of Prolan Protective Lanolin coating.

I. Backwash Spray System: The screens shall be cleaned by back-spraying with a spray bar along the length of the drum filter. A collection trough shall discharge backwash water out of the filter, with a pipe connection supplied with the filter, for connection to the sewer. High pressure spray nozzles shall be constructed of durable ceramic, or Type 316 or better stainless steel, for long operational times with minimal maintenance. The package of equipment supplied with the drum filter shall include following in pre-assembled piping for backwash water to the spray jets:

1. Isolation Valve: PVC ball valve or gate valve.
2. Solenoid Valve: Pilot-actuated PVC solenoid valve by Plast-O-Matic, slow-closing solenoid valve by ASCO; or high-quality equal.
3. Strainer: Inline strainer for protection of spray jets.

J. Booster Pump: Package shall be supplied with a skid-mounted booster pump for required back-spray flow and pressure.

K. System Overflow Assembly: The package shall be equipped with a device to overflow such that if, the input flow exceeds the filter capacity, excess water will overflow from influent to effluent side of filter, bypassing filter plates without overflowing outer tank.

L. Internal Weir: Unit shall include a weir for control of minimum water level in the rotating screen chamber.

M. Pipe Connections: Equip with pipe flange or flange-pad fittings, with ASME 125/150 lb. bolt pattern, for all piping connections.

N. Level and Motor Controls: Filters shall be delivered with all controls, sensors, automatic controller, and wiring for necessary routine monitoring, automatic backwashing, and automatic shutdown and warning indications upon detection of equipment failures.

1. Controls to connect to level sensors for initiation of automated functions.
2. Controller shall have a programable controller, with HMI color touch-screen, with intuitive interface for setup and setting of parameters. The controller shall use algorithms to allow drum filter operators to maximize the efficiency of drum filter operation. The system shall

have the capability for dynamic drum screen operations give total suspended solids (TSS) input.

3. Controller shall include optional modes for optimization of filtration and/or water savings. Controller shall allow for modes with continuous screen rotation or static screen filtration mode.
4. The controller shall vary the rotational speed of the drum, using the VFD, for maximization of removal of fine particulate and minimization of backwash water requirements.
5. For water savings, the controller shall include a static screen mode (no rotation) with a reverse rotation on high water level to allow for increased particulate capture without a spray-water wash. After a programmable number of reverse rotations, the controller shall perform a full spray-water wash of the screen, after which the filter shall return the static screen water-saving filtration mode.
6. The controller shall include data logging of control events and alarms
7. An Ethernet connection port shall be provided for connection to the LSS ACS for remote/external on/off control, run status, remote activation of backwash, and signaling of alarm conditions.
8. Provide automated controls associated with two level sensors. One level sensor shall be used for start of backwash sequencing. A second level sensor shall be for overflowing alarm. Level sensors shall be submersible pressure level transmitters, such as “HLS Series” by *Hayward,* or equal.
9. Automated control for solenoid valve to supply backwash water to the spray bar. For backwash water from a domestic potable water source, shall be a “slow closing” stainless steel solenoid valve by ASCO, or equal. For saltwater backwash water, shall be “pilot actuated” PVC solenoid valve by Plast-O-Matic, or equal.

O. Electrical Power Connections: Equip filter skid with U.L. approved electrical junction boxes for power connections. All wiring shall be enclosed in corrosion-resistant conduit (exposed wires are not acceptable).

2.3 SPARE PARTS

A. Manufacturer shall deliver each unit with the following replacement spare parts, for each unit delivered:

1. (10) Ten spray jet nozzles.
2. (1) One spare screen panel.
3. (20) twenty screen patching plugs.
4. (1) One Elastomer Drum Seal.

2.4 MANUFACTURER

A. Base Manufacturer: The Drawings and specification are based on products available from the following manufacturer:

1. CM Aqua, HEX “X” Series Supplied by *Integrated Aqua Systems* (760) 745-2201 www.integrated-aqua.com;

B. Alternate Manufacturers: This listing of potential manufacturers shall not compromise the above specified requirements and may require the Contactor to make adjustments in pipe routing from what is shown on the Drawings:

1. PRAqua Supplies, Ltd. Nanaimo, B.C., Canada, (250) 754-4844 www.praqua.com;

2. Supplied by Aquatic Eco-Systems, Apopka, FL.

2.5 COMPACT WASHER

A. Compact Wheeled Pressure Washer: Provide a compact wheeled pressure washer with delivery of drum filter(s). Equipped with four wheeled chassis with two swivel casters for ease of transporting.

1. 1800psi +/- 200 psi spray at 1.0 to 1.5 gallons per minute.
2. Onboard detergent tank.
3. Equipped with a long power cord and a 30-foot minimum length high pressure hose.

B. Manufacture:

1. Karcher;
2. *Southern Environmental* 128 Park Center Street Leesburg,FL 34748 (352) 360-0036 www.seelsbg.com;
3. Or substitute.

PART 3 - EXECUTION

3.1 INSTALLATION - CONTRACTOR

A. The Contractor shall install the equipment as specified herein, as recommended by manufacturer, and as shown on the drawings and make all necessary connections or adjustments for a complete and correct installation.

B. Coordinate installation of gravity discharge pipe with outlet on filter sump. Arrange pipe elevations to maximize the slope of the pipe from the connection at the filter to the pipes downstream elevation.

C. Connecting piping shall commence only after setting and leveling of the filters.

D. Install field wiring from drum filter control panel to level switches.

E. Contractor shall ensure electrical equipment is in conformance with a approved testing laboratory listing and bears certification labeling.

F. Install piping from sprayer booster pumps to connection at drum filter and install field wiring from drum filter control panel to level switches.

G. Complete installation of electrical grounding of the drum filter and verify grounding connects to the internal wetted drum frame.

H. Connect the local automated controller(s) to the LSS Automated Controls System (ACS).

I. Contractor shall make arrangements for technical startup assistance, and an Owners technical training seminar, by the drum filter factory representative/supplier. Contractor shall deliver a

"Factory Affidavit" of the startup and training seminar as further described under the Submittals section above.

J. Deliver spare parts to the Owner, including one complete specified set per installed filter.

K. Deliver one (1) compact pressure washer for the project.

L. Demonstrate drum filter operations to the satisfaction of the Owner.

END OF SECTION

SECTION 170032 - BAG FILTERS

PART 1 - GENERA

1.1 USAGE

A. The bag filters are used for filtration of saltwater aquarium water.

B. Spare Filter Bags: Provide one spare filter bag, in addition to each installed filter bag, for each installed filter vessel.

1.2 SUMMARY

A. Bag filters, and hanger supports, as specified herein.

1.3 SUBMITTALS

A. Submit product data on filtering elements, all materials of construction, dimensional drawings, and list of any custom materials.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 PRESSURE VESSEL & BAG FILTER

A. Housing: Over the top design custom fabricated for use with sea water with all liquid contacting components of non-metallic materials. Manufactured for use with 7-inch by 32-inch industry standard filter bag.

B. Connections: 2-inch diameter flanged ports with ASME 150 lb. bolt pattern. 0.75-inch gauge ports at up and downstream locations.

C. Pressure Testing: Strength of each model shall be proven by factory pressure testing to no less than 75 psi.

D. Bag Filters: Suitable for use with sea water. 7-inch by 32-inch in dimension and containing approximately 30 square foot aggregate or 4 square foot projected of filter media. Filter of polypropylene. Bag ring and bottom clamp of polypropylene or titanium (custom materials).

E. Supplier:

1. Hayward Flow Control, Clemmons, NC (888) 429-4635, www.haywardflowcontrol.com;
2. Aquatic Eco-Systems, Apopka, FL;
3. Or approved substitute

2.2 BAG FILTERS AND HANGERS

A. Design: Drop-in type bag filters for use with saltwater with bag ring and bottom clamp.

B. Bag Filters: 7-inch by 32-inch needled-felt polypropylene filter bag containing approximately 30-square foot aggregate or 4-square foot projected of filter media.

C. Performance: Efficiency in removal of 10-micron particles shall exceed 99% when operated at 16 GPM. Pressure drop at 16 GPM shall be less than 0.4 PSI and or functional for the hanger type installation.

D. Supports: Designed to securely support the drop-in filter bags matching requirements of the installed situation. Bag ring and bottom clamp of polypropylene or titanium.

E. Suppliers:

1. *3M* brand bag filters;
2. *Hayward Flow Control*, Clemmons, NC (888) 429-4635, www.haywardflowcontrol.com;
3. *Aquatic Eco-Systems*, Apopka, FL;
4. or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in location(s) shown on the drawings. Exercise care during installation so permanent stresses are not imposed on the filter units from the connecting piping. Arrange overhead clearance for entry of filter bag without obstruction.

B. For hanging filter bags, provide and install racks, matching the size of rings at the open end of the filter bags.

C. Deliver backup stock of bag filter element(s) to the Owner/Representative in individual protective cartons.

END OF SECTION

CARTRIDGE FILTERS - SECTION 170035

PART 1 - GENERAL

1.1 USAGE

A. Tag No. LCR-FGN001-001 Live Coral Flexible Cartridge Filter Housing. Housing provided and installed by Contractor. Inner filter element provided and installed by Owner.

B. Tag No. HTT-FCRT01-001 Holding Touch Tank / Carbon Cartridge Filter. Housing and filter element provided and installed by Contractor.

1.2 SUMMARY

A. Complete cartridge filter unit shall be supplied as specified herein. The size and location of all units shall be as indicated on the drawings. The General Conditions shall apply to this Section as fully as if repeated herein.

B. One complete set of replacement cartridge elements for each filter unit installed shall be provided to the Owner upon completion of the project. Applies to Tag No. HTT-FCRT01-001.

1.3 SUBMITTALS

A. Submit product data on cartridge filtering elements, all materials of construction, and dimensional Drawings.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 FILTER HOUSINGS

A. Polycarbonate housing with stainless steel swing bolts for securing top cover. Manufactured to function in a pressurized water system with a maximum working pressure of 125 psi. 2-inch port connections and rated at 15 gpm or more with carbon media filtration with a pressure loss less than 5.0 psi. Width of 12-inch O.D. and overall height of 40-inch.

B. Materials: Glass reinforced PP housing and cap, Type 304 or Type 316 stainless steel swing bolts, and EPDM O-rings. No brass parts.

C. Model and Manufacturer: Model BBH-150-NP , “Big Bubba” filter by *Watts Water Technologies* (800) 659-8400 www.watts.com

2.2 INTERNAL FILTER ELEMENT

A. Carbon media shall be supplied in an encapsulated cartridge. The cartridge shall have the ability to withstand a 30 psi differential pressure without loss of carbon media. The cylindrical cartridge 7-inch by 31-inch with 5 micron particulate filtration rating. Activated carbon rated for 90% chlorine reduction.

B. Cartridge with activated carbon by *Watts Water Technologies* (800) 659-8400 www.watts.com.

PART 3 -

PART 4 - EXECUTION

4.1 INSTALLATION

A. Filter units shall be installed in the locations shown on the drawings. Provide a level concrete housekeeping pad as necessary or as indicated on the Drawings.

B. Exercise care during installation so permanent stresses are not imposed on the filter units from the connecting piping. Anchor vessels to floor slab with fasteners per Section 170316. Complete installation per manufactures recommendations.

C. Supply backup cartridge element, for Tag No. HTT-FCRT01-001, to the Owner's representative in protective carton.

END OF SECTION

SECTION 170062 - SAND FILTER MEDIA

PART 1 - GENERAL

1.1 USAGE

A. For installation in pressure vessel filters as follows:

1. Support media, with #20 fine sand top layer, per this specification Section.
2. Support media per this specification Section with Glass top layer per specification Section 170063.
3. Support media per this specification Section with Carbon top layer per specification Section 170072.

1.2 GENERAL & QUALITY CONTROL

A. Stratification for the various types of filter media shall be as indicated on the Drawings. The General Conditions shall apply to this Section as fully as if repeated herein.

B. All filter media shall be supplied specifically for use in granular filters. The media supplier shall have a history of supplying filter sand for similar applications.

C. The supplier shall be responsible for maintaining quality control of the product from selection of the quarry source through delivery. Sampling, inspection and testing shall be in accordance with Federal Specification SS-C744a, the ASCE Manual of Engineering Practice No. 13 "Standard for Filtering Material," and AWWA B 100 Standard for Filter Material.

D. Soundness testing of representative quarry material may include but not be limited to the following:

1. The sodium sulfate soundness test for any signs of disintegration, cracking, flaking, checking, splitting, or crumbling. The loss of material from original rock pieces shall not exceed 5-percent after twenty (20) cycles of the test (see ASCE Manual of Engineering Practice No. 13).
2. Testing for hardness, toughness, wear, and compression strength.

E. Contractor shall be responsible for complete installation of all media as described below.

1.3 REFERENCED STANDARDS

A. The following standards shall be referenced for definitions of terminology used in this specification and testing and sampling methods:

1. AWWA Designation B100 Standard for Filtering Material.
2. ASCE Manual of Engineering Practice No. 13 "Standard for Filtering Material."
3. Federal Specification SS-C744a.
4. American Petroleum Institute (API) Recommended Practices for Testing Sand Used in Hydraulic Fracturing Operations, document API RP 56.

1.4 SUBMITTALS

A. Submit sieve analysis and a graphic plot of the grain size distribution for all sands.

B. Provide the following data for all sand and gravel:

1. Effective grain sizes for all sands.
2. Typical dimensions of gravels.
3. Uniformity coefficients for all sands.
4. Description of rock type or geology of quarry.
5. Sphericity and roundness or angularity.
6. Percent fines passing No. 200 sieve.

C. Submit to the Engineer for approval samples of each type and grade of media to be provided. Samples shall be placed in properly labeled, sealed containers holding not less than one pound each. The filter media delivered to the site shall equal in all respects to the approved samples. Media for installation shall not be shipped to the site prior to approval of samples.

D. Upon the specific request of the Engineer for this project submit: source of material, hardness, density, sodium sulfate soundness testing of quarry material, acid solubility testing of graded material, or other descriptive data. This additional information is usually only necessary if proposed sample are suspected as substandard.

PART 2 - PRODUCTS

2.1 GENERAL MATERIALS

A. Angularity, sphericity and roundness shall be determined using Chart for Visual Estimation of Sphericity and Roundness Frac Sand Sphericity and Roundness, Fig. 5.1 API Recommended Practices for Testing Sand Used in Hydraulic Fracturing Operations. The original chart for estimation of sphericity and roundness is given in Stratigraphy and Sedimentation, Second Edition, Krumbein, W.C. and Sloss, L.L., Copyright 1963 by W.H. Freeman and Co., New York, N.Y. (a.k.a. the Krumbine Roundness chart.)

B. All media shall be free from any significant amounts of iron or manganese compounds.

2.2 SUPPORT GRAVEL

A. Shape of gravels shall be generally spherical or equidimensional. Shall have a roundness of 0.4 or greater and a sphericity greater than 0.5. Not more than 25-percent by weight shall have more than one fractured face; refer to AWWA B-100. Support gravel with sharp points and/or edges is not acceptable.

B. All gravel shall consist of hard and durable inert rock. Specific gravity not less than 2.60. Indurated rock which fractures along sedimentary striation planes or crumbles under impact is not acceptable.

C. Shall not contain more than 2-percent thin, flat or elongated pieces as defined by having a sphericity of 0.3 or less. Shall not contain a total of more than 1-percent loam, clay, sand, shells, dirt and organic impurities or other foreign matter.

D. Acid solubility of gravels shall be not more than 10-percent when tested in accordance with Section A2.2 of AWWA Standard B100 or methods given in Section 6 of the API reference.

2.3 SUPPORT SAND MEDIA

A. Shape of support sand media shall be generally spherical or equidimensional. Support sand may be round or angular with a sphericity of 0.7 or greater.

B. Support sand is defined as the strata above 3/8 inch pea gravel and below the top media layer. Support sand shall consist of hard, durable and inert particles with no less than 90% silica dioxide content. Total quartz no less than 85% and total feldspar no greater than 15%. Average specific gravity not less than 2.60.

C. Gradation of supporting sand shall be as follows:

Media Size	Effective Grain Size	Uniformity Coefficient	Comment
#16 Supporting Sand	0.59 mm to 0.71mm	1.6 maximum	Equidimensional
#10 Supporting Media	1.5 mm to 2.0mm	2.0 maximum	Needs to be clean

D. Shall not contain more than 2-percent thin, flat or elongated pieces as defined by having a sphericity of 0.3 or less. Shall not contain loam, clay, sand, shells, organic impurities or other foreign matter.

E. Acid solubility of gravels shall be not more than 5-percent when tested per Section A2.2 of AWWA Standard B100 or methods given in Section 6 of the API reference.

2.4 TOP FILTER SAND MEDIA

A. The top layer of fine sand shall consist of angular particles manufactured from crushed rock. Shall have a roundness of 0.5 or less and a sphericity greater than 0.5. Round and uniform size fine filter sand is not acceptable.

B. Gradation of the top layer of fine sand shall be as follows:

Media Type	Effective Grain Size	Uniformity Coefficient	Comment
Typical Fine Media, #20	0.45mm to 0.55mm	1.35 to 1.70	Angular

C. Fine media shall consist of hard, durable, dense silica sand, resistant to degradation during handling and backwashing, with an average specific density of 2.62 or greater. Total quartz no less than 60% and total feldspar no greater than 35%. Rock types other than quartz and feldspar shall not exceed 5%.

D. Shall not contain any visible loam, clay, dust, shells, organic impurities or other foreign matter. Material passing No. 200 sieve (0.074mm) shall not exceed 2-percent by weight. Shall not contain more than 5-percent dark particles by count. Shall not contain more than 5-percent flat particles (material with a sphericity of 0.3 or less).

E. Acid solubility of sands shall be not more than 5-percent. A two gram sample of the sand, crushed and powdered to pass a 50 mesh screen and digested without stirring in ten milliliters of 40% hydrochloric acid at a temperature of 65-75 deg F for 24 hours, shall not show a loss of weight greater than five percent. See also acid solubility test in AWWA B 100.

F. Sand and Gravel Supplies: The following suppliers are for reference and this listing does not connotate product approval.

1. Best Sand Corporation Chardon, OH (440) 285-3132 www.fairmountminerals.com;
2. Holliston Sand Company, Inc. Slatersville, RI (401) 766-3144 www.hollistonsand.com;
3. Northern Gravel Co. Muscatine, IO (319) 263-2711;
4. Oglebay Norton Industrial Sands Colorado Springs, CO (719) 390-7969;
5. Red Flint Sand and Gravel Eau Claire, WI (800) 238-9139 www.redflint.com;
6. Ricci Brothers Port Norris, NJ (856) 785-0166 www.riccisand.com;
7. Standard Sand and Silica Miami, FL (954) 574-5322 or (877) 444-7263 www.standardsand.com;
8. U.S. Silica Berkeley Springs, WV (800) 257-7034 u-s-silica.com.

2.5 TOP FILTER GLASS MEDIA

A. See specification Section 170063.

2.6 TOP FILTER CARBON MEDIA

A. See specification Section 170072.

PART 3 - EXECUTION

3.1 INSTALLATION - GENERAL

A. Storage: Media shall be stored in places protected from the weather and shall not be deposited directly on the ground.

B. Preparation of Filters: Before placing the gravel, the Contractor shall determine that all holes in the underdrain system are open and free of debris. Before placing any media, the filter piping must be complete and necessary hydraulic connections must be in place for backwashing of filters. Immediately prior to placement of any media in a filter, the Owner's Representative shall be given the opportunity to inspect each filter internally.

C. Placing Filter Media: Install each layer up to the required elevation, make level over the entire filter bed area, and smooth to a true surface. In placing each successive layer of media, extreme care shall be taken to avoid disturbing the previous layer.

D. Special Backwashing: If layers are suspected to contain excessive fine or dirty materials, then the intermediate layer shall be backwashed before beginning the placement of the next size.

Fine-grained materials which accumulate at the surface of the bed shall be scraped off and removed after each backwashing.

3.2 INSTALLATION OF GRAVEL AND SUPPORT SAND LAYERS

A. Required Initial Backwash: The empty filters shall be backwashed at no less than the standard backwash rate and drained prior to placing gravel.

1. The filter shall be checked for proper water flow, and/or excessive pressure drop, at the time of initial backwashing.
2. Following the initial backwashing of the empty filter, the top hatches shall be open and the condition of the lower laterals shall be visually inspected.

B. Care shall be taken when depositing media as to avoid damaging the distributor piping. It is very important that the gravel surrounding the lower filter distributor does not contain fine material.

C. Particular attention must be given to prevent finer particulate and sand from working into the gravel and clogging the filter's lower distributor slots.

3.3 INSTALLATION OF TOP SAND LAYER

A. Care shall be taken in transporting and placing the sand to keep the sand clean. Any sand which may have become dirty, either before or after it has been placed in the filters, shall be either washed or removed and replaced by clean media. All sand contaminated by organic matter will be rejected.

B. Unless indicated otherwise on the drawings, install sufficient quantity of top fine media to fill two-thirds of the space between the preceding support sand and the top distributor port.

C. Washing Sand Media: Filters shall be backwashed after installation media. Take care to admit water slowly so that the air can be released gradually as the water fills the tank. Wash-water applied at the start at a rate not to exceed two gallons per minute per square foot of filter area and shall be gradually increased to the rate given on the Piping & Instrumentation Diagrams rate for not less than a 5-minute duration. In the case where additional scouring is determined necessary, the filtration sand bed shall be backwashed at a rate of 18 gallons per minute per square foot.

D. After backwashing, open the access manhole and check level of media, top-off the final layer as necessary, and backwash once more. Fine-grained materials which accumulate at the surface of the bed shall be scraped off and removed after each backwashing.

END OF SECTION

SECTION 170063 - GLASS FILTER MEDIA

PART 1 - GENERAL

A. SEE SPECIFICATION SECTION 170062.

PART 2 - PRODUCTS

2.1 GENERAL MATERIALS

A. SEE SPECIFICATION SECTION 170062.

2.2 SUPPORT SAND MEDIA

A. SEE SPECIFICATION SECTION 170062.

2.3 TOP CRUSHED GLASS FILTER MEDIA

A. The top layer shall consist of post-industrial glass processed through a series of crushers, dryers, and screens to remove contaminants and to produce a range of uniformly sized filtration media. The post-industrial glass shall be completely free of the potential organic (sugars, labels, etc.) and inorganic (aluminum rings, steel caps, etc.) contamination.

B. Media shall not be sourced from general recycled glass.

C. Shall have an “angular-subangular” roundness and a sphericity greater than 0.3.

D. Gradation of the top layer of crushed glass shall be as follows:

E. Crushed glass media shall an average specific density of 2.55 or less.

Media Type	Effective Grain Size	Uniformity Coefficient	Comment
Top Crushed Glass	0.45 mm to 0.55	1.35 to 1.7	Angular

F. Crushed glass media suppliers: The following suppliers are for reference and this listing does not connotate product approval.

1. Lincoln Equipment, Inc. P.O. Box 20134 Portland OR, contact Mark Dernedde (800) 223-5450 x 106 mdernedde@lincolnaquatics.com;
2. Trivitro Corporation Seattle, WA, telephone (360) 733-2122;
3. Or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION - GENERAL

A. See also specification Section 1700062 for support sand and gravel.

B. Placing Crushed Glass Filter Media: Install crushed glass up to the required elevation, make level over the entire filter bed area, and smooth to a true surface. Unless indicated otherwise on the drawings, install sufficient quantity of top fine media to fill two-thirds of the space between the preceding support sand and the top distributor port.

C. After backwashing the top layer, open the access manhole and check level of media, top-off the final layer as necessary, and backwash once more. Fine-grained materials which accumulate at the surface of the bed shall be scraped off and removed after each backwashing.

END OF SECTION

SECTION 170072 - CARBON MEDIA

PART 1 - GENERAL

1.1 USAGE

A. The project has the following types of applications:

1. Incoming water filters loaded with Carbon Media.
2. Pressure filters for quenching of dissolved ozone loaded with carbon media.

1.2 GENERAL MATERIALS

A. SEE SPECIFICATION SECTION 170062.

1.3 SUPPORT SAND MEDIA

A. SEE SPECIFICATION SECTION 170062.

1.4 QUALITY CONTROL

A. The quantity and depth shall be as indicated on the Drawings.

B. All media shall be shall specifically recommended by the supplier for use in water treatment.

1.5 SUBMITTALS

A. Submit the following information for GAC Carbon Media:

1. Manufacturer’s detailed technical information on the product.
2. Iodine Number (mg/g).
3. Mesh size, % greater than & % less than (U.S. Sieve).
4. Mean particle size.
5. Apparent density (g/cc and/or lbs./ft3).
6. Mono-chloramine removal efficiency where used for de-chlorination.
7. Compliancy Standards

PART 2 - PRODUCTS

2.1 GAC CARBON MEDIA (Coconut Shell)

A. Manufacturer’s Recommendations: A catalytic GAC specifically recommended by the manufacturer for de-ozonation or chloramine removal. Where used for treatment of incoming City water, the GAC shall be “surface activated” and capable of removing a minimum of 75% monochloramine with a 10-minute contact time.

B. Product Description: Activated carbon derived from coconut shells manufactured by high heat activation. Substitution with a product derived from coal is not acceptable.

1. Iodine Number: 975 mg/g minimum per ASTM D4607.
2. Size: Grade 20 x 50 mesh size preferred, 12 x 40 option is acceptable.
3. Apparent Density: 0.49 to 0.60 g/cc per ASTM D2854.
4. Ash: 2% maximum per ASTM D2866.

C. Standards: Shall meet standards of Food Chemical Codex, comply with AWWA B604- 9 specifications, and have NSF and WQA Gold Seal certification. Or shall meet AWWA Standards, certified for ANSI/NSF Standard 61, and Prop 65 compliant for drinking water applications.

D. Cleanliness: Supplied pre-moistened and acid washed to eliminate dust and have very low fines. Shall be a premium grade product having superior adsorption properties.

E. Product and Suppliers:

1. AGC-50 CSAW, by *Resintech, Inc*., West Berlin, NJ (856) 768-9600 www.resintech.com;
2. *American Activated Carbon Corp*., Canoga Park, CA (310) 491-2842 www.aacarbon.com;
3. *Carbon Activated Corp*., Compton, CA (310) 885-4555 www.activatedcarbon.com;
4. GAC-2050-S Spartan Series by *PureWater* (866) 535-5092 www.purewatersite.com;
5. Approved Substitute.

PART 3 - EXECUTION

3.1 INSTALLATION - GENERAL

A. Support Media: Install supporting gravel media as specified in Section 170062.

B. Storage: Media shall be stored in places protected from the weather and shall not be deposited directly on the ground.

C. Safety & Health: Special care must be taken in transporting and storage of the carbon media/GAC to ensure that the containers are kept completely sealed until their use. In addition, wet activated carbon removes oxygen from air. In closed or partially closed spaces, oxygen depletion may reach hazardous levels. Appropriate sampling and work procedures for low-oxygen spaces should be followed. Adhere to all manufacturer's safety recommendations and MSDS information.

D. Special Handling: Take special care not to handle media in a manner which may result in the creation of fine particles and dust.

E. Washing Media: At the time of installation, thoroughly wash media the media to remove all fine material and dust, prior to final placement.

END OF SECTION

SECTION 170088 - PACKING & DRIFT ELIMINATORS

PART 1 - GENERAL

1.1 SUMMARY

A. Provide packing where indicated on the drawings and as specified herein where “Packing” is call for in the Deaeration Towers and Biotowers.

1. Structural packing to be installed in deaeration towers.
2. Random packing to be installed in biomedia chambers.

B. Provide protective grid on top surface of structured packing.

C. Provide drift eliminators where indicated on the Drawings.

1.2 COORDINATION

A. Coordinate with as-built dimensions of deaeration towers before cutting structured packing to finished dimensions. Allow ¼-inch clearance between the vessel wall and packing to facilitate installation and removal.

1.3 SUBMITTALS

A. Random Packing: Submit description of random packing. Submit sample of media for review. Do not ship media to jobsite prior to review. Media delivered to the jobsite shall be equal in all respects to the sample.

B. Structured Packing:

1. Submit general description of structured packing and detailed data on dimensions and material properties of selected product.
2. Submit information on protective grid.
3. Submit dimensions and layout of structured packing coordinated with other components of the tower including, but not limited to: piping, supports, tower risers and distributors. Sizes of individual units shall be coordinated with access restrictions, size of hatches, and other dimensions indicated in the Drawings.

C. Cellular Drift Eliminators: Submit general description of drift eliminators and specific dimensions of selected product.

PART 2 - PRODUCTS

2.1 RANDOM BIOMEDIA

A. Usage: Used in filtered aquarium saltwater trickling chambers for the purpose of nitrification reducing entrained bubbles. Biomedia packing with plastic elements for a maximum

impingement of flow. Packing shall consist of a single rigid molded piece. Assemblies requiring attachment clips are not allowed.

1. Void space in excess of 93%.
2. Specific surface area in excess of 48 ft2/ ft3.
3. Size: 2-inch.
4. Material: Packing shall be of clean PP (Polypropylene) castings, free of any excessive flashing, resilient and not susceptible to breakage when dropped on concrete from a height of 25 feet. Tough virgin plastic resin construction, not containing any re-grind resins.

B. Manufacturers:

1. *Koch Engineering Company Inc.* (FLEXIRING media) Buena Park, CA (714) 739-8853;
2. *Lantec Products Inc*., Agoura Hills, CA (818) 707-2285;
3. *Norton Company* (Plastic Pall-Ring media) Anaheim, CA (714) 970-3000;
4. *Lee's Aquarium & Pet Products* (Bio-Pinball media) San Marcos, CA (619) 744-8230;
5. *RK2 Systems Inc.* (Bio-Pinball media);
6. *Glitsch Inc*. (Plastic Ballast Ring) Dallas, TX (214) 631-3841;
7. *Aeration Engineering Resources Corporation* (AERCOR ACTIFIL media) Worcester, MA (508) 756-1020;
8. *Jaeger Product Inc.* (Plastic Nor-Pac media) Spring, TX (713) 444-9500.

2.2 STRUCTURED TOWER PACKING MEDIA AND PROTECTIVE GRID

A. Structured Packing: To be used in Deaeration chambers for the purpose of reducing entrained bubbles and may be used for biological filtration at aquarium facilities. Packing shall be designed for the purpose of scrubbing and air stripping with cross-corrugated plastic sheets for a maximum impingement of flow.

1. Void space in excess of 95%.
2. Specific surface area in excess of 67 ft2/ ft3.
3. Corrugation angle of 30 deg .
4. Sheets/ft. = 26.
5. Mixing and redistribution points in excess of 2,400/ft3.
6. Sheet thickness of 10 mil for indoor installations, 10 mil for outdoor installations.
7. Height of packing layers may vary from 11.8-inch to 12-inch.
8. Brentwood CF 1200 or substitute.

B. Overall Dimensions: As called for on the drawings with the following exception. The unit dimensions may be maximized for economy, as recommended by the Manufacturer for the specific application and dimensions of tower and supports; however, the depth of packing shall be at least two (2) layers placed perpendicular to each other. Packing units shall be custom trimmed for circular towers, piping, supports, tower risers and distributors.

C. Material and Properties: Packing shall be of clean PVC sheet moldings, free of any excessive flashing, trimmings, solvents or un-cured glues. Material properties shall conform to the specification in CTI STD 136 and as listed below:

1. Tensile Strength: 5,500 psi minimum average value per ASTM D638/D882.
2. Elastic Modulus: 350,000 psi minimum average value per ASTM D638/D882.
3. Flexural Strength: 10,000 psi minimum average value per ASTM D790.
4. Flexural Modulus: 350,000 psi minimum average value per ASTM D790.
5. Impact Resistance: 1.2 in-lbs/mil thickness per ASTM D4226.

6. Heat Distortion: 160 deg Fahrenheit minimum per ASTM D648.

D. Protective Grid: U.V. stabilized black polypropylene 2" x 2" grid, 1.25-thickness, designed for installation on top of structured tower to avoid damage from walking and hydraulic impact.

E. Manufacturer:

1. ACCU-PAC and AccuGrid manufactured by *Brentwood Industries Inc*. and available from *L S Enterprises LLC*, East Earl, PA (239) 851-1175 or (717) 351-3933 www.biofilters.com;
2. Or approved substitute.

2.3 CELLULAR TYPE DRIFT ELIMINATORS

A. Cellular type drift eliminator designed to remove entrained water droplets from the leaving air stream at minimum pressure loss. Fabricated from rigid, corrugated PVC (or CPVC) sheets conforming to ASTM D 1784. The mass drift quantity shall be determined by the CTI STD-140 HBIK drift test Code, or the EPA method 13 A system of analysis, and the drift quantity/loss shall not exceed 0.0005% recirculation.

B. Manufactured to be field-cut, for tight fit, without sacrificing structural integrity.

C. The eliminators shall be the cellular type with end caps to provide extra structural integrity for beam strength and durability.

1. Unit Depth: 5.25-inch.
2. Cell Size: 0.86-inch. 0.80-inch to 1-inch for alternate manufacturers.
3. Material Gauge: 13 mil (0.33mm) thickness for up to 4-ft span. 20 mil (0.51mm) heavy duty thickness for up to 6-span. May be 15 mil thickness for spans up to 5-ft where available from alternate manufacturers.

D. Base Model and Manufacturer:

1. Models CFUltra or CF80Max by *Brentwood Industries Inc.* www.brentwoodindustries.com and available from *L.S. Enterprises* Gainesville, FL (352) 379-5626 www.biofilters.com;

E. Other Manufacturers which may or may not meet specified requirements:

1. *Koch-Glitsch Wichita*, KS (888) 562-4911 www.koch-glitsch.com;
2. *Sulzer Chemtech USA Inc*. Humble, TX www.sulzer.com.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Contractor shall take responsibility for damage to packing, dimensions of packing units and fit through openings and around piping, supports, tower riser, distributors and as required for installation.

B. Random Biomedia:

1. Compare each load to an acceptable sample; do not load any media exhibiting excessive molding-flashings, broken pieces or otherwise below quality of specified material.
2. Place by dumping in a manner that avoids breakage and refrain from dropping from heights. Place randomly to required height indicated on drawings and rake for a uniform final surface level.

C. Structured Packing:

1. Place packing in at least two (2) layers aligned perpendicular to each other.
2. Allow approximately ¼-inch clearance between the vessel wall and packing to facilitate installation and removal.
3. Trimmings, shavings or other pieces of packing shall be completely removed from the packing and the tower prior to filling the system with water.
4. Install protective grid over top of last layer of packing.

D. Protective Grid: Install a covering of the Protective Grid over the packing segments cut in plan arrangements to avoid alignment of gaps in the packing with seams of the Protective Grid.

E. Drift Eliminators: The drift modules shall be installed as per manufacturer's recommendations.

1. The drift modules shall be carefully cut or trimmed to fit within 1/4 inch (or less) of any obstruction or sidewall to prevent air bypass. The shaping, cutting and trimming of the drift modules may be done in the tower provided that precaution is taken by the Contractor to prevent any chips, broken pieces, or debris from falling into the media and caution that the cutting may weaken the structural integrity of the product.
2. The drift modules shall be placed in the tower to provide the closest possible fit with adjacent modules without damaging the modules.
3. Drift modules shall be installed such that the sheets of all modules are perpendicular to the support beams and/or in alignment with seams of supporting FRP grate.
4. The drift modules are not intended to have workmen walking on them. To prevent damage or injury, the contractor shall use plywood or other suitable temporary planking.
5. Final installations where foot traffic may be required shall have a protective grid installed over the drift modules.

END OF SECTION

SECTION 170107 - CURRENT EFFECTS GENERATORS

PART 1 - GENERAL

1.1 USAGE

A. Used in the Live Coral and Sand Shark saltwater aquarium tanks to boost water circulation.

1.2 QUALITY ASSURANCE

A. Pumps and motors shall be preassembled at the factory to ensure quality control and quality assurance.

B. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). The supplier/ manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.3 COORDINATION

A. Refer to Exhibit Design drawings for integration into the thematic setting. Coordinate exact installed locations with Aquarium operational staff at the time of installation.

B. Coordinate required mounts with selected model and tank locations. Use available magnet mounting as required; however, the stability of the magnetic mount may not be possible through thick tank walls and require additional in-tank mounts.

C. Coordinate length of factory available power cord with electrical power.

D. Coordinate dry location for installation of controller with environmental conditions.

E. Coordinate secondary grounding for generator unit housing to building grounding with electrical.

1.4 SUBMITTALS

A. Submit the following items:

1. Manufacturer’s brochure information including indication of model number and selected materials.
2. Submit manufacturer’s grounding lug for connection from generator unit housing to building grounding.
3. Submit proof that installed materials will bear testing agency listing mark or classification markings.
4. Submit manufacturer’s installation instructions, for review, prior to approval.

1.5 WARRANTY

A. The manufacture or supplier shall warranty products to be free of defects in material and workmanship, and perform as specified, for 1-year after startup in the water treatment system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever is less. The manufacture or supplier shall replace or repair products found defective within the 1-year warranty period.

PART 2 - PRODUCTS

2.1 CURRENT EFFECTS GENERATORS

A. Propeller type mixer specially designed for installing in an aquarium tank and moving large volumes of water. The intake shall have a surface area four times greater than the exit with water streaming into the pump at a maximum of 3 feet per second. The mixer shall produce a non-rotating current with a maximum exit velocity approximately 11 feet per second.

B. In the submerged condition, the pump shall produce maximum flow of 160,000 L/hour or more.

C. Electric motor shall be built for submersible operation with a variable speed range from zero to 100% RPM.

D. Provided with mounting lugs for securing the unit into a wide range of mounting positions.

E. All wetted components of plastic or Titanium. All wetted materials shall be safe for permanent use in marine environments.

F. Controller: Shall be provided with a programmable control system. Program options shall include for wave and random modes. The pump and/or controller shall include safety functions for dry running, high temperature, and overload protection.

G. Provide Manufacturer's grounding lug for connection from generator unit housing to building grounding for personal protection and with regard to dissipation of emitted electromagnetic interference (EMC).

H. Manufactures:

1. Base Manufacturer: *Abyzz America, LLC.* Star, ID www.abyzzamerica.com
   Supplied by: *CoralVue* Slidell, LA (985) 781-1220 www.CoralVue.com.
2. Alternate Manufacturer: "Hydrowizard" by *KAG* email to fish@belowwater.com.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with the Manufacturer's instructions at locations indicated on the Drawings.

B. Location: Position under the water surface at a location as directed by the Aquarium operator at the time of construction.

C. Controller: Install controller with wall-mount for dry, safe, and accessible location. Do not mount the controller directly over water.

D. Mounting: Only Type 316/316L stainless steel fasteners shall be used.

E. Contractor shall ensure electrical equipment is in conformance with a listed testing laboratory and bears certification labeling.

F. Contractor shall install secondary grounding for generator unit housing to building grounding with electrical.

END OF SECTION

SECTION 170110 - CHEMICAL METERING PUMPS

PART 1 - GENERAL

1.1 USAGE

A. The chemical metering pumps are used for pumping acid, base, chlorine, bromine, saltwater, or RO freshwater.

1.2 GENERAL REQUIREMENTS

A. General: The General Conditions apply to this Section as fully as if repeated herein. In addition to metering pumps, provide storage tanks and agitators as specified below and indicated on the drawings.

B. Operating Characteristics: Pump capacity, maximum operating pressure, electrical requirements, and other requirements as shown on the drawings.

C. Codes: Comply with all applicable safety codes, ASTM, and ANSI.

D. Electrical equipment shall be in conformance with all local, State of North Carolina, and Federal codes, statutes and ordinances where they apply, including required listing by testing authorities. Acceptable listing authorities include Underwriters Laboratory (UL), Canadian Standards Association (CSA), or other approved by the State of North Carolina.

1.3 SUBMITTALS

A. Submit complete motor and pump data together with dimensional drawings, indicate model numbers, pumping rate and pressure rating, listing of all types of materials and specific list of optional equipment provided. For the motor: motor type, horsepower, voltage rating, number of phases, and name of motor manufacturer. Submit installation instructions, for review, prior to approval. Submit warranty.

B. Submit proof that installed materials will bear approved testing agency listing mark or classification markings.

1.4 WARRANTY

A. Warranty: Guaranteed against defective parts for a minimum of 2-years from the date of startup in the complete system, or 2-years after Owner acceptance of the units from the installing Contractor, whichever is less.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in section 170010.

1.6 COORDINATION

A. Coordinate with separate on/off power relay.

PART 2 - PRODUCTS

2.1 STENNER PERISTALTIC-TYPE CHEMICAL METERING PUMPS

A. General: Peristaltic-type with variable output. All units shall be of the same manufacturer. Provide in capacities and for specific uses as given on the Pump Schedule of the Drawings.

B. Pump Head: Clear plastic, peristaltic roller housing, removable from the motor housing without the use of tools. Output volume adjustable, while pumps are in operation, from 5% to 100% by means of a rotating bezel ring.

C. Drive: Pump drive incorporating a fan cooled motor, on/off toggle switch, with standard three prong receptacle plug.

D. Mounting: Provide with corrosion resistant mounting bracket.

E. Pump Tubing: Tygon tubing "beige" color, or Santoprene, resistant to ozone and UV light; or approved equal. Tubing shall meet USP Class VI, FDA, and NSF criteria. Sized as required for proper pump operation. Manufactured by: Norton “Phar Med” supplied by AIN Plastics Inc. Santa Fe Springs, CA (310) 946-2351; or approved substitute.

F. Required Options and Spares:

1. Clay lead tube weight (to submerge the foot valve).
2. A foot valve with integral strainer.
3. Spare pumping tube assembly.
4. 20 foot of 3/8 inch lead tubing.
5. Connection fittings, nuts and ferrules.

G. Manufacturer: *G.H. Stenner and Co.* Jacksonville, FL (800) 683-BEST; or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with the Manufacturer's instructions at locations indicated on the drawings.

B. Mounting: Only Type 316 stainless steel hardware shall be used.

C. Connections: Provide all necessary tubes and fittings to install as indicated on the drawings.

D. Splash Shield: Provide hinged acrylic splash shield at pump shelf to prevent facial exposure to accidental spray from loose or incorrectly attached tubing. The hinges and all hardware shall be nonmetallic or Type 316 stainless steel.

1 END OF SECTION

SECTION 170120 - HORIZONTAL FRP PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. Pump capacity, horsepower, TDH (Total Dynamic Head), speed, minimum efficiency, suction and discharge diameters, type, and other requirements shall be as shown on the drawings and shall comply with the requirements as specified herein for each type of service. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Pump performance shall be optimized with provision of variable speed drives (VFDs) where designated.

C. The specified *Fybroc* pumps are built to ANSI dimensional standards.

1.2 CODES

A. Comply with all applicable safety codes, ASTM, and ASME/ANSI.

1.3 COORDINATION

A. Housekeeping Pads: Concrete material for base of frame mounted pumps is to be provided in accordance with the Structural Drawings; coordinate concrete work with baseplate sizes.

B. Coordinate Power Supply with Electrical: The Contractor is responsible to fully coordinate pump motor sizing with the electrical power supply. Coordinate power wiring from motor starter, to junction box on pump motor, with Electrical Division of the Project Manual and Electrical Code requirements. See Electrical drawings for power supply to the motor starters.

C. Coordinate VFDs with Electrical: Variable frequency drives (VFDs) and motor starters are called out in the Electrical documents. The Mechanical Contractor is responsible to fully coordinate pump motor sizing with the electrical power supply. Installation of the specified braided grounding cable required a ground termination, installed at the pump by, as approved by the Electrical requirements.

D. Seal Flush Piping Plan: Coordinate the seal flush piping “Plan” with manufacture for each specific pump installation.

E. Where pumps are equipped with local controls provided by the pump manufacturer, control wiring shall be fully coordinated with the Electrical Contractor.

F. The following pumps shall be supplied with abrasion-resistant VR-1A resin and Plan 31 seal flush piping:

1. REC-PFIL01-001 & -002.
2. REC-PFRAC01-001.
3. REC-PTRN01-001 & -002.
4. SMU-PMIX01-001.

G. Temporary Startup Strainers: For *Fybroc* pumps not installed with permanent basket strainers in the pump suction piping, install temporary startup strainers prior to running any flow of water thorough the pumps.

1.4 SUBMITTALS

A. Submit shop drawings and product data in accordance with Division 1. Submittals shall include a complete pump description plus material list including casings, impellers, covers, seals, shaft, hardware, bearing frame, motor mounts, guards, baseplate, exterior coatings, and the following items:

1. Certified dimensional drawings of each item of equipment and auxiliary apparatus to be furnished, including equipment weights and location and size of anchor bolts.
2. Literature and drawings describing the equipment, including parts list and materials of construction, in sufficient detail to indicate full conformance with the detail specifications.
3. Motor performance data and wiring diagrams.
4. Cut sheets on accessory items.
5. Manufacturer's certified rating curves, to satisfy the specified design conditions, showing pump characteristics of discharge, head, brake horsepower, efficiency and guaranteed net positive suction head required (NPSHR).
6. Where applicable, variable speed curves shall be provided showing at least three speeds plotted equally from maximum rpm to minimum rpm. Minimum rpm shall be no less than that required to obtain minimum flow. Curves shall show the full recommended range of performance and include shut off head. This information shall be prepared specifically for the pump proposed. The substitution with catalog sheets showing a family of curves will not be acceptable.

B. Installation Instructions and Operating and Maintenance Manuals shall include recommended protection and maintenance required for storage prior to putting pumps in service, and may be submitted anytime before shipment of the pumps.

C. Shop drawings of safety cages required around all rotating elements.

D. Submit technical information on special grounding of motors for VFD pumps.

E. Submit information on temporary startup strainers. Required in pump suction piping where design does not include permanent strainer baskets in the pump suction piping.

F. Submit statement that the Contractor will retain services of the manufacturer’s factory representative for checking alignment and initial operation. Or provide a statement that the Contractor will be responsible for alignment of frame-mounted pumps and motors and cover the all costs related to damage of the mechanical seals if mis-alignment is suspected.

G. Submit warranty covering or exceeding requirements given below.

1.5 WARRANTY

A. Pump equipment Manufacturer shall warrant and guarantee all equipment furnished to be free from defect in materials for a minimum of 1-year from the date of startup of the complete system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever date occurs first. Manufacturer’s warranty shall not relieve the Contractor from furnishing a complete system warranty as specified in the General Conditions. The motor manufacturer’s standard warranty shall not be reduced because of use with a variable speed drive service.

1.6 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Sectional 170010.

1.7 CURVE FITTING FOR VARIABLE FREQUENCY DRIVE (VFD) APPLICATIONS

A. Trim & Speed Selection: Pump supplier shall optimize the pump efficiency by varying the speed and impeller trim given the following constraints:

1. Filter Pumps:

   a. Must produce 100% of scheduled GPM and 100% scheduled TDH between 85% to 100% of scheduled speed.
   b. Manufacturer shall optimize impeller trim for maximum efficiency at 100% scheduled GPM and 80% scheduled TDH.
   c. Final impeller trim shall be coordinated with the submittal review by the Engineer and shall be the maximum possible diameter without requiring an increase to the motor horsepower.

2. Other Pumps: Typically select most efficient impeller trim for pump operating at scheduled speed, flow, and TDH. Where increased efficiency can be gained by operating at a lower than scheduled speed, manufacturer shall provide the higher efficiency pump with speed reduction by the VFD; where cost is a consideration, the higher efficiency pump may be listed as an alternate to the basic size scheduled pump.

1.8 FACTORY TESTING

A. Factory performance testing — required for all frame-mounted centrifugal pumps: a non-witnessed factory test, per Hydraulic Institute Standards; Acceptance Level A, per ANSI/HI 1.6-2000 or latest revision; shall be performed on one pump of each size and trim. Tests may be those previously performed on identical pumps, or otherwise, shall be performed on the actual pumps supplied for this project.

1.9 MANUFACTURER

A. *Fybroc*, *CECO Environmental* (1500 Series, frame-mounted/long-coupled); (1530 Series, close-coupled) Telford, PA (215) 723-8155 www.cecoenviro.com .

PART 2 - PRODUCTS

2.1 FRP END-SUCTION CENTRIFUGAL PUMPS

A. Type: In accordance with latest revision of the American National Standard ASME/ANSI B73.5, "Specification for Horizontal End Suction Centrifugal Pumps for Chemical Process." The following types of pumps shall be as per the Pump Schedule on the Drawings:

1. "Frame-Mounted" *Fybroc* Series1500 Process Pumps.
2. "Close-Coupled" *Fybroc* Series 1530 Process Pumps.
3. Recessed Impeller" *Fybroc* Series 3000.

B. Impellers & Casings:

1. General: Impellers shall be semi-open impeller type and shaft sleeve shall be integral one-piece design without gaskets or O-rings. Casings shall be continuous-strand FRP thermoset construction for maximum strength and corrosion resistance. Casing volutes shall have foot mounts and be of one-piece construction with integral flat face flanges dimensioned according to ANSI/ASME B16.5 Class 150).
2. *Fybroc* Series 1500 Frame-Mounted Process Pumps: Frame-mounted pumps shall employ drop-out or spacer-type coupling for ease of servicing drive shafts and seals. Shaft thrust adjustment shall be by means of external jack screws or micrometer-type adjuster.
3. *Fybroc* Series 1530 Close-Coupled Process Pumps: Shipped from the pump manufacture with a ridged power frame connecting the motor to the pump casing.
4. *Fybroc* Series 3000 Recessed Impeller Pumps: Designed with a recessed impeller, with internal clearances, to provide smooth flow-through of water with solids content and heavy-duty applications. Suitable for pumping seawater of 3.3 percent salinity, sand and grit suspended in the water, and capable of passing spheres up to 1-7/8 inches in diameter. The impeller shall be radial-vained, non-clog, and located outside of the flow path. Capable of operating under continuous vacuum conditions. Available with “frame-mounted” pump motor combinations. The casing shall be a back-pullout design with external adjustment for the shaft thrust.

C. Power Frames: Cast iron or ductile iron. The exterior surfaces shall have a highly corrosion resistant treatment and coating system conforming to the coating requirements specified below. The metal power frame shall have an electrical bonding wire connected to the main grounded components or have a separate identified ground wire terminal.

1. Frame-Mounted Pump/Motor Combinations:

    a. Bearing housing shall have inboard single row radial bearing and outboard double row axial thrust bearings.
    b. Bearings shall be oil lubricated and built with oil reservoir and sight glass for ease of filling, fill port to prevent overfilling, and INPRO Type VBX labyrinth seals, or approved equal.
    c. Equip with standard Woods SC couplings, Dodge D-Flex couplings, or approved substitute.
    d. Provide nickel-plated bronze and Viton labyrinth type oil seals with all frame mounted end suction centrifugal pumps. *INPRO/SealTM Type VBX,* or approved equal.
    e. Safety Guards: Provide a corrosion resistant stainless steel or non-metallic guard covering all rotating elements, including shaft, coupling and mechanical seal and/or otherwise in compliance with OSHA Standard 29 CRF 1910.219

2. Close-Coupled Pump/Motor Combinations: Power frame built for ridged connection of the pump casing to the motor while allowing for installation of mechanical water seal at the back of the pump casing.

D. Suitability and Materials: The pump shall be suitable for pumping seawater of 3.3 percent salinity. Where materials of construction are not specified herein, the Manufacturer shall use first class, commercial grades best-suited for the particular use for which they are employed and shall conform to the following:

1. Pump casing: Fiberglass Reinforced Polymer (FRP)* with vinyl ester resin.
2. Pump impeller: Fiberglass Reinforced Polymer (FRP)* with vinyl ester resin.
3. Pump shaft: Type 316 or 2205 stainless steel.
4. Bearing Housing: Cast iron or ductile iron.

* Pumps designated for ""Recovery" and "Mixing" applications shall be supplied with abrasion-resistant materials such as *Fybroc* VR-1A or equal.

E. Baseplate and Mounts:

1. Base Mount for Grout Fill: Shall be of highly corrosion resistant FRP material, rigid construction, sloped drip pan under the pump with tapped drain connection, threaded inserts to accept all ASME/ANSI pumps and NEMA/IEC frame motors, drilled and tapped for pump and motor mounting bolts, and with grout holes. Pump and motor shall be factory mounted on the common baseplate.
2. All shims shall be of Type 316 Stainless Steel. All blocking shall be of specified materials; non fiber-reinforced plastic not allowed.

2.2 CORROSION-RESISTANT COATING REQUIREMENTS

A. All external exposed ferrous metal parts, except stainless steel, to be factory coated as follows:

1. Surface Preparation: Break all sharp edges by grinding or filing to prevent "pin-pointing" of coating. Prepare base metal with abrasive blast and/or solvent cleaning to remove any contaminants, grease, mill scale, oil, and oxidation products. Follow with treatment of the cleaned surfaces with zinc or iron phosphate to improve corrosion protection.
2. Corrosion Resistant Coating: Finish with a coating system consisting, recommended for corrosion resistance, of no less than two coats epoxy with a minimum total dry film thickness of 8-12 mils, or a polyester thermosetting powder coating (Spraylat PRPL 96005 or approved equal) with a minimum total dry film thickness of 5-8 mils.

B. Exterior Motor Coatings: All external metal parts, except stainless steel, shall be protected with the motor manufacturer's recommended coating system for maximum corrosion-resistance. No less than two coats epoxy are required with a minimum total dry film thickness of 8-12 mils.

2.3 MOTORS

A. Motor Types: All motors shall be totally enclosed and fan cooled (TEFC). Exposure duties shall be as follows:

1. Motors 1-hp and smaller shall be either Chemical Duty, Severe Duty, or coated to resist corrosion.
2. Motors 2-hp through 5-hp shall meet the NEMA Standard for Chemical Duty and Premium Efficiency.
3. Motors larger than 5-hp shall meet NEMA Standards for either Chemical Duty or Severe Duty and Premium Efficiency.
4. Motors powered by variable frequency drives shall meet the NEMA Standard for Inverter Duty, MG1, Part 31.

B. Motor Sizing: Fixed-speed motors shall not overload for pump flows between zero and 130 percent of the pump design point; however, certain motors have been scheduled on the Drawings for non-overload throughout the operational range of the pump curve, such as vacuum service pumps. Minimum size of motors for installation with Variable Frequency Drives shall be sized for full synchronous speed. Pump supplier shall verify scheduled horsepower meets above requirements and in no case shall the horsepower be less than indicated on the Drawings without specific approval from the Engineer.

C. Power: Electrical requirements including phase, frequency, and voltage are indicated on the Drawings. Motors shall have minimum 1.15 service factor. The pump manufacturer shall verify motor is sized for rated shaft horsepower at full load 60 Hz speed (full synchronous speed) regardless of selected operating speed, unless noted otherwise on the Drawings. Vendor shall confirm that motor current does not exceed allowable full load amperage at reduced frequency.

D. Insulation: Class F insulation minimum for Class B temperature rise.

E. VFD Duty: Where a Variable Frequency Drive (VFD) requirement is indicated on the Drawings, the motors shall be rated by the motor manufacturer for variable frequency duty and meet requirements of NEMA MG1-1993, Part 31.

F. Motor Efficiencies: For VFD applications, *Inverter Duty* motors shall be supplied as specified above. All single speed motors shall be either "High Efficiency" or "Premium Efficient" as specified below.

1. Motors 1-hp and smaller shall be "High Efficiency" motors or better (unless Inverter Duty is required).
2. Motors larger than 1-hp shall meet or exceed the "Premium Efficient" motors mandated by U.S. Department of Energy, Energy Policy Act (EPACT) of 1992 (except in the case where Inverter Duty motors are required); "Premium Efficient" motors shall have higher full-load efficiencies than "High Efficiency" motors as defined by IEEE Standard 112, Method B.

G. VFD Motor Grounding: All VFD pumps and Inverter duty motors shall be provided with shaft grounding rings to dissipate the buildup and discharge of electric currents within the motor and/or its bearings. Grounding rings shall be provided and installed by the motor or pump manufacturer. Manufactured by:

1. *Aegis,* Mechanic Falls, ME, (207) 998-5140 www.est-aegis.com;
2. *Shaft Grounding Systems* (SGS), Florence, Oregon (541) 997-4068 www.shaftgroundingsystems.com;
3. or approved substitute.

2.4 MECHANICAL SEALS

A. Pump seals shall be compatible with other pump materials with regard to corrosion resistance and wear. The pump supplier shall take full responsibility for proper installation and selection for application of all seals. Mechanicals seals shall be flushed via an internal pump cover flush, unless shown on the Drawings or otherwise specified. This shall allow the process fluid to recirculate internally and provide a flush of the mechanical seal faces, thereby eliminating the need for a separate fresh water flush.

B. Main seals:

1. Process type pumps larger than 5-horsepower shall be provided with single external mechanical type seals. Seal face materials shall be carbon versus chemical grade ceramic, or silicon carbide versus silicon carbide (where designated for abrasive applications), or as selected by the pump manufacturer for the specific application. Elastomers shall be EPDM or Viton rubber. Glands and sleeves shall be Type 316 SS or FRP. Metal parts shall be Type 316 SS and springs shall be of Type 316 SS or Hastelloy-C. John Crane single 8B2 seal.
2. Smaller pumps shall be provided with the Manufacturer's recommended mechanical seal suitable for saltwater, unless otherwise indicated on the drawings.

2.5 SEAL FLUSH PIPING PLAN

A. Seal Flush Piping Plan: Provide with fittings and tubing for the following arrangements as applicable for the specific installations:

1. Plan 11: Circulation from pump discharge to seal chamber for typical horizontal process applications.
2. Plan 31: Seal flush from pump discharge through a cyclone separator for water with heavy laden suspended solids or sand. Applicable for pumping dirty backwash “Recovery” water, water with settlement, vacuuming pumps, and “Mixing” pumps.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Pumps shall be installed in accordance with the Manufacturer's instructions.

B. General Requirements:

1. Housekeeping Pads: Unless shown otherwise on the drawings, provide a concrete housekeeping pad for all pumps.
2. Pump Discharge Connections: The drawings show suction and discharge sizes for the pumps. Increasers or reducers, as may be required at the pump outlet port, and shall be provided by the installing Contractor. All increasers on the discharge side of pumps shall be FRP gradual reducers by Conley Composites www.conleyfrp.com, or equal, and substitution with bushing fittings is not acceptable.
3. Where "reducing" type flex couplings are indicated at the pump suctions, "straight" type couplings shall not be substituted.
4. Piping Alignment: Inlet and outlet piping must be in alignment with pump nozzles prior to fastening and not re-aligned by bolting to pump.
5. Start-up Strainers: Install temporary cone strainers in the intake pipe, directly before each pump where a permanent basket strainer is installed upstream of the pump.

C. Additional Requirements for Frame-Mounted Pumps:

1. Pre-Alignment: Prior to grout fill rigidly securing the mounting base, adjust alignment of pump base so there is no stress between the pump and the piping.
2. Rotation: Verify motor rotation with motor coupling disconnected.
3. Pump/Motor Alignment: Proper field alignment is the responsibility of the Contractor. The Contractor shall retain and coordinate services of the manufacturer’s factory representative to check the pumps, assembly, installation, alignment and initial operation.
4. Certify Installation: Prior to operation of each pump, an authorized manufacturer’s representative shall certify the installation meets manufacturer’s instructions. An authorized representative shall be present at pump startup. After installation, the Contractor shall deliver to the Owner a certificate of proper pump installation authorized by the pump manufacturer.

D. Close-Coupled Pumps:

1. Where not mounted on a factory solid-filled baseplate, the base mounts shall be solid grout filed by the installing Contractor including provision of grout-stop at open end(s) if required.

2. Rotation: Verify motor rotation, starting with an electronic rotation checker, and cautiously initially bumping power to the pump.

E. Grout Fill FRP Bases: Before the pumps and motors are aligned and certified as properly installed, the cavity between the FRP baseplate and the housekeeping pad shall be filled with non-shrink grout. It may be necessary for the Contractor to drill "extra" grout holes in addition to those provided by the pump manufacturer. It is essential that non-metallic bases are completely and fully grouted without any air-gaps or voids below the top plate. Steel base frames do not require a grout fill

F. Grounding for VFD Driven Pumps:

1. Insure motor shafts are provided with grounding rings to prevent stray currents from traveling through bearings. Complete any grounding in accordance with the recommendations or the manufacture of the grounding rings.
2. Install a braided tin-plated copper ground wire from the power frame to an established ground termination. This cable is required in addition to any other grounding wiring.

G. Do not install valves directly on pump discharge flanges.

H. Where seal flush tubing is delivered separate of the pump, complete the tubing installation with the Seal Flush Plan Piping in accordance to the installed application and the manufacturer's recommendations. Contractor shall verify that "Recovery" pumps and "Mixing" pumps are installed with Plan 31 or better seal flush.

I. Startup pumps in accordance with manufacturer's recommendations. Pumps must be flooded or primed with water prior to starting. Open the inlet valve. Close, or partially close, the discharge valve; then open discharge valve slowly soon after starting the pump.

J. Technical Seminar: At completion of the installation, the contractor shall make arrangements for technical seminar by the pump factory representative to the owner' staff. The seminar shall include instruction on pumping operations, seal replacement, shaft alignment, lubrication, preventative maintenance, and other routine maintenance requirements.

END OF SECTION

SECTION 170129 - SMALL COMPOSITE PUMPS & CONTROLLERS

PART 1 - GENERAL

1.1 SUMMARY

A. Pumps are installed for all 120V, 1 phase DC pumps noted on the pump schedule, shall be horizontal centrifugal type, and may be installed submerged in water or mounted in air environment The submersible pumps are typically used in process treatment reservoirs with less than a 6-ft water depth.

B. Pump capacity, power, TDH (Total Dynamic Head), suction and discharge diameters, type, and other requirements shall be as scheduled on the Drawings and shall comply with the requirements as specified herein for each type of service. The General Conditions shall apply to this Section as fully as if repeated herein.

C. Provide one spare pump for unit size called out in equipment schedule.

1.2 PUMPS AND CONTROLLERS

A. Quantity of Controllers: Installed with one (1) pump with one (1) dedicated controller, 1:1.

B. Power wiring to the pump controllers shall be completed by the Contractor in the field per the electrical Design Documents. Cables from controllers to the pumps, shall be provided by the manufacture, and installed per the LSS Design Documents.

1.3 QUALITY ASSURANCE

A. Pumps and motors shall be preassembled at the factory to ensure proper fit.

B. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). The supplier/ manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.4 COORDINATION

A. Mounting of Controllers: Coordinate mounting of local controllers on stanchion, or appropriate mount, and coordinate with current breaker and power cable provided with the Electrical Design Documents. Location of the controllers shall allow for ease of operator access, avoid any splashing of water from associated reservoir tanks, and minimize length of power cables from the controller to the tanks.

B. Connection Cable Length: Coordinate length required for the cable from the controller or drivers, to the submersible pumps, with factory cable options and each installation requirement for the length of cable.

C. Cable Conduits: Where conduits are provided by the Contractor for wiring, the diameter may have to be oversized to accommodate the pump manufacturer's standard materials.

1.5 SUBMITTALS

A. Submit complete motor and pump data. Characteristic curves showing flow, TDH, efficiency, and power. Complete pump description plus material list including casings, impellers, seals, shaft, bearing frame, and fasteners. Submit guaranteed maximum submergence depth.

B. Submit physical and operational data for controllers.

C. Submit warranty.

1.6 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.7 WARRANTY

A. The manufacture shall warranty the pumps and controllers to be free of defects in material and workmanship for 2-years after startup in the water treatment system, or 2-years after Owner acceptance of the units from the installing Contractor, whichever is less.

PART 2 - PRODUCTS

2.1 10 GPM AND GREATER SMALL COMPOSITE SUBMERSIBLE PUMPS

A. General: The submerged pumps shall be suitable for pumping saltwater. Where materials of construction are not specified herein, the manufacturer shall use first class commercial grades best suited for the particular use for which they are employed. The centrifugal type pumps shall have direct suction to a high efficiency impeller. Shall be built for installation in no less than 2-meter water depth.

B. Balance: All rotating parts shall be accurately machined and trimmed for optimum rotational balance.

C. Materials: All wetted components of plastic or Titanium. All wetted materials shall be safe for permanent use in marine environments.

D. Inlet/Outlet: Order and deliver with optional "Imperial" size port adapters.

E. Motor: Integrated motor designed to run submerged in saltwater and DC powered by the provided controller.

F. Controller/Drive: Factory packaged with a programmable driver with a soft start. Program options shall include for wave bursts and random modes. The pump and/or controller shall include safety functions for dry running, high temperature, and overload protection.

G. Connection Cable: The pump shall be delivered with connecting cable and permanently sealed against water intrusion at the motor end.

H. Controller / Drivers

1. General: Compact, high performance, high functionality, high quality, current vector motor drive. The programmable unit shall have the following features:

    a. Variable speed range from 0 to 130% of synchronous motor speed.
    b. Dry run protection.
    c. Soft start.
    d. Temperature protection.
    e. Over-current protection.
    f. Low noise operation.

2. Design Features: Shall include microprocessor logic, push-button operation adjustments, LED status display. IP65-rated splash-proof controller.
3. Service Conditions: Ambient service temperature: 2 deg C to 40 deg C (33 deg F to 105 deg F).
4. Frequency Performance:

    a. Input frequency: +/-5%; 50/60 Hz
    b. Output frequency: 0 to 78 Hz (or greater)
    c. Frequency resolution: 0.01 Hz with digital reference or 0.06 / 60 Hz with analog reference.
    d. Frequency accuracy: 0.01% with digital command or 0.5% with analog command function.

5. Display: The display shall have an overview of pump operating conditions, including the following:

    a. Adjusted power setting in percent.
    b. Driver temperature.
    c. Operating mode.
    d. LED status lamp indicating the product is working properly.
    e. Other factory status options.

6. Shall include the following protective features: Current limit, stall prevention, motor and drive overload, over and under voltage prevention, instantaneous over current, and ground fault protection.

I. Manufacturer of Packaged Pump and Controller

1. Base Manufacturer*: Abyzz America, LLC.* Star, ID www.abyzzamerica.com
2. Alternate Manufacturers: Alternate potential manufacturers shall not compromise the above specified requirements and may require the Contactor to make adjustments in pipe routing, equipment layout, and power supply from what is shown on the Drawings.

2.2 10 GPM AND LESS SMALL COMPOSITE SUBMERSIBLE PUMPS

A. General: The versatile submersible and non-submersible application pumps shall be suitable for pumping saltwater.

B. Materials: All wetted components of plastic or Titanium. All wetted materials shall be safe for permanent use in marine environments.

C. Inlet/Outlet: Included with “QuickCouple” connectors.

D. Motor: Integrated motor designed to run submerged in saltwater and DC powered by the provided controller.

E. Controller/Drive: Factory packaged with a programmable driver with a soft start. Program options shall include for wave bursts and random modes. The pump and/or controller shall include safety functions for dry running, high temperature, and overload protection.

F. Connection Cable: The pump shall be delivered with connecting cable and permanently sealed against water intrusion at the motor end.

G. Manufacturer of Packaged Pump and Controller/Driver

H. Base Manufactuer:

1. Vectra Return Pump *by Ecotech Marine* https://ecotechmarine.com/vectra. Supplied by: CoralVue Slidell, LA (985) 781-1220 www.CoralVue.com.
2. Alternate Manufacturers: Alternate potential manufacturers shall not compromise the above specified requirements and may require the Contactor to make adjustments in pipe routing, equipment layout, and power supply from what is shown on the Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Pumps shall be installed in accordance with the Manufacturer's instructions. The composite plastic submersible pumps shall not be installed in water depths exceeding 6-foot.

B. The installation of the controllers/drivers shall be completed as compact as possible while maintaining required safety clearances. The location shall be free of, or otherwise protected from, water splashing and moisture. Ensure sufficient air flow for cooling of drivers.

C. Rotation: Verify motor rotation prior to final installation.

D. Demonstrate proper operation of pumps and controllers to the Owner’s staff.

E. Deliver spare pumps to Owner at end of construction (refer to equipment schedule)

END OF SECTION

SECTION 170130 - GENESYS & ADVANCED MDM PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. This specification is limited to only “Genesys” and “Advanced” models as manufactured by *MDM Pumps*.

B. Pump capacity, horsepower, TDH (Total Dynamic Head), speed, minimum efficiency, suction and discharge diameters, type, and other requirements shall be as shown on the drawings and shall comply with the requirements as specified herein for each type of service. The General Conditions shall apply to this Section as fully as if repeated herein.

1.2 COORDINATION

A. Housekeeping Pads: Provide concrete pad as required for level mounting condition.

B. Anchoring for “Genesys” Pumps: Install Type 316 SS female inserts in concrete base pad matching alignment of pump anchor bolts. See pump detail on drawings.

C. Coordinate with Electrical: The Contractor is responsible to fully coordinate the electrical power supply with the pump motor sizing. Coordinate power wiring from motor starter, to junction box on pump motor, with Electrical Division of the Project Manual and Electrical Code requirements. See Electrical drawings for power supply to the motor starters.

D. VFDs: Coordinate pumps with Variable Frequency Drives (VFDs) with the Electrical Design Documents.

1. VFDs and starter switches shall be provided per the Electrical Design Documents at pump locations where VFDs are called for on the LSS Pump Schedule.
2. Provide each VFD pump installation with an Inductive Absorber, and/or shaft Grounding Ring as specified below.

E. Coordinate Seal Flush Piping Plan:

1. Plan 1: Applicable for pump Tag No.: FMU-PHEX01-001.
2. Plan 13: Circulation from seal chamber to pump suction for typical saltwater process applications.
3. Plan 31: Applicable for Tag No.: REC-PFIL01-001 & -002.

1.3 SUBMITTALS

A. Submit complete motor and pump data. Characteristic curves showing flow, TDH, efficiency, horsepower, and NPSH required. Complete pump description plus material list including casings, impellers, seals, shaft, bearing frame, motor mounts, guards, base plate, and exteriors.

1. Dimensional drawings of each item of equipment and auxiliary apparatus to be furnished, including equipment weights and location and size of anchor bolts.
2. Literature and drawings describing the equipment, including parts list and materials of construction, in sufficient detail to indicate full conformance with the detail specifications.
3. Motor performance data and wiring diagrams.
4. Manufacturer's certified rating curves, to satisfy the specified design conditions, showing pump characteristics of discharge, head, brake horsepower, efficiency and net positive suction head required (NPSHr).
5. Where applicable, submit information on the seal-flush plan.
6. For “Genesys” pumps submit information on factory-supplied spacer matching the motor mounts with the pump casing mounts.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.5 WARRANTY

A. The pump manufacture shall warranty products to be free of defects in material and workmanship, and perform as specified, for 1-year after startup in the water treatment system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever is less. The manufacture shall replace or repair products found defective within the 1-year warranty period.

PART 2 - PRODUCTS

2.1 “GENESYS” MODEL NON-METALLIC CLOSE COUPLED PUMPS

A. Type: Industrial end suction centrifugal pumps with flange casing connections and close coupled motor. Shall be a true back-pullout design allowing pump casing to remain bolted to piping while performing maintenance on seal and impeller.

B. Materials: The pump shall be suitable for pumping seawater of 3.3 percent salinity. All wetted parts shall be of non-metallic, stainless steel, corrosion resistant material.

1. Pump Casing: Compression molded thermoset cross-linked vinyl ester resin.
2. Impeller: Noryl plastic.
3. Seal: Non-metallic seal, selected by manufacturer, for compatibility with saltwater. Impenatra® non-metallic seal by *MDM* or equal. With EPDM elastomers.
4. Impeller Insert: If required, Type 316 SS threaded impeller insert suitable for saltwater duty.

C. Motor: Equipped with a TEFC motor, voltage and current phases as scheduled on the Drawings.

1. 3- phase motors, or 0.5 hp and larger, shall have Class F insulation; smaller motors may have manufacturer’s selected insulation Class protection against overheating.
2. Where used with variable frequency drives (VFDs), the motor shall for sustained operation while running on the active VFD and capable of a minimum 2:1 turn-down ratio.
3. Factory equipped with motor support spacer for matching base of pump casing mounts.

D. Seal Flush Piping Plan: Provide with fittings and tubing for the following arrangements as applicable for the specific installations:

1. Plan 1: No seal flush piping for intermittent duty freshwater applications.
2. Plan 13: Circulation from seal chamber to pump suction for typical saltwater process applications.
3. Plan 31: Seal flush from pump discharge through a cyclone separator for water with heavy laden suspended solids or sand. Installed for pumping dirty backwash water, water with settlement, or a vacuuming pumps.
4. Plan 32: Seal flush from an external clean source where pumps operate with a negative pressure at the suction such as a primed operation.

E. Model Manufacturer: *MDM "Genesys" pump,* Colorado Springs, CO (800) 447-8342 www.mdminc.com.

2.2 "ADVANCED" MODEL NON-METALLIC CLOSE COUPLED PUMPS

A. Type: Industrial end suction centrifugal pumps with threaded-type casing connections and close coupled motor. The pump and motor assembly shall be designed to allow access to impeller, seals and motor, with the pump volute remaining connected to the piping. Semi-open type impeller.

B. Materials: The pump shall be suitable for pumping seawater of 3.3 percent salinity. All wetted parts shall be of non-metallic, stainless steel, corrosion resistant material.

1. Casing & Impeller: Molded glass reinforced Noryl plastic where available, otherwise Polypropylene.
2. Seal: Non-metallic seal, selected by manufacturer, for compatibility with saltwater. Impenatra® non-metallic seal by *MDM* or equal.
3. Impeller Insert: If required, Type 316 SS threaded impeller insert suitable for saltwater duty.

C. Motor: Equipped with a TEFC motor, voltage and current phases as scheduled on the Drawings. Where used with variable frequency drives (VFDs), the motor shall for sustained operation while running on the active VFD and capable of a minimum 2:1 turn-down ratio.

D. Model Manufacturer: *MDM "Advance" pump,* Colorado Springs, CO (800) 447-8342 www.mdminc.com.

2.3 INDUCTIVE ABSORBERS AND/OR GROUNDING RINGS.

A. VFD Motor Grounding or Induction Absorbers: All Inverter duty motors shall be provided with shaft grounding rings, or antistatic ring, and/or induction absorbers to help dissipate the buildup and discharge of electric currents within the motor and/or its bearings.

1. Shaft Grounding Rings: Shall be provided and installed by the motor or pump manufacturer. *Shaft Grounding Systems* (SGS), Florence, Oregon (541) 997-4068 www.shaftgroundingsystems.com; or *Aegis, Mechanic Falls, ME, (207) 998-5140 www.est-aegis.com;* or approved substitute.
2. Inductive Absorbers: These are to be installed on the power supply cables. "CoolBLUE" inductive absorbers by *MH&W International Corp* (201) 252-8125 www.coolblue-mhw.com; or approved substitute. Applies to pumps 0.5 hp and larger.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Pumps shall be installed in accordance with the Manufacturer's instructions.

B. For pumps 0.5 hp and larger, running on VFDs, install inductive absorbers on power cables or install shaft grounding rings. Installed inductive absorbers close to the VFD, on power cables, leading to the pump motors.

C. For pumps running on VFDs, install a braided tin-plated copper ground wire from the power frame to an established ground termination. This cable is required in addition to any other grounding wiring.

D. Inlet and outlet piping must be in alignment with pump nozzles prior to fastening and not re-aligned when fastening to pump.

E. Rotation: Verify motor rotation with motor coupling disconnected or verify motor rotation using a rotation tester for AC pump motors.

F. Prime pump, or flood with water, before running. Demonstrate proper operation of constant speed pumps and pumps with local VFDs.

3.2 “GENESYS” PUMP INSTALLATION

A. Pumps shall be installed in accordance with the Manufacturer's instructions and above “General” notes.

B. Where seal flush tubing is delivered separate of the pump, complete the tubing installation with the Seal Flush Plan Piping in accordance to the installed application and the manufacturer’s recommendations.

C. Verify a factory-supplied spacer is included for matching the motor mounts with the pump casing mounts.

D. Pump and motor shall be anchored to allow for removal of motor while leaving the pump casing anchored in place. Anchoring shall be done using threaded female inserts installed in the concrete base with Type 316 SS cap screws anchoring pump/motor flanges to the inserts. See pump installation detailing on Drawings.

3.3 “ADVANCED” PUMP INSTALLATION

A. Pumps shall be installed in accordance with the Manufacturer's instructions and above “General” notes.

B. Pump and motor shall be anchored to allow for removal of motor while leaving the pump casing anchored in place. Mount pump and motor on a thick HDPE baseplate. Mount the HDPE baseplate on Type 316 SS all-thread stanchions with a 2.5-inch space below the HDPE baseplate for access to pump and motor mount fasteners. See pump installation detailing on the Drawings.

1 END OF SECTION

SECTION 170138 - MAGNETIC DRIVE PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. Pump capacity, horsepower, TDH (Total Dynamic Head), speed, minimum efficiency, suction and discharge diameters, type, and other requirements shall be as shown on the drawings and shall comply with the requirements as specified herein for each type of service. The General Conditions shall apply to this Section as fully as if repeated herein.

1.2 COORDINATION

A. Housekeeping Pads: Provide concrete pad as required for level mounting condition.

B. Coordinate with Electrical: Coordinate power wiring from motor starter, to junction box on pump motor, with Electrical Division of the Project Manual and Electrical Code requirements.

1.3 SUBMITTALS

A. Submit complete motor and pump data. Characteristic curves showing flow, TDH, efficiency, horsepower, and NPSH required. Complete pump description plus material list including casings, impellers, motor mounts, and exterior coatings.

B. Submit warranty covering or exceeding requirements given below.

1.4 WARRANTY

A. Pump equipment Manufacturer shall warrant and guarantee all equipment furnished to be free from defects in materials for a minimum of 1-year from the date of startup of the complete system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever date occurs first. Manufacturer’s warranty shall not relieve the Contractor from furnishing a complete system warranty as specified in the General Conditions.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 MAGNETIC DRIVE PUMPS

A. Suitability: Suitable for pumping clear saltwater of 3.3 percent salinity.

B. Materials: All wetted parts shall be of polypropylene, polyvinylidene fluoride resin, or suitable glass reinforced plastic. Exterior hardware shall be Type 316 Stainless Steel.

C. Type: End-suction, close-coupled, seal-less magnetic drive pump. Mounted via motor support bracket.

D. Motor shall be high energy efficient, TEFC, three-phase, 60 Hertz, 208 volts. Regardless of the motor horsepower given on the pump schedule, pump supplier shall verify specified horsepower meets the scheduled requirements.

E. Manufacturer:

1. *Iwaki America*, Holliston, MA (508) 429-1440 www.iwakiamerica.com;
2. Sethco Division (*Metpro Corporation*), Hauppauge, NY (516) 435-0530;
3. *March Manufacturing Inc*., Glenview, IL (708) 729-5300;
4. *Hayward Flow Control* – RX model GFPPL magnetic-drive pump Clemmons, NC (888) 429-4635;
5. or approved substitutes.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Pumps shall be installed in accordance with the Manufacturer's instructions.

B. Inlet and outlet piping must be in alignment with pump nozzles prior to fastening and not re-aligned by bolting to pump.

C. Check motor rotation using a rotation tester for AC pump motors prior to “bump” testing for checking rotation.

D. Prime pump, or flood with water, before running.

END OF SECTION

SECTION 170140 - ELECTRIC VALVE ACTUATORS

PART 1 - GENERAL

1.1 SUMMARY

A. The location of electric valve actuators shall be as indicated on the Process and Instrumentation Diagrams and/or scale drawings. Sizing shall match requirement for valves and process conditions. The General Conditions apply to this Section as fully as if repeated herein.

B. The installing contractor shall make arrangements with the factory supplier of the actuators for final adjustment of limit switches and setting of all other operational parameters.

C. Motor actuators shall bear Underwriters Laboratories (U.L.) recognition, CSA or FM label.

1.2 COORDINATION

A. Before ordering, the Contractor shall verify the mating of actuators to valves. Whenever possible, it is recommended the valves and actuators are supplied to the Contractor as a single unit.

B. Coordinate for installation of higher VAC 3-phase power where electric actuators are installed for larger valves. For instance, valve 200 for the Sand Tiger Shark exhibit.

C. See specification Section 170142 for butterfly type valves.

D. See specification Section 170144 for ball type valves.

E. Electrical Contractor shall provide all conduit; provide, pull and terminate all wiring from electric valve actuators to controls cabinets. Termination shall consist of installing hard wiring for completion of circuits at termination points.

F. Coordinate with Automated Controls System (ACS) as required.

G. Contractor shall determine where oversized electric valve actuators may place excessive forces on valve/piping and provide separate support of such actuators as required. This situation is not uncommon for small actuated valves.

1.3 QUALITY CONTROL

A. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). The manufacturer/supplier shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.4 SUBMITTAL

A. Submit complete information describing all dimensions and materials.

B. Submit list of required stem torque for opening and seating of selected valves and output torque of corresponding actuator. This will require coordination with the valve selection.

C. Submit details of factory and custom designed actuator extensions, mounts, extension supports and bushings where required.

D. Submit proof that installed materials will bear approved testing agency listing mark or classification markings.

1.5 WARRANTY

A. The manufacture shall warranty the entire actuator to be free of defects in material and workmanship for 2-years after startup in the water treatment system, or 2-years after Owner acceptance of the units from the installing Contractor, whichever is less. The manufacture shall replace any components found defective within the 2-year warranty period.

1.6 MAINTENANCE AND OPERATIONAL DATA AND TECHICAL SEMINAR

A. Include pertinent information in the project bound Operation & Maintenance Data Manual per requirements in Section 170100.

B. After installation and at the operational startup of the facility, the manufacturer's representative shall conduct an on-site training seminar for the owner's operational staff including instruction on basic operations and routine maintenance requirements.

PART 2 - PRODUCTS

2.1 MOTOR ACTUATORS FOR BUTTERFLY VALVES

A. Quarter-turn gear type electric motor operated actuator provided with the following:

1. Housing: Actuator housing and primary carriers of high-grade Aluminum, carbon steel, ductile iron, or composite non-metallic. Housing to be NEMA 4 enclosure rating with O-Ring seals. Housing shall have provisions for a visual position indicator.
2. Torque Rating: Torque rating shall be minimum of 25% in excess of calculated torque for the design or installed condition.
3. Coating: If ferrous metal, provide special "corrosion resistant" zinc primer with over-coating. For outdoor installation provide acrylic or polyester coating with UV inhibitors top-coat (epoxy not recommended for outdoor exposure).
4. Mounts and Couplings: Where mounting blocks are required, they shall be Type 316 stainless steel. Valve shaft coupling of carbon steel, bronze or Type 316 Stainless Steel.
5. Drivetrain: Annulus gear of epicyclic type actuators shall be of hardened steel or bronze alloy. Output drive, input gear, worm gear, compound gear shall be of steel (aluminum or plastic gears are not acceptable). Where applicable, drive shaft journal shall be of high-density polyethylene material other appropriate non-metallic product. The drivetrain shall be permanently lubricated with molybdenum grease.

6. Manual Operator: Manual override handwheel with "spinner" handle and valve position indicator. Manual Operator shall be clutch free design requiring no lever engagement for valve positioning via handwheel operation. Handwheel shall not rotate when actuator is in motor driven positioning state.
7. Over-torque: Equip with over-torque protection. Over-torque limit switches may be located in a compartment separate from the terminal compartment to allow adjustments without electrical hazard and, if so, an internal heater shall be provided in the separate compartment.
8. Heater: Provide internal heaters for reduction of condensation.
9. Sequencing: The following appurtenances shall be selected to meet requirements of the Automated Controls Supplier. "Typical" motor actuators shall be suitable for open and close control and capable of “Jogging or Pulse Modulation” for intermediate positioning via pulse powering
10. Motor Duty: Electric motor rated for continuous 15-minute duty and sized by the Manufacturer per conditions indicated on the drawings and based on an operating pressure of 50 psig. Motor actuator shall bear Underwriters Laboratories (U.L.) recognition, CSA or FM label. Motors shall have class F insulation rating or higher. Motors shall include internal thermal overload protection (self-resetting design) triggering at 275 deg F.
11. Brake: Actuator geartrain shall utilize a design to eliminate valve disc positioning via fluid force, or otherwise equipped with a positive brake.
12. Speed: Rotation time shall be 30-seconds or less for 90-degree of travel or include motor speed shall be potentiometer adjustable with a 6:1 turndown ratio.
13. Limit Switches: Two (2) sets of position limit switches, minimum, for opened and closed valve position. Limit switches for open/close valve position shall be independent of other internal contacts such as over-torque limit switches.
14. External Hardware: All exposed cap screws, washers and other hardware shall be of 300 Series stainless steel.
15. Electrical: Nominal motor voltage shall match project installation requirements. Actuator shall have a or, conduit connector with screw terminal for wiring connections.

B. Manufacturer and Models:

1. *EIM (Emerson Process Management)* Missouri City, TX (800) 679-1561 www.emersonprocess.com;
2. *Asahi/America* (“Series 10” or “Series 19”) Lawrence, MA 01843 (800) 343-3618 www.asahi-america.com;
3. *Hayward Flow Control*, HRS Series Clemmons, NC (888) 429-4635 www.haywardflowcontrol.com;
4. No substitutes.

2.2 MOTOR ACTUATORS FOR REVERSING TWO-WAY BALL VALVES

A. Coordinate with requirements of Automated Controls System meeting the following specifications:

1. Housing: Non-metallic composite construction or cast aluminum housing with thermally-bonded power coating. NEMA 4X enclosure rating and all covers to have O-Ring seals.
2. Motor Duty: Reversing-type electric motor rated for *minimum* of 25% duty at 10 second intervals.
3. Indicator: Shall have an external visual position indicator.
4. Limit Switches (required option): Open and closed limit switches with silver contact points.
5. Condensation Protection (required option with metal housings): Provide heater. May be thermostat activated of be constantly energized.
6. External Hardware: All exposed cap screws, washers and other shall be of 300 Series stainless steel material.

7. Actuator shall provide manual override capability via easily accessible externally mounted hex socket or spinner wheel.

B. Manufacturer and Models:

1. *Asahi/America*, Series 19 “SAV” SMART Actuator, Lawrence, MA 01843 (800) 343-3618 www.asahi-america.com;
2. *EIM Company, Inc*. www.eim-co.com;

4. *Plast-O-Matic* Cedar Grove, NJ (973) 256-3000 www.plastomatic.com;
5. TRIAC Series 300/400 by *A-T Controls Group* Cincinnati, OH (513) 530-5175 www.a-tcontrols.com.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall supply all materials and labor for the complete installation of all actuators, mounting to valves, and other specified equipment. Install actuators as required for a complete workable system in accordance with Manufacturer's recommendations.

B. Contractor shall ensure electrical equipment is in conformance with a approved testing laboratory listing and bears certification labeling.

C. Where the exact location of a actuator is not shown, it shall be installed in an accessible place and as directed by the Owner's Representative.

D. Shall be orientated to allow visual inspection of the valve position indicator from the service corridor path and installed to allow of routine servicing.

E. Install direct support of valve actuator where an “oversized” condition exists. Otherwise install direct support, or adjacent piping supports, to eliminate excessive deflection and carry the additional loading.

F. Install intermediate supports for valve operator extensions as recommended or required by valve or actuator manufacturer. Excessive deflection in the extension during normal operation, as determined by the Owner’s Representative, shall be corrected immediately by the Contractor at no additional cost to the Owner.

G. Contractor shall deliver services, as needed by the factory supplier of the actuators, for final adjustment of limit switches, setting of cam positions, completion of wiring terminations, and setting of all other operational parameters as required for fully functioning electric valve actuation.

END OF SECTION

SECTION 170142 - BUTTERFLY VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. The size and location of all valves shall be as indicated on the Process and Instrumentation Diagrams and/or scale drawings. The General Conditions apply to this Section as fully as if repeated herein.

B. All butterfly valves shall be installed with permanently fixed stainless steel or engraved plastic identification tag. All tags shall be of a neat and uniform design, with relief or engraved lettering. Tags shall clearly identify the valve number, as given on the Process and Instrumentation Diagrams. See specification Section 170010 for pipe and valve identification requirements.

C. All similar type butterfly valves shall be of the same manufacturer.

1.2 COORDINATION

A. Before ordering valves, the Contractor shall verify the mating of valves to selected flanges or other connections.

1. Where flanged bodied butterfly valves are installed, they shall be ordered to match adjoining flanges in all ways.
2. Contractor shall take all necessary measures to provide proper clearances, including verification of swing out requirements for butterfly valves, coordination of flange dimensions, slight modifications to standard flanges, or provision of additional spacers/shims.

B. Coordinate provision of electric actuators with specification Section 170140.

C. Coordinate ordering of butterfly valves with threaded lug inserts for the following installed locations. Otherwise, provide wafer style bodies without drilled lugs at typical in-line locations. Threaded lugs required at following locations:

1. Pump suction.
2. Filter effluents.
3. Heat exchanger influent and effluent.
4. Where required for isolation of auxiliary equipment.
5. Where specifically called for on the drawings.

D. Typically butterfly valves shall be installed with the shaft in a horizontal position, unless otherwise noted. Stems shall be in the horizontal position wherever there is a concern with debris flowing through the pipe. Valves with heavy electric actuators, and flowing clear filtered water, may be installed in the vertical position. Large diameter butterfly valves, at the discharge of deaeration towers, shall be installed with stem in the vertical position. See also requirements given below under Installation in Part 3.

1.3 SUBMITTAL

A. Submit complete information describing all dimensions and materials of valve composition.

B. Submit a schedule itemizing the location of each butterfly valve to be provided with lugs. Lug type butterfly valves shall be provided at the following locations, whereas either lug or non-lug wafer type butterfly valves may be provided at remaining locations:

1. Pump suctions.
2. Pump discharges where not entering a filter, heat exchanger or other isolatable unit process.
3. Filter discharge.
4. Heat exchanger discharge.
5. Ozone contactor discharge (ozone resistant valve).
6. UV sterilizer effluent and influent
7. Other “side stream” equipment where isolation of equipment is required for servicing equipment.

C. For all valves 12-inch diameter and greater, submit a table cross-referencing typical valve opening requirements with the opening diameter of the proposed flanges.

D. Submit details of factory and custom designed operator extensions, mounts, extension supports and bushings where required.

1.4 WARRANTY

A. The valve Manufacturer shall warrant and guarantee all products to be free from defect in materials for a minimum of 1-year from the date of startup of the complete system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever date occurs first. Manufacturer’s warranty shall not relieve the Contractor from furnishing a complete system warranty as specified in the General Conditions.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operation & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 GENERAL MATERIAL REQUIREMENTS

A. Coatings: All exposed metal parts, except stainless steel, to be factory coated. With consideration corrosion resistance, durability, and best use, coatings shall be provided as follows:

1. Nylon Coatings: Applicable for single piece valve bodies, valve disks, and actuator handwheels. Use standard factory applied product.
2. Dry Indoor Locations: Baked-on epoxy "powder" coating or high-solids liquid applied epoxy. Grind sharp corners, grit-blast, and otherwise prepare surfaces as necessary. If liquid epoxy: Apply no less than two coats, minimum dry film thickness of 12 mils. Or submit alternate coating for review.
3. Submerged, wet-dry, and outdoor locations: A high-performance zinc/acrylic coating system. Prime coat of inorganic zinc primer with not less than 80% total zinc in the dry film, *Carboline* "Carbo Zinc 11 RS", *Porter* Zinc Rich Epoxy Primer"*, International Protective Coatings* “Interzinc”; or approved substitute. Second and third coat with water-borne acrylic enamel compatible with the prime coat, *Carboline* "D3359", *Porter* DTM

Acrylic Gloss Enamel , *Dunn-Edwards* Permasheen; or equal; or for indoor locations the acrylic enamel may be substituted with epoxy or manufacturers selected topcoat.

B. Gaskets: Provide gaskets and sealants as recommended by the Manufacturer and as required. See specification Section 170010 for gasket materials. Butterfly valves with inner boot type seal do not require gaskets.

C. Fasteners: All valves shall be installed using only Type 316 stainless steel nuts, hex-head bolts, and washers per Section 170316. Substitution with “all-thread” is not an acceptable substitute.

2.2 ACTUATORS FOR BUTTERFLY VALVES

A. Lever Actuators: Quarter-Turn butterfly valves 4-inch in diameter and smaller provided with notch-position throttling handle. Handle, top locator-plate, spring, and hardware shall be non-metallic or 300 series stainless steel; hub of handle may be constructed of corrosion-resistant material other than stainless steel. Where indicated or required, provide valve stem extension as specified below under "Remote Operators."

B. Gear Actuators: Quarter-turn valves 6-inch in diameter and larger to be provided with enclosed submersible worm gear operator, with handwheel and position indicator. Packed with grease, O-ring seals, and rated for 3-psi submergence with IP67 weather resistance. Shall have the ISO bolt pattern conforming to 5211/I - 5211/II for valve mounting.

1. Components as follows: Non-metallic composite housing. Stainless steel fasteners. Worm Gear/Shaft of Beric zinc alloy.
2. Provide options where indicated on the drawings, including: remote chain operators, or locking devices.
3. Model & Manufacturer: Plasgear by ASAHI/AMERICA or equal.

C. Electric Actuators: Valves with electric actuators, shall be delivered to the Contractor by the valve supplier pre-assembled with the valve and actuator as a single unit. See specification section 170140 for electric actuators.

2.3 REMOTE OPERATORS

A. Where Required: Where valve operators are located below a platform, within a vault, excessively high, or difficult to access locations, Contractor shall provide extensions to allow remote operation of the valve. Where operated from the platform, remote operator shall allow valve actuation without removal of the platform's grate or valve vault cover. Select type of remote operator based on the following situations:

1. Where valve is located in a permanently dry, non-buried location, and operated from above, provide a handwheel extension.
2. Where valve is located in a wet location or buried, and operated from above, provide solid bar valve stem with gear actuator (where required) mounted top-side.
3. Where valves are located higher than 72-inches above the finished floor, Contractor shall provide valves with chain-wheel operators.

B. Handwheel Extensions: Typically install handwheel extensions on gear actuated valves where operated from above. Extensions to be of Type 316 stainless steel stock. Where required to prevent excessive movement in long-stemmed situations, provide a top-end mount, and intermediate supports and bushings as required. Provide bronze "spinner" on handwheel.

C. Actuator Extensions: Typically install solid bar extensions for top-side location of the valve actuator. Provide valve stem extensions for lever actuated valves and all buried valves. Valve

stem extensions are to be housed in a rigid pipe with mating flanges fabricated for bolting directly to mounting holes on valve and actuator. Stem extensions to be of Type 316 stainless steel stock.

1. Where required to prevent excessive movement in long-stemmed situations, provide a top-end mount with intermediate supports and bushings.
2. If a top-end mount and intermediate supports are required, provide universal joints at each end where stem extension mates with valve and gear stems.
3. Where the length a solid-bar extension cause excessive wind-up during operation, a custom designed large diameter tube with special intermediate mounts shall be provided.

D. Off-Set Extensions: To overcome obstacles in the installation of a straight stem extension, and articulated extension, manufactured specifically for that purpose may be installed. Supplied by Trumbull, www.trumbull-mfg.com; or approved substitute. Custom off-set stem extensions may consist of the following:

1. Extension Stem.
2. Stem Connectors.
3. Torque Tube Assembly and/or Thrust Collar.
4. Miter Gear Assemblies or Universal Joints.
5. Coupling to Valve.

E. Chain Wheel Operators: Typically install for actuation of overhead valves. Capsulated chain wheel on gear operator. Gear operators shall be as otherwise specified. Provide with stem extension as required to eliminate any chaffing by the chain on piping or equipment below the valve. Provide a continuous linked chain to within 12 to 24-inches above floor.

F. Coatings: All exposed ferrous metal parts shall be delivered with a factory applied corrosion resistant coating as previously specified in subsection 2.1. Stem housing pipes are to be coated both internally and externally.

2.4 PVC BUTTERFLY VALVES

A. Requirement: Industrial grade butterfly valve suitable for saltwater use and installation between 150 psi class flanges with wafer body. Sizes 2.5” and larger. All disks shall open into Schedule 80 PVC pipe without interference or modification.

B. Typical Materials:

1. Disc: Typically PVC. PVDF for heavy abrasive conditions. Polypropylene (PPL) shall not be used for chlorinated, brominated, ozonized, or oxidized conditions. PP or PVDF where recommended by manufacturer and PVC is not available. May be PDCPD composite plastic where larger than 24-inch diameter.
2. Shaft: Type 316 stainless steel.
3. Seat: EPDM.
4. Seals: EPDM.
5. Body: PVC or PP with composite glass filament.

C. Materials where “Teflon” valves are specifically called for in ozonized water situations:

1. Disc: Solid Teflon (PTFE), or Teflon covered plastic.
2. Shaft: Type 316 stainless steel.
3. Seat: Teflon or PTFE.
4. Seals: Viton or Teflon.
5. Body: Teflon or PTFE where wetted, or PVC or PP with composite glass filament, where not wetted.

D. Lug Requirement: Provide Type 316 SS threaded lug inserts in at pump suction and filter discharge lines, isolation valves for auxiliary equipment, and where specifically called for on the drawings. Otherwise, provide wafer style bodies without drilled lugs at typical in-line locations.

E. Actuators: Valves are to be installed with actuators as specified above in subsection 2.2.

F. Manufacturer: (Valves shall be supplied with necessary options to meet materials and operator requirements.)

1. *ASAHI/AMERICA*, Malden, MA (781) 321-5409 Type 57 (wafer), Type 57IL (Lug), or Type 75;
2. *GF Piping Systems*, Tustin, CA (800) 854-4090 www.gfpiping.com Type 578 Lug Style where required;
3. *Hayward Flow Control*, Clemmons, NC Phone (888) 429-4635 www.haywardflowcontrol.com BYV Series (1.5-inch thru 12-inch diameter), BYB Series (14-inch thru 24-inch);
4. No substitutes.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall supply all materials and labor for the complete installation of all valves, actuators and other specified equipment for a complete workable system in accordance with Manufacturer's recommendations.

B. All disks shall open into pipe openings without interference.

C. Typically butterfly valves shall be installed with the shaft in a horizontal position, unless otherwise noted.

1. Butterfly valve stems shall be in the horizontal position for the following installations:
   a. Where indicated on the Drawings in a horizontal position.
   b. Where there is a concern with debris flowing through the pipe — all tank “return” valves and “drain” valves.
   c. For installation where there is not a heavy electric actuator mounted on the valve.
   d. Where a horizontal stem orientation is required for access and operations of the valve.
   e. Where the valve is installed overhead and a chainwheel operator is required.
2. Butterfly stem may be in the vertical position for the following installations:
   a. Where valves are flowing clear filtered water and more suitable in the vertical position, such as at the discharge of deaeration towers or other clear-water basins, where valves are equipped with heavy electric actuators.
   b. Where a vertical stem orientation is required for access and operation of the valve.
   c. Where indicated on the scale Drawings with the stem vertical and an actuator on top of the valve.

D. Where valves cause excess strain or deflection, extra supports shall be provided in addition to the spacing recommended by the pipe Manufacturer for an uninterrupted length of pipe.

E. Where valves create a "raised face" condition, it may be necessary to add an appropriate backing ring or shim. If the Manufacturer of the flange recommends additional reinforcement, backing rings or shims shall be provided in accordance with Section 170010.

F. Where “wafer” or “lug” type butterfly valves are adjacent to the flexible coupling, use of a solid spacer flange is required to assure a positive sealing surface for the flex coupling and mating to the seal of the valve. (Spacer flange is not required for flanged butterfly valves.)

G. Where the exact location of a valve is not shown, it shall be installed in an accessible place and as directed by the Owner's Representative.

H. Valve operators shall be placed so as not to interfere with nearby piping and equipment and to facilitate operation. The operator shall be orientated to allow visual inspection of the valve position indicator from the service corridor path. Excessive deflection in the extension during normal operation, as determined by the Owner’s Representative, shall be corrected immediately by the Contractor at no additional cost to the Owner.

I. Where valves are equipped with a chain wheel operator, valve shall be mounted so the position indicator is visible while operating the chain.

J. Install intermediate supports for valve operator extensions as recommended or required by valve Manufacturer.

K. Fasteners:

1. Install valves using only Type 316 stainless hex-head bolts, and washers per Section 170316. Substitution with “all-thread” is not an acceptable substitute.
2. Nuts may be bronze material to prevent galling with stainless steel bolts; otherwise, install with stainless steel nuts and anti-seize compound.
3. Flat washers are required under all bolt and nut heads with an additional, split-ring lock washer under the nut side or as specifically recommended by the fitting Manufacturer.
4. Lug type butterfly valves shall have separate hex head bolts securing flanges from both sides. Where lug valves are permanently or temporally installed in a dead-end location, securing bolt threads shall extend completely through the valve’s threaded lug. Threads of connecting bolts shall be lubricated with grease or an anti-seize compound prior to installation.

END OF SECTION

SECTION 170144 - BALL VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. The size and location of all valves shall be as indicated on the Process and Instrumentation Diagrams and/or scale drawings. The General Conditions apply to this Section as fully as if repeated herein.

1.2 COORDINATION

A. Mechanical contractor shall determine where “oversized” electric valve actuators may place excessive forces on valve/piping and provide separate support of such actuators as required. This situation is not uncommon for small actuated valves.

B. Electric Actuators: Valves with electric actuators, shall be delivered to the Contractor by the valve supplier pre-assembled with the valve and actuator as a single unit. See specification section 170140 for electric actuators.

1.3 SUBMITTAL

A. Submit complete information describing all dimensions and materials of valve composition.

B. Submit details of factory and custom designed operator extensions, mounts, extension supports and bushings where required.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 REMOTE OPERATORS

A. Where Required: Where valve operators are located below a platform, within a vault, excessively high, or difficult to access locations, Contractor shall provide extensions to allow remote operation of the valve. Where operated from the platform, remote operator shall allow valve actuation without removal of the platform's grate or valve vault cover.

B. Provide lever extensions, actuator extensions, sleeved cable operators, or chain wheel operators as required for the specific situation.

C. Coatings: All exposed ferrous metal parts shall be delivered with a factory applied corrosion resistant coating.

2.2 PVC/CPVC TWO-WAY BALL VALVES

A. Location: Standard ball valves typically used in saltwater exhibit piping and PVC/CPVC piping installations.

B. Sizes: 2" and smaller.

C. Design: Standard 2-way open/close ball valves, PVC/CPVC bodied with Teflon seats and Viton or EPDM seals. Valves to be suitable for 150 psi operating pressure at 75 deg F.

1. Typically, "True Union" type.
2. Body and Ball: PVC in PVC piping and CPVC in CPVC piping.
3. Provide "Single Entry" or "Utility" (non-true union) ball valves at end of service locations such as vent and drain lines.

D. Manufacturer:

1. *ASAHI/AMERICA* Malden, MA (781) 321-5409;
2. *GF Piping Systems* Tustin, CA (800) 854-4090 www.gfpiping.com;
3. *Hayward Industrial Products Inc.,* Elizabeth, NJ (908) 351-5400;
4. or approved substitute.

2.3 PVC/CPVC FLOW CONTROL BALL VALVES AKA LINEAR FLOW

A. Location: Ball valves, for proportional flow control, installed only at locations called out on the Drawings as "Linear" type where there is one-way directional flow.

B. Design: Ball valves manufacturer for linear increasing water flow in equal proportion to the degree open. PVC/CPVC bodied with Viton or EPDM seals, Teflon seats, and EPDM or FKM O-Rings. Valves to be suitable for 150 psi operating pressure at 75 deg F.

1. "True Union" type.
2. Ball shall be full-port design and full sphere shape.
3. Body and Ball: PVC in PVC piping and CPVC in CPVC piping.

C. Manufacturer:

1. *ASAHI/AMERICA* Malden, MA (781) 321-5409;
2. *Hayward Industrial Products Inc.,* Elizabeth, NJ (908) 351-5400***;***
3. or approved substitute.

2.4 PVC PVC LAB COCKS & GAUGE COCKS

A. Lab Cocks: Located at sample taps and where otherwise shown on the Drawings. PVC uni-body type lab cock with lever handle. 1/4-inch male threaded pipe connection with 90-degree elbow and hose barb fittings at outlet end.

B. Gauge Cocks: Located at taps for pressure gauges. PVC uni-body type gauge cock with lever handle. Longitudinal in-line design with two 1/4-inch female threaded pipe connections.

C. Materials: PVC body with EPDM seats and seals.

D. Manufacturer: As may be available from *ASAHI/AMERICA*; *GF Piping Systems*; *Hayward;* or approved substitute.

2.5 STAINLESS STEEL 3-PIECE BALL VALVES

A. General: Swing-out 3-piece type ball valves suitable for the transmission of three percent ozone gas in air at 120 deg F.

B. Materials:

1. Body & Ball: Forged and machined Type 316 (ASTM A 351) stainless steel.
2. Packing: *Teflon*, reinforced PTFE, or graphite.
3. O-ring or Seats: Viton PTFE, or reinforced PTFE
4. Trim: Type 316 stainless steel.

C. Connection: ANSI B16.11 socket weld tube end connection, female pipe thread.

D. Appurtenances: Supply each valve with universal mounting bracket and hinge for swing-out valve service, except for panel mounted valves.

E. Manufacturer:

1. *Whitey Company* (Swagelok) (Series 63) Highlands Heights, OH;
2. *Worcester* (Mizer Valve) Marlborough, MA (617) 481-4800;
3. *Neles-Jamesbury* (Series 3) Worcester, MA (508) 852-0200;
4. Apollo Stainless Steel 3-Piece Ball Valve *Conbraco Industries, Inc*. Matthews, NC (704) 841-6000 www.conbraco.com;

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall supply all materials and labor for a complete workable system in accordance with Manufacturer's recommendations.

B. Where valves cause excess strain or deflection, extra supports shall be provided in addition to the spacing recommended by the pipe Manufacturer for an uninterrupted length of pipe.

C. Where the exact location of a valve is not shown, it shall be installed in an accessible place and as directed by the Owner's Representative.

D. Install flow control ball valves only where there is one-way water flow and for water flowing in the direction of the arrow printed on the valve body.

E. Valve operators shall be placed so as not to interfere with nearby piping and equipment and to facilitate operation. The operator shall be orientated to allow visual inspection of the valve position indicator from the service corridor path.

F. Install intermediate supports for valve operator extensions as recommended or required by valve Manufacturer.

1 END OF SECTION

SECTION 170146 - GLOBE VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. The size and location of all valves shall be as indicated on the Process and Instrumentation Diagrams and/or scale drawings. The General Conditions apply to this Section as fully as if repeated herein.

1.2 SUBMITTAL

A. Submit complete information describing all dimensions and materials of valve composition.

B. Submit details of factory and custom designed operator extensions, mounts, extension supports and bushings where required.

1.3 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 PVC GLOBE VALVES

A. General: Designed by the manufacture specifically for frequent throttling applications. Valve shall be capable of sustained throttling with minimum seat erosion. May be standard configuration or Y-Pattern design.

B. End Connections: Bodies shall be flanged with 150 psi ANSI B15.1 bolt pattern.

C. Pressure Rating: No less than full vacuum rating. Two-inch and smaller rated not less than 150 psi pressure and larger than 2-inch size rated not less than 90 psi pressure.

D. Materials: PVC body with EPDM, Viton or Teflon seals.

E. Manufacturer:

1. *ASAHI/AMERICA* Malden, MA (781) 321-5409;
2. *Hayward Industrial Products Inc*. Elizabeth, NJ (908) 351-5400;
3. *Spears Manufacturing Co*. Sylmar, CA (818) 364-1611;
4. Or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall supply all materials and labor for a complete workable system in accordance with Manufacturer's recommendations.

B. Fasteners:

1. Install valves using only Type 316 stainless hex-head bolts, and washers per Section 170316. Substitution with all-thread is not an acceptable substitute.
2. Nuts may be bronze material to prevent galling with stainless steel bolts; otherwise, install with stainless steel nuts and anti-seize compound.
3. Flat washers are required under all bolt and nut heads with an additional, split-ring lock washer under the nut side or as specifically recommended by the fitting Manufacturer.

C. Where valves cause excess strain or deflection, extra supports shall be provided in addition to the spacing recommended by the pipe Manufacturer for an uninterrupted length of pipe.

END OF SECTION

SECTION 170148 - DIAPHRAGM VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. The size and location of all valves shall be as indicated on the Process and Instrumentation Diagrams and/or scale drawings. The General Conditions apply to this Section as fully as if repeated herein.

1.2 SUBMITTAL

A. Submit complete information describing all dimensions and materials of valve composition.

B. Submit details of factory and custom designed operator extensions, mounts, extension supports and bushings where required.

C. Submit factor warranty.

1.3 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 DIAPHRAGM VALVES FOR LIQUID SERVICE

A. General: Designed specifically for throttling of sludge slurry and/or corrosive liquids.

B. End Connections: Bodies shall be flanged with ANSI 150 lb. bolt pattern.

C. Pressure Rating:

1. Where installed in sludge and vacuum service line, shall have options as required for vacuum service.
2. Minimum 75 psi positive pressure rating.

D. Materials: PVC body with EPDM diaphragm.

E. Manual Actuators: Provide with standard non-rising round handle.

F. Manufacturers:

1. *ASAHI/AMERICA,* Malden, MA (781) 321-5409;
2. *GF Piping Systems,* Tustin, CA (800) 854-4090 - ;
3. *Hayward Flow Control,* Clemmons, NC (888) 429-4635 www.haywardflowcontrol.com;

4. or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall supply all materials and labor for a complete workable system in accordance with Manufacturer's recommendations.

B. Fasteners:

1. Install valves using only Type 316 stainless hex-head bolts, and washers per Section 170316. Substitution with “all-thread” is not an acceptable substitute.
2. Nuts may be bronze material to prevent galling with stainless steel bolts; otherwise, install with stainless steel nuts and anti-seize compound.
3. Flat washers are required under all bolt and nut heads with an additional, split-ring lock washer under the nut side or as specifically recommended by the fitting Manufacturer.

C. Where valves cause excess strain or deflection, extra supports shall be provided in addition to the spacing recommended by the pipe Manufacturer for an uninterrupted length of pipe.

END OF SECTION

SECTION 170155 - CHECK VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. The size and location of check valves shall be as indicated on the Process and Instrumentation Diagrams and/or scale drawings. The General Conditions apply to this Section as fully as if repeated herein.

1.2 COORDINATION

A. Before ordering valves, the Contractor shall verify the mating of valves to selected flanges or other connections. Contractor shall take all necessary measures to provide proper clearances, including verification of swing out requirements for discs of wafer-type check valves, and coordinate valve selection with dimensions of adjoining piping. Contractor shall provide additional spacers/shims, or otherwise select valves and fittings, for completely satisfactory installation.

B. Contractor shall coordinate configuration of check valves, and/or piping arrangement, or vertical or horizontal valve orientation.

1.3 SUBMITTAL

A. Submit complete information describing all dimensions and materials of valve composition.

B. Submit a schedule of all check valves, listing the horizontal or vertical orientation, identified by location and service.

C. Submit details of factory and custom designed linkages, lever arms, and springs.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 CHECK VALVES FOR LIQUID SERVICE

A. Check Valves 2.5-inch Diameter and Larger: Wafer, swing-type check valve manufactured of PVC.

1. Swing type wafer check valve, with spring, manufactured with one-piece body. 8-inch size and smaller rated for 150 psi pressure at 70 deg F. 10-inch size and larger rated for not less than 85 psi pressure at 70 deg F.

2. Valves shall have a one-piece disc and shaft design suitable for either horizontal or vertical installations. Equipped with spring for assist of disc closure (factory option as required).
3. Body and disc construction shall allow for nearly complete opening of disc without the need for additional spacers. Disk shall fully open with a pressure of 0.5 PSI or less. Minimum flow coefficients shall be as follows:

    a. 3-inch size, minimum Cv = 137
    b. 4-inch size, minimum Cv = 200
    c. 6-inch size, minimum Cv = 663
    d. 8-inch size, minimum Cv = 1225
    e. 10-inch size, minimum Cv = 1750

4. Materials:

    a. Body: PVC plastic.
    b. Seals: FKM (Viton) or EPDM rubber.
    c. Spring: Hastelloy, Inconel, or manufacturers selected material with an ETFE coating.

5. Installation with full-face gaskets, in addition to the O-ring seal, can help to prevent leakage.
6. Manufacturer:

    a. *Hayward Flow Control,* (***Special Ordered*** with Hastelloy spring Material) Clemmons, NC (888) 429-4635;
    b. *ASAHI/AMERICA,* (***Special Ordered*** with specified spring) Malden, MA (781) 321-5409;
    c. Or approved substitute.

B. Check Valves Two-Inch Diameter and Smaller:

1. "Y" type check valve, PVC body, with threaded end connections and hex end-cap with Viton O-ring cap seal. C_v factor for 1.5-inch size shall not be less than 40 GPM at one PSI. Ball type check valves are not an acceptable substitute. Manufacturer: Hayward Flow Control, Clemmons, NC Phone (888) 429-4635; or approved substitute.
2. Clear plastic valve, true-union end connections, with EPDM seals. “Swing Check” design with weighted disc and no internal spring. By *Spears Manufacturing*, no substitutes.

2.2 CHECK VALVES FOR OZONE GAS SERVICE

A. Stainless Steel “Soft Seat” Check Valves (0.25 to 2" diameter): Designed specifically for corrosive environments for protection against reverse flow. Valve shall be of suitable materials for ozone gas flow and protection against seawater reverse flow.

1. Pressure Rating: 125 psi saturated steam.
2. Flow Coefficient: 0.5-inch valve design shall have minimum CV of 1.40 gpm/psi; other valve sizes shall have proportional CV values.
3. Body: ASTM A351 Stainless Steel or better.
4. Check Seat: “Soft Seat” Viton 1-inch and smaller, “Cone Ball” where larger.
5. Spring: Type 316 stainless steel or better.
6. Manufacturer: *Conbraco Industries, Inc*. Matthews, NC (704) 841-6000 www.conbraco.com; or approved substitute.

2.3 DOUBLE DOOR CHECK VALVES

A. "Technocheck" elastomer-hinged wafer style check valve. Materials shall be ozone gas resistant and serviceable for air temperatures up to 400 degree Fahrenheit. For installations at discharge of air blowers, ozone off-gas venting, and similar locations.

B. Materials:

1. Body: Wafer style, ASTM A 351, Type 316 stainless steel, for installation between ASME 150 lb. flanges.
2. Disc: Double-door, ASTM A-351, Type 316 stainless steel.
3. Hinge & Seals: FKM/Viton Rubber, -20 to 400 deg. F temperature rating.
4. Fasteners & Screws: Type 316 stainless steel.

C. Spring: No spring for vertical up-flow installations. Provided with Type 316 stainless steel spring for horizontal installations.

D. Performance & Installed Conditions:

1. Pressure: 150 lb. pressure class. Installed operating pressure is 0 to 25 psig.
2. Temperature Rating: 400 deg. F, operating temperature is less than 200 deg. F.
3. Flow Coefficient: (air Cv) of 160 SCFM at 0.1-psi differential for 2-inch valve

E. Model & Manufacturer: Style 5296-316 by *Techno Corporation*, Erie, PA (814) 838-4561 may be supplied by www.usvalve.com ; or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall install check valves as required for a complete workable system in accordance with Manufacturer's recommendations.

B. Provide gaskets and sealants as recommended by the Manufacturer, as required, and as specified in Section 170010.

C. Fasteners:

1. Install valves using only Type 316 stainless hex-head bolts, and washers per Section 170316. Substitution with "all-thread" is not an acceptable substitute.
2. Nuts may be bronze material to prevent galling with stainless steel bolts; otherwise, install with stainless steel nuts and anti-seize compound.
3. Flat washers are required under all bolt and nut heads with an additional, split-ring lock washer under the nut side or as specifically recommended by the fitting Manufacturer.

D. Where disks open into pipes, take all measures necessary to eliminate interference problems or situation where the disk may bump into and damage the pipe wall.

E. Do not install check valves directly on pump discharge flanges. Provide concentric tapered reducers where shown at pump discharges for mounting of check valves or extension pipe spool. If reducing fittings are not required at pump discharges, install a pipe spool not less than two (2) pipe diameters in length for installation of check valves remote of the pump discharge flange.

1 END OF SECTION

SECTION 170157 - NEEDLE TYPE VALVES

PART 1 - GENERAL

1.1 SUMMARY

A. The size and location of all valves shall be as indicated on the Process and Instrumentation Diagrams and/or scale drawings. The General Conditions apply to this Section as fully as if repeated herein.

1.2 SUBMITTAL

A. Submit complete information describing all dimensions and materials of valve composition.

B. Submit air flow rate curves showing flow rate vs. pressure drop for all needle valves and regulating valves used in conjunction with the ozone gas injection system.

1.3 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 STAINLESS STEEL NEEDLE VALVES

A. General: Designed for regulating of flows of corrosive ozone gas (3% max.) in air (assume same density and gas characteristics as air at 70 deg F).

B. Materials: Body and stem constructed of Type 316 stainless steel with Teflon packing.

C. Size & Coordination: Valve size to be as indicated on Drawings, if not indicated, valve to be same size as adjacent piping. Orifice and flow rate sizing must be coordinated with actual purchased equipment sizing. Submit air flow curves for review for each location.

1. Up to 37 SCFH: 3/8-inch Whitey "1" *Integral Bonnet Needle Valve,* with 0.172-inch diameter orifice and regulating type stem, with max. C_V = 0.37; where indicated on P&ID for gas flow rates up to but not exceeding 37 SCFH.
2. Up to 110 SCFH: 3/8-inch Whitey "1" *Integral Bonnet Needle Valve,* with 0.250-inch diameter orifice and regulating type stem, with max. C_V = 0.73; where indicated on P&ID for gas flow rates up to but not exceeding 110 SCFH.
3. Up to 290 SCFH: 3/8-inch or ½-inch Whitey "6N" *Severe Service Union Bonnet Valve,* with 0.250-inch diameter orifice and regulating type stem, with max. C_V = 0.86; where indicated on P&ID for gas flow rates up to but not exceeding 290 SCFH.
4. Up to 550 SCFH: ½-inch Whitey "18" *Integral Bonnet Needle Valve,* with 0.375-inch diameter orifice and regulating type stem, with max. C_V = 1.80; where indicated on P&ID for gas flow rates up to but not exceeding 550 SCFH.

5. Up to 650 SCFH: ½-inch, ¾-inch or 1-inch Whitey "12N" *Severe Service Union Bonnet Valve,* with 0.437 inch diameter orifice and regulating type stem, max. C_V = 2.2; where indicated on P&ID for gas flow rates up to but not exceeding 650 SCFH.

D. Connection: Male NPT. Provide adjacent true-union fitting or coupling to allow for quick replacement of valve.

E. Manufacturer: Whitey Company (Swagelok), Willoughby, OH www.swagelok.com; or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall supply valves, materials, and labor for a complete workable system in accordance with Manufacturer's recommendations.

END OF SECTION

SECTION 170220 - PVC/CPVC PIPE AND FITTINGS

PART 1 - GENERAL

1.1 IDENTIFICATION

A. Schedule 40 PVC piping is generally used for exhibit water transmission piping and where designated with the PROCESS-PVC-SIZE tag number.

B. Schedule 40 CPVC piping is to be used where water temperatures may exceed 140 deg F and where designated with the PROCESS-CPVC-SIZE tag number.

C. Schedule 80 CPVC piping, manufactured with the specified of *Corzan*® resin, is to be used for ozone in-solution piping and ozone off-gas piping and where designated with the PROCESS-CPVC-SIZE tag number.

D. Clear Schedule 40 PVC where “Clear Spools” are called for and other situation where clear PVC is called for on Drawings.

E. PVC Conduit: See specification 170261 for PVC conduit, and long-sweep fittings, used for dual-containment of Teflon tubing for ozone gas.

1.2 SUMMARY

A. Note, requirements given for PVC in this specification shall apply equally for CPVC.

B. The General Conditions apply to this Section as fully as if repeated herein.

C. Installed piping shall be pressure tested by Contractor per specification Section 170010.

1.3 SUBMITTALS

A. Submit information describing all dimensions and materials of fittings.

B. For all fabricated fittings, the Manufacturer shall submit a quality assurance (QA) manual.

C. Submit name of proposed PVC field supervisor, training certificates, and resume of completed thermoplastic piping projects.

D. Submit PVC solvent cements and PVC primer proposed for the piping. Solvent cement manufacturer shall provide cement selection and application procedures for review prior to starting work.

1.4 FIELD COORDINATION & QUALITY CONTROL

A. Complete System: It is the Contractor's responsibility to provide piping by means that account for all necessary coordination, including, but not limited to: water stops, oversize sleeves, pipe supports, valves and other attachments, etc.

B. Special Conditions:

1. Where required at non-standard off-sets and angle elbows, the contractor may elect the use of “Special Fabricated Fittings.”
2. Where required to meet short laying length conditions (*typical* at filter discharges, manifold connections and other restrictive areas) the Contractor shall obtain fittings available from specified manufacturers with short laying lengths.

C. Pressure Test: Pressure test with water in accordance with Section 170010. Pressure testing of PVC piping with compressed air is not allowed. Provide pipe extensions and temporary caps as necessary for pressure testing requirements specified in Section 170010. Contractor shall coordinate timing of pipe pressure testing with Owner’s representative for recording of pressure test logs.

D. Field Supervision: Contractor shall ensure that one person on their staff is the designated supervisor for fabrication and installation of all PVC piping. This person shall be on site supervising or performing all thermoplastic piping work to ensure continuity in quality of the installation. The designated field PVC supervisor shall have completed manufacturer’s training in the installation of thermoplastic piping systems and shall provide a resume listing at least five (5) thermoplastic piping projects.

E. Flexible PVC: Coordinate with the Aquarium animal husbandry staff where used in exhibit water tanks.

PART 2 - PRODUCTS

2.1 PIPE & FITTING PRESSURE RATINGS

A. The pressure ratings for Schedule 40 pipe and fittings shall be as follows:

1. Sch 40 pipe shall sustain a minimum of 120 psi at 73 deg F.
2. Solvent cemented joint fittings 4-inch diameter and smaller shall sustain a minimum of 130 psi at 73 deg F.
3. 6-inch and 8-inch diameter cemented joint fittings shall sustain a minimum of 90 psi at 73 deg F or be structurally modified for a higher pressure rating where necessary.
4. 10-inch diameter and larger Sch 40 cemented joint fittings shall sustain a minimum of 120 psi at 73 deg F.
5. Threaded joints for Schedule 40 pipe and fittings are only allowed for 2-inch diameter material and shall sustain a minimum of 90 psi at 73 deg F. All other threaded joint fittings shall be Schedule 80 or have the pressure rating verified for the service condition.
6. Fabricated Sch 40 fittings, of all sizes, shall sustain a minimum pressure of 120 psi.

2.2 PVC PIPE & FITTINGS

A. Pipe: All new, solvent welded, polyvinyl chloride (PVC) rigid pressure pipe; PVC pipe made from Class 12454 (formerly Type I, Grade 1) virgin compounds, as defined in ASTM D1784. Dimensions and maximum operating pressure shall conform to ASTM D-1785.

B. Cement: Solvent weld in accordance with ASTM D-2855 and/or ASTM D-2564.

C. Special Fabrications: Special fabrications such as manifolds shall be designed to carry stresses developed with the "Free Ends" condition, without thrust blocking or backfill when hydrostatic pressure testing is performed.

D. PVC Fittings:

1. Base Material: Of the same schedule rating as adjoining pipe, polyvinyl chloride (PVC) made from Class 12454 compounds, containing no fillers or re-grounds in accordance with ASTM D-1784.
2. Self-Supporting Design: All fittings shall be designed to carry stresses developed with a "Free Ends" condition when hydrostatic pressure testing is performed.
3. Construction: Fittings 12-inch diameter and less for common angles shall be "molded" type. Where special angles or manifold configurations are required, the fittings may be of the fabricated type.
4. Identification: Fittings shall have identifying markings per applicable ASTM Standards.

E. PVC Fittings Manufactured by:

1. *Dura Plastic Products Inc.* Beaumont, CA (909) 845-3161 www.duraplastic.com ;
2. *Chemtrol Division of Nibco* Elkhart, IN (800) 343-5455 www.nibco.com;
3. *George Fischer Harvel USA* (800) 854-4090 or (714) 731-8800 www.gfpiping.com;
4. *Spears Manufacturing Company* Sylmar, CA (818) 364-1161 www.spearsmfg.com;
5. *Eslon Thermoplastics* Pineville, NC (704) 889-2431;
6. or approved substitute.

F. Flanged Reducers: At pump discharges, and other locations identified on the Drawings, provide 150 lb. concentric flanged FRP composite reducer fittings. Thickness of the FRP flange shall not be less than as shown on Table 5 of NBS-PS15-69 for 150 psi design pressure. By *Conley Corporation* Tulsa, OK; *Smith Fibercast* Little Rock, AR; *Ram Fiberglass* Chino, CA ramfiberglass@aol.com; or approved substitute.

G. Special Fabricated Fittings: Special fabrications shall be made where non-standard bend elbows or where multi-outlet manifolds are required.

1. Manufactured from PVC pipe stock made in the U.S.A. conforming to applicable ASTM Standards D1785 or ASTM D2241. Wall thickness-loss in fabrication shall not exceed 10% without additional reinforcement.
2. All products shall sustain a minimum pressure of 90 psi at 73 deg F.
3. Fabricated fitting sockets shall have an interference fit as required by ASTM D2466 and ASTM D2467.
4. Multi-Outlet Manifolds shall be fabricated to match dimensions, with inlets, outlets, reductions, socket ports, and threaded connections as shown on the Contract Drawings.
5. For custom bend elbows, change of direction fittings shall not exceed a 1-degree plus/minus variance from the angles called out, or implied, on the Contract Drawings or as submitted on shop drawings.
6. The manufacture shall be responsible for secure and permanent bonding of all parts. Bonding may consist of using the manufacturer's proprietary bonding agent; or WELD-ON 811 2-part high strength reactive adhesive, by *Weld-On Adhesives, Inc.* www.weldon.com; or presision hot-air welds, and/or over-wrapping or floc with fiberglass and resin.
7. Finished products shall meet factory Q.A. testing requirements.
8. All fittings shall be marked with the specific part number and marked with certification as fabricated by the submitted manufacturer.
9. Manufacturer: *Spears Manufacturing Company* Sylmar, CA (818) 364-1611 www.spearsmfg.com; or approved substitute.

2.3 CPVC PIPE & FITTINGS

A. CPVC Pipe & Fittings: Shall be Schedule 80 manufactured of *Corzan*® CPVC, or "EverTUFF" by *Spears Manufacturing,* with the following material properties:

1. Specific Gravity: 1.55 nominal
2. Hardness: 119 minimum R-Scale per ASTM D785
3. Notched Izod Impact: 2.9 ft-lbs / inch notch test, minimum per ASTM D256
4. Tensile Strength: 7,320 psi, minimum per ASTM D638
5. Flexural Strength: 13,200 psi, minimum per ASTM D790
6. Heat Distortion Temperature: 212 °F, minimum per ASTM D648
7. Cell Classification: 24448 or 23558, per ASTM C 1784

B. CPVC Pipe: All new, solvent welded, chlorinated polyvinyl chloride (CPVC), rigid pressure pipe; made from (Type IV Grade I) virgin compounds, as defined in ASTM D1784. Dimensions and maximum operating pressure shall conform to ASTM F441.

C. CPVC Fittings: Of the same schedule rating as adjoining pipe, chlorinated polyvinyl chloride (CPVC) made from Class 23447 compounds, containing no fillers or re-grounds in accordance with ASTM D-1784. Fittings shall be molded type and designed to carry stresses developed with a "Free Ends" condition. Fittings shall have identifying markings per applicable ASTM Standards.

D. Solvent Cement: Use only the piping product manufacturer's recommendations for solvent welding cements, such as Type 724 for 12-inch diameter and smaller and Type 729 for the larger sizes by *IPS Weld-On* Compton, CA www.ipscorp.com or equal.

E. CPVC Pipe Manufacturers:

1. Charlotte Pipe & Foundry Co. Charlotte, NC (800) 438-6091;
2. *Harvel Plastics, Inc.* Easton, PA (610) 252-7355.

F. CPVC Fittings Manufacturers:

1. Charlotte Pipe & Foundry Co. Charlotte, NC (800) 438-6091;
2. *IPEX* Pineville, NC (800) 463-9572;
3. *Nibco, Inc.* Elkhart, IN (800) 642-5463;
4. Spears Manufacturing Company Sylmar, CA (818) 364-1161 *www.spearsmfg.com*.

2.4 FLEXIBLE PVC

A. Solvent-Weldable flexible Schedule 40 PVC pipe matching cemented PVC fitting dimensions. By FlexPVC www.flexpvc.com or equal. This specification is to apply for in exhibit tank end-of-line piping to alleviate difficulties with rockwork and the need expressed by the Aquarium staff.

2.5 CLEAR PVC PIPE

A. Solvent-Weldable clear Schedule 40 PVC pipe matching cemented PVC fitting dimensions. By IPEX; or equal. Installed only where called out on the Drawings.

2.6 PIPE JOINTS

A. Solvent-Welded Joints: Straight pipe and typical PVC fittings shall be solvent-welded, bell and spigot joints unless otherwise noted. Straight-end pipe with solvent-welded joining is acceptable. "O-Ring" joints are not acceptable.

1. Solvent Cement: Use only the piping product manufacturer's recommendations for solvent welding cements.
2. Chemical Service: For chlorine, acid, and other piping for chemical service in PVC/CPVC piping, use Weld-On 724 by IPS Corporation; CPVC- 24 by Spears Manufacturing Co; or other approved solvent cement.

B. Flange Fittings: Where pipe joins to a dissimilar material, provide a flanged coupling, unless otherwise shown, socket welded, 150 lb. bolt pattern, with extra heavy reinforcing in the flange to prevent cracking. Companion flanges two-inch diameter and larger shall be "Vanstone" type.

C. True Union Couplings: Where true union couplings are used for special situations, the couplings shall be 100-percent PVC material and not have external metal reinforcement bands.

D. Fabricated Telescoping Expansion Joints:

1. Use: For telescoping installations, adjustable "Hartford Loops," and to meet requirements for pipe expansion and contraction. May also be spliced into a removed pipe segment for use as a repair coupling where specifically approved by the Owner's representative.
2. Design: PVC coupling with telescoping design, with non-binding design, and no less than two (2) wiper O-rings. Where temperatures may dip below freezing, provide with EPDM rubber O-rings. Where temperatures will always be above freezing, provide with FKM/Viton O-rings. Minimum 12-inch travel model required for all Hartford Loop installations
3. Manufactured by: *Spears Manufacturing Company*, Sylmar, CA.

E. Full-Circle Stainless Steel Repair Clamps:

1. Use: Do not use for standard construction. Use only for pipe repairs where no other means is possible, only with approval or the Owner or the Owners representative, or where specifically called for on the Drawings.
2. Design: All stainless steel split-clamp coupling, with nitrile or EPDM gaskets, no less than 7.5-inches long, with Type 316 stainless steel fasteners.
3. Manufacturers: Type 257 by *Smith-Blair*, Type 300 by *Baker*, or by *Straub*.

F. Bulkhead Fittings (Tank Adapters):

1. Use: Used for adding additional ports to plastic walled tanks.
2. Design: Manufactured with a screw-on lock-ring and EPDM rubber gasket to make a non-metallic mechanical connection through a tank wall. Made of heavy-duty PVC construction with a bell type outlet to maximize the free flow of water.
3. Manufactured by: *Spears Manufacturing Company*, Sylmar, CA; *Harrington Industrial Plastics Inc.* Chino, CA (909) 597-8641 www.harringtonplastics.com; *Hayward Industrial Products Inc.* Elizabeth, NJ (908) 351-5400 www.haywardindustrial.com ; or *Ryan-Herco Products Corporation*, Burbank, CA (800) 848-1141 www.ryanherco.com.

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. See also Section 170010 for pipe installation requirements; including limitations for PVC piping installed in CDF encasement, and compliance with AWWA Manual M23 and AWWA C605.

B. Typical PVC joints are to be solvent-welded except where the pipe abuts equipment and valves, or where specifically shown or called for on the plans to be flanged or jointed with special couplings. Provide True-Union or flanged fittings in piping arrangement where necessary to perform servicing of equipment.

C. Joints shall be solvent-weld, in accordance with ASTM D2855 and the pipe manufacturer's instructions, unless otherwise shown. Be sure to use Weld-On 724 or Spears CPVC-24 cement for "chemical duty" PVC and CPVC piping, or approved equal.

END OF SECTION

SECTION 170233 - COMPRESSED AIR PIPING

PART 1 - GENERAL

1.1 USAGE

A. Compressed air piping locations:

1. This specification Section, for non-metallic piping generally used throughout the LSS back areas, near or below saltwater, and other locations where plastic compressed air piping is called for on the Drawings.
2. Use copper piping, per specification Section 170206, for compressed air piping from ozone a air compressors to air receiver, from ozone air receivers to air filters, and other locations where “CU” piping is called for on the Drawings.

1.2 SUMMARY

A. Provide where indicated on the drawings by the designation "CAP". The General Conditions apply to this Section as fully as if repeated herein.

B. The compressed air distribution piping to the project shall be of plastic material and specifically manufactured for compressed air service. PVC is not acceptable by Code for compressed air service. The Contractor shall choose one of the following systems for the compressed air piping.

1. Fusion welded high-density polyethylene (HDPE).
2. Solvent-welded ABS.
3. Push-to-connect ABS.

C. Installed piping shall be pressure tested by Contractor per specification Section 170010.

1.3 SUBMITTAL

A. Submit information describing all dimensions and materials of fittings

1.4 FIELD COORDINATION

A. It is the Contractor's responsibility to provide piping by means that account for all necessary coordination.

B. Contractor shall coordinate timing of pipe pressure testing with Owner’s representative for recording of pressure test logs.

PART 2 - PRODUCTS

2.1 DISTRIBUTION PIPE & FITTINGS

A. Piping shall be shatter resistant and specifically intended by the manufacturer for compressed air service.

1. HDPE Pipe Option: High-density polyethylene designed for operating pressures to 230 psi with a safety factor of 2.2. Color coded blue for compressed air service. Supplied by ASAHI/AMERICA, Malden, MA (781) 321-5409 or (800) 343-3618; or Ryan Herco, Richmond, VA, 818/973-2621; or approved substitute.
2. ABS Pipe Cement-Joined Option: ABS piping rated for not less than 145 psi at 73 °F with integral color coding for compressed air service. Duraplus ABS Air-Line supplied by *Harrington Industrial Plastics, Inc.* Nashville, TN (615) 726-0112; *IPEX* Roseville, CA www.ipexamerica.com or Chem-Aire by *Chemtrol/NIBCO INC.* Elkhart, IN (219) 295-3221, www.nibco.com; or approved substitute.
3. ABS Pipe Push-to-Fit Option: ABS piping rated for not less than 145 psi at 73 °F color coded green for compressed air service. Push-to-fit fittings shall be easily disconnected by means of a simple collar-tool. Submit proposed supplier for review.

2.2 LEADER PIPING

A. Leader piping shall be installed upstream of plastic compressed air piping, and connecting to compressor equipment, and shall be of metallic materials.

1. Installed for a minimum length of 10-ft after air compressors and air blowers for heat dissipation.
2. Pipe: Schedule 10 Type 316 Stainless Steel piping or better. Conforming to ASTM A312 ASME SA312.
3. Fittings: Type 316 Stainless steel threaded fittings are acceptable where flanged fittings are not required for connection to equipment.

PART 3 - EXECUTION (See Section 170010)

END OF SECTION

SECTION 170250 - POLYETHYLENE (PE) PIPE AND FITTINGS

PART 1 - GENERAL

1.1 USAGE

A. The PE pipe and fittings are used for recirculation and filtration of aquatic animal exhibits.

1.2 SUMMARY

A. The General Conditions shall apply to this Section as fully as if repeated herein.

B. The drawings label piping with a PROCESS-MATERIAL-SIZE designation. Provide where indicated on the drawings by the designation "PE." All dimensions are "nominal" pipe sizes per Table 7 of ASTM F714 for IPS sizing.

C. Both straight lengths of pipe and fittings shall be from the same supplier or distributor.

D. This project will require special installation techniques otherwise not required for straight-line-piping run projects. The Contractor is responsible for as many field joints as may be required to meet site requirements. Special techniques may be required where piping is highly fixed, particularly where piping terminates near hydraulic structures.

E. The field personnel making the fusion joints shall be fully trained and/or qualified as specified below.

F. Installed PE piping shall be pressure tested by Contractor per specification Section 170010. This calls for a 3-hour expansion phase with pressure at 90 psi, followed by an 80 psi 1-hour pressure test, among other requirements.

1.3 FIELD COORDINATION

A. The piping shall be manufactured extensively in factory-made-up "spooled" assemblies; however, the Contractor shall allow for sufficient field-fused joints and extra laying lengths to provide for field adjustment.

B. Provide flanges and backing rings with 150 lb. drilling pattern for all valves and other locations shown on the drawings.

C. Typical field joints shall be thermally butt-fused pipe ends or electrofusion couplings. The Contractor provide coordination for over-excavation for butt-fusion machinery and other critical path items. Exposed metal electrodes are not allowed in waters of fish or shark tanks.

D. Contractor must obtain prior approval of Owner before addition of any buried flanged connections not shown on the original Contract Documents.

E. The Contractor shall use procedures developed by the pipe and/or fitting manufacturers that have been proved to produce reliable heat fusion joints; or where manufacturer’s written procedures are lacking, the Contractor shall use heat fusion practices given in ASTM F2620. Approved heat

fusion methods include butt, saddle, and socket heat fusion; however, extrusion welding of pressure pipe connections is not acceptable. Extrusion welding shall only be used for bonding of anchor flanges and other external brackets not related to holding water pressure. Other fusion practices developed by manufacturers shall be submitted for review.

F. It is the Contractor's responsibility to provide piping by means that account for all necessary coordination, including, but not limited to: water stops, oversize sleeves, pipe supports, valves and other attachments, any over-excavation required for fusion machinery or other equipment, etc.

G. Provide pipe extensions and temporary caps necessary for pressure testing requirements specified in Section 170010. Contractor shall coordinate timing of pipe pressure testing with Owner's representative for recording of pressure test logs.

H. Coordinate installation and pressure testing of piping with temperature and thermal limitations given below and in referenced standards.

1.4 QUALITY CONTROL

A. In-Plant Pipe Production Program: Use an in-plant quality control program to monitor production of pipe in compliance with latest ASTM specification to assure compliance with this Specification including maintaining records and supply of copies to the purchaser if requested.

B. Fitting Shop Program: Shall employ in-shop quality control methods to monitor production of fittings in compliance with latest ASTM specification. Pertinent data shall be recorded and available upon request. Program shall conform with ISO 9001 and/or cover the following:

1. Typical scheduled testing and inspection of fusion equipment.
2. Uniformity of plate temperatures.
3. Random inspection of no less than one fitting from each lot

C. Field Fusion Joints: Field butt-fusions may be made by either the PE pipe supplier's Field Fusion Technician or Contractor's personnel who have been individually trained in thermal fusion by the pipe manufacturer or the manufacturer's qualified representative. A list of those personnel trained in making butt-fusion joints shall be posted in the Contractor's site trailer.

D. Individual Qualification: The Contractor shall ensure that persons making heat fusion joints have received training and are certified in the Manufacturer's recommended procedure. The Contractor shall maintain records of trained personnel, and shall certify that training was received not more than 12-months before commencing construction. As part of required fusion training, in order to verify the fusion operator skills, it is required that sample fusion joints be made for destructive testing. These tests shall be on representative size pipe, fused by the personnel in training per the ASTM F2620 fusion procedure, and successfully tested per the bend-back testing in Appendix X4 of ASTM F2620. Certification shall include training of the individual in making large diameter fusions, where bend-back testing is not applicable, where certification shall be based on data logging and visual inspection.

E. Field-Fusion Joint Quality: A log of all field-fusion joints shall be maintained with the following information:

1. Time of fusion[1]
2. Heater plate temperature[1]
3. Hydraulic cylinder pressure[1]
4. Size and SDR of pipe

5. Duration of heat cycle
6. Duration of cooling cycle
7. Interfacial pressure used & corresponding drag factors
8. Visual condition of bead roll-back
9. Comments

Notes: [1] Indicates information recorded directly onto data logging instrument by *McElroy Manufacturing Inc*., or approved substitute.

F. Referenced Specifications:

1. ASTM D3035 Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter.
2. ASTM D3261 Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing.
3. ASTM F714 Specification for Polyethylene (PE) Plastic Pipe (SDR-PR) Based on Outside Diameter, per Table 7 for IPS pipe.
4. ASTM F905 Practice for Qualification of Polyethylene Saddle-Fused Joints.
5. ASTM F2206 Standard Specification for Fabricated Fittings of Butt-Fused Polyethylene (PE).
6. ASTM F2620 Standard Practice for Heat Fusion Joining of Polyethylene Pipe and Fittings.

1.5 SUBMITTALS

A. General Information:

1. Submit information describing all dimensions and all specified physical properties of pipe and fittings.
2. Submit detailed information on dimensions of fabricated reducing Tee fittings where a reduced diameter may be included in the smaller branch piping. Submit dimensional information on all other fittings for compliance with 100-percent SDR 17 internal diameters.
3. This submittal information is to be completed prior to shipping of any materials to the site or commencement of any factory fabrications.

B. Cell Classification Properties: Submit listing of cell classification properties, ring tensile strength, and other properties called out under "Pipe Materials" specified below in Section 2. The Owner may choose to select samples for testing from pipe or fittings supplied to the job. All such material and labor prior to testing shall be delivered at the Contractor's expense. Laboratory costs for this testing shall be at the Owner's expense. Any pipe or fitting with material not meeting the minimum cell classification value will be rejected.

C. Testing: If there are any discrepancies at any time, the contractor shall submit results on tests of each factory production run of pipe (from material or pipe) for the following listed items. The cost of the above testing shall be carried by the Contractor in the base bid and tested per ASTM F714.

1. Melt Index.
2. Density.
3. Percent Carbon.
4. Dimensions.
5. Ring Tensile Strength and/or Burst Pressure.

D. Guarantee Delivered Materials: Submit a guarantee, or affidavit, or quality certification that all pipe and fittings delivered to the project will match properties of the submitted items within

industry standard tolerances. At the minimum, certification shall indicate compliance with referenced ASTM standards.

E. The Contractor shall only submit Record Drawings which have incorporated dimensions from the pipe supplier's shop drawings.

F. Q/A for Pipe: For all pipe, submit a description from the pipe manufacturer giving details of factory quality assurance (Q/A) procedures.

G. Q/A for Fittings: For all factory fabricated fittings, submit a description from the fitting fabrication shop giving details of the fabricator's quality assurance (Q/A) procedures, or submit a certificate of compliance with Q/A procedures defined by ASTM and the PPI Handbook.

H. Personnel Qualifications: Before beginning field assembly of field-fabricated fittings, submit documentation of fusion training and certification for field personnel.

1. Submit documentation, that the Field Fusion Technician, and/or Fusion Provider, and/or Contractor's field installing personnel, are qualified or certified by the pipe distributor or manufacturer of the butt-fusion equipment, and where applicable have received competent training in the proper use of the electro-fusion devices.
2. Submit list of Contractor's personnel who have received competent training in making fusions with date of training and name of specialist giving the training. Include listing of training for "standard butt-fusion" and/or "electrofusion" as applicable.

I. Coupling Fusion Device: Submit information describing electronic device used with "electro-fused couplings" including list of data automatically recorded with each coupling fusion.

J. Warranty: Submit warranty conforming at minimum to the limitations listed below.

1.6 IDENTIFICATION

A. All pipe and fittings shall be clearly identified with the manufacturer's name, nominal size, SDR rating and production date at the minimum.

B. All factory-made fusion beads shall be identified with a code number and the manufacturer shall keep records for tracking of any such fusion to its place and time of origin. Identification shall be by imprint in or adjacent to the bead.

C. All field fusions shall be imprinted with an identification number and the installer shall keep a log book recording each joint with pertinent information.

1.7 WARRANTY

A. Pipe and fitting supplier shall provide a one-year warranty coving defects in product material and workmanship. Warranty period to begin at "startup" of the life support system when operation of the piping system is turned over from the Contractor to the Owner. A successful pressure test, or pressure leak test, prior to the expiration of the warranty period shall not relive the supplier of warranty responsibility for the full warranty term.

B. Fusion Providers (or the Field Fusion Technician) shall provide a one-year warranty concerning defects in fusion joining workmanship that shall provide for remaking defective butt fusion, saddle fusion, or electrofusion joints. Warranty period to begin at "startup" of the life support system

when operation of the piping system is turned over from the Contractor to the Owner. A successful pressure test, or pressure leak test, prior to the expiration of the warranty period shall not relive the supplier of warranty responsibility for the full warranty term. The Contractor shall bare all costs associated with excavation, and repair of materials above, with warranty of buried piping.

PART 2 - PRODUCTS

2.1 PIPE MATERIALS

A. Pipe shall be manufactured in accordance with ASTM F714 Standard Specification for POLYETHYLENE (PE) PLASTIC PIPE (SDR-PR) BASED ON OUTSIDE DIAMETER per Table 7 for IPS pipe sizing.

1. Typical wall thickness for piping larger than 2-inch in diameter piping shall be **SDR 17.** The term “piping” shall mean both pipe and fittings.
2. Wall thickness for piping 2-inch and smaller in diameter shall be **SDR 11**.

B. To address the basis of design in terms of stress and long-term strain, it is the specifying Engineer's intent that the pipe be rated for 125 psi in accordance with ASTM F714. All pipe, fittings and fabrications shall be applicable pressure testing specified in the General Conditions for a 3-hour 90 psi expansion phase followed by a 1-hour 80 psi test phase.

C. Polyethylene pipe shall be rated as PE4710 by the Plastic Pipe Institute and shall conform to ASTM D3350 (latest edition) with a cell classification meeting the following criteria (which meets or exceeds PE445574C). This criteria shall be documented by the pipe manufacturer and/or the resin manufacturer.

1. Density of 0.955 gm/cc nominal, 0.947 gm/cc minimum, per ASTM D 1505.
2. Melt Flow Index of 0.15 gm/10 minute nominal, 0.2 gm/10 minute maximum, at 190 deg C / 2.16 kg load; or 9.0 gm/10 minute nominal (8.0 min. to 9.5 max.) at 190 deg C / 21.66 kg load; per ASTM D1238.
3. Flex Modulus of 135,000 psi nominal, 110,000 psi minimum, per ASTM D790.
4. Tensile Yield Strength of 3,500 psi nominal, 3,200 psi minimum per ASTM D638.
5. Environmental Stress Cracking (ESCR) of 5,000 hrs. minimum per ASTM D1693 (cond. C) or Slow Crack Growth in excess of 500 hours per PENT (F1473).
6. Long Term Hydrostatic Strength of 1,530 psi minimum per ASTM D2837 for a Hydrostatic Design Basis of 1,600 psi.
7. U-V Stabilizer shall be 2% to 3% carbon black.
8. Shore "D" hardness of 60 minimum, 65 nominal per ASTM D2240.

D. All pipe shall be supplied in straight lengths. Pipe coiled on spools is not acceptable and will be rejected.

2.2 FITTINGS

A. Fitting Construction:

1. Elbow fittings 8-*inch di*ameter and smaller shall be factory molded-type and manufactured in accordance with ASTM D3261.
2. Elbows larger than 8-inch may be molded-type or mitered fabrication**.**

3. Molded fittings 3-inch and larger shall be SDR 17 not be substituted with lower SDR fittings with reduced internal diameter.
4. Fittings 2-inch and smaller shall be SDR 11.
5. 90-degree elbow fittings in “vacuum” piping shall long-sweep radius of molded or mitered construction. If mitered construction, shall be of 5-segment minimum.

B. Mitered Fabricated-Type Elbow Fittings:

1. Thermally butt-fused mitered construction is allowable only for elbow fittings 10-inch and larger in diameter and in compliance with ASTM F2206.
2. 90-degree elbows shall be 5-segment minimum.
3. Constructed of all SDR 17 segments where 3-inch and larger.
4. Mitered elbow fittings shall be within three-degree in tolerance of the nominal bend.
5. All *internal* beads shall be trimmed flush with the I.D. of the pipe wall. *External* beads shall not be removed.

C. Mitered Fabricated-Type Tee Fittings;

1. Thermally butt-fused mitered construction is allowable only for Tee fittings with the main line segment larger than 6-inch diameter and in compliance with ASTM F2206.
2. All *internal* beads shall be trimmed flush with the I.D. of the pipe wall. *External* beads shall not be removed.
3. Standard Tee fittings with equal size main line and branch piping shall be constructed of all SDR 17 pipe segments. Main line segments shall all be from SDR 17 pipe.
4. Mitered Tee fittings shall be within three-degrees in tolerance.
5. Reducing-Tee fittings with smaller diameter branch piping shall conform to ASTM F2206.7.2 using one of the following methods:

    a. Increased wall thickness by increasing the O.D. and machining the ends for fusion with SDR 17 pipe.
    b. Increased wall thickness of only the smaller diameter branch pipe, by used of an SDR 11 segment at the Tee fusion weld, with SDR 17 dimensions at the end connection.
    c. An internal lip at the fusion of the branch pipe no less than the internal diameter of SDR 11 pipe +/- ¼” to allow for hole saw size. The lip shall be the result of boring the hole into the main segment after fusion of the smaller diameter branch pipe.

6. Full-size standard Tee fittings (i.e. 10”x10”x10”) shall have all internal beads ground smooth and equal to the SDR 17 pipe I.D.

D. Fabricated fittings shall be manufactured to withstand constructed to withstand the specified test pressure or the full-rated pressure of the SDR pipe.

1. The specified pressure test call for a 90 psi 3-hour expansion phase, followed by an 80 psi 1-hour test phase, and other requirements specified in Section 170010.
2. Fittings shall be fabricated to carry specified pressures in the "free-ends" condition without external blocking or support of backfill.

E. Internal Surface Conditions: Mitered fabricated-type fittings shall be delivered to the job site with all of the *internal* roll-back beads trimmed flush and smooth with the pipe wall—except in the case of reduced diameter branches of Tee fittings which may have diameter reduced to SDR 11 pipe I.D.

F. Side-Wall Fused Reducing Tees: All such joints shall be of products or by equipment specifically devised for making fully fused joints such as the use of electrofusion saddles.

G. Reducers: Reducers shall conform to the details of the drawings and shall be concentric, or eccentric with flat side on top or bottom, as indicated on the drawings. Where geometry of conical reducers is unclear, the Contractor shall notify the Engineer for clarification before fabrication.

H. Electro-fusion Fittings: May be substituted for thermally butt-fused pipe joints. Shall be designed for installation with electronic monitoring and meet or exceed the SDR of the adjoining pipe.

I. Non-Approved Fittings: Adjustable fittings and other fittings, which may not be fully fused, have reduced internal diameters, or pockets which may trap debris or interfere with passage of cleaning pigs, are not acceptable and will be rejected.

2.3 PIPE JOINTS

A. All pipe-to-pipe joints and pipe-to-fitting joints shall be completed by a technique that maintains the full axial strength of the original pipe. The cost of all materials and labor shall be included in the Contractor's base bid. No reduction of testing pressure is allowed for any coupling used.

B. Typical Joints: The design intent is for typical PE pipe joints to be thermally butt-fused by a factory approved technique that maintains the full axial strength of the original pipe.

C. Electro-fused Couplings: May be substituted for thermally butt-fused pipe joints that maintains the full axial strength of the original pipe. Shall be per ASTM D3261 and designed for installation with electronic monitoring and meet or exceed the SDR of the adjoining pipe.

D. Companion Flanges: Flanged ends are typically allowed only where pipe joins to piping of a differing material, at valves, where otherwise specifically shown on the drawings, or where prior approval for use of flanges is given by the Owner. Flange-to-flange connections for joining fixed-end PE piping may be used only with prior written approval of the Owner.

1. All flanges shall have a 150 lb. bolt pattern. Bolt holes shall straddle the vertical centerline (i.e., "two-holed," level).
2. All flange adapters (or molded stub ends) shall be of the same material and have the same pressure rating as the pipe.
3. Backing rings shall be sized for ANSI 125/150 lb. bolt hole configuration and shall be sufficiently rigid to avoid any visible flexing. Material shall be Type 316 stainless steel, non-metallic material, or iron covered with thick reinforced PE coating designed for saltwater service. By *Improved Piping Products* (800) 969-0962 www.ipp-inc.com; or approved substitute.
4. The use of PE “Butterfly Valve Adapter” flanges, with relief on the inside diameter for opening of valve discs, is recommended. If required for proper mating of butterfly valves, custom polyethylene spacers shall be provided. Gaskets are not required between the spacer and rubber booted butterfly valves. Faces of spacers on the valve side must be flat, and without "O" ring grooves or other undulations, in order to be compatible with installation of valves. Gaskets between the PE spacer and the PE pipe are optional and may be provided at the discretion of the Contractor.
5. Provide ribbed EPDM type rubber gaskets where flanges are used to accomplish a change in material.

E. Transition Fitting: Used for transition from PE pipe to PVC pipe where specifically called out on the Drawings where a flanged connection is not indicated on the Drawings. Limited to small pipe diameters for standard available manufactured transition fittings. All transition fittings shall be products manufactured specifically for PE to PVC pipe transitions and recommended by the manufacturer for that application.

1. Transition Union Fittings: Available in 2”x2” size. Manufactured of grey PVC and meeting ASTM D-1784 and F-1970 standards. Built with a PVC True Union coupling, with a BUNA-N rubber O-ring, for connection to 2-inch diameter HDPE pipe and a threaded PVC male end. Shall be delivered with an SDR 11 HDPE pipe stub. Rated for 100 psi minimum. *Manufactured by Lasco Fittings, Inc.* Brownsville, TN (800) 776 -2756 www.lascofittings.com; or approved substitute.
2. Transition Couplings 3-Inch through 16-Inch: Manufactured with SDR 17 PE end, Sch 40 or Sch 80 PVC end matching project specifications for PVC piping, with an external Type 316 stainless steel coupling to joint all material as a single component meeting strength requirements. The design shall not allow the external stainless steel coupling to be in contact with internal fluid. Couplings shall be approved for pressure piping by the AWWA. The product shall be manufactured to meet Hydrostatic Pressure Test standards per ASTM D2513, D1599, D1598, and F-714. Shall submit information that the manufacturer has subjected fittings matching the delivered product to hydrostatic testing with a minimum pressure of 670 psi, at a minimum 80 deg Centigrade water temperature, for a test of 170 hours minimum. Shall submit information that the manufacturer has subjected fittings matching the delivered product to a pull-out test force exceeding 4,000 lbs. force. All buried transition couplings shall be wrapped by the installing Contractor with the corrosion resistant wrapping specified in the General Provisions Section of the specifications. Manufactured by *Poly-Cam, Inc.* Anoka, MN (888) 355-5574 www.polycam.com; or approved substitute.

2.4 MISCELLANEOUS

A. Wall Flanges/Anchor Flanges: Flange rings shall be provided as indicated on the drawings, and/or as required by Section 170010, to act as water-stops and to restrain pipe. Typically anchor flanges are to be provided at all concrete wall and slab penetrations. Anchor flanges may be machined from large OD pipe stock, or attached by fillet welding or butt fusion. Machined wall anchors shall be by *ISCO Industries* or approved substitute.

B. Branched Manifolds: Where branched manifolds are factory spooled, adequate protection shall be provided to prevent excess stress on the piping. Gusseting or transportation jigs and cradles shall be provided as required to protect spooled piping before installation. Grind inner joints smooth, flush and neatly where the internal diameters join together.

C. Custom Fabrications: All fittings and custom fabrications shall be fully rated for the same internal pressure as required for the mating piping/fittings. Fabrications shall be specially machined from cut pipe, polyethylene sheet stock or molded fittings. Materials shall be joined by fully heat fusing joining methods.

D. Unacceptable Joints and Fabrications:

1. Any type of joint or method not specifically addressed in this Specification or otherwise specifically approved by the Engineer.
2. Any elbow delivered to the site more exceeding specified alignment tolerance at normal temperatures and not in direct sunlight.
3. Side-wall "socket" type joints are not allowed. (Acceptable side-wall fusions must be made by either heating elements specially constructed to follow the radius of the pipe or by provision of an electro-fusion saddle with electronic monitoring.) Use methods in compliance with ASTM F905 Practice for Qualification of Polyethylene Saddle-Fused Joints.
4. Extrusion welded joints are not acceptable for pressure applications.
5. Any material with rough-hewn edges, exhibiting saw marks, or otherwise crudely fabricated and not within process industry standards is unacceptable and will be rejected.

6. Any fitting delivered to the job site with excessive material protruding past the inner wall surface in such a manner that would disturb the flow stream will be rejected.
7. Use of buried flanges shall not be added to the project without prior written approval of the Owner.
8. Use pipe overlay straps for coupling of pipes is not allowed.

2.5 PIPE MANUFACTURERS

A. Pipe Manufacturers & Suppliers:

1. *Chevron Phillips Chemical Company LP* Plano, TX (800) 527-0662 www.cpchem.com;
2. *ISCO Industries* Louisville, KY (800) 345-4726 www.isco-pipe.com;
3. *JM Eagle* Los Angeles, CA (800) 621-4404 www.jmeagle.com;
4. *Georg Fisher Central Plastics* Shawnee, OK (800) 654-3872;
5. *WL Plastics* Fort Worth, TX (682) 831-2710 www.wlplastics.com.

2.6 MOLDED FITTING MANUFACTURERS

A. Molded Fitting Manufacturers & Suppliers:

1. *Integrity Fusion Products, Inc.* Peachtree City, GA (888) 770-6330 www.integrityfusion.com;
2. or approved substitute.

2.7 FABRICATED FITTING MANUFACTURERS

A. Fabricated Fitting Manufacturers:

1. *Plasson USA* Stafford, TX (800) 241-4175 www.plassonusa.com;
2. or approved substitute.

2.8 ELECTROFUSION FITTING MANUFACTURERS

A. Electrofusion Fitting Manufacturers & Suppliers:

1. *Georg Fisher Central Plastics* Shawnee, OK (800) 654-3872;
2. *Ipex* (Friatec Gas & Water Inc. electro fusion fittings) Pineville, NC (704) 889-2431;
3. *Integrity Fusion Products, Inc.* Peachtree City, GA (888) 770-6330 www.integrityfusion.com;
4. *Plasson USA* Stafford, TX (800) 241-4175 www.plassonusa.com;
5. *Strongbridge International Inc.* Jacksonville, FL (904) 278-7499 www.strongbridge.us;
6. or approved substitute.

2.9 FIELD FUSION TECHNICIANS

A. Field Fusion Technicians:

1. *HDPE, Inc.* Mulberry, FL (863) 607-4730 www.hdpeinc.com;
2. *High Country Fusion* Bellevue, ID (800) 780-6330 www.hcfusion.com;
3. *ISCO Industries* Louisville, KY (800)-345- 4726;

4. *Shale-Inland PVF* Lakeland, FL (863) 646-1493 or (800) 966-0617 www.shalepvfflorida.com;
5. S & S Directional Boring, Ltd. Bryan, OH (419) 630-0726;
6. Or approved substitute.

PART 3 - EXECUTION

3.1 GENERAL PIPE INSTALLATION

A. Per Section 170010.

3.2 PE PIPING INSTALLATION

A. See Section 170010 for requirements for special trenching and backfill for PE/HDPE pipe per AWWA M55. Buried PE/HDPE piping, located under hydraulic structures, may be installed with properly compacted backfill material, or CDF encasement, except in cases where CDF is specifically called for on the Drawings.

B. Pipe shall be off-loaded and handled in accordance with the pipe manufacturer's instructions and AWWA M55.

C. Pipe shall be handled and supported with the use of woven fiber pipe slings or approved equal. Care shall be taken to not cut, gouge, scratch or abrade the piping in any way. Use of hooks, chains, wire rope or device which damages the surface of the piping is strictly prohibited.

D. All thermally field-fused joints shall be made by personnel trained and/or qualified as specified above. Pipe fusion shall be performed using the pipe manufacturer's recommended procedures; including temperature of heater, fusion interface pressures and cool down times; per ASTM F2620.

E. Alignment of End Connections: Since polyethylene is a flexible material, the Contractor must make special arrangements to maintain tolerances at connection flanges, including one of the following methods:

1. *Method No. 1:* Before encasing or burying PE pipe, bolt flanged ends to above grade manifolds including in-line valves and properly align the entire assembly.
2. *Method No. 2:* Before encasing or burying PE pipe, secure ends to be connected to above-grade piping with rigid steel template and align to precisely match underground piping with above-grade piping.
3. *Method No. 3:* A Contractor selected method rendering all piping properly installed, pressure tested, connected to differing materials, and properly aligned.

F. Typically, all PE-to-PE joints for pipe smaller than 24-inch diameter, joints shall thermally butt-fused, or joined by electro-fusion couplings. ASTM F1290 and the electrofusion fitting manufacturer's recommended joining procedure shall be observed for installation of electrofusion joints.

G. Electro-fused couplings shall be removed and replaced whenever the electronic monitoring registers an abnormal fusion process regardless of pressure testing results.

H. Electro-fused fittings and joints not meeting the pressure test shall not be re-fused or attempted to be patched by fillet welding. Defective electro-fusion shall be removed and replaced.

I. Where electrofusion fittings are used in waters of a fish or shark tanks, the exposed metal electrode shall be ground to below the surface of the PE with a manually applied PE cap made over the metal electrode by field-fusion or the metal electrode shall be encased in structural concrete to a depth not less than 3-inch.

J. Field fillet-welding shall not be used on any piping for any reason except for attachment of anchor flanges.

K. Branched piping shall be specially rigged to prevent any excess stresses before and during installation.

L. The addition of any elbow or bend fittings, not specifically shown on the drawings, must be approved by the Engineer before installation.

M. Field-fused joints tying in long lengths of piping shall be done as close to operating temperature (65 deg F) as possible. Such joining shall be scheduled for early in the morning or otherwise acceptable periods during the day when the piping is cool.

N. Piping shall be restrained with an anchor flange at all penetrations through concrete slabs and walls. Where used as waterstops, the flanges shall be ringed at the pipe circumference with waterstop material per detailing shown on the drawings. Anchor flanges may be field installed.

O. Where the Contractor believes it is necessary to further restrain the piping to ensure proper dimensions are held, or as otherwise required for installation of the piping system, the Contractor may optionally encase or block portions of the polyethylene pipe in CDF, at his own expense, along with consent of the Owner. Under no circumstances shall the Contractor encase any joints prior to completion of a witnessed and approved pressure test in accordance with Section 170010.

P. All completed piping shall be hydrostatically pressure tested after installation as specified in Section 170010 and in accordance with manufacturer's recommendations—all pipe, fittings and fabrications shall be pressure tested in the field with a 3-hour 90 psi expansion phase followed by a 1-hour 80 psi test phase—including other conditions specified in Section 170010 General Conditions. When pressure testing polyethylene piping, the pressure will vary throughout the duration of the test; the pressure test shall be qualified by visual inspection for leaks.

Q. The Contractor shall take precautions for expansion and contraction of PE piping when pressurized or with changes in temperature.

1. When pressurized, the expansion must be taken into account by the Contractor where piping is free to move and otherwise specially secured where the piping is fixed at a given location.
2. Where PE piping penetrates a hydraulic wall structure (or tank wall) the concrete shall not be placed when the PE piping material is at temperature higher than 100 deg F due to direct sunlight or environmental conditions. The Contractor shall only place concrete at PE wall penetrations in the cool hours of the day or provide special shading and icing for cooling of the PE pipe at the wall penetrations.

R. Where piping is defective or damaged, the entire section shall be cut out and a new section shall be thermally butt-fused in place. Where pipe wall is gouged deeper than 10% of its wall thickness, it shall be replaced. Where physically impossible to remove the defective or damaged

section, a heat-fused repair blanket (or ”electro-fused pipe strap“) may be used to make the repair if approved in advance by the Owner.

S. Backfill in accordance with the manufacturer's recommendations, Section 170010, and as indicated on the drawings. Pipe is to be filled with water at a slight pressure (2 to 5 psi) during backfilling.

END OF SECTION 170250

SECTION 170261 - OZONE GAS PIPING

PART 1 - GENERAL

1.1 USAGE

A. The ozone gas piping is used for pressurized ozone gas and oxygen carrier gas. A combination of stainless steel tubing, or dual containment piping is specified, depending on locations indicated on the Drawings. The intent is to have the most corrosion-free system possible, where non-metallic dual containment piping can be used, while stainless steel tubing is used for practical situations.

1.2 SUMMARY

A. The General Conditions apply to this Section as fully as if repeated herein.

B. The drawings label piping with a PROCESS-MATERIAL-SIZE designation. Provide piping specified herein where designated as 316 SS on the Drawings.

C. Work includes:

1. Stainless steel ozone gas tubing at the ozone generator(s), and at the ozone injectors, where the dual containment piping system is not used.
2. Dual containment piping consisting of Teflon tubing encased in PVC electrical conduit.
3. Molded PVC junction boxes at transition between stainless steel pipe and dual containment piping.
4. Teflon tubing connection at the injectors.

1.3 SUBMITTALS

A. Submit information describing all dimensions and materials of fittings.

1.4 COORDINATION

A. Coordinate fittings with ozonation equipment and valves.

PART 2 - PRODUCTS

2.1 STAINLESS STEEL TUBING OR PIPE MATERIALS

A. Provide where dual containment system is not installed for ozone gas piping. Either welded Sch 40 piping, or tubing, as specified below.

B. Stainless Steel Tubing Option: Type 316, fully annealed, stainless steel tubing suitable for bending and flaring. No grade of tubing other than high quality, seamless hydraulic tubing manufactured of Type 316 is acceptable. Wall thicknesses per ASTM A269.

1. All tubing and fittings shall be cleaned of all grease for oxygen service.

2. Stainless Steel Tubing Fittings: Joints for connecting ozone gas tubing shall be two, ferrule-type tube fittings: Fittings suitable for the transmission of 5% ozone and 95% oxygen at 120 deg F. All pieces machined of Type 316 or Type 316L stainless steel, in either case carbon content shall be limited 0.05%. Design shall incorporate a make-up gap for go/no go gaging for calibration of installation. Each fitting shall be capable of at least 20 remakes. Seal design shall allow compensation in normal variations in tubing dimensions. Manufactured by: *Crawford Fitting Company* (Swagelok) Solon, OH; or equal.

C. Stainless Steel Pipe Option: Pipe shall be Type 316, Schedule 40, stainless steel pipe. No other grade of stainless steel is acceptable. Shall be high quality, seamless, hydraulic piping, ASTM-A312 with markings per ASTM-A530 and dimensions as shown in ANSI B 36.19. Pipe joints shall be as follows:

1. Typical pipe joints shall be socket-welded, including couplings and elbows. Socket-welded joints shall be Type 316 stainless steel socket weld pipe fittings. Welding shall be by the Tungsten Inert Gas (TIG) process. Manufactured by: Cajon Company (Swagelok), Macedonia, OH; or approved substitute.
2. Where specifically called out on the Drawings, connections to the ozone generators shall be with flexible hose as specified below.
3. Connections at valves shall be threaded with adjacent unions to facilitate removal of installed valve for maintenance.
4. Miscellaneous: Where required to connect to equipment or valves, flanged fittings shall be Schedule 80 with 150 lb. ANSI bolt pattern, Type 316 stainless steel body and hardware with Teflon or Hypalon gaskets.

2.2 TEFLON TUBING & FITTINGS

A. Install Teflon tubing in dual containment system with PVC electrical conduit as the exterior containment pipe. All flex tubing inside the PVC dual containment shall be of a continuous length from the spool and free of connecting fittings.

B. Tubing: Teflon, or PTFE, or fluorinated ethylene propylene (FEP) flexible tubing sized to work with specified fittings. Conforming to ASTM D 3296, Type II fractional inch sizes, Class D chemical tubing. Natural translucent color. “Standard” wall thickness for 5/16 inch and smaller; “Heavy” wall thickness for 3/8 inch through 7/8 inch; “Standard” wall thickness for one-inch inside diameter and larger; as follows:

NOMINAL SIZE	OUTSIDE DIAMETER	WALL THICKNESS	INSIDE DIAMETER
1/4 in	5/16 in	0.030 in	0.250 in
5/16 in	3/8 in	0.030 in	0.313 in
3/8 in	1/2 in	0.062 in	0.375 in
7/16 in	9/16 in	0.062 in	0.438 in
1/2 in	5/8 in	0.062 in	0.500 in
5/8 in	3/4 in	0.063 in	0.625 in

C. Fittings: Provide flared type fittings (compression type fittings not recommended). Body and nuts constructed of Teflon, PTFE, PVDF, PFA or FEP. Seals and/or O-rings (as applicable) of viton, silicon, or Gortex. Provide threaded end connections as required for connection to dissimilar materials.

D. Manufacturers & Suppliers:

1. *Altaflo* Hopatcong, NJ (973) 663-3303 www.altaflo.com;
2. *Furon* Anaheim, CA (714) 630-5818 www.furon.com;
3. *Harrington Industrial Plastics, Inc.* Chino, CA (909) 597-8641 or (800) 937-2527;
4. *Corrosion Products, Inc.* St. Louis, MO (800) 528-7473 www.corrosionproductsinc.com;
5. Approved substitute.

2.3 PVC CONDUIT AND JUNCTION BOXES

A. Conduit: For outer wall of dual containment piping with Teflon tubing as the inner ozone gas carrying conduit. Schedule 80 PVC (polyvinyl chloride) conduit and long-sweep fittings. Conduit to comply with NEMA Specification TC-2 and UL Standard 651. Fittings to comply with NEMA Specification TC-3 and UL Standard 514b. All fittings and couplings installed with manufacturer's approved cement.

B. Junction Box: Used for transition between stainless steel ozone gas pipe and dual containment piping. Manufactured of molded PVC to meet NEMA-4X standards with screw attached gasketed cover.

C. Manufacturers: *Carlon Lamson & Sessions* Cleveland, OH www.carlon.com; or equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install and support piping per Sections 170010 and 170310.

B. Install piping connections to ozone generators to allow for routine maintenance of ozone generators and reduce transmission of vibrations into the piping system. This may include "off-sets" and changes in direction of installed pipe to allow for movements required during maintenance.

C. Install specified translucent *Teflon* tubing between hard piping and ozone injector. Length as required for one single length of Teflon tubing at connection to injector. Install specified fittings as necessary to prevent kinking of tubing. At end connections, provide threaded male or female fitting for connection to stainless steel piping and the eductor/check valve.

D. Clean all piping for oxygen service and free of grease and oils.

E. Leak check all single-wall fittings and other single-wall gas pipe connections by soap-bubble testing with SNOOP Liquid Leak Detector manufactured by: Nupro Company (Swagelok), Willoughby, OH; or approved substitute. And/or check for ozone leaks with a solution of potassium iodide (2% KI) soaked on a clean white by observing a brownish-red color if ozone is present on the moist white rag.

END OF SECTION

SECTION 170267 - LSS PIPING INSULATION

PART 1 - GENERAL

1.1 SUMMARY

A. Installed on all interior piping where there is a potential for the water temperature of 64 degrees Fahrenheit or less. Including the following installations:

1. EX2- LPS – SPINY LUMPSUCKER
2. EX3 – PRC – PACIFIC ROCKEY COAST
3. CRO – COLD REVERSE OSMOSIS SALTWATER SYSTEM

1.2 SUBMITTALS

A. Submit data identifying thermal conductivity, thickness, and jackets (both factory and field applied, if any).

B. Submittal shall include manufacturer's recommendation for use with trace heating cable.

C. Submit typical details/drawings of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.

D. Submit typical details/drawings for attachment and covering of heat tracing inside insulation.

E. Submit color selection for PVC jacketing, where applicable.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: Insulation shall be installed by skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

1.4 COORDINATION

A. Coordinate insulation with size and location of supports, hangers, and insulation shields.

B. Coordinate installation and testing of heat tracing. Where required by Code or governing authority, heating cables shall be installed by Electrical Contractor.

C. See specification Section 170666 for removable insulating jackets required at cold water heat exchangers.

PART 2 - MATERIALS

2.1 GENERAL INSULATION MATERIALS

A. This Section includes insulation for exterior life support piping. The insulating system shall have the following properties:

1. Excellent resistance to moisture.
2. Tough exterior resistant to abrasion.
3. Made with EPA registered antimicrobial protection.
4. Recommended system for heat trace cable on the pipe.
5. Thermal R value shall meet or exceed of 4.0 hr/sq-ft/ deg F/Btu at 75 deg F (Thermal Conductivity shall be less than 0.245 Btu in/hr sq-ft deg F at 75 deg F.)
6. Flame-spread index shall be 25 or less and smoke-developed index shall be 50 or less for thickness up to 1-1/2 inches as tested by ASTM E 84.

2.2 INSULATION MATERIALS

A. Flexible Closed-cell Elastomeric: Closed-cell rubber materials. Comply with ASTM C 534, Type I for tubular materials and Type II for sheet materials.

1. Selected product shall have high temperature limit of at least 200 deg. F for compatibility with heat trace cable.
2. Provide external moisture barrier system as, and if, recommended by manufacture of insulation. Water Absorption rating of closed-cell elastomeric material shall be a maximum of 0.2% by volume
3. Manufacturers:

    a. “Aerocel EPDM” by *Aeroflex USA Inc.* www.aeroflexusa.com
    b. “Armaflex” *Armacell LLC* www.armacell.com

A. Substitutes: Substitute insulation materials shall be subject to review by the specifying engineer and shall not include water absorbing materials such as mineral wool, fiberglass, or calcium silicate.

2.3 JACKETING

A. When the insulating product requires a jacketing, include a complete 30 mil PVC exterior jacket. Exterior jacket shall be provided in owner-approved color selections or painted per Section 170010.

B. High-impact-resistant, UV-resistant PVC complying with ASTM D 1784, Class 16354 C; 30 mil thickness; roll stock ready for shop or field cutting and forming.

C. Manufacturers: Johns Manville; P.I.C. Plastics, Inc.; Proto PVC Corporation; or Speedline Corporation.

PART 3 - INSTALLATION

3.1 GENERAL

A. All piping assemblies shall be pressure tested and leak tested before insulation is installed.

B. Refer to the manufacturer's installation instructions and design guide for proper installation and layout methods. Information in the manufacture's Application Manual is much more extensive than the specified notes and shall be adhered to by the installing Contractor.

C. Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application. Verify that surfaces to be insulated are clean and dry and have been tested and are free of defects.

D. Where required, install and test heating cable system prior to insulation. Where necessary, install secondary high-temp insulation to protect insulation with a limited high temperature rating. Where heating cables are to be installed, secure heating cables with fiberglass or foil tape beneath insulation. It is recommended to increase the insulating diameter of closed-cell elastomeric tubes where installed over heat tracing cables.

E. Install insulation with smooth, straight, and even surfaces; free of voids throughout the length of equipment, piping including fittings, valves, and specialties.

F. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive and tape as recommended by insulation material manufacturer.

G. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarding integrity, unless otherwise indicated. Arrange insulation to permit access to packing and valve actuator servicing and to allow valve operation without disturbing insulation. Insulate valves using preformed fitting insulation or sectional pipe insulation. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Install closed-cell elastomeric insulation up to valve actuation spindles as illustrated in insulation manufacturer's Application Manual.

H. Insulate pipe elbows using preformed fitting insulation, including field preforming methods illustrated in insulation manufacturer's Application Manual. Each piece shall be butted tightly against adjoining piece.

I. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

J. Install removable insulation covers at locations indicated where routine access is required

3.2 JACKETING

A. Install jackets over insulation on piping where moisture and abrasion protection is required.

1. Install PVC jacketing over insulation within 6-foot of finished floor.
2. Where elastomeric insulation is greater than 6-foot above finished floor, installation of jacketing is not required.

B. Where required, install jacketing as recommended by the manufacturer.

1. Completely encapsulate insulation with coating, leaving no exposed insulation. Draw jacket tight and smooth.
2. Cover circumferential joints with 3-inch- wide strips, of same material as insulation jacket.
3. Overlap jacket longitudinal seams at least 1-1/2 inches.

4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
5. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
6. Finish exterior surfaces with acrylic latex coating.
7. Where jacketing is terminated, at indoor piping 6-foot AFF, seal the edge of the jacketing to the closed-cell elastomeric insulation with a sealant or tape as recommend by the manufacture of the closed-cell insulation.

3.3 CLEAN UP

A. Leave all areas free of adhesives, paint or other debris. Use *Goof Off*, acetone or MEK to remove adhesive from hard surfaces — do not use such solvents on elastomeric insulation or other materials which may have original new surfaces damaged by strong solvents

END OF SECTION

SECTION 170270 - FLEXIBLE MOLDED-RUBBER COUPLINGS

PART 1 - GENERAL

1.1 SUMMARY

A. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Provide flexible couplings (also known as rubber expansion joints) where indicated on the drawings. Locations may be shown on the Piping and Instrumentation Diagrams, or in plan, section, elevation, or detail. Locations may include pump connections, where required for maintenance of valves, and other specific locations.

C. Types at Locations:

1. Provide “twin sphere” where indicated on P&IDs at pump suctions.
2. Provide “single sphere” in valve pits to assist with ease of valve maintenance.

D. Both flex couplings, and spacer flange(s) with drilled holes for ANSI 125/150 bolt pattern, shall be supplied by the manufacturer.

1.2 SUBMITTAL

A. Submit description of couplings and identify materials selected for this application. Identify chemical resistance and temperature range for compatibility of selected materials. Submittal shall include shop drawings for reducing style couplings where not shown as a standard catalog product.

1.3 MAINTENANCE AND OPERAATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.4 COORDINATION

A. Coordinate the dimensions, detailing and strength requirements of mating flanges, valves and other connecting materials.

PART 2 - PRODUCTS

2.1 GENERAL CONFIGURATIONS AND MATERIALS

A. At Pump Suctions: Molded-rubber covered, “Double-Arch” (a.k.a. "Twin Sphere") or “Wide Arch” type design, multi-layered cord fabric design suitable for working pressures ranging from -10 psi to +20 psi on continuous basis. Constructed with a full-face rubber sealing surface. Axial restraining control rods are not desirable and not required. 10-inch size and greater shall allow for minimum axial compression of 1.75-inch and axial extension of 1-inch. 6-inch size and greater shall allow for transverse minimum transverse deflection of 0.875-inch.

B. At Valve Vault Locations: Provide flex couplings to allow for removal and replacement of valves at fixed piping locations. Molded-rubber covered, single-arch (or "Single Sphere") type design, multi-layered cord fabric design suitable for working pressure for the operating pressure but not less than 30-psi. Constructed with a full-face rubber sealing surface.

C. Miscellaneous Locations: Submit appropriate flex connector for review.

D. Reducing Requirement: Where piping connections change in size, provide "reducing" style flex connectors.

E. Metal flanges, backing rings, other flange plates, and tension rings between spheres shall be Type 304 or Type 316 stainless steel or hot-dipped galvanized carbon steel. Backing rings shall be solid one-piece construction or of an interlocking design that prevents “hinging” of the backing ring when mounted with a wafer type valve.

F. Spacer Flange(s): Supply each flex coupling with at least one spacer flange constructed for mating of the flex coupling where a flat surface is not otherwise provided. In the case of reducer couplings, the spacer shall be of the larger diameter. Flange adapter plates shall match ID/OD of coupling and be constructed of thick PVC or Type 316L stainless steel.

G. Liner Materials:

1. General: Interior lining shall be suitable for use with chlorinated and ozonated saltwater or seawater, and animal waste products.
2. At pump suctions: Interior lining shall be suitable for use with a mild oxidizing solution, such as EPDM rubber.
3. If installed downstream of ozone contactor or at the Deaeration Tower: Interior lining shall be suitable for use with an oxidizing solution and constructed of Viton rubber or silicone lined.
4. Where resistance to heat is required: Acceptable materials include hydrogen-peroxide-cured EPDM with Kevlar reinforcement, rated for 250 deg F.

H. Face Detailing: Faces of the coupling's flanges must be compatible for proper mating with opposing pipe and equipment flanges.

I. Manufacturer: The specified product with “2-Arch Expansion Joint with Solid Back Up Ring” and must be ***Special Ordered*** (i.e. double-arch reducing styles) to meet the above requirements.

1. *General Rubber* Pittsburg, PA (800) 233-6294 www.general-rubber.com;
2. *Mason Industries Inc.* Anaheim, CA (714) 535-2727 www.mason-ind.com;
3. *Proco Products, Inc.* Stockton, CA (800) 344-3246 www.procoproducts.com;
4. *Red Valve Company Inc.* (Redflex) Carnegie, PA (412) 279-0044 www.plantfloor.com;
5. *RM-Holz Inc.* (InterTech Group) Lodi, CA (209) 368-7171;
6. *Unaflex* Pompano Beach, FL (954) 943-5002 www.unaflex;
7. or approved substitute.

PART 3 - EXECUTION (See also 170010)

3.1 INSTALLATION

A. At pumps:

1. Fasten couplings directly to the pump flanges with hex-head bolts per Section 170316.
2. Do not use flex connectors to correct for gross misalignment of piping. Without a fixed condition/bolting, the piping shall not be more than 5-degrees or 0.5-inch out of alignment at the connection to the flex connector.

B. When butterfly valves or check valves are adjacent to the flexible coupling, use of a solid spacer flange is required to assure a positive sealing surface for the flex coupling.

C. Provide secure supporting of piping as required to reduce unacceptable displacement or movement.

END OF SECTION

SECTION 170280 - MECHANICAL PIPE SEALS

PART 1 - GENERAL (Also see Section 170010)

1.1 REQUIREMENTS

A. Locations:

1. Use for “repair” situations where new pipes requiring a water-stop seal penetrate existing pool wall. Not intended for use as water-stops for typical planned construction with new cast-in-place concrete wall construction.
2. May be used as pipe centering device in non-hydraulic walls where pipe is double sleeved (a.k.a. casing sleeves).
3. May be used for planned water-stops in new wall construction only after Owner’s approval of a substitution request where proposed to save on the cost of concrete form penetrations. Where a substitution request is approved, the wall insert shall be oversized PVC pipe sleeve with an outer perimeter cast-in-place water-stop flange.

1.2 COORDINATION

A. Sizing: Contractor shall ascertain size required for mechanical pipe sealing device based on actual outside diameter of pipe and actual diameter of core hole in concrete. Non-standard diameter seals may be necessary, especially in the case where fiberglass pipe is used.

B. Other Trades: Coordinate core drilling of concrete with structural requirements.

1.3 SUBMITTALS

A. Submit information describing all dimensions, materials physical of equipment.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 MECHANICAL SEAL

A. Description: Modular mechanical type, consisting of interlocking, synthetic rubber links shaped to continuously fill the annular space between the pipe and wall opening. Tightening of thru-bolts shall provide a completely watertight seal between the pipe and wall opening. Seal shall be rated for 40 ft. hydrostatic pressure when properly installed.

B. Materials: Interlocking links made of EPDM rubber. Pressure plates made of composite plastic material. Tap bolts and nuts shall be of Type 316 stainless steel.

C. Manufacturer:

1. *Special Ordered* "Link-Seal" with Type 316 stainless steel hardware by *GPT Industries,* Houston, TX (800) 423-2410 www.gptindustries.com;
2. *Flexicraft Industries* Chicago, IL (800) 533-1024;
3. or approved substitute.

PART 3 - EXECUTION (See also 170010)

3.1 INSTALLATION

A. Before core drilling, determine approximate location of reinforcement steel, with non-destructive electronic equipment (*Zircon* “Metallicanner” or similar equipment), and slightly adjust exact location of pipe penetration accordingly to minimize damage to reinforcing steel.

B. Where steel reinforcement has been cut or exposed, coat the exposed steel with a 20-mil thickness of “Armatec 110 EpoCem” by *Sika*, or equal corrosion protection coating.

C. Install in accordance with Manufacturer's instructions and finish-out as detailed on the drawings.

END OF SECTION

SECTION 170286 - QUICK DISCONNECT FITTINGS & VACUUM HOSE

PART 1 - GENERAL (See 170010)

1.1 USAGE

A. Common quick disconnect fittings are used with saltwater situations.

1.2 SUMMARY

A. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Provide where indicated on the drawings. For situations such as vacuum hose connections, provide a full compliment of both male and female fittings. For each permanently installed quick disconnect, provide a dust cap or plug as the case may require. Fittings on “loose” pipe or hose need not be supplied with dust cap or plug.

1.3 COORDINATION

A. Provide fitting style to match pipe, hose or type of end connection required.

B. Where mating to existing fittings, verify and assure proper fit of new fittings.

C. Coordinate installation of male and female ends for the situation at hand.

1.4 SUBMITTALS

A. General Information: Submit information describing all dimensions, materials physical of equipment.

B. Submit a guarantees’ and/or warranty. Cam handles shall be warranted by the manufacturer and addressed in the submittal.

PART 2 - PRODUCTS

2.1 NON-METALLIC QUICK DISCONNECT FITTINGS

A. Body of glass filled polypropylene or PVC. Manufactured to MIL-C-27487 dimensions for standard cam couplers.

B. Provide male and female fittings as indicated on the drawings.

C. Manufacturers/suppliers:

1. ‘’Cam Lever Couplings” by *Banjo* www.banjocorp.com , supplied by *Harrington Plastics, Inc.*;

2. *PT Coupling* www.ptcoupling.com ;
3. or approved substitute.

2.2 VACUUM HOSE AND CLEANING HEAD

A. Hoses: Provide no less than two reinforced flexible vacuum hoses, 2-inch diameter, each 50-foot length.

B. Vacuum Head: Plastic end fitting with tapered end manufactured for cleaning hard surfaces.

C. Supplier: Local swimming pool supply store.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install where indicated on the Drawings and per manufacturer's instructions.

B. Recommend installation of threaded fittings using both Teflon tape and Teflon pipe dope.

C. Deliver vacuum hose and vacuum devices to the Owner.

END OF SECTION

SECTION 170288 - EDUCTOR INJECTORS

PART 1 - GENERAL (See also 170010)

1.1 USAGE

A. For injection of ozone gas.

1.2 SUBMITTAL

A. Submit manufacture’s product information.

1.3 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 EDUCTOR INJECTORS

A. Size & Capacity: Provide injectors meeting requirements given on the drawings.

B. Materials: Body of black *Kynar* plastic.

C. Check Valve: Equip with manufacturer provided check valve on gas inlet.

D. Manufacturer:

1. *Mazzei Injector Corporation* Bakersfield, CA (805) 845-2253;
2. no substitutions.

PART 3 - EXECUTION (See 170010)

3.1 INSTALLATION

A. Minimize downstream fittings and install as close to contactor or fractionator as possible.

B. Arrange piping and/or provide flanges or unions to allow complete removal of injectors for servicing.

C. Recommend installing with use of both *Teflon* tape and *Teflon* pipe thread paste to prevent leaking at the threaded fittings.

1 END OF SECTION

SECTION 170310 - PIPE SUPPORTS

PART 1 - GENERAL

1.1 USAGE

A. Materials shall be selected based upon the location of supports and environment to which is will be exposed. The type of piping or the fluid/gas contained within is not a criterium for selection of support material.

B. As called for below: “Floor Zone” shall be less than 8-ft from the finished floor. “Ceiling Zone” shall be 8-ft and greater from the finished floor.

1.2 SUMMARY

A. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Provide pipe supports and bracing where indicated on the drawings and as specified herein. Not all pipe supports are shown specifically on the drawings. Pipe supports shall also be provided where necessary to limit loads on equipment. Contractor shall refer to the pipe support guidelines, published or adopted by the pipe manufacturer, for spacing of supports. The Contractor shall evaluate each pipe configuration and span in order to determine the required support necessary.

C. Where pipe supports are not shown but are required to avoid excessive pipe deflections, provide in accordance with the pipe Manufacturer's recommendations. Pipe supports shall be similar in construction to those detailed on the drawings for similar applications. At no time shall any visible deflection in any piping be acceptable.

D. Pipe Bracing shall be provided where necessary for above support or as indicated on the drawings. Pipe bracing shall be made of the same material as supports.

1.3 COORDINATION

A. Coordinate supports with mechanical, plumbing and other trades. In common areas and parallel runs, provide similar supports using the higher grade of corrosion resistant material typically as specified in this Section.

1.4 SUBMITTAL

A. Submit manufacturer’s product information.

PART 2 - PRODUCTS

2.1 GENERAL CONSTRUCTION & MATERIALS

A. All supports shall be as detailed on the drawings and as specified herein or as supplied by support Manufacturer as per Engineer approved submittal details.

B. “All-Thread” and other threaded rod, shall conform to materials requirements for “fasteners” in Section 170316.

C. Material Locations:

1. Water Zone Locations: All submerged supports and supports over open water shall be non-metallic with Type 316 SS fasteners. Ferrous metal not allowed.
2. Floor Zone Locations: Non-metallic, aluminum with epoxy isolation coating, 300 Series SS structural components. Type 316 SS fasteners. Ferrous metal not allowed less than 8-Ft above the floor level.
3. Ceiling Zone Locations: Non-metallic, aluminum with epoxy isolation coating, 300 Series SS structural components, hot dip galvanized carbon steel, or dichromate plated manufactured supports. Type 316 SS fasteners. Plated carbon steel only allowed where 8-Ft or greater above the finished floor.

2.2 TYPES OF SUPPORTS

A. Custom Metallic Pipe Supports: Provide where custom fabrications are detailed on the drawings. Shall be manufactured of 300 Series stainless steel, Type 6061 T-6 aluminum or of carbon steel with hot dipped galvanized plating. Only stainless steel or aluminum construction shall be used for metal supports less than 8-ft above finished floor.

B. Floor Mounted Pipe Stands: Fabricated, floor mounted pipe supports shall be manufactured of fiberglass, stainless steel, or PVC pipe sections and fittings, with the following provisions:

1. Fiberglass supports shall be designed against a minimum 9:1 design stress ratio and finished with a corrosion resistant gloss coat.
2. Aluminum shall be Type 6061 T-6 and provided with the epoxy coating where mounting on concrete or masonry surfaces.
3. PVC pipe sections and fittings may be used for supports where lightly loaded. Floor stands shall consist of Schedule 80 PVC pipe sections with solvent-welded saddles top and flanged fittings at the bottom, anchored to the floor with no less than four bolts, use full size bolts for 150 lb. drilling pattern. Face and backing ring of flange shall be one piece construction (not Vanstone type). “Wedge Tee-Fittings” to fit supports onto pipe runs may be purchased from *Flo Control, Inc*., Burbank, CA.
4. Stainless steel pipe stands shall be constructed of 300 Series stainless steel.

C. Pipe Racks: Pipe hangers, wall mounted racks, trapeze type and other "standard" hangers shall comply with “Floor Zone” and “Ceiling Zone” material requirements described above. Above the Floor Zone, pre-fabricated pipe racks constructed of dichromate plated steel (A.K.A. “Unistrut”) are acceptable, along with other specified materials.

D. Pipe Hangers: Provide manufactured tear-drop or U-strap with spreader bar pipe hangers. FRP pipe hangers shall be of hand-wrapped fiberglass or of plastic composite material. Otherwise, pipe hangers shall be constructed of specified materials acceptable for the installed location.

E. Pipe Clamps:

1. FRP pipe clamps shall be heavy duty model designed for carrying water in pipes (example: clamps for 6 inch diameter pipe shall be rated for no less than a 175# load) and secured with Type 316 stainless steel bolts. Where installed in highly oxidized environments (such as ozone), clamps shall be of *vinyl ester* resin construction. Adjustable pipe straps and/or clamps with non-metallic bolts are not allowed unless specifically called out on the drawing at special situations.
2. Metal pipe clamps shall be constructed of specified materials depending on the installed location.

F. FRP Struts and Structural Shapes: Struts, mounting brackets, channels, structural box sections, etc., shall be of the pultruded method of construction.

1. Primary structural components of pultruded premium grade resin meeting E-84 ASTM Class 1 Flame Rating and self-extinguishing requirements of ASTM D-635. Resin material shall have a maximum glass content of 50% and utilize a synthetic surfacing veil for maximum chemical and ultraviolet protection.
2. Use *vinyl ester* resin for "ozone" applications, such as *Hetron* by *Ashland Chemical* or approved substitute by *Dow*. The particular resin product number used shall be the commodity specifically recommended by the resin manufacture for the actual ozone related application.
3. FRP threaded rod shall be made from *vinyl ester* resin.
4. Struts and structural shapes may be either polyester or *vinyl ester* resins for general applications.
5. Cut edges shall have sharp edges ground smooth and sealed with a compatible resin or epoxy sealer.

2.3 CONNECTIONS & FASTENERS

A. FRP Connections: Connections of fiberglass structures shall be only of non-metallic FRP nuts and bolts and/or adhesives, or Type 316 stainless steel fasteners. Anchor bolts and assembly fasteners shall be per Section 170316. FRP U-bolts shall be manufactured by: *Steelfree Inc.* Redmond, WA; or approved substitute.

B. Combination Joints: Where combination adhesive and mechanical joints are shown, the surfaces must be carefully prepared in strict accordance with the Manufacturer's recommendations. The joints shall be cured for not less than 48 hours prior to the application of any loads.

C. FRP Adhesives: The following epoxy adhesives may be used; Shell 828 Epoxy Resin; or Dow D.E.R. 331 Epoxy Resin; or MMFG Epoxy Adhesive; or equal.

2.4 FINISH

A. Epoxy Coating/Isolation: Provide protective coating over surfaces of aluminum supports that bear against concrete, stainless steel, or as coatings are otherwise called out on the drawings. Use high-solids, two component epoxy applied in not less than two coats to a total dry film thickness of 12 mils minimum. Manufacturer: *Soc-Co Plastic Coating Company* (Keysite 740) Cucamonga, CA; *Carboline* Carbothane 134 VOC; or approved substitute coating/isolation system.

B. Galvanized Plating: Provide over all custom fabricated carbon steel supports and all floor stands made from carbon steel stock. Hot dip galvanize after fabrication. (Only allowed above the Floor Zone and not above saltwater.)

C. Dichromate Plating: Stock metal strut and channel shapes with factory applied electro-chromate finish. The finish shall be dichromate over zinc by "Superstrut" Metal Framing Division, *Midland-Ross Corporation* Goshen, IN (219) 533-0335; or approved substitute. All field cut ends shall be finished with a cold galvanizing corrosion resistant coating. (Only allowed above the Floor Zone and not above saltwater.)

2.5 MANUFACTURERS

A. Non-metallic/FRP Manufacturers and Suppliers:

1. *Aickin Engineering Inc.* [pipe clamps & general shapes] Seattle, WA;
2. *Champion Strut,* Spring, TX (281) 655-8900 www.championfiberglass.com;
3. *Creative Pultrusions Inc*. Alum Bank, PA (814) 839-4186;
4. *Dura Plastics* [PVC pipe clips] Beaumont, CA (714) 845-3161;
5. *FRP Supply Company* [pipe clamps & general shapes] Burbank, CA;
6. *IMCO Reinforced Plastics, Inc.* [pipe clamps & general shapes] Moorestown, NJ (609) 235-7254;
7. *Lee Composites, Inc.* Spring, TX (888) 389-4415 www.leecomposites.com [hangers, pipe clamps & general shapes];
8. *Plasti-Fab Inc.* [hangers & general shapes] Tualatin, OR (503) 692-5460;
9. *Pupco,* Charlotte, NC (704) 333-5776 www.pupco.com [Type 316 SS, strut and hangers];
10. *Seasafe Inc*. Lafayette, LA (318) 837-9993;
11. *Steelfree Inc*. Redmond, WA (206) 869-5500;
12. *Strongwell* Rancho Cucamonga, CA (909) 941-1875 www.strongwell.com;
13. *StrutTech* (Entrum Industries Inc.) Redmond, WA (800) 848-8708 [pipe clamps & general shapes];
14. *Western Piping & Engineering Company* San Francisco, CA (415) 822-6464 [hangers & general shapes].

PART 3 - EXECUTION (See also Section 170010)

3.1 MOUNTING

A. Refer to the pipe manufacturers guidelines for pipe span lengths.

B. Adhere to Water, Floor, and Ceiling Zone limitations for installation of various materials.

C. Use only fasteners manufactured of Type 316 stainless steel, as specified in Section 170316.

D. Touch up galvanized components using one of the three methods specified in ASTM A 780 Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.

END OF SECTION

SECTION 170316 - FASTENERS

PART 1 - GENERAL

1.1 SUMMARY

A. This Section covers fasteners and anchor bolts used in conjunction with the life support system. This includes, but is not limited to, fastening and anchorage of valves, pumps, handrails, ladders, structural supports, pipe supports and all other equipment. The General Conditions apply to this Section as fully as if repeated herein.

1.2 SUPPLIERS

A. Contractor is ultimately responsible for ensuring all equipment in his scope is provided with fasteners meeting these Specifications.

B. Where connecting fasteners are provided by supplier of FRP supports, the fasteners used in the assembly of the packaged components may be or either FRP or Type 316 stainless steel.

C. Fasteners supplied integral with Owner Furnished equipment are excluded from the Contractors direct responsibility. However, the Contractor shall supply all necessary fasteners for installation of equipment in accordance with this Specification.

1.3 SUBMITTALS

A. Submit manufacturer’s information describing the products.

1.4 COORDINATION

A. Contractor installing the life support equipment shall refer the Structural Engineer’s equipment anchoring requirement, where available.

PART 2 - PRODUCTS

2.1 MATERIAL REQUIREMENT

A. Typical Fasteners: Where Type 316 stainless steel is called for, designation shall be in conformance with ASTM specification A193/A194, Class 2, Class 2B, Class 2C, or Class 1. Type 317 SS may be substituted where Type 316 is not available. Alloying of Type 316/317 SS shall be as follows: 16% to 20% Cr, 10% to 15% Ni, 2% to 4% Mo, and no more than 0.08% Carbon.

B. Identification of all “Type 316" metal bolts per ASTM A193 (part 18. Product Marking) or with correct AISC designation stamped on head.

C. Non-metallic fasteners shall be of materials specifically formulated and manufactured for threaded connections. FRP material shall be *vinyl ester* resin with U.V. inhibitors or approved substitute. Non-reinforced PVC is *not* allowed.

1. Studs: Pultruded, machined fiberglass reinforced *vinyl ester*;
2. Bolts: "*Fibrebolt*" by: *Strongwell* www.strongwell.com;
3. Washers: FRP, resistant to strong oxidation environments.

D. Wall Anchors:

1. Option 1: Threaded plastic (non-metallic) inserts, installed in C-I-P concrete behind wall forms, where the product provides required tension loads. By *Meadow Burke*, *Bowco Industries*, or approved substitute.
2. Option 2: Drilled and epoxy anchored Type 316 stainless steel all-thread.

E. All-Thread: Where “all-thread” and other threaded rod is specified in Section 170310, and indicated elsewhere, all-thread shall conform the materials requirements as “fasteners” in this Section.

2.2 GENERAL FASTENER LOCATIONS

A. Typically, all valve flange bolts, pipe support fasteners and miscellaneous fasteners shall be Type 316 stainless steel bolts, nuts and washers; unless other material is specifically called out.

B. Where specifically called for, provide Fiber-Reinforced Plastic (FRP) fasteners.

C. Where fasteners are used to secure components in Seismic Design Categories C or greater, anchors shall be of the type recommended for use in seismic applications.

D. At all locations where "bolt" is called for, a "hex-head bolt" shall be provided. Hex-head bolts shall not be substituted with "all-thread" without prior written consent of the Owner. Hex-head bolts shall be provided for installation of all valves, companion flanges, flex connectors and other similar locations.

2.3 ANCHOR STUDS & THREADED INSERTS

A. Minimum pullout strengths shall meet or exceed those published in the *International Building Code* (IBC), *ASCE*, or other authorized publications.

B. Anchor bolts, studs, washers and nuts shall be Type 316 stainless steel of the following design:

1. Cast-in-place; "J" bolts type.
2. Drilled; set in with an epoxy/aggregate filler.
3. Drilled; expansion type (wedge anchors).
4. Dual Drilled: non-expansive swiss lock type.

C. Only where specifically called for, provide *Fiber-Reinforced Plastic* (FRP) anchor studs. Minimum size of 3/4 inch diameter, unless otherwise specifically called for on the drawings.

D. Threaded Inserts: Use behind C-I-P wall and slab forms for threading of anchors. 0.375-inch size with minimum tension capacity of 600 lbs. 0.5-inch size with minimum tension capacity of

2,880 lbs. 0.75-inch size with minimum tension capacity of 3,400 lbs. Model PC-11 manufactured by Meadow Burke; or approved substitute.

2.4 MANUFACTURERS

A. Cap Screws (Standard Hex-Head Bolts), Nuts and "J" bolts: Non-proprietary manufacturer of Type 316 stainless steel hardware.

B. Expansion Type Anchor Studs: Type 316 stainless steel by *Hilti Inc.* Tulsa, OK (800) 879-8000; or approved substitute.

C. Anchor Bolts: Type "VD-1" bolt with epoxy/aggregate secured threads by *Structural Anchoring Systems* Worcester, MA (508) 853-3991; or approved substitute.

D. Swiss Lock Anchors: Type "SR" system by *Structural Anchoring Systems* Worcester, MA (508) 853-3991; or approved substitute.

E. Epoxy Aggregate Capsules:

1. "Parabond" by: *Molly Fastener Group* Temple, PA;
2. Type "VD" Anchor Capsules by: *Structural Anchoring Systems* Worcester, MA (508) 853-3991;
3. or approved substitute.

F. FRP Studs and Nuts: *Strongwell* Bristol, VA (540) 645-8000 www.strongwell.com; or approved substitute.

PART 3 - EXECUTION (See Section 170010)

3.1 INSTALLATION

A. As modified by seismic zone requirements given above, only cast-in-place with concrete, or drilled-into-concrete with epoxy/aggregate or expansion type anchoring systems shall be used; powder driven fasteners are not allowed. All anchors shall be perpendicular to surfaces.

1. Cast-in-place fasteners shall have positive anchoring heads or tabs resistant to pulling out of concrete.
2. Epoxy/Aggregate Anchoring System: Drill and fix threaded studs in place with glass capsulated epoxy/aggregate mixture per Manufacturer's recommendations.
3. Expansion type shall be installed per Manufacturer’s recommendations and held fast in concrete without side-to-side movement possible. Expansion type anchors are limited to C-I-P concrete slabs and not to be installed in wall surfaces.

B. Apply *ANTI-SEIZE COMPOUND TO ALL STAINLESS-STEEL* nuts and bolts to prevent metal transfer of similar metals.

C. Install FRP fasteners in strict accordance with Manufacturer’s recommendations, including the following:

1. A torque wrench *must* be used.
2. Bearing surfaces must be parallel to the fastener’s surface.

3. Lubricate according to Manufacturer's recommendations.
4. Spray with a light coat of polyurethane after installation.

END OF SECTION

SECTION 170360 - BASKET STRAINERS

PART 1 - GENERAL (See Section 170010)

1.1 USAGE

A. The basket strainers are used to remove gross solids such as rocks, sticks, and hay from water returning from aquatic animal exhibits. All strainers shall be manufactured for saltwater use.

1.2 SUMMARY

A. Provide where indicated on the drawings and as specified herein. The General Conditions shall apply to this Section as if fully repeated herein.

B. Provide one spare strainer basket for each unit size installed on project.

1.3 SUBMITTALS

A. Supplier to submit product data on basket strainers, all materials of construction, and dimensional drawings. Submit manufacturer's recommended maximum water pressure for standard models, and for high pressure applications, submit information covering the installed water pressure.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 CLEAR PLASTIC Y-STRAINERS

A. Location: Where indicated on drawings for 0.5-inch to 2-inch line sizes.

B. General: Y-type strainers manufactured of clear PVC with non-metallic perforated screen. Installed with flanged or true-union connections.

C. Shall be listed by the manufacture for a water pressure greater than 100 psi at 80 deg F. Basket strainer shall be capable of operation under full negative vacuum pressure.

D. Manufacturer:

1. *ASAHI/AMERICA* Malden, MA (781) 321-5409 www.asahi-america.com;
2. *Hayward Flow Control* Clemmons, NC (888) 429-4635 www.haywardflowcontrol.com;

3. *Spears Manufacturing Company* Sylmar, CA (818) 364-1611 www.spearsmfg.com;
4. or approved substitute.

2.2 CLEAR CAP BASKET STRAINERS

A. Location: Where indicated on drawings for 3-inch through 12-inch line sizes.

B. General Description: Vertical style basket strainer with FRP over-wrapped PVC body, clear acrylic top cover. Shall have "oversized" body diameter and meet end-to-end laying length indicated on the scale drawings. End connections shall be Vanstone type flanges. Minimum dimensions shall be as follows:

1. Strainers with 3-inch nozzles shall have shall have minimum Basket to Pipe cross section ratio of 29:1 or 200 square inch basket area or greater.
2. Strainers with 4-inch nozzles shall have shall have minimum Basket to Pipe cross section ratio of 28:1 or 350 square inch basket area or greater.
3. Strainers with 6-inch nozzles shall have shall have minimum Basket to Pipe cross section ratio of 19:1 or 424 square inch basket area or greater.
4. Strainers with 8-inch nozzles shall have shall have minimum Basket to Pipe cross section ratio of 15:1 or 754 square inch basket area or greater.
5. Strainers with 10-inch nozzles shall have shall have minimum Basket to Pipe cross section ratio of 13:1 or 1,020 square inch basket area or greater.
6. Strainers with 12-inch nozzles shall have shall have minimum Basket to Pipe cross section ratio of 12:1 or 1,350 square inch basket area or greater.

C. Cover Closure: Top release shall be an easy-to-access design, with twist and release hasps or "Tee" handles of Type 316 stainless steel.

D. Basket: Type 316 stainless steel strainer basket of welded or brazed construction. Manufacturer's standard (larger if option exists) perforations.

E. Pressure Rating: Shall withstand full vacuum through the maximum water pressure for specific application. Standard models shall be listed by the manufacturer of a maximum positive pressure not less than 50 psi.

F. Accessories:

1. Top vent.
2. Pressure taps at inlet and outlet ports.
3. Spare basket(s). Deliver one (1) spare basket per basket size on the project.

G. Manufacturer: Not all of the following manufactures may be able to meet the specified requirements with a standard product in which case the selected manufacturer must provide custom manufactured basket strainers meeting the specified requirements.

1. *FLUIDTROL Process Technologies Inc.* (ESW Series), Huntsville, AL (205) 444-9355 www.fluidtrol.com;
2. *Mer-Made Filter, Inc.,* Denmark, SC (803) 793-4265 www.mermade.com;
3. or approved substitute.

PART 3 - EXECUTION (See Section 170010)

3.1 INSTALLATION

A. Do not install ahead of pumps already equipped with integral basket strainers.

B. Construct piping layout to provide proper off-sets for connection to strainer body.

C. Coordinate with height required for concrete housekeeping pad for pump.

D. Deliver spare strainer baskets to Owner at end of construction (one for each size installed).

75 END OF SECTION

SECTION 170410 - PRESSURE GAUGES

PART 1 - GENERAL

1.1 USAGE

A. The pressure gauges are used in liquid and gas piping systems where indicated on the P&ID drawings.

1.2 SUMMARY

A. Provide where indicated on the drawings, including all "Diagrams" and "Standard Details, and as specified herein. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Installation is required at all pump suction, filter influent (pump discharge), filter effluent, heat exchanger influent, heat exchanger effluent, and eductor influent lines (regardless of indication on Drawings).

1. Provide positive pressure gauges where “PG” is indicated on the P&IDs.
2. Provide compound negative-positive pressure gauge where “CG” on the P&IDs.

1.3 COORDINATION

A. Coordinate maximum pressure rating for each application. The lowest pressure gauge shall be selected without the maximum applied pressure exceeding the maximum gauge pressure.

B. Install pressure snubbers to reduce pulsations at or near discharge of centrifugal pumps. Not required at other locations.

1.4 SUBMITTALS

A. Submit product literature for each type of gauge, in accordance with the General Provisions. Submittal shall be appended with a list that correlates Manufacturer's model numbers with specified type and installation location.

B. Where mounting bracket assembly is required, Contractor shall submit details of the arrangement for approval.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 PRESSURE GAUGES

A. Type 1: Located at all pump suction lines.

1. Compound Range: 30-inch Hg vacuum to 15-psi or 30-psi.
2. Stainless steel case with ¼ inch stem out bottom.
3. 2.5-inch to 80mm glycerin-filled dial.
4. Type 316 stainless steel Bourdon tube and connections.
5. Make direct connection with Type 316 stainless steel gauge cock.

B. Type 2: Located at all pump discharge and appurtenant equipment influent and effluent lines (such as heat exchangers, sterilizers, sensor bypass lines, etc.).

1. Range: Zero to 30-psi.
2. Stainless steel case with ¼ inch stem out back preferred for installation in vertical pipe (out bottom acceptable).
3. 2.5-inch to 80mm glycerin-filled dial.
4. Type 316 stainless steel Bourdon tube and connections.
5. Make direct connection with Type 316 stainless steel gauge cock.

C. Type 3: Located at all large diameter (four foot and larger) pressure filter effluent lines.

1. Range: Zero to 15-psi.
2. Stainless steel or plastic case with ½ Inch stem out bottom.
3. 3.5-inch to 4.5-inch dial.
4. Type 316 stainless steel Bourdon tube and connections.
5. Make direct connection with ½ inch Type 316 stainless steel gauge cock.

D. Type 4: Located in pressurized ozone gas supply lines to eductor influents.

1. Range: 30-inch Hg vacuum to 15-psi pressure; or 10-inch to 10-psi.
2. Stainless steel casing.
3. 3-inch to 80mm dial with 0.5-inch and/or 0.2-psi graduations with 1/4 inch stem out bottom.
4. Type 316 stainless or Monel connections and Bourdon tube or actuation capsule.
5. Make direct connection with Type 316 stainless steel gauge cock.
6. Supply specified 30-inch to 15-psi gauge with overload and underload stops; or supply as 30-inch to 30-psi "retard" type gauge; or supply with over-pressure safety valve.

E. Miscellaneous Pressure Gauges: All pressure gauges used for the LSS shall be one of the types listed above, unless specifically approved otherwise by the Engineer. Clarification regarding type of pressure gauge required for specific application shall be obtained from the Engineer prior to installation

F. Manufacturers:

1. *Ametek U.S. Gauge Division* (compound gauge with lower stem) Sellersville, PA (215) 257-6531 www.ametek.com;
2. *Ashcroft/Dresser Instrument* Stratford, CT (203) 378-8281 www.dresser.com/instruments;
3. *H.O. Trerice Co.* Oak Park, MI (248) 399-8000 www.trerice.com;
4. *Weksler Instruments Corp*. Freeport, NY (561) 988-8003;
5. *WIKA Instrument Corporation* Lawrenceville, GA 30043 (770) 513-8200 or (888)945-2872 www.wika.com;

6. or approved substitute.

2.2 GAUGE COCKS

A. PVC uni-body type gauge cock body, EPDM seats and seals, with lever handle. Longitudinal in-line design with two 1/4-inch female threaded pipe connections.

B. Manufacturer: *Hayward Industrial Products Inc*., Elizabeth, NJ (908) 351-5400*;* or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Direct Mount: Install gauge cock between gauge and pipe connection. Anti-seize thread compound must be used in addition to Teflon tape.

B. Indirect Mount: If gauges cannot be mounted directly to the gauge cock, the Contractor shall provide an additional mounting bracket assembly. Connect with Type 316 stainless steel sample tubing, or polypropylene tubing for water applications, or Type 316 braided stainless steel flexible hose lined with TFE (Teflon) manufactured by Cajon Company (Swagelok) Macedonia, OH or approved substitute.

C. Pressure Snubbers: Install pressure snubbers where gauge is at or near discharge of centrifugal pumps. Not required at other locations.

D. Where installed at pump suction and discharge ports, provided adapter fittings and pipe or tubing, as required, for vibration-free installation of pressure gauges.

END OF SECTION

SECTION 170430 - TEMPERATURE DEVICES

PART 1 - GENERAL (See 170010)

1.1 USAGE

A. The thermometers and sensing wells are used in:

1. 49 deg F to 80 deg F aquarium seawater.

1.2 SUMMARY

A. The General Conditions shall apply to this Section as fully as if stated herein.

B. Contractor shall purchase and install thermowells and thermometers adjacent to influent and effluent of heat exchangers, and at all other locations indicated on the Piping and Instrumentation Diagrams.

1.3 COORDINATION

A. Coordinate with Automated Controls System.

B. Coordinate length of thermowells with water pipe size and size of inner temperature probe.

C. Electrical Contractor shall provide all conduits; provide, pull and terminate all wiring from temperature transmitters to controls cabinets. Termination shall consist of installing hard wiring for completion of circuits at termination points. Temperature transmitters shall be installed with 3-wire cable.

D. Line-Of-Sight Locations: Install common specified mercury thermometers where reading can be clearly seen and accessed at floor level by operational staff.

1.4 QUALITY ASSURANCE

A. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International, National Technical Systems (NTS), or other approved research laboratories.

1. The manufacturer shall be fully responsible for compliance with this requirement.
2. The specified equipment is available on request from *Pyromation* as an assembly with a CSA testing laboratory accreditation.
3. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.5 SUBMITTALS

A. Submit manufacturer's information describing the products. Where manufacturer's part numbers are submitted, submittal shall include factory description of order codes.

B. Submit proof that installed materials will bear approved testing agency listing mark or classification markings.

1.6 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 MERCURY THERMOMETERS

A. Red reading liquid column in glass; adjustable to any angle; maximum 2-degree divisions on scale; 2-degree accuracy throughout entire scale; one-piece aluminum V-shaped case, dual Fahrenheit and Celsius scales, with front glass; adjustable angle stem.

B. Stem: Type 304 stainless steel where available, brass stem where stainless is not available.

C. Scale: 7-inch (9-inch where 7-inch not available), dual deg F & deg C.

D. Temperature range shall be:

1. For circulating process water: 0 °F to 120°F & -15°C to 48°C (or 20°F to 120°F) with 1-degree graduations.
2. For heating water: 30 °F to 240°F & 0°C to 115°C with 2-degree.
3. For chilling water: 0 °F to 120°F & -15°C to 48°C with 1-degree graduations.

E. Manufacturer:

1. *Weksler* Deer Park, NY (866) 415-2002 www.weksler-gauges.com;
2. *Trerice Company* (Series A405) Oak Park, MI (248) 399-8000;
3. or approved substitute.

2.2 SENSING WELLS / THERMOWELLS

A. Thermowell, in water piping for receiving of temperature probe, with ½-inch NPT hex nipple, filled with a non-solidifying heat conducting paste.

1. Sensor well diameter: 0.375-inch or 0.5-inch.
2. Sensor Well Length: As required for diameter of water piping and length of temperature probe.
3. Male Tap Thread Diameter: 0.5-inch MPT
4. Female End Thread Diameter: 0.5-inch FPT.

B. Materials: Titanium, Hastelloy, or AL6XN.

C. Manufacturers:

1. *AquaLogic* www.aqualogicinc.com (Titanium available);
2. *Delta Hydronics* www.deltahydro.com (Titanium available);
3. *Pioneer Enterprise* www.favfittings.com (Hastelloy available);
4. Approved substitute.

2.3 TEMPERATURE SENSORS / TRANSMITTERS

A. Product: RDT temperature sensor with transmitter installed in weatherproof non-metallic head. Delivered from the manufacture as a complete assembly with the thermowell.

B. Description: The given descriptions shall prevail over the suggested Model or Part Numbers.

1. Fluid Immersion Sensor: Platinum RTD element, 100 ohms with accuracy +/- 0.56 deg. F at 32 deg. F.

   a. *Pyromation* Order Number: R1T185L483 thermowell, SC element.
   b. *Weed* Model: 723-PB.

2. Head Housing: Polypropylene body and cap, chain for cap retention, with weatherproof gasket. The protection rating shall be no less than IP 65 with the transmitter installed.

   a. *Pyromation* Order Number: 63C or 8HN22.
   b. *Weed* Model: 05.

3. Transmitter: PC programmable for converting the resistance input signal into a scalable 4 to 20 mA output signal given a 24 VDC voltage from the Automated Controls System (ACS). 3-wire circuit for resistance adjustment. Transmitter installed in the polycarbonate sensor head. Rated for 95% max. relative humidity.

   a. *Pyromation* Order Number: T31-385U-S(0-100)F
   b. *Weed* Model: 4600H.

4. Thermowell: Per above specified requirements.

   a. *Pyromation* Order Number: ST4CZSSXX and as specified above.
   b. *Weed* Model: As specified above.

C. Exterior Cover by Contractor: For outdoor locations, provide a non-metallic housing or marine canvas cover with grommets and nylon cord. For additional protection of the IP-65 rated polypropylene head against deterioration by sunlight and weather.

D. Manufacturers:

1. *Weed* by *Ultra Electronics,* Round Rock, TX (800) 880-9333 or (512) 434-2850 www.ultra.energy/weedinstrument/;
2. *Pyromation RTD,* Fort Wayne, IN, telephone (260) 484-2580 www.pyromation.com.

PART 3 - EXECUTION (See 170010)

3.1 INSTALLATION

A. Install at all locations indicated on the P&ID drawings.

B. Mercury Thermometers: Install for visibility by operational staff; however, do not install thermometers projecting out into pathways where they would be prone to damage.

C. Thermowells: Locate thermowells such that they are in the path of moving fluid and not positioned in stagnant or dead-end locations. Wells shall not obstruct the flow of the fluid being measured. Pipes one-inch and smaller shall be increased as required. Install thermowell with both Teflon tape, and a liberal coating of PTFE pipe dope, on the pipe threads. Fill thermowells with a non-solidifying heat conducting paste with installation of temperature probes.

D. Final: Complete installation of wiring of temperature transmitters to automated controls system or temperature controller and demonstrate functionality to Owner's satisfaction.

END OF SECTION

SECTION 170441 - MAGNETIC FLOW MONITORS

PART 1 - GENERAL (See Section 170010)

1.1 SUMMARY

A. Provide all flow meters where indicated on the drawings, including all "diagrams" and "standard details," and as specified herein. The General Conditions shall apply to this Section as fully as if stated herein.

B. The required locations are indicated on the P&ID drawing as "FS" and "FM" *for flow sensor* and *flow monitor* respectively. Flow monitors are also known transmitters.

C. Flow Monitor Types:

1. Pitot Tube Type as specified in Section 170447. Where indicated on the Drawings with no connection to the Automated Controls System (ACS). No wiring is required.
2. Mag-Meter Type, as specified in Part 2.1 below. Arrange valves and fittings to allow the longest possible straight piping run where Mag-Meter Type sensors are installed.

D. Contractor shall be responsible for selection of transmitter/indicator locations depending on best line-of-sight options. Provide necessary FRP mount stanchions, brackets and hardware for separately mounted transmitter/indicators. May be mounted on FRP “Instrument Stand” by *Champion Strut,* Spring, TX (281) 655-8900 www.championfiberglass.com

1.2 QUALITY ASSURANCE

A. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.3 SUBMITTALS

A. Submit Manufacturer's brochures for the flow sensors and transmitters, dimensional information, electrical requirements, and information on installation fittings and other related piping specialties.

B. Submit information describing the NEMA-4X instrument enclosure.

C. Submit information on 24 VDC power supplies where required.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.5 COORDINATION

A. At filters, install flow sensors in the center of the piping run to allow sensor to read flow in forward and reverse directions. Order flow sensors configured by supplier for forward and reverse flow where required. The lay lengths shown in the Contract Documents shall be considered as minimum and the Contractor shall not reduce the lay length without written approval of specifying engineer—this lay length is the distance between fittings where the flow sensor is installed.

B. Perform all necessary coordination with Automated Controls System (ACS) supplier and ascertain provision of all required work.

C. Electrical Contractor shall provide all conduit; provide, pull and terminate all low-voltage wiring from flow transmitters to controls cabinets. Termination shall consist of completing hard wiring for completion of circuits at termination points. Electrical Contractor shall provide power wiring.

D. Coordinate power as required:

1. GF 2581 FlowtraMag® require a separate 24 VDC power cable.
2. GF 2551 Mag-Meters are powered from the cable to the transmitter. The 2581 is equipped with factory-installed cables, while cables for the 2551 are to be field-installed shielded 3-wire.
3. GF 9900 Transmitters are supplied 120 VAC power.

E. Data/Communications Wiring: Shall be separate from power wiring.

1. Output cables from GF 2581 FlowtraMag® and GF 2551 Mag-Meters flow sensors, to transmitters, shall be cabling for S^3L signal. The 2581 is equipped with factory-installed cables. Cables for the 2551 are to be field-installed shielded 3-wire, provide *Belden* 8772, 20 AWG, 3-wire; or equal.
2. Output from 9900 transmitters shall be 24 VDC “loop powered” 4-20 mA cabling from the automated controls system (ACS).
3. Where “2-wire” for low-voltage 4–20 mA control wiring is not specifically called out on Drawings, or Electrical Documents, or by ACS supplier, provide *Belden* 9802, 2 conductor, 20 AWG, with PP insulation; or equal.

F. Power Supply Options: All flow meters and transmitters are to be powered through the ACS cabinet.

G. Field-Mounts & Enclosures: Coordinate the required field-mount accessory or enclosure as required per the selected transmitter, power supply, and installed location.

1.6 WARRANTY

A. The manufacture shall warranty the entire package assembly to be free of defects in material and workmanship for not less than 1-year after startup of the water treatment system and not less than purchase of the units by the installing Contractor. The manufacture shall replace any components found defective within the warranty period.

PART 2 - PRODUCTS

2.1 MAG-METER FLOW SENSORS FOR 6-INCH AND LARGER PIPING

A. Application: Flow meters, with display transmitter or connection to ACS, for 6-inch and larger pipe shall be mag-meter type as specified below.

B. Design: Insertion style magnetic flow sensor that features no moving parts capable of reading bi-directional water flow. Order sensor with the required length for field-installed pipe fittings. It is preferable that sensors are delivered with jumper wiring, required for reading bi-directional water flow, to be factory-installed in the delivered product.

C. Operational Parameters: Suitable for reading flow from water with a minimum conductivity of 20 µS/cm. Flow rate range of 0.15 to 33 ft/s. Water temperature range from 32 to 185 deg F. Maximum water pressure of 150 psig at 77 deg F.

D. Non-Wet Materials:
1. Case: PBT plastic with NEMA 4X/IP65 protection rating.
2. Type 316L stainless steel screws and miscellaneous alloy components.

E. Wetted Materials:
1. Upstream of Ozone: polypropylene (PP) body; Type titanium electrodes; and FPM, FKM, or EPDM O-rings.
2. Downstream of Ozone: PVDF body, titanium electrodes, and Kalrez (FFKM) O-rings

F. GF 2551 Sensor Installation Fittings:

1. PVC Pipe 8-inch & Smaller: Provide PVC "Clamp-On" type Sensor Installation Fitting by *GF Signet*.

G. Manufacturer and Model: GF Signet 2551 Mag-Meter Flow Sensor by *GF Signet*, www.gfps.com.

2.2 TRANSMITTER FLOW MONITOR

A. Used for receiving S^3L/frequency signal from flow sensor, transmitting signal to the automated controls system (ACS), and displaying flow rates locally. Shatter-resistant glass window; bright LCD screen with digital readout of flow and units and a “Dial-type” digital bar graph; with external keys for set-up and calibration of output. Housing Material of PBT plastic with NEMA 4X/IP 65 front.

B. Temperature range from 14 deg F to 158 deg F. Accuracy +/- 0.5% of reading.

C. Signal Output: Externally powered 4 to 20 mA current signal.

D. Power Requirements: Transmitter will receive 120 VAC power from the ACS cabinet. Provide the monitor box assembly with a 120 VAC to 24 VDC transformer.

E. Flow Indicator shall include standard NEMA 4X/IP 65 front cover and mounting bracket.

F. Manufacturer: *Georg Fischer Inc.* Irvine, CA, telephone (800) 854-4090 or (714) 731-8800 www.gfps.com

2.3 TRANSMITTER HOUSINGS

A. Provide housings matching transmitter requirements.

1. Housing for 9900 Transmitters: Use for installation of transmitters and factory installed 120 VAC / 24 VDC power supply. The housing shall be a NEMA-4X instrument enclosure, by *GF Signet*, 11.31" x 13.31" x 5.59" with 316 SS door hinge and latches, ¼ DIN cutout for transmitter, DIN rail for mounting of power supply with terminals, conduit holes with liquid-tight grommets; or industry standard substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install as recommended by the Manufacturer and as indicated on the drawings. Where instrumentation is located outdoors, install to match manufacturer's recommended installation requirements; do not install in direct sunlight; provide protective covering as required to prevent damage from sunlight, or weathering, or revise location as required.

B. Transmitter/Indicators shall be located for ease of visible reading from equipment service area. Do not install face of monitor in direct sunlight or provide sunshade.

C. Power, control wiring and related conduits shall be supplied, pulled, terminated and connected to correct contacts by the Contractor. All work shall be performed to Code regulations and quality references given in the Electrical Specification Subsection.

D. Install flow meters and related instruments with ground wires and shielding per manufacturer's recommendations. Connect the ground terminals with 14 AWG directly to a local earth ground. Install shielded cable, connected only at remote instruments, but do not connect the shield at the Mag-Meter sensor — per manufacturer's recommendations.

1. 2551 Magmeter requires field-installed shielded 3-wire, provide *Belden* 8772, 20 AWG, 3-wire; or equal.

E. Prior to arrival of the ACS supplier for installation of controls software, verify proper installation of all flow measurement and related devices and perform all calibration and necessary adjustments.

F. Technical Seminar: Contractor shall coordinate a "Technical Seminar" presented by manufacturer's technical representative to the Owner's maintenance and operations staff.

END OF SECTION

SECTION 170446 - FLOW ROTAMETERS

PART 1 - GENERAL (See Section 170010)

1.1 USAGE

A. Ozone gas (5.5% ozone gas, 90% oxygen, 4.5% dry air), air, or saltwater, as indicated on the Drawings.

1.2 SUMMARY

A. Provide all rotameters where indicated on the drawings, including all "diagrams" and "standard details," and as specified herein. The General Conditions shall apply to this Section as fully as if stated herein.

1.3 SUBMITTALS

A. Submit Manufacturer's brochures, dimensional information, and information on installation fittings and other related piping specialties. Submit scale units, dual metric and SCFH preferred.

B. Submit factory recommendations for calibration with applied gas and pressures, or saltwater flows.

1.4 COORDINATION

A. If used for metering ozone gas (5.5% ozone gas, 90% oxygen, 4.5% dry air), coordinate percent ozone produced by actual installed ozone generating equipment.

B. Where used for metering ozone gas, coordinate with installation of ozone gas metering panels if such panels are proposed for the installation.

PART 2 - PRODUCTS

2.1 OZONE GAS FLOW ROTAMETERS

A. Type: Variable area float meters. The brand model selected by supplier for conditions and ozone gas flow rates shown on the Drawings.

B. Usage: External environment is indoors. Internal service is ozonized oxygen (5.5% ozone gas, 90% oxygen, 4.5% dry air).

C. Materials:

1. Tube: Glass for ozone service.
2. Float: *Teflon,* glass, Type 316 SS, Hastelloy, or Tantalum.
3. Seals: *Teflon*.
4. Safety Cage: 300 Series stainless steel frame with polycarbonate shields.
5. End Connections: Resistant to oxidation by ozone for ozone service. Panel mount or straight-through as required for proposed installation.

D. Scale: Dual Metric and SCFH preferred. Submit to owner for approval prior to shipping.

2.2 AIR OR WATER FLOW ROTAMETERS

A. Type: Variable area float meters. The brand model selected by supplier for conditions and flow rates shown on the Drawings.

B. Usage: External environment is indoors. Internal service is air, compressed air, or water.

C. Materials:

1. Tube: Acrylic or Polysulfone.
2. Float: *Teflon,* glass, Type 316 SS, Hastelloy, or Tantalum.
3. Seals: *Teflon* or Viton.
4. End Connections: Series 300 SS or plastic for air service. Type 316 stainless steel for saltwater service.

D. Scale: SCFH for air. GPM for water.

E. Options: Needle valve at base mount

PART 3 - EXECUTION (See Section 170010)

3.1 INSTALLATION

A. Install as recommended by the Manufacturer and as indicated on the drawings.

B. Install flow indicators in a visible location.

END OF SECTION

SECTION 170455 – ORP AND pH MONITORING

PART 1 - GENERAL

1.1 LOCATIONS

A. Model 9900 Transmitters shall be used for single-point one-to-one ORP sensor monitoring.

1.2 GENERAL REQUIREMENTS

A. ORP and pH sensors shall be installed where indicated on the Drawings including all "diagrams" and "standard details" and as specified herein. The General Conditions apply to this Section as fully as if repeated herein.

B. The sensors are used in 55 to 85 deg F ozonized saltwater.

C. The work consists of:

1. Installing ORP sensors at locations shown on the LSS Drawings for indication of ORP and/or monitoring of ORP readings by the automated controls system and for controlling the ozone generator's rates of production.
2. Installing pH sensors at locations shown on the LSS Drawings for indication of pH and/or monitoring of pH readings by the automated controls system

1.3 QUALITY ASSURANCE

A. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.4 SUBMITTALS

A. Submit Manufacturer's brochures, dimensional information, electrical requirements, and information on installation fittings and other related piping specialties.

B. Submit information for 24 VDC power supply transformer and enclosures

C. Submit factory warranty information.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.6 GENERAL COORDINATION

A. Coordinate the type of ORP/pH sensor electrode with the system design. Use platinum-tipped ORP sensors for ozone, hypochlorite bleach, or calcium hypochlorite

B. Coordinate with Automated Controls System (ACS) wiring requirements.

C. Power Supply: All display transmitters shall be powered with 120 VAC power from the ACS cabinet. All ORP sensors shall be powered from the 9900 single display transmitter.

PART 2 - PRODUCTS

2.1 PACKAGED ASSEMBLY — OPTION 1 BY GEORG-FISCHER

A. The complete assembly for the ORP/pH sensor and integral display transmitter shall be delivered by GF Signet supplier, to contractor.

B. “Wet Tap” style ORP sensors, capable of reading the oxidation reduction potential (ORP) from -2000 to +2000 mV range.

C. Sensor shall consist of the following components integrated into a single package from the manufacturer:

1. Electrode: Signet 2757-WTP electrode with DryLoc electrical connection for ORP. Signet 2756-WTP electrode with DryLoc electrical connection for pH.
2. Preamplifier with Dry Lock: *Signet* 2751 NEMA 4X construction with a DryLoc connection for the ORP/pH electrode.

D. Equip the ORP sensor package with integrated the G-F *Signet* 9900 transmitter known at the “Field Mount” transmitter.

E. Transmitter: Used for receiving signal from *Signet* 2751 ORP/pH Sensor, transmitting signal to the Owners Automated Controls System (ACS) and displaying ORP/pH locally. Shatterproof glass window; bright Human Machine Interface (HMI) screen with digital readout of ORP in mV units and a “Dial-type” digital bar graph; with external keys for set-up and calibration of output. Housing Material of ABS plastic with NEMA 4X/IP 65 front cover.

1. Input signal compatible with *Signet* 2751 ORP/pH Sensor.
2. Temperature range from 14 deg F to 158 deg F.
3. Accuracy +/- 0.5% of reading.
4. Signal Output: Externally powered 4 to 20 mA current signal.
5. Power Requirements: Transmitter will receive 120 VAC power from the ACS cabinet. Provide the monitor box assembly with a 120 VAC to 24 VDC transformer.
6. Model: *Signet* 9900 ORP Monitor by *G-F Signet*.

F. Angle Adapter Adjustment Kit 396 by *G-F Signet*. Installed in between the sensor preamplifier and the transmitter/monitor.

G. Close-end nipple fitting, and any other parts required for completion of the complete assembly.

H. Provide threaded tee-fitting or PVC "saddle" fitting.

I. Power Supply Transformer: Provide a 24 VDC power supply for 85 to 264 VAC input, mounted in a NEMA-4X Enclosure with conduit holes equipped with liquid-tight wiring connections. *By G-F Signet*; or approved substitute.

J. Option 1 Supplier: *Signet by Georg Fischer Inc.* Tustin, CA (800) 854-4090 or (714) 731-8800 www.us.piping.georgefischer.com.

2.2 PACKAGED ASSEMBLY — OPTION 2 BY OZONE WATER SYSTEMS

A. The complete assembly for the ORP/pH sensor and indicating transmitter shall be delivered by Ozone Water Systems, to contractor, as follows with all products having supplier-verified part numbers:

1. Clear Acrylic Wet-Tap Assembly with bolt-on PVC saddle fitting.
2. ORP/pH Electrode by *G-F Signet*.
3. ORP/pH Sensor Electronics by *G-F Signet*.
4. Housing-Mounted Indicating Transmitter with 120 VAC/24 VDC power supply.
5. Pipe Saddle Mount.

B. Wet Tap Assembly: Wet tap assembly shall allow for sensor replacement, maintenance, and calibration without shutdown of the process water flow. The sensor block shall be constructed of clear acrylic sensor block to show any build-up or contamination on the probe. Shall include multiple sensor ports including one (1) 3/4” and three (3) 1/2” ports for male National Tapered Pipe Thread (MNPT) sensor installation, and one (1) water sample port materials shall consist of PVC, acrylic; EPDM, Kalrez or Viton rubber; and Type 316 SS or superior alloy metals. Shall include a Carpenter 20 alloy sensor grounding electrode.

C. ORP/pH sensor consisting of electrode and preamplifier, capable of reading the oxidation reduction potential (ORP) from -2000 to +2000 mV range.

D. Housing-Mounted Transmitter and Power Supply:

1. Housing for 9900 Transmitters: Use for installation of 9900 transmitter and 120 VAC / 24 VDC power supply, factory installed. The housing shall be a NEMA-4X instrument enclosure, by G-F Signet, 11.31” x 13.31” x 5.59” with 316 SS door hinge and latches, ¼ DIN cutout for transmitter, DIN rail for mounting of power supply with terminals, conduit holes with liquid-tight grommets; or industry standard substitute.

E. Option 2 Supplier: *Ozone Water Systems,* Phoenix, Arizona (480) 421-2400 www.ozonewatersystems.com;

2.3 ORP and pH CALIBRATION EQUIPMENT

A. Obtain necessary solutions, pH buffer kit, instructions, and apparatus for calibration of sensors and turn over to Owner.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install sensors at locations indicated on drawings and per Manufacturer's recommendations. Establish in an orientation that facilitates maintenance and does not permit air binding. Install sensor fitting at the 10-O'clock or 2-O'clock positions where possible.

B. Install ORP/pH transmitter and housing within 5-feet of respective sensor location, per Manufacturer's instructions, serviceable for calibrating and so displays are easily viewed.

C. Install shielded conductor from sensor to transmitter in one-half inch flexible conduit and mount securely. Connect grounding wire to earth ground separate of other electronic equipment.

D. Install housings with power supplies as required.

E. Install power supplies and ACS comm wiring. Install shielded conductor from sensor to transmitter in one-half inch flexible conduit and mount securely. Connect grounding wire to earth ground separate of other electronic equipment.

F. Contractor shall complete installation of ORP and pH sensors and transmitters, calibrate the display in mV, and demonstrate the display functionality to the Owner's satisfaction.

G. Contractor shall coordinate a "Technical Seminar" presented by manufacturer's technical representative to the Owner's maintenance and operations staff. Seminar shall provide instruction on removal and replacement of ORP/pH probes, cleaning, and demonstration of calibration.

END OF SECTION

SECTION 170467 - CO2 FEEDER & ACCESSORIES

PART 1 - GENERAL

1.1 GENERAL

A. This specification is for a package of equipment for feeding CO2 gas, as specified below, including the following items:

1. CO2 Feeder.
2. In-Line Heater.
3. Gas Pressure Regulator.
4. 3/8” CO2 gas tubing.
5. Couplings and fittings, as required for installation of the CO2 gas tubing.
6. Diffuser with fitting for connection to PVC piping.
7. CO2 Monitor and Alarm.
8. Contractor shall provide two (2) initial 20 lb. CO2 gas cylinders for startup of the system. May be obtained from a local reputable welding gas supplier.

1.2 COORDINATION

A. Coordinate pH sensor via LSS ACS, to this CO2 Feeder, for activation of CO2 feeding when lowering of pH is required.

B. Coordinate installation of electrical outlets for 120 VAC to the In-Liner Heater.

C. Complete water piping and gas tubing installation as required.

1.3 QUALITY ASSURANCE

A. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The manufacturer/supplier shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.4 SUBMITTAL INFORMATION

A. Catalog cuts and sufficient data for each specified item in the package of equipment.

B. Submit proof that installed materials will bear approved testing agency listing mark or classification markings.

C. Submit warranty. The manufacture's standard start of the warranty period, at delivery, may require revision for compliance with this specification.

1.5 WARRANTY

A. Warranty: Installed equipment shall be guaranteed against defective parts for a minimum of 2-years from the date of delivery.

1.6 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 240010.

1.7 SUPPLIER OF PACKAGED EQUIPMENT

A. All specified equipment shall be provided by the supplier as a single package.

B. Direct suppliers if available from the listed suppliers with an approved testing laboratory label:

1. *ProMinent Fluid Controls, Inc*. Pittsburgh, PA (412) 787-2484 www.prominent.us;
2. *Link Automation*, a division of Mer Made Filter, Ramsey, NJ, telephone (201) 236-0217.
3. or an approved substitute.

C. If re-packaging is required for an approved testing laboratory label, the Contactor shall order specified equipment provided with an approved label delivered from one of the following suppliers:

1. *Ozone Water Systems*, Phoenix, Arizona Tel: (480) 421-2400 www.ozonewatersystems.com;
2. Approved substitute.

PART 2 - PRODUCTS

2.1 CO2 FEEDER

A. NEMA 4X polycarbonate enclosure for housing terminal strip, solenoid valve, internal tubing and wiring, and for mounting of flowmeter and selector switch. The feeder shall be designed to receive control signal from the (ACS) and provide easy installation, reliable performance and safe operation.

B. Feed Rate: Designed for delivery of 10 – 100 SCFH.

A. Water Flow Meter: Shall include variable area float meter, also known as rotameters. By Blue-White Industries Westminster, www.bluwhite.com; Gilmont Instruments www.barnant.com; or King Instruments, www.kinginstruments.

B. Solenoid Valve: Shall include a reliable, quite operating, normally closed, solenoid valve.

C. Electrical Power: 120 VAC, 50/60 Hz, 15 VA maximum.

D. Manufacturers: *ProMinent Fluid Controls, Inc.*; *Link Automation*, a division of Mer Made Filter; or an approved substitute.

2.2 IN-LINE HEATER

A. In-line heater designed to prevent CO2 regulator freeze-up. 120 VAC single phase. *Profax*, supplied by *Airgas*; or equal.

2.3 GAS PRESSURE REGULATOR

A. Two-Stage Gas Pressure Regulator: Designed for reducing the high-pressure CO2 gas, with a constant lower pressure at the outlet. Equipped with a spring, diaphragms, and adjustment knobs. Shall be a two-stage regulator, with the first stage reducing pressure to approximately 90 psi, and the second stage reducing gas pressure to 0 to 15 psi. Bronze body and internal materials compatible with CO2 gas.

B. Regulator Connector: Bronze regulator connector, for Compressed Gas Association (CGA) Type 320. With no less than 12 extra use-once flat washers, provided to the Owner.

C. Manufacturer: Harris www.harrisproductsgroup.com or equal.

2.4 DIFFUSER INJECTOR

A. Diffuser for injection of CO2 gas into water piping.

1. ProMinent CO2 Feeder: P/N 7746926 CO2-D-L Diffuser, use only for 50 SCFM maximum applications.
2. Link Automation: Injection/Check Valve as provided by manufacturer.

2.5 TUBING AND FITTINGS

A. Gas Tubing: Polyethylene compatible with CO2 gas and equipped with union connectors as required. Typically a 50-ft length of tubing by the supplier of the CO2 feeder.

B. Manufacturer: John Guest, or equal

2.6 CO2 MONITOR AND ALARM

A. Dioxide Monitor: Wall-mounted ambient CO2 gas monitor, with alarm, for protection of the facility staff personnel against excessive CO2 gas in the environment. Must be recommended by the manufacture for personnel breathing safety. Accuracy of +/- 100 ppm CO2, or lower value, at the installed detection range. Equipped with a visual alarm display and an auditory alarm. Provided with a 120 VAC to 24 VDC transformer power supply as required.

B. Electrical Power: 120 VAC; or 120 VAC to power supply with low-voltage to the monitor.

C. Manufacturers: Honeywell, ATI, Sensaphone, or approved substitute.

2.7 CO2 CYLINDER

A. Pressurized CO2 Cylinders: 20 lb. 7.75-inch diameter size, commercial grade pressurized liquid CO2, in 1,800 psi cylinders, from of reputable source, such as a welding gas supplier, or www.beveragelements.com; or equal.

PART 3 - EXECUTION (See Section 170010)

3.1 INSTALLATION BY CONTRACTOR

A. Install package of equipment to provide a fully operational and complete working system as per these specifications, the construction drawings, and the Manufacturer's recommendations.

B. Contractor shall ensure electrical equipment is in conformance with a approved testing laboratory listing and bears certification labeling.

C. Mount wall-mounted equipment on walls as required. Where equipment cannot be wall-mounted, install with products specific in Sections 240310 and 240316 and/or stanchion-mount.

D. Install 120 VAC wiring as required. Outlet plug may need to be removed tor hard-wiring to the Chemical Analyzer. The heater may be either, plugged in directly to a wall outlet, or split-off from the 120 VAC wiring from the relay of the Chemical Analyzer.

E. Deliver extra use-once flat washers, used at the pressure regulator, to the Owner.

END OF SECTION

SECTION 170476 - PRESSURE TRANSMITTERS

PART 1 - GENERAL

1.1 USAGE

A. The pressure transducers are used for measurement of saltwater surface elevations.

1. Pressure transducers with the “PLSM01” tag number shall have the capability for keeping water level within a range of +/- 0.10-inch elevation and are installed with a separate wall-mounted transmitter. These are required for water level measurement at all exhibit tanks with surface skimmers in addition to any other locations identified on the Drawings.
2. Pressure transmitters with the “PLSM02” tag number shall have the capability for keeping water level within a range of +/- 0.84-inch elevation and are equipped with integral transmitter with LED display.

1.2 SUMMARY

A. The General Conditions shall apply to this Section as fully as if repeated herein.

B. Locations: Provide where indicated on the drawings, including all "Diagrams" and as specified herein.

1.3 COORDINATION

A. Installing contractor shall coordinate available transducer pressure ranges with the installed conditions.

B. Contractor shall provide 24 VDC loop power from the ACS cabinet as indicated on the LSC drawings.

1.4 QUALITY ASSURANCE

A. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.5 SUBMITTALS

A. Submit product literature for each type of device, in accordance with the General Provisions.

1 1.6 MAINTENANCE AND OPERATIONAL DATA

2 A. Include pertinent information in the project bound Operations & Maintenance Data Manual per
3 requirements in Section 170010.

4 PART 2 - PRODUCTS

5 2.1 PLSM01 PRESSURE TRANSDUCERS (Installation at 3.0-ft max water depth)

6 A. Locations: Where “PLSM01” is called out on the Drawings.

7 B. Pressure Transmitter: Unit equipped with ¼-inch NPT male instrument connection with NEMA
8 4X sealed electronics. Type 316L SS housing, with integral junction box, and Type 316L SS
9 process connections. Pressure transducing by means of polysilicon strain gauge.

10 1. Range: 0 to 1.5 psi.
11 2. Diaphragm: Type 316L stainless steel.
12 3. Output Signal: 4 - 20 mA loop powered output.
13 4. Power requirements: 10 to 36 VDC, unregulated, 3 mA maximum.

14 C. Model and Manufacturer: Model E2G Pressure Transducer, by *Ashcroft Inc.* Stratford, CT
15 www.ashcroft.com or approved equal

16 2.2 PLSM02 PRESSURE TRANSMITTERS (Installation at 20.0-ft max water depth)

17 A. Locations: Where “PLSM02” is called out on the Drawings.

18 B. Pressure Transmitter: Unit equipped with ¼-inch NPT male instrument connection with NEMA
19 4X sealed electronics. Type 316L SS housing, with integral junction box, and Type 316L SS
20 process connections. Pressure transducing by means of polysilicon strain gauge.

21 1. Range: 0 to 10 psi.
22 2. Diaphragm: Type 316L stainless steel.
23 3. Output Signal: 4 - 20 mA loop powered output.
24 4. Power requirements: 10 to 36 VDC, unregulated, 3 mA maximum.

25 C. Model and Manufacturer: Model E2G Pressure Transducer, by *Ashcroft Inc.* Stratford, CT
26 www.ashcroft.com or approved equal

27 2.3 INDICATING GAUGE

28 A. For all PLSM02 pressure transducers, provide indicating pressure gauge, "Type 2" per Section
29 170641, for local readout and calibration of pressure sensor.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Elevation: Do not install 1.5 psi range transducer lower than 3.0-ft below the water surface.

B. Provide 0.5-inch ball valve (as a pressure gauge cock) between gauge and pipe connection.

C. Install common analog indicating pressure gauge, in-line, after the gauge cock and before the pressure transmitter.

D. Install separate low-voltage power and comm wiring the transmitter/display monitor.

E. Calibrate the transmitter display to read the water pressure and correlated to the correct water surface elevation and demonstrate functionality to the Owner's satisfaction.

END OF SECTION

SECTION 170584 - NON-METALLIC AIR BLOWERS

PART 1 - GENERAL (See Section 170010)

1.1 USAGE

A. The air blowers are used to blow air into, and exhaust moist salty air out from the top, of the Sand Tiger Shark deaeration tower.

1.2 REQUIREMENTS

A. Blower capacity, pressure, speed, type, and other requirements shall be as indicated on the Drawings.

B. Blower, electric motor, and specified items shall be supplied as a complete pre-assembled packaged unit on a skid mount frame. The inlet silencer may be provided with the blower assembly, or provided separately, and field assembled.

1.3 CODES

A. Comply with all applicable codes listed in Section 170010 and conform to ASME B19.1, "Safety Standard for Air Compressor Systems."

B. Comply with standards set by the Air Movement and Control Association (AMCA) for drive and blower arrangements.

1.4 COORDINATION

A. When placing the order, coordinate the required drive arrangement, discharge and inlet box position, and motor position for each specific flower installation. This may require sending of shop drawings to the blower supplier for coordination. Use standards of the Air Movement and Control Association (AMCA) when coordinating the arrangements.

B. Variable Frequency Drives (VFDs) are to be provided, as indicated on the Equipment Schedule, per the Electrical Contract Documents.

1.5 SUBMITTALS

A. Data shall be prepared by the blower and/or motor manufacturer and shall include:

1. Name of blower manufacturer and model number.
2. Dimensional drawing of packaged equipment.
3. Characteristic curves showing: Flow quantity, pressure, speed, and horsepower.
4. Complete blower description plus material list including: Housing, rotors, seals, and shaft.
5. Submit AMCA fan and drive arrangements for each delivered unit.
6. Name of motor manufacturer and supporting data for: Nominal, horsepower, speed at full load.

7. Warranty.

B. Submit required accessories.

1.6 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.7 WARRANTY

A. Warranty: Guaranteed against defective parts for a minimum of 1-year from the date of startup in the complete system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever is less.

PART 2 - PRODUCTS

2.1 PLASTIC BLOWERS

A. Type: The blower shall use a radial wheel and constructed of corrosion-resistant materials and suitable for continuous 24-hour duty. Direct-direct drive with speed adjustment by VFD.

B. Construction:

1. Scroll housing and blower wheel shall be made of polypropylene, or fiber reinforced polypropylene, or similar non-metallic materials
2. Dynamically balanced and factory tested.
3. Equipped with a drain plug at the bottom of the scroll housing.

C. Motors: Factory equipped with a direct-drive electric motor, VAC and RPM speed per Equipment Schedule on the Drawings. Variable Frequency Drive (VFD) capability per Equipment Schedule on the Drawings.

D. Base: Equipped with a corrosion-resistance, Type 316 stainless steel, base support of the motor.

1. The components shall be assembled so that routine or annual maintenance can be performed without undo disassembly.
2. Exterior Coating: All ferrous metal parts shall be coated with a zinc-rich primer followed by a durable top-coating for superior corrosion resistance.

E. Required accessories:

1. Provide inlet screen/guard on the blower intake for protection.
2. Provide Flex PVC connector at air blower suction and discharge per blower manufacturer recommendations.
3. Provide adjustable CPVC butterfly damper per blower manufacturer.

F. Manufacturer:

1. *Plastec,* Bradenton, FL (941) 751-7596 www.plasticventilation.com;

2. Or equal model by, *Harrington Plastics*;
3. Approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall mount the equipment as shown on the drawings and make all necessary connections and adjustments for a complete and correct installation. All air lines shall be purged of foreign debris before starting.

B. Installation shall include a secure connection of the inlet silencer to the air blower with the complete assembly operational without any rattling sounds.

C. Install electrical power, including VFD capability, per Electrical Contract Documents.

D. Test as recommended by the manufacturer and demonstrate functionality to the Owner.

END OF SECTION

SECTION 170586 - ROTARY BLOWER PACKAGE

PART 1 - GENERAL (See Section 170010)

1.1 USAGE

A. Tag No. GEN-ABO001-001. The blower is used to provide low pressure air to miscellaneous aquarist air uses.

1.2 REQUIREMENTS

A. Blower capacity, pressure, speed, type, and other requirements shall be as indicated on the drawings.

B. Provide blower, electric motor, filter, muffler and other specified accessory items as a complete pre-assembled packaged unit on a skid mount frame.

1.3 CODES

A. Comply with all applicable codes listed in the General Provisions and conform to ASME B19.1, "Safety Standard for Air Compressor Systems."

1.4 SUBMITTALS

A. Supply the following data:

1. Dimensional drawing of all equipment.
2. Characteristic curves showing: Flow quantity, pressure, efficiency, and horsepower.
3. Complete description plus material list including: Casing, rotors, seals, shaft.
4. Submit information on all “Accessories.”
5. Name of motor manufacturer and supporting data.
6. Copy of two (2) year warranty.
7. Submit type 316 stainless steel piping information.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.6 WARRANTY

A. Warranty: Guaranteed against defective parts for a minimum of 1-year from Substantial Completion.

PART 2 - PRODUCTS

2.1 ROTARY TYPE BLOWER

A. Type: Rotary blower package to include rotary lobe type blower packaged in a sound attenuating enclosure that allows all maintenance access from the front of the blower. Suitable for heavy-duty continuous industrial service. Blower shall be oil-free, positive displacement, rotary lobe type designed for air service. IEC IP-54 for superior dust and splash-tight enclosure.

1. Silencers: Equipped with inlet and discharge absorption silencers. Discharge silencer designed to designed to reduce noise by 5-8 dBA.

2. Air Filter: Equipped with “Com-paK Plus” Rotary Blower Package by Kaeser Compressors inlet air filter.

3. Expansion Joints: Provide where required for sound attenuation and vibration reduction.

4. Pressure Relief Valve: Equipped with a spring-loaded relief valve installed on the discharge silencer. Shall prevent blower dead head air flow condition. Set relief pressure for valve per manufacturer’s recommendations.

5. Motor: Motor shall be energy efficient, IE3, with thermistors, with speed controlled by VFD. Unit shall include a speed monitor.

6. Ventilation Fan: Provided in the enclosure to ensure proper cooling.

7. Drive: V-belt drive with automatic tensioner and fully-enclosed belt guard.

8. Blower Construction: Precision machined or die-cast surfaces and dynamically balanced. Blower may be close-coupled to the electric motor; or mounted in tandem with enclosed drive belt if installation allows.

9. Indicators: Temperature gauge, pressure gauges on inlet and outlet.

B. Electrical: The package shall be delivered from the factory for a single point of connection for electrical power.

C. Performance: Air flow with a 3.0 psig differential: 19 SCFM at minimum frequency, 60 SCFM at design point, and 65 SCFM at maximum frequency.

D. Make & Model: “Com-paK Plus” Rotary Blower Package, BB 52 package with Omega 21P blower, by *Kaeser Compressors*, Fredericksburg, Virginia (540) 898-5500; or approved substitute.

2.2 TRANSMISSION PIPING

A. Piping Material at Discharge:

1. Installed for a minimum length of 10-ft after the blower for heat dissipation.
2. Pipe: Schedule 10 Type 316 Stainless Steel piping or better. Conforming to ASTM A312 ASME SA312.

3. Fittings: Type 316 Stainless steel threaded fittings acceptable

B. Compressed Air Piping: See specification 170233 for air piping to be installed after the SS heat dissipation piping.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Mount equipment as shown on the drawings and make all necessary connections and adjustments for a complete and correct installation.

B. Purge air lines of foreign debris before starting.

END OF SECTION

SECTION 170666 - PLATE-TYPE HEAT EXCHANGERS

PART 1 - GENERAL

1.1 SUMMARY

A. Provide heat exchangers of quantity and capacities as given on the Equipment Schedule of the Drawings. The General Conditions apply to this Section as fully as if stated herein.

B. Governing Parameter: The delivered heat exchangers shall not be sized for less than the "minimum capacity" given on the drawing equipment schedule. If adjustments in design parameters are required, the manufacture shall make slight adjustment to the water flow rate for chilling or slight adjustment in the temperature differential for heating. The maximum pressure differentials shall remain a 5.0 psi.

1.2 SUBMITTALS

A. Catalog cuts and sufficient data including temperatures in and out, flow rates, pressure drops, effective transfer area, dimensions, weight, nozzle size and location, and material schedule. Include information on stainless steel support feet.

B. Computer sizing information/calculations shall be included with submittal and shall be stamped and signed by a Registered Professional Engineer.

C. Submit price list for replacement plates, gaskets, and other commonly use parts.

D. Submit 1-year guarantee.

1.3 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.4 CODES, STANDARDS AND TESTING

A. Shall be designed, fabricated, and tested in accordance with the applicable Sections of the ASME Code for Un-fired Pressure Vessels, Section VIII, Division I. Code stamping is required.

B. After complete assembly but before shipment, the exchanger shall be hydrostatic tested in accordance with the requirements of ASME Section VIII, Division 1.

1.5 INSPECTION REPORTS AND CERTIFICATES

A. Manufacturer's Data Report: The Seller's data report should contain the following documents in the English language and British Units (i.e., BTU's). Form U-1 (Paragraph UG-120 of the ASME Code) with the applicable sections properly filled out.

1.6 MANUFACTURERS GUARANTEE AND WARRANTY

A. Guarantee and Contractor's Warranty: Prior to acceptance of the units, the Manufacturer shall furnish a written guarantee of the equipment for no less than 1-year of trouble-free service, backed in full for 100% material costs. Manufacturer shall warrant and guarantee all equipment furnished to be free from defects in materials for a minimum of 1-year from the date of startup of the complete system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever date occurs first. Manufacturer's warranty shall not relieve the Contractor from furnishing a complete system warranty as specified in the General Conditions.

PART 2 - PRODUCTS

2.1 PROCESS

A. Heat Transfer Fluids: Pool fluid will be ozone treated saltwater, specific gravity of 1.03. Heating/chilling fluid will be a solution of 0% glycol in water.

B. Shall be single pass, counter-current flow design, with all end connections on the stationary cover plate.

C. Frame shall be designed to permit future installation of a minimum of 15% additional plates in addition to 10-percent excess plate area for fouling.

D. Maximum velocity through extended flanged nozzles shall be 16.0 fps. Maximum velocity through stud-port nozzles shall be 11.0 fps.

E. Minimum velocity between plates shall be 0.5 fps.

F. The maximum allowable overall pressure drop shall be five psi.

G. Computer print-out shall give data for theoretical plate area with 0% fouling factor. To account for the specified fouling factor, the heat exchanger shall be delivered with the excess number of plates as required for an additional 10% plate area.

H. Process water bypassing is not allowed. Temperature requirements shall be met at the inlet and outlet nozzles without the use of internal or external bypassing of process water.

2.2 CONSTRUCTION

A. Plate and frame heat exchanger of new design and current manufacture, ASME construction, and labeled for 100 psi working pressure at 265°F in accordance with Section VIII, Division 1 of ASME Code for un-fired pressure vessels.

B. Connection nozzles shall accommodate ANSI B16.5 connections. May be equipped with either flanged pipe nozzles (16 FPS max.) or oversized stud-port type connections (11 FPS max.).

C. Plates:

1. The minimum thickness of plates before pressing shall be 0.5 mm (0.020 inch) nominal and of adequate rigidity for independent hydrostatic testing of each circuit separately.

2. Port holes not feeding passes between plates shall be fully gasketed and vented to the atmosphere, and relieving grooves shall be located such that leakage of liquids cannot occur without external evidence.
3. Plates shall be of one-piece design, without seams. Additional "loose" type hanger straps are acceptable.
4. The heat exchanger shall be delivered with 10% excess plate area to allow for fouling.

D. Fixed and Movable Covers: Shall have all nozzle/flange connections located on the stationary cover plate.

E. Compression Bolts and Nuts: The compression bolt length shall accommodate the provision for 15% additional future plates—in addition to the 10% plate area for fouling provided by plates delivered with the heat exchanger.

F. Plate Gaskets:

1. An FDA approved "Food Grade" adhesive compound compatible with the gasket material; or glue-less gasketing.
2. One-piece gaskets are required.
3. The compressed plate pack dimension shall be given on the seller's assembly drawing. This dimension shall also be shown on the permanent nameplate attached to each respective heat exchanger.

G. Handling Devices: Permanent lifting points shall be provided to handle the exchanger.

H. Materials for Saltwater Process:

1. Frame: Carbon steel SA-515 or SA-516 Grade 60/70.
2. Plates: Titanium, Grade 1; or better.
3. Tie Rods: All-thread Type 316, 317, 416 or 417 stainless steel.
4. Nuts: Dissimilar stainless steel from the rod metal to avoid metal transfer and seizing.
5. Gaskets: Resin-cured butyl rubber or EPDM rubber (vendor to verify selection of gasket material for specific application).
6. Splash Shield: Aluminum or stainless steel.
7. Upper & Lower Carrying Bars: Type 316 stainless steel, solid or clad.
8. All Nozzles: Solid titanium or titanium-lined carbon steel.
9. Support Feet/Angles: Type 304 stainless steel.

I. Materials for Freshwater Process:

1. Frame: Carbon steel SA-515 or SA-516 Grade 60/70.
2. Plates: Type 316 stainless steel; or better.
3. Tie Rods: All-thread Type 304 stainless steel.
4. Nuts: Dissimilar stainless steel from the rod metal to avoid metal transfer and seizing.
5. Gaskets: Resin-cured butyl rubber or EPDM rubber (vendor to verify selection of gasket material for specific application).
6. Splash Shield: Aluminum or stainless steel.
   Upper & Lower Carrying Bars: 300 Series stainless steel, solid or clad.
7. Connection Nozzles: Solid Type 316 stainless steel or Type 316 stainless steel-lined carbon steel.
8. Support Feet/Angles: Type 304 stainless steel.

2.3 FACTORY APPLIED COATING

A. Carbon Steel Components: *Special Order* with *corrosion resistant* coating required on all carbon steel surfaces.

1. Surface Preparation: Break all sharp edges by grinding or filing to prevent "pin-pointing" of coating. Prepare base metal with abrasive blast for a Commercial Finish immediately before application of coating.
2. Required Prime Coating: Prime coat of inorganic zinc primer, *Carboline* "Carbo Zinc 11 HS" or approved substitute.
3. Topcoat for Outdoor Installations: Two (2) topcoats with water-borne acrylic enamel, *Carboline* "D3359" for outdoor exposure to sunlight; or approved UV resistant substitute; or two (2) coats *Amerlock 2* epoxy, followed by final topcoat of *PPG Spectracron 380* or equal product with excellent exterior color and gloss retention.
4. Topcoat for Indoor Installations: Two (2) topcoats with water-borne acrylic enamel; or aliphatic urethane gloss enamel; or a two-part epoxy finish.

B. Titanium, aluminum, and stainless steel surfaces shall not be factory painted.

2.4 DATA PLATE & I.D.

A. Mount a permanent stainless steel data plate with the following information:

1. Manufacturer’s name
2. Model number
3. Unique serial number
4. Design pressure drop across both sets of nozzles
5. Design temperatures at each nozzle

B. Clearly label each nozzle for in or out and fluid type.

2.5 PREPARATION FOR SHIPMENT

A. Surface Protection: Machined surfaces exposed to the atmosphere shall be suitably protected from saltwater spray and corrosive material during shipment by means of an easily removable rust preventive coating of satisfactory consistency.

2.6 SPARES

A. Manufacturer shall maintain a stock of spare parts within the country where unit is installed; spares shall be available upon demand; submit replacement price list of plates, gaskets, and other commonly use parts.

2.7 MANUFACTURERS

A. Manufacturers:

1. *Alpha-Laval Inc.*, Richmond, VA (804) 222-5300 or San Diego, CA (858) 569-1300 www.alphalaval.com;
2. *APV Crepaco Inc.*, (937) 558-7518 www.apv.com;

3. *Autopropac,* Orem, UT www.autopropac.com;
4. *Delta Hydronics,* Hudson FL (727) 861-2421 www.deltahydro.com;
5. *S.A. Armstrong Limited,* Toronto, Ontario (416) 755-2291;
6. *Bell and Gossett (ITT Fluid Handling Corporation),* Morton Grove, IL (847) 9666-3700 www.bellgossett.com;
7. *Graham Corporation,* Batavia, NY (585) 343-2216 www.graham-mfg.com;
8. *Mueller Accutherm (Paul Mueller Company),* Springfield, MO (417) 831-3000 www.muel.com;
9. *Tranter PHE Inc.*, http://us.tranter.com;
10. or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in strict accordance with the Manufacturer's recommendations.

B. Provide concrete housekeeping pads.

C. Install butterfly valves at heat exchanger for all process fluids only after increasing line size to size of transmission piping shown on the drawings.

D. Install Type 316 stainless steel vent-cocks at all high points on vent lines or as otherwise indicated on the drawings.

E. Install gauge connector plugs and/or pressure gauges and/or thermometers as specified elsewhere.

F. Field-coat exposed stainless steel and aluminum metal surfaces with penetrating lubricant finish specified in Section 170010.

G. Balance heat exchanger flows as follows:

1. Balance cold chilling water, and hot heating water flow, as required by the Mechanical Engineer.
2. When running in the cold-water chilling mode, for the LSS/pool side of the heat exchangers, check for a temperature differential within 2 degrees F plus or minus of temperature differentials given in the Heat Exchanger Schedule on the Drawings.
3. When running hot water heating mode, for the LSS/pool side of the heat exchangers, check for a temperature differential within 4 degrees F plus or minus of temperature differentials given in the Heat Exchanger Schedule on the Drawings.
4. If the differential temperatures are low, throttle the outlet valve of the LSS/pool heat exchanger pump to achieve the correct differential temperature and/or increase the flow of cold chilling water or hot heating water. If excessive throttling of LSS heat exchanger pump is required, issue a report to the Owner that the heat exchanger may not be performing as specified.
5. If the differential temperature on the LSS/pool side of the heat exchanger is excessive, then reduce the flow of cold chilling water or hot heating water, flowing from the Mechanical side thru the heat exchanger.

END OF SECTION

SECTION 170667 - TUBE TYPE HEAT EXCHANGERS

PART 1 - GENERAL

1.1 USAGE

A. The heat exchangers are used in filtered saltwater process water for small aquatic animal exhibits.

1.2 SUMMARY

A. Provide heat exchangers of quantity and capacities as given on the Heat Exchanger Schedule of the Drawings and as specified herein. The General Conditions apply to this Section as fully as if stated herein.

1.3 COORDINATION

A. Provide with factory supplied Type 316 stainless steel mounts to match with installed situations.

1. Factory wall-mount support where installed wall-mounted.
2. Factory floor stands where floor mounted.

B. Hot and cold water piping and valves must be coordinated with the LSS ACS design requirements.

1.4 SUBMITTALS

A. Catalog cuts and sufficient data including temperatures in and out, flow rates, pressure drops, dimensions, weight, nozzle size and location, and material schedule.

B. Submit warranty.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.6 WARRANTEE

A. The warranty period shall begin at startup of the water treatment system, or at Owner acceptance of the units from the installing Contractor, or starting 6-months from date of shipment, whichever is less. Unless warranted by a longer manufacturer's warrantee, the manufacture shall replace any components found defective within a 1-year warranty period.

PART 2 - PRODUCTS

2.1 TUBE TYPE HEAT EXCHANGER

A. Provide heat exchanger packaged as a single unit mounted on a stainless steel mounting rack/stand.

B. Performance: Heat exchangers shall deliver the scheduled minimum Ton chilling rate, or Btu/hr heating rate, at the differential temperature indicated on the Equipment Schedule.

C. Housing Shell: Constructed of Schedule 40 or Schedule 80 CPVC.

D. Inner Tubing: Titanium.

E. Pressure loss shall be less than 5-psi.

F. Insulation: Main cylinder of body wrapped with closed-cell insulation.

G. Support Rack: The tube shall be delivered with a support rack for wall or floor mounting, of Type 316 stainless steel or Type 304 stainless steel with a superior corrosion-resistant coating.

H. Manufacturers of Tube Type Heat Exchangers:

1. *AquaLogic, Inc.*, San Diego, CA (858) 292-4773 www.aqualogicinc.com;
2. *Delta Hydronics,* Hudson FL (727) 861-2421 www.deltahydro.com;

PART 3 - EXECUTION

3.1 INSTALLATION BY CONTRACTOR

A. Install in accordance with the Manufacturer's recommendations.

B. Provide mounting brackets and bracing as required.

C. Install valves at heat exchanger for all process fluids only after increasing line size to size of transmission piping shown on the drawings.

D. Install thermometers thermowells as specified in specification Section 170430.

E. Contractor shall startup, verify performance of heat exchangers, and demonstrate functionality to Owner.

END OF SECTION

SECTION 170723
OZONE GENERATION EQUIPMENT

PART 1 - GENERAL (See Section 170010)

1.1 SUMMARY

A. Ozone gas generators and related equipment shall be supplied as specified herein. The size and location shall be as indicated on the Drawings. The General Conditions shall apply to this Section as fully as if repeated herein.

B. The ozone generators, and all equipment specified within, interlocks, and appurtenances, including labor, shall be furnished by a single Ozone Systems component provider as a complete system. The Ozone Systems component provider shall provide all components per specifications, accurate submittals of components for review, installation assistance, operation instruction, and training for ozone system components as specified below. A single vendor shall be selected by the Contractor to provide all equipment in this specification Section, including the following items:

1. Air-Cooled Ozone Generators: As scheduled on Drawing LS0.03.
2. Backflow Prevention: Each ozone generator to be equipped with, or served by, a device for active prevention of water from back-flowing into the generator from the ozone gas piping.
3. Air Preparation Equipment: As indicated on the Drawings and as specified below.
4. Off-Gas Decomposers: Type “A” at pressure ozone contactors, Type “B” at deaeration towers and fractionators, and Type “C” for exhausting dual containment ozone gas piping.
5. Ambient Ozone Monitors: Located in each equipment room with potential ozone and remote ozone sensors where called for on Drawings.
6. External Warning Devices: Located at the entry to each room with potential ozone.
7. Safety Equipment Cabinets: One located outside of the ozone equipment room and outside the fractionator room.
8. Signage: Safety warnings as required by Code.

C. Equipment/Products: The Ozone Systems component provider shall provide the following equipment and services:

1. All specified products in this Section including ozone generators and other specified ozonation equipment.
2. Submit technical information for approval of equipment prior to delivery.
3. Installation consultation and recommendations as required for other sub-contractors and consultants to install the delivered ozone equipment.
4. Startup of system, testing, commissioning of equipment and systems.
5. Training of Aquarium operations staff.
6. Warranty of all specified equipment.

1.2 QUALITY ASSURANCE

A. New equipment of current design and backed by practical testing and successful installations. All the equipment specified within shall be furnished as a package from a single source.

B. “Standard 250 for Enclosures for Electrical Equipment” shall be used as a guide for fabrication of the ozone generator cabinets: National Electric Manufacturers Association, 2101 L Street, N.W., Suite 300, Washington, DC 20037.

C. The Ozone Systems component provider shall provide assistance for meeting the requirements in the National Fire Protection Association (NFPA) code as related specifically to the components of the specified ozone equipment. However, the Ozone Systems component provider shall not be responsible for obtaining permits, or code compliance, with elements of the building including, but not limited to, existing equipment, building materials, ventilation, automated controls, and transmission pipes through the building envelope to the outdoors.

D. This specification assumes that NFPA 1 - Uniform Fire Code - 2003 Edition, Annex G Ozone Gas-Generating Equipment, has been adopted by the regulating officials in jurisdiction where the equipment is being installed.

E. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the "Equipment Category" other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.3 SUBMITTALS

A. Catalog cuts and sufficient data including capacities, flow rates, pressures, name of sub-component manufacturers and model numbers and dimensional drawings of packaged equipment.

B. Submit proof that installed materials will bear approved testing agency listing mark or classification markings.

C. Provide complete schematics, complete description of operation, control schematics including coordination with other electrical control devices.

D. Submit list of specified and recommended spare parts.

E. Submit performance Guarantee for generator and Warrantee on dielectrics.

F. Submit description of Start-Up Services.

G. Where Contractor selects an alternate manufacturer from the listed Base Supplier, the Contractor shall list all modifications required for the alternate product to match the Contract Drawings including Shop Drawings of the alternate product with the Submittal.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

1.5 COORDINATION

A. Coordinate work with installation of automated controls, a.k.a. LSS ACS.

B. Coordinate selected equipment's electrical power requirements with final field conditions.

C. See other specification Sections for related equipment:

1. 170261 for ozone gas piping. The entire ozone gas supply line, interconnecting piping, and off-gas ducting supplied by and installed by the Contractor as specified in Ozone Gas Piping Specification Section 170261.
2. 170288 for Mazzei ozone gas injectors.
3. 170454 for ORP monitors.
4. 170805 for pressure ozone contactor vessels

1.6 GUARANTEE & WARRANTY

A. The Ozone Systems supplier shall be responsible for factory warrantees for all related peripheral equipment.

B. The supplier shall guarantee all equipment to be free from defects in manufacturing, workmanship or materials, and shall repair or replace defective equipment within one year from Substantial Completion. The manufacturer shall guarantee the documented power consumption, hour test capacity and production of the ozone generator.

C. The dielectrics shall have a non-prorated 100% warrantee for three-year life. For failure of any dielectric, for any reason other than breakage by mischievous physical tampering, the supplier shall deliver new dielectrics to the Owner within 24 hours.

1.7 FACTORY START-UP ASSISTANCE AND TRAINING

A. Technical Construction Assistance Visits: The ozone systems component provider shall provide at least two visits for assistance with installation of the new system.

B. Field visits visit(s) to assist with equipment, completion of automated controls, debugging of the system, and completion of a final punch list of work performed by others. At the completion, of installation of all equipment, the component provider shall commission all ozonation equipment by verification of service limitations, calibration of sensors and instrumentation, and proof of function of all operational variables.

C. Training Seminar: ozone systems component provider shall provide a personnel training visit, separate, or in combination with the equipment commissioning visit. The component provider's senior personnel to give complete formal seminar on the fundamentals, routine operation, standard maintenance, and rebuilding instruction demonstrations for the ozone generators and all other ozonation equipment. Shall include educational material handouts for the Aquarium staff, demonstration of actual components and visual aids.

1.8 OZONE EQUIPMENT SUPPLIERS

A. Base Suppliers: The Drawings and specified equipment conforms to equipment available from the following base supplier:

1. *Ozone Water Systems*, Phoenix, Arizona Tel: (480) 421-2400
www.ozonewatersystems.com;

B. Alternate Suppliers: Selection by the Contractor of the following alternate suppliers may result in variations from detailing on the Drawings resulting in the preparation of shop drawings by the Contractor to account for modifications. The Contractor's selection of Alternate ozone suppliers will require coordination of space for the physical equipment well as coordination for alternate electrical power requirements. Any required changes to accommodate an alternate is the Contractor's responsibility The following suppliers may or may not be able to supply equipment and/or ozone generators as specified:

1. *Telchine Research & Development*, LLC rob@telchine-rd.com
Largo, FL 33773 Telephone: (727) 385-2328

2. *International Ozone Services*, Inc. www.io3service.com.
Mount Dora, FL 32757 Telephone: 321.238.8097

PART 2 - PRODUCTS

2.1 AIR-COOLED OZONE GENERATORS

A. Type: Ozone generators shall be self-cooled or air-cooled corona discharge type. U.V. bulb type generators are not acceptable. All components used within the ozone generators shall be constructed of ozone-resistant materials.

B. Capacity: Production capacity of ozone generators shall as scheduled on the Life Support Drawings. Generators shall produce ozone gas using air as feed source to a percentage within the range of 1.5% to 2.75% by weight.

C. Manual Control Devices. The ozone generator/control cabinet shall be equipped with the following devices for manual settings:

1. Power supply on switch.
2. Emergency stop button (oversized and “red” in color).
3. Local / Remote or HOA switch. Capacity adjustable by way of a manual output control dial or adjusted fully automatically on Ethernet signal from the LSS ACS.
4. Gas pressure control valve.

D. Production Chambers: Each ozone generator may consist of one or more independent ozone production chamber(s). Each cathode within the production chamber shall be constructed of 316L stainless steel with Teflon end caps.

E. The ozone generator shall be capable of operating continuously for a period of one (1) year without a major cleaning of internal components. No degradation of materials including tubing, fittings, O-rings or wiring shall occur for a minimum of three (3) years. Design environmental conditions are as follows:

1. Min./Max. temperature: 40 to 95 degrees F continuously.
2. Humidity: 20% - 90% relative humidity, non-condensing environment.
3. Line voltage: +/- 10% rated input.

F. Emergency Shut-Off: The ozone generator skid shall have a red manual shut down button for the ozone generators within 10-ft of the exit door.

G. Each ozone generator shall be factory tested for a minimum of 8 hours. Testing of the generator’s output shall be per the Water Quality Association (WQA) Testing Methodology Guideline criteria for rating ozone output in grams per hour and percent concentration (by weight) at specific feed gas flow rates.

H. Generators shall have a label stating serial number, date of manufacture, ozone output, model number and address of manufacturer affixed to the side.

I. Monitoring Features: Each generator include an *Ethernet* connection for electronic communication of the following status items:

3. Run Status
4. Gas Flow
5. Gas Pressure
6. Display of dielectric power consumption (Wattmeter)
7. Cabinet Temperature
8. Display of faults such as high temperature, electrical shorts, voltage out of limit, set points out of limit, et cetera

9. In-service hour counter
10. Back Flow Preventer Status

J. Output Adjustment: Each ozone generator shall have the functionality via an Ethernet connection to the LSS ACS:

1. Remote Start
2. Remote Stop
3. Ramp Up Ozone Production
4. Ramp Down Ozone Production

K. Air Flow Meter: A physical air flow meter, with variable area float, shall be mounted on or in the cabinet.

L. Ozone Gas Piping:

1. Internal Piping: Internal feed gas, ozone delivery lines, and fittings shall be made of Kynar, Teflon, or Type 316 stainless steel.
2. External Piping: All external ozone gas piping shall be in accordance with specification Section 170261.

M. Electrical Power: Refer to equipment schedule for power. Equipped with a main fuse; separately fused transformer; and separately fused cooling fans where applicable; permanent external labeling of proper fuse sizes. All insulated internal electrical wiring jacketed with ozone resistant materials to prevent deterioration.

N. External Interlocks: Ozone generators shall interface with the LSS ACS through the Interface Control Panel in the Ozone Generator Enclosure. The Control panel shall communicate with the ACS through an ethernet connection.

1. High Ambient Ozone: Upon closed contact switch on the ambient ozone monitor, the related ozone generators shall stop production of ozone. System may restart automatically upon open switch on the ambient ozone monitor.
2. Ozone Injection Pump Status: ACS programming shall not allow production of ozone without conformation of run status of related ozone injectors.
3. Off-Gas Destruct Status: ACS programming shall not allow production of ozone without conformation of run status of related off-gas destruct unit.
4. Dew Point Monitor: Following a short time delay ozone production shall be curtailed on a high dew point in the feed gas. System shall remain off until a manual restart is initiated.

2.2 BACKFLOW PREVENTION

A. Supply one ozone and saltwater corrosion resistant check valve with each generator at the inlet to an active backflow prevention device described below.

B. For each ozone generator, supply an active backflow prevention device consisting of a mechanical float valve and normally closed valve designed to positively prevent backflow of water into the generator.

1. Provide an automatic mechanism to shut down and or purge the ozone generator if liquid backs up inside the ozone gas line between the gas injection point and the ozone generator.
2. Shall include a clear glass enclosure for observation of correct functionality.
3. All related gas connections will be capable of sustaining an operating pressure of 45 psi or full vacuum.
4. Blue “Alarm Clear” indicator lamp and red “Alarm” condition lamp.
5. Termination or relays for alarm for clear dry status condition.

2.3 LOW-VOLTAGE CONTROL WIRING

A. Control Wiring: Where low-voltage is not provided at limited locations. Where “2-wire” for low-voltage 4 – 20mA control wiring is required, provide *Belden* 9802, 2 conductor, 20 AWG, with PP insulation; or equal

2.4 AIR PREPARATION EQUIPMENT

A. General: The Air Preparation Equipment shall consist of gear necessary to supply feed gas to all ozone generators from a single reliable source. No single piece of equipment mounted on the skid shall produce more than a 76 dB sound level (air compressor shall produce less than 72 dB) and optional mufflers and/or enclosures shall be provided as required.

B. Process Train: The air preparation system shall consist of, but not limited to, the following series of apparatus:
   1. Rotary Air Compressors (2).
   2. Particulate and Coalescing Filters* (2).
   3. Refrigerated Air Dryer* (2).
   4. Air Receiver Tank (1, with automatic condensate drain).
   5. Oxygen concentrator (1).
   6. Oxygen Receiver Tank (1).
   7. Desiccant air dryer, on by-pass for alternate duty (1).

   * Note filters and refrigerated air dryer may be combined with the compressor unit

C. Rotary Air Compressor: Either an oil-less rotary scroll type air compressor, or a oil lubricated rotary screw type compressor with ultra-filtration.
   1. Compressor shall be packaged in an enclosed sound attenuation cabinet with a noise level less than 72 DBA.
   2. Shall be an industrial rotary screw air compressor designed for 24-hour, quiet vibration-free operation. Direct or vee-belt drive. Shall include an oversized heavy-duty inlet air filter, and air-cooling fan.
   3. Vent Connection: Shall be constructed for venting of cooling air connected to ducting for discharge out of Ozone Equipment Room.
   4. Motor shall be TEFC, 480, 60 hertz. Equipped with a separate U.L. certified electrical power disconnect switch. Provide motor starter in control panel, if required.
   5. Instrument panel incorporating pressure gauge, temperature gauge, hour meter, HOA switch. Include U.L. listed controls for automatic start/stop operation. Provide high temperature shut-down switch and diagnostic light, and pressure control switch.
   6. If an oil lubricated rotary screw type compressor is selected, equip with an oversized oil separator/filtration to allow for extended operation and prevent any oil contamination of the ozone generator's dielectric cells. Provided with a differential pressure switch and high pressure warning lamp to indicate loading of filter.
   7. Manufacturers of oil-less rotary scroll type air compressors:
      a. Kaeser
      b. *Atlas Copco Compressors Inc*. Holyoke, MA (413) 536-0600;
      c. *Powerex* (with specified options and spare parts) Harrison, OH (513) 367-3120;
      d. or approved substitute

D. Particulate and Coalescing Filters: Provide particulate and coalescing filter after the receiver. Include condensate trap automatically operating bleed-off valve. Manufactured by:
   1. Domnick Hunter Inc. Charlotte, NC (704) 568-8788;
   2. or approved substitute.

E. Refrigerated Dryer: Provide an industrial, direct expansion type, refrigerated dryer intended by the manufacturer for continuous 24 hour duty. Dryer may be integral with air compressor. Manufactured by:
   1. *Pneumatech Inc*. Kenosha, WI (414) 658-4317;
   2. *Airtek* Lancaster, NY (716) 685-4040 www.airtek.com;
   3. or appropriate substitute.

F. External Receiver: Vertically oriented ASME Code VIII air receiving tank, separate of the air

compressor, with auto-condensate drain devise.

1. Size the air receiver to limit total compressor start-ups to less than six times per hour at maximum ozone generator demand. 60 gallon minimum.

G. Equip receiver with automatically purging condensate drain based on liquid level sensing. Device shall use electronic water level sensors, not a mechanical float mechanism, and shall discharge only condensate water and not compressed air. BEKOMAT from *Benz Engineering* Montebello, CA (800) 698-1250 www.benzcas.com; or approved substitute

H. Condensate Drains: Equip air receiver, coalescing filters, and other condensate traps with automatically purging condensate drain.

I. Oxygen Concentrator: Oxygen concentration device using pressure swing absorption technology. Designed for continuous 24 hour duty. Minimum purity of oxygen produced shall be no less than necessary for ozone generator=s requirements to produce the specified ozone. Shall be piped internally and externally with copper piping and brass or stainless steel fittings; plastic piping components are not allowed. Pressure purge valves shall be equipped with muffler to limit maximum sound level to less than 76 dB. Manufactured by:

1. *Air Sep*; *OSIG, Inc*. Niagara Falls, NY;
2. or approved substitute.

J. Oxygen Receiver Tank: ASME Code VIII air receiving tank.

K. All feed gas piping shall be of stainless steel piping cleaned for oxygen service.

2.5 OFF-GAS DECOMPOSERS

A. Type “A”: Off-Gas Decomposers at Contactors without Blower.

1. Location: Off-gas unit operating on system pressure shall be installed, downstream of pressure ozone contactor, as shown on the drawings.
2. The off-gas decomposer shall be designed to destroy all residual ozone gas from pressurized discharge. The contact process shall be assumed to be zero-percent efficient in reducing the applied ozone gas. The unit shall be supplied as a complete integrated package for wall or stanchion mounting. Equip with U.L. certified electrical power disconnect switch.
3. De-mister: Constructed of ozone and saltwater spray resistant materials (Type 316 grade stainless steel or non-metallic construction); capable of removing foam and water particles damaging to the catalytic elements. Where installed outdoors, constructed of opaque U.V. resistant materials. Include drain trap where installed remote of ozone contactor. Manufactured by the ozone equipment supplier.
4. Heater: Resistance-type constructed of Type 316 stainless steel and controlled by an integrated circuit controller to provide the minimum low temperature required by catalytic unit.
5. Catalytic Canister: Shall be sized for destruct of 100% of the applied ozone. The unit shall not be "optimized" to operate at a temperature higher than 200 deg. F maximum
6. The destruct unit shall be provided with a water trap/demister assembly to remove condensate from the off gas and ensure moisture getting into the catalyst canister.
7. Materials: Housing shall be constructed of Type 316 stainless steel.

B. Type “B”: Large Off-Gas Decomposers with Blower.

1. Locations: For use for drawing off-gas from gravity contact tower and for drawing off-gas from fractionators.
2. The off-gas decomposer shall be designed to destroy all residual ozone gas drawn from top of each fractionator for the initial build-out condition. The contact towers and fractionators shall be assumed to be zero-percent efficient in reducing the applied ozone

gas. Supplied as a complete integrated package, either cabinet, or skid, or wall mounted. Equip with U.L. certified electrical power disconnect switch, and status contact switch to interlock with ozone generator. The de-mister may be supplied separately.

3. De-mister: Constructed of ozone and saltwater spray resistant materials (Type 316 grade stainless steel or non-metallic construction); capable of removing foam and water particles damaging to the catalytic elements. Where installed outdoors, constructed of opaque U.V. resistant materials. Shall be oversize to preclude blow-thru of mist or liquids. Include drain trap where installed remote of ozone contactor.
4. Heater: The heater shall provide the minimum low temperature required by catalytic unit. Resistance-type, constructed of Type 316 stainless steel and controlled by an integrated circuit controller.
5. Catalytic Canister: Capable of converting 100% of the applied ozone gas at flow rates as scheduled on Drawing LS0.06. Shall be designed for an expected maximum pressure drop of 2-inches of water throughout first six months of operation. The unit shall not be "optimized" to operate at a temperature higher than 200 deg. F maximum. The unit shall have a maximum bed velocity number of 3,500 and a maximum face velocity or 1.5 ft./second; or a flow rate per volume of catalyst no greater than 20 SCFM per cubic foot; or a minimum empty bed contact time of 3.0 seconds.
6. Vacuum Gauges (two required or one differential pressure type): Bourdon Tube, dial faced, with 316 stainless steel bellows. Range shall be "zero to ten" inches of water pressure with smallest graduations of 0.25 inch. Locate gages on either side of the catalytic unit.
7. Blower: Current design and available upon request as a stock off the shelf item, as low speed RPM as possible, and equipped with ball bearings with external lubrication points. Located downstream of the heater and catalytic converter and designed for long life at high temperatures.
8. Materials: All corrosion resistant materials. Electrical box and electrical conduit shall be of non-metallic materials and all equipment shall be rated for outdoor use.
9. Miscellaneous: Inlet/outlet connections shall be flanged with 150 lb. drilling pattern.
10. Controls: Shall include termination for connection to the LSS ACS for relay of status condition.

C. Type “C”: Small Off-Gas Decomposers with Blower

1. Locations: For use for at dual containment ozone gas piping and installed in ozone generator rooms.
2. The off-gas decomposer shall be designed to destroy ozone gas drawn from dual containment piping in the case of an unexpected leak. The dual containment piping is dry and a demister is not required.
3. Heater: The heater shall provide the minimum low temperature required by catalytic unit.
4. Catalytic Canister: Capable of converting 100% of the applied ozone gas from the largest ozone generator in the piping system connected to the off-gas decomposer.
5. Blower: Capable of a producing a 10 to 45 SCFM flow rate in a free air flow situation and capable of running continuously with a zero air flow. Located downstream of the heater and catalytic converter and designed for long life at high temperatures. Provide a check valve to allow ambient air to be drawn into the suction of the blower as required.
6. Controls: Shall include termination for connection to the LSS ACS for relay of status condition.

2.6 AMBIENT OZONE MONITOR

A. Location: Low concentration ozone monitors located per drawings and equipment schedule.

B. Range 0 - 1 ppm, resolution 0.01 ppm, repeatability +/- 0.01 ppm. Monitors shall have a digital readout which displays the ozone concentration directly in ppm.

C. Monitors shall use a stable electrochemical gas sensor close-coupled to a digital transmitter.

D. Monitors shall be equipped with dry-contact interlock switches. All switches shall close when the ozone level exceeds an adjustable preset level. Switches shall not lock-out, but shall open when the ozone level falls below the adjustable preset level plus a dead-band control range. The interface with the ACS control panel will be 24VDC.

E. The alarm set point shall be adjustable via the instrument's software.

F. Monitors shall be microprocessor controlled with continuous internal diagnostics. When the diagnostics detect a fault with the monitor, all the dry-contact interlock switches shall close.

G. Instrument related errors or power failure shall be reported on the front panel display and equipped with a dry contact for external announcement of such errors.

H. Manufacturer: *Ozone Water Systems* (OWS); *Analytical Technology, Inc*. (A.T.I.), Oaks, PA.; or approved substitute.

2.7 EXTERNAL WARNING DEVICE

A. Locations: Mounted in visible locations outside entry doors rooms with ozone generation.

B. Supply a remotely mountable warning device which includes the following, at minimum: two flashing lamps (one amber-equipment failure, one red-ozone leak), horn (ozone leak, with acknowledgment button), and warning plaque all contained in a Nema 4X enclosure. Plaque shall have permanent contrasting lettering reading:

WARNING: OZONE GAS, A STRONG TOXIC OXIDANT
MAY BE PRESENT WHEN LAMP AND HORN ARE ACTIVATED

C. Power shall be supplied to the Warning Device from the Ambient Ozone Monitor. Supply with a reset switch to switch power off to warning lamp and horn. Switch shall automatically reset when dry contact on ambient monitor is closed. Provide test position or warning test switch.

D. Supply lamp, horn and plaque on a common base with fixture for wall mounting.

2.8 SAFETY EQUIPMENT CABNIET

A. Locations: Locate one fully stocked safety equipment cabinet outside the entrance of each room with ozone generation.

B. Cabinet for safety equipment: Provide a non-metallic NEMA 4X cabinet to contain safety equipment specified herein. Cabinet shall be wall mounted, gasketed, weather-tight, shelves/hangers for related equipment, glass front window, and non-locking handle.

C. Respirator Masks: Furnish in each cabinet two (2) half-faced respirator masks as follows: Of 100% silicone rubber, medium size with replaceable purifying cartridges and with NIOSH/MSHA approvals. Provide one extra headband for each mask. Provide with each mask a box of six (6) replacement cartridges listed for the removal of ozone gas (white type K, acid gas). Silicone half-face mask and accessories by Pro-Tech or approved substitute.

D. Personal Sensors: Furnish in each cabinet: one (1) portable personal type sensor manufactured specifically for detection of ozone gas. The monitors shall visually alert personnel of conditions that exceed the current OSHA 15 minute Permissible Exposure Limit (PEL) with either a flashing lamp, or bar graph, or audible alarm or digital readout. Include battery charger, carrying case and calibration equipment as required, by one of the following manufacturers: Eco Sensors www.ecosensors.com; ENMET Corporation www.enmet.com; O3 Company; ATI Analytical Technology, Inc.; or approved substitute.

E. Monitor Badges: Furnish six (6) clip-on personal diffusion type monitors manufactured specifically for detection of ozone gas. The monitors shall visually alert personnel of conditions that exceed the current OSHA 15 minute Permissible Exposure Limit (PEL).

F. Provide information on health and safety for operation of ozone generators and related equipment.

2.9 SIGNAGE

A. At each ozone generator room, and off-gas decomposer location, provided an engraved plastic plaque with permanent contrasting lettering reading:

WARNING: OZONE GAS, A STRONG TOXIC OXIDANT

PART 3 - EXECUTION (See Section 170010)

3.1 INSTALLATION & START-UP SERVICES BY EQUIPMENT SUPPLIER

A. The ozone systems equipment supplier shall provide technical assistance to on-site contractors of related trades, field visits for supervision of the installation, and an Owner Technical Training Seminar, as specified above and as required of fully functioning ozone generating systems.

B. When on site, the ozone systems technician shall provide written startup, shutdown, and routine operations procedures covering both standard operations and special operations encountered at the time of start-up. Prior to leaving the site, the technician shall provide written documentation signing-off on the status of all equipment and functionality of the projects ozone systems.

3.2 INSTALLATION BY CONTRACTOR

A. General: Install all the equipment as recommended by the manufacturer, specified and shown on the drawings in a neat and orderly manner to result in a complete, safe and functional system.

B. If an Alternate Manufacture is selected by the Contractor, make all necessary modifications for a complete functional system including, mounting requirements, piping changes, additional valves, modified electrical power supply, and other required changes for a complete installation.

C. Contractor shall ensure electrical equipment is in conformance with a approved testing laboratory listing and bears certification labeling.

D. Mounting: Provide housekeeping pads where required for skid/base mounted equipment. Mount safety equipment storage cabinet outside each ozone generator room.

E. Connections: Make all connections necessary to complete the process indicated on the contract drawings or otherwise required by the manufacturers shop drawings; the primary connections are generally as follows:

1. Air Prep Equipment: Electrical power, interlock wiring, make connection at compressor with braided stainless steel hose, use copper piping for air line. Connect inlet to air receiver tank on side near bottom with outlet at top. Install automatic condensate drain at bottom and route discharge to oil/water separator. Optionally, Contractor may arrange for control wiring to be installed by the ozone equipment vendor.
2. Ambient Monitor and Warning Alarm: Provide interlock connections. Power shall be provided with connection to the control panel of the ozone generator.
3. Off-Gas Decomposers: Electrical power, interlock wiring, and piping (ducting) connections. Provide condensate drain piping from the de-mister and other low points in the off-gas piping and route to floor drains with gas traps.

4. Auto Condensate Drains: Provide electrical power. Route discharges to condensate management system or floor drain.
5. HVAC Interconnect: Connect wiring to the building HVAC system to verify operation of operational exhaust system for the ozone generator room.

F. Warning Annunciator: Mount warning plaque, horn, and flashing lamp above entry to ozone room and complete wiring to ambient ozone monitor.

G. Safety Cabinet: Mount safety equipment cabinet in appropriate location, stock with specified gear, and sign-off on delivery of safety equipment with Owner's Representative.

H. Transmission Piping: Install ozone gas tubing, fittings, valves and off-gas duct-work as specified in Section 170261.

I. Backflow Prevention: Contractor shall check to make sure the following process water backflow prevention measures have been taken:

1. Ozone generator equipped with normally closed valve on ozone out line (provided with packaged equipment).
2. Check valve on ozone out line (provided with packaged equipment).
3. Active backflow prevention device (provided with packaged equipment).
4. High loop in the ozone supply line, with drain plugs at low points.
5. Check valve(s) in ozone supply line near dosing end point (provided by Contractor, valve per spec Section 170155).
6. Mazzei injector equipped with manufacturer's standard check valve option (see spec Section 170288).

J. Pressure Regulation: Adjust pressure regulators at each ozone generator to meet requirements of various equipment operating on the same pressurized air supply.

END OF SECTION

SECTION 170753 - CALCIUM REACTORS

PART 1 - GENERAL

1.1 GENERAL REQUIREMENTS

A. The Calcium Reactors are intended for maintaining calcium and alkalinity after calcium is added by the operational staff to achieve the desired base calcium concentration.

B. Project includes calcium reactors as scheduled on the Drawings.

C. Manufacturer shall provide all components necessary for operation, in a pre-engineered package, compatible with the seawater system and facilities provided. The package of equipment shall be completely self-supporting.

D. Capacity and Sizes:

1. Flow Rate: Designed to operate with a rangeable water flow. The incoming/effluent water flow rate may be adjusted from the flow rate specified above as recommended by the manufacturer of the calcium reactor.
2. Recirculation Rate: Each reactor shall have a factory-supplied recirculation pump. The recirculation water flow rate shall be as recommended by the manufacturer of the calcium reactor.
3. Reaction Chamber: Clear acrylic reaction chamber, sized by manufacturer. See Reactor Schedule on the Drawings for preliminary sizing.
4. Secondary Chamber: Clear acrylic reaction chamber sized by manufacturer. Filled with calcium carbonate media, for the purpose of improving the calcium and alkalinity saturation and increasing the pH.

E. Individual electrical components shall be in conformance with all local, State of North Carolina and Federal codes, statutes and ordinances where they apply, including required listing by testing authorities.

F. Provide all wiring complete with packaged equipment, including all junction boxes and transformers as required, for a single point of connection for 120 VAC power supply. All wiring shall be completed with the factory shipment or by the manufacturer’s factory representative during the on-site Technical Seminar.

G. Each Calcium Reactor shall be mounted on a non-metallic corrosion-resistant base, including carbon dioxide proof tubing for the discharge and drain lines. The CO2 pressure tank(s) shall be separate from the Calcium Reactor skids.

H. The manufacturer shall provide an on-site Technical Seminar for final setup and demonstration of proper operations to the Aquarium’s operational staff.

1.2 SUBMITTALS

A. Submittal manufacturer’s product information, including all components, bill of materials, dimensions, electrical requirements, installation recommendations, capacities and quantities. Use equipment tags from the LSS drawings to indicate items being submitted. Verify quantities and capacities as given on the drawings.

B. Submit verification of on-site Technical Seminar by factory representative and a brief description of activities when on site.

C. Submit warranty covering all equipment a guarantee for drip-tight operation at 20 psi water pressure minimum.

1.3 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010, including recommendations for maintenance prior to putting in service.

1.4 COORDINATION

A. Contractor shall coordinate installation with the electrical drawings and specifications. Including wiring, conduits, breakers and switches, relays and other power supply and control devices.

B. Contractor shall be responsible for assembly of items shipped separately. Any final adjustments, including required materials, shall be completed by the factory representative at the time of the Technical Seminar.

C. The Contractor shall complete the installation of Carbon Dioxide Monitors, with connection to the Automated Controls System (ACS), along with local visual and audible alarms. Installation of dedicated Carbon Dioxide Monitor is required as where CO2 cylinders are in-use or stored.

D. Contractor shall provide the initial CO2 gas cylinder for startup of the system. May be obtained from a local reputable welding gas supplier if not supplied by the manufacturer of the Calcium Reactors.

E. Manufacturer of the Calcium Reactor shall check the water feed flow rate on the Drawings and verify sufficient flow is available.

F. If 3-phase 120 VAC power is required, the proper electrical power wiring shall be installed by the Contractor.

1.5 WARRANTY & GUARANTEE

A. Manufacturer shall warranty all parts and performance of the system for no less than 2-years following the date of receiving shipment. The acrylic chambers, covers, and adjoining parts shall be guaranteed for dry drip-proof operation with 20-psi minimum water pressure.

1.08 PACKAGED EQUIPMENT MANUFACTURER/SUPPLIER

A. Base Manufacturer: The following manufacturer has standard off-the-shelf units meeting this specification:

1. *My Reef Creations*, Lawrenceville, GA www.myreefcreations.com contact Raj at (678) 407-3773.

B. Alternate Manufacturers: The following manufacturers may or may not have products available for meeting specified requirements:

1. *Integrated Aqua Systems* (760) 745-2201 www.integrated-aqua.com;
2. *Korallin*;
3. *Reef Octopus*, Slidell, Louisiana, telephone (507) 304-2579, www.reefoctopus.com.

PART 2 - PRODUCTS

2.1 CALCIUM REACTOR(S)

A. Shall be designed to deliver calcium and alkalinity to promote growth of stony corals and clams. Each unit shall include a large reaction chamber and secondary chambers to increase buffering and dissolution capability.

B. All specified equipment, meeting the specified performance requirements, shall be provided as a single component package mounted on a non-metallic corrosion resistant base.

1. Materials: All components, including fasteners, shall be of Type 316 stainless steel or better, non-metallic materials, clear acrylic, Sch 40 PVC piping, CO2 compatible materials where applicable, and otherwise built for installation in a saltwater aquarium. Use of ferrous metal materials shall not be incorporated in any components of the saltwater process. Bronze may be used for gas regulating valves.
2. Electrical: The package shall be delivered complete with electrical wiring, conduits, fastenings, junction boxes, and transformers for a single-point of connection to a 120 VAC power source. All electrical wiring shall be Code compliant and compliant with local electrical regulations.
3. Piping and Tubing: Rigid water piping shall be Sch 40 PVC. Plastic tubing, of *Tygon* or equal, may be used for small water flow and union connectors and stop valves by *John Guest*, or equal. Tubing used for CO2 gas shall be as recommended by the tubing manufacture for use with CO2 gas.

C. Media Chambers: Each Calcium Reactor skid, shall be provided with two (2) or three (3) chambers as follows:

1. Reactor Chamber(s): One (1) or two (2) main calcium reactor chambers built for recirculation of water through calcium media for the purpose of dissolving the calcium media. Constructed of a clear acrylic tube not less than 0.375-inch thickness. Components in the profile of the up-flow reactor shall be as follows:
    a) Top access cover with vent fittings as required.
    b) Outlet to recirculation pump suction with gas/bubble release device.
    d) Space for recommended volume of calcium media.
    f) Perforated water distribution plate or center spray-bar pipe.
    g) Piping at the bottom of the reactor arranged for distribution of recirculating water.
2. Secondary Chamber: Clear acrylic tube not less than 0.25-inch thickness for processing of the final effluent water, filled with calcium media, for the purpose of improving the calcium and alkalinity saturation and increasing the pH.
3. Chamber Construction: Chambers constructed with a clear vertical tube with a full-diameter flanged end on top for access. Flange thickness shall be as required to prevent any buckling and be drip-tight. Top covers secured with key-hole screw hasps, or metallic lock-levers, for ease of securing the top cover. Provided O-rings in grooves built into the flange of the chamber below the top plate.
4. Drip-Tight Construction: Acrylic reactors shall be constructed and guaranteed not to leak at pressures up to 20 psi, although actual operational pressures are expected to be less than 20-psi.

D. Skid Base: Provide with a skid base with mounting lugs for bolting to the floor, constructed of Type 316 stainless steel and/or non-metallic components.

E. Gas Tubing: Tubing compatible with CO2 gas and equipped with union connectors and stop valves by *John Guest*, or equal.

F. Two-Stage Gas Pressure Regulator: Designed for reducing the high-pressure CO2 gas, with a constant lower pressure at the outlet. Equipped with a spring, diaphragms, and adjustment knobs. Shall be a two-stage regulator, with the first stage reducing pressure to approximately 90 psi, and the second stage reducing gas pressure to 0 to 15 psi. Bronze body and internal materials compatible with CO2 gas. By *Harris* www.harrisproductsgroup.com or equal.

G. Regulator Connector: Bronze regulator connector, for *Compressed Gas Association* (CGA) Type 320. With no less than 12 extra use-once flat washers, or *Teflon* gaskets, provided to the Owner.

H. Needle Valve: Body and stem constructed of Type 316 stainless steel with Teflon packing and sized for fine adjustment of the CO2 gas.

I. Check Valve: Body and stem of Type 316 SS and located to prevent backflow of saltwater between the CO2 gas pressure regulator and the reactor.

J. Effluent Out Valve: Diaphragm type valve for adjustment of small water flow going out back to the LSS, by *ASAHI America,* substitute valve selected by manufacture of Calcium Reactor.

K. Water Flow Meters: Installed in the reactor recirculation pump discharge piping and installed in the final saltwater effluent piping. Variable area float meters, also known as rotameters. By *Blue-White Industries* Westminster, www.bluwhite.com; *Gilmont Instruments* www.barnant.com; or *King Instruments* www.kinginstrumentc.com; no substitutes.

L. Bubble Counter or Carbon Doser: Bubble counter or electric valve that generates on one portion carbon gas bubble every 0.1 to 10 seconds. Rheostat knob for CO2 control. Equipped with power supply, tubing, and non-return valve. By *TUNZE Aquatic Eco Engineering* or bubble counter selected by manufacturer.

M. Mixing Chamber: As may be required, clear chamber for mixing of feed water with CO2 gas from the Carbon Doser or bubble counter.

N. Calcium Media: A natural product specifically recommended by the manufacturer of the calcium reactor(s) for stony coral aquarium use. Consisting of relatively uniform size coral bones harvested from a sustainable source in the Western Pacific Ocean. Also known as aragonite pebbles from fossil corals. Shall be legally sourced.

1. Size: Coarse size. Coral bones larger than 1 cm are preferred. Package shall be free of fine coral sand.
2. Cleanliness: Washed in RO water to eliminate dust and have very low fines as well as manual removal of any snail or clam shells before packaging.
3. Dissolution: Shall completely dissolve over time in the calcium reactor.
4. Product Name: “Reborn Calcium Reactor Media”
5. Suppliers: *Bulk Reef Supply*, telephone (763) 432-9691 www.bulkreefsupply.com; *My Reef Creations*, Lawrenceville, GA www.myreefcreations.com contact Raj at (678) 407-3773; or Approved Substitute.

O. Carbon Dioxide Monitors: Wall-mounted ambient CO2 gas monitors, with alarm, for protection of aquarium staff personnel against excessive CO2 gas in the environment. Must be

recommended by the manufacture for personnel breathing safety. Accuracy of +/- 100 ppm CO2, or lower value, at the installed detection range. Equipped with a visual alarm display and an auditory alarm. 4-20 mA output for connection to the Automated Controls System (ACS). Provided with a 120 VAC to 24 VDC transformer power supply as required. May be mounted with the equipment skid or installed separately as a wall-mounted unit. By *Honeywell*, *ATI*, *Sensaphone*, or approved substitute.

P. Pressurized CO2 Cylinders: Sizes recommend by the manufacture of calcium reactors. Commercial grade pressurized liquid CO2, in 1,800 psi cylinders, from of reputable source, such as a welding gas supplier, or www.beveragelements.com. May be delivered at time of Technical Seminar.

Q. Recirculation Pump: Recirculation pump as recommended by manufacture of the Calcium Reactor. Equipped with a Variable Frequency Drive (VFD) if recommended by the manufacturer. Must be 120 VAC, single phase, powered.

R. Bleed Valve: Provide either a process for remixing gas that accumulates in the reactor chamber or a bleed valve. Bleed valve may be a Type 591 by *Georg Fischer*.

S. Solenoid Valve: Included if recommended by the manufacturer of the calcium reactor.

T. pH Controller: Each reactor unit shall include a pH probe/controller, probe holder with piping, wiring, and hardware/software programming.

PART 3 - EXECUTION

3.1 INSTALLATION AND SET-UP

D. Install all equipment as recommended by the manufacturer, specified and as shown on the Drawings in a neat and orderly manner to result in a complete, safe, and functional system. Install PVC true-union connections with a grease lubricant to keep them from freezing up from the excess calcium in the water.

E. CO2 cylinder(s) shall be installed as close to each reactor as possible.

F. Take precautions as recommended by manufacturer of the Carbon Doser, or bubble counter, when operating CO2 gas valves.

G. CO2 cylinders shall not be installed or stored at indoor or enclosed location before proof of and operational and calibrated ambient CO2 gas monitor.

H. Fill the reaction and secondary chambers, to within 1.5-inch of the top, with specified media.

I. Install the bubble counter as recommended by the manufacture.

A. Contractor shall coordinate a “Technical Seminar” presented by manufacturer’s technical representative to the Owner’s maintenance and operations staff. Verify delivery of no less than 12 extra use-once flat washers, or *Teflon* gaskets, for connection to the pressure regulator.

END OF SECTION

SECTION 170774 - ULTRAVIOLET STERILIZERS

PART 1 - GENERAL

1.1 USAGE

A. The ultraviolet sterilizers are used in 35 to 95 deg F fresh and saltwater.

1.2 REQUIREMENTS

A. Submittals shall be in accordance with procedures set forth in Section 170010.

B. Provide in quantities and capacities as given on the drawings.

C. Electrical equipment shall be in conformance with all local, State of North Carolina, and Federal codes, statutes and ordinances where they apply, including required listing by testing authorities. Acceptable listing authorities include Underwriters Laboratory (UL), International Organization for Standardization (ISO), American National Standards Institute (ANSI), Canadian Standards Association (CSA), and Edison Testing Laboratories (ETL). The manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The manufacturer shall have at least 20-years of experience in the manufacture of similar items with a record of successful installations.

B. The manufacturer shall be ISO;9001 certified.

1.4 COORDINATION

A. Verify all electrical, life support and other trades requiring that interface with the sterilizer.

B. Coordinate cooling requirement of unit with ventilation of enclosure.

C. Do not install electronic monitors, such as water flow sensors, or ORP transmitters, withing 15-foot of U.V. lamps or the U.V. ballast/controller.

D. Contractor to verify, prior to ordering, if extended cable lengths between control box and UV vessel are required compared to standard (approximate 15 ft) cable length.

1.5 SUBMITTALS

A. Submit dimensions of all components, capacities, bill of materials, electrical requirements, and installation recommendations.

B. Submit literature/data from the manufacturer of the lamps.

C. Warranty: Guarantee all equipment furnished under this Section against defective parts and workmanship covering 100% parts and labor for a minimum of two years from the date of delivery.

D. Submit warrantee and affirmation of warranty period as specified below.

1.6 WARRANTY

A. The manufacture shall warranty all components to be free of defects in material and workmanship for 2-years after startup in the water treatment system, or 2-years after Owner acceptance of the units from the installing Contractor, whichever is less – excluding consumables, such as lamps and O-rings. Lamps warranty to be prorated based on service time before failure.

1.7 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 DESIGN AND PERFORMANCE

A. The geometry shall be of a compact arrangement of the UV lamps, and water ports, allowing for installation and maintenance within the limited available space at the project site. Vessel configurations shall be a U-type configuration, or *SITA* Z-type configuration as shown on project drawings.

B. Lamps shall be high efficiency low pressure amalgam – 200W for small units, 440W for large.

C. Basic performance rating shall be greater than 99.9 percent bacterial reduction across the sterilizer. The UV transmissivity (UVT) of the water shall be assumed to be 90% for the purposes of design.

D. Units shall conform to the requirements listed in the equipment schedule shown on the drawings. At end of lamp life with a minimum UVT of 90% at rated water flow rates, the sterilizers shall deliver a minimum light intensity of:

1. 30,000 micro-watts-sec per square centimeter for recirculated aquatic animal systems.
2. 40,000 micro-watts-sec per square centimeter, for human contact / interaction (“Touch”) tanks, such as TOU system with touch pools.
3. Performance at flow shall be validated via CFD analysis.

E. Pressure drop across the sterilizer, from inlet to outlet, shall be no greater than 2-psi when operated at the specified intensity. Pressure drop at design flow shall be confirmed by the manufacturer via CFD analysis.

F. Vessel shall have a max pressure of 75 PSI minimum.

G. Temperature limitations are from 35 °F to 95° F process water temperatures at ambient air temperatures from 41 °F to 113 °F. Unit shall include high temperature protection resulting in power cut-out on high temperature with a lock out for manual re-set.

H. Water flow pattern shall have proven performance to create sufficient turbulence to assume full exposure to ultraviolet rays.

I. UV Sterilizers shall have flanged port size, with ANSI 125/150 lb. bolt pattern, as indicated on the Drawings.

J. Equip with controller separate of the UV bulb/water contacting housing for ballast starting of the lamps.

K. Minimum lamp life, with at least 85% output, under the specific design ratings shall be no less than 16,000 hours for 440W lamps and 14,000 hours for 200W lamps.

L. The units shall not require flowing fluid to prevent overheating.

M. Vertical or Horizontal Lamp Orientation:

1. Small *SITA* unit (200w lamps) can be mounted vertically or horizontally.
2. Large *SITA* units (440w lamps) to be mounted horizontally.

N. Support Legs: Shall have HDPE legs included with dimensions matching the installation as shown in the Drawings as required.

O. Provided transformers shall not generate EMI disturbances. Include required transformer to site's 120V power as necessary. Provided transformers shall not generate EMI disturbances.

2.2 MATERIALS

A. Lamp sleeves shall be quartz glass specifically designed for transmission of U.V. light. Shall have tool-free design for maintenance of lamp and quartz sleeve.

B. All wetted components shall be corrosion free materials.

1. The UV vessel housing shall be constructed of heavy-duty carbon black polyethylene (HDPE). Joints shall be welded and not glued.

C. Cabinet and hardware for ballast/transformer/controller (not exposed to process water) shall be sealed NEMA4X plastic with passive heat dissipation without need for ambient air exchange.

2.3 ELECTRICAL AND INSTRUMENTATION

A. Basic ECOLINE/RACK LCD controller.

1. Control box to have LCD HMI screen with push button navigation, resettable lamp life hour meter, vessel temperature display, UV intensity display, and alarm LED.
2. Shall have individual LED displays provided for indication of lamp operation.
3. Remote on/off contact.
4. On/off timer.
5. UV vessel shall have temperature sensor and UV-C sensor.
6. Dry contact NO/NC for general alarm (2 amp max.)

2.4 MANUFACTURER

A. Base Model & Manufacturer: *SITA UV,* Distributed by *Integrated Aqua Systems, Inc. ,* www, integrated-aqua.com Vista, CA, telephone (760) 745-2201.

B. Alternate Manufacturers: This listing of potential manufacturers shall not compromise the above specified requirements and may require the Contactor to make adjustments in pipe routing from what is shown on the Drawings. The Contractor's selection of Alternate UV Sterilizers will require coordination of space for the physical unit and bulb removal clearance, as well as coordination for alternate electrical power requirements. Any required changes to accommodate an alternate is the Contractor's responsibility. Potential alternate manufactures, who may not have off-the-shelf size units as listed on the Contract Drawings, include the following:

1. Albright Ultraviolet, LLC. Cheyenne, WY (307) 316-2622 www.albrightuv.com;
2. approved substitutes.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install equipment as recommended by the manufacturer, specified and shown on the drawings in a neat and orderly manner to result in a complete, safe and functional system.

B. Do not install electronic monitors, such as water flow sensors, or ORP transmitters, withing 15-foot of U.V. lamps or the U.V. ballast/controller.

C. Set level and secure along lines established on contract drawings or as revised by approved shop drawings.

D. Mount Ballast Box on wall or mounting stanchion (if delivered with remote electrical enclosure) with instrumentation panel clearly visible from maintenance space.

E. Complete installation of power cables, from the ballast to the UV housings, in a neat and orderly manner, using cable trays or other support for a uniform and secure finish.

F. Contractor shall startup and verify operational functionality of ultraviolet sterilizers.

END OF SECTION

SECTION 170786 - REVERSE OSMOSIS DE-IONIZATION SYSTEM AND WATER SOFTENER

PART 1 - GENERAL

1.1 USAGE

A. The system is used, for treatment of potable water, to deliver RODI membrane filtered water to a storage tank for make-up of water for aquatic animals with high sensitivity to toxins and other unwanted compounds in the water.

1.2 SUMMARY

A. Packaged Delivery: The pretreatment water softener and reverse osmosis equipment shall be delivered by the same supplier and it is the responsibility of the supplier to ensure that both systems work in concert with each other.

B. Capacity: The RODI system shall be designed to meet the performance criteria identified on the equipment schedule on the contract drawings — a delivery of 3,000 gpd R.O. Product Water. Contractor shall verify flow rate with capacity Scheduled on Drawing.

C. Carbon Filtration: Pretreatment of the source water includes GAC filtration occurs upstream of this system and is not required with the delivery of the RO equipment in this specification.

D. Pretreatment Water Softener: Provide a vertical pressure type water softener system with pressure vessel, softening resin, control valve, brine maker, and controller as indicated on the drawings and as specified.

E. Reverse Osmosis (RO) System: Work includes furnishing and installing a complete packaged RO system including all necessary appurtenances to provide a complete operational system.

F. With De-ionization system cylinders.

G. Source Water: The source of water is from surface and groundwater sources as delivered by the City of Syracuse municipal water supply and is carbon media filtered before delivery to the Pretreatment Water Softener.

1. Water Pressure: 40 psi minimum
2. Water Temperature: 60 to 90 degrees Fahrenheit
3. Fluoride: 0.99 ppm maximum
4. Nitrate: 0.45 ppm nominal
5. Turbidity: 0.5 NTU maximum
6. Free Chlorine: 1.76 mg/L (before GAC filtration)
7. Chloramines: Unknown
8. Copper: 0.297 ppm maximum
9. Chloride: 26 ppm nominal (RO System shall be designed for 500 ppm maximum chloride concentration)
10. Iron: Unknown, supplier to verify prior to fabrication.
11. Manganese: Unknown, supplier to verify prior to fabrication.
12. pH: 7.3 to 8.6
13. TDS: 320 ppm maximum
14. TOC: 2.6 ppm maximum
15. Total Hardness as CaCO3: 390 ppm maximum.

H. The above parameters are before carbon filtration.

I. Verify Parameters: The delivered equipment shall perform at required for the parameters given above, which are maximums, or for a current “Water Quality Report” published by the City of Syracuse, New York, Public Water Works for water delivered to Onondaga Aquarium project site.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The RO supplier shall have at least 10-years experience in the manufacture of similar items with a record of successful installations. RO supplier shall have a local service center within 50 miles of the Aquarium.

B. Design Requirements: Design shall comply with these Specifications and all OSHA and local safety codes.

C. Testing Laboratory Requirements: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the “Equipment Category” other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

D. The systems shall be fully tested at the factory and only require simple utility connections (feed water inlet, product water outlet, drain and power).

1.4 SUBMITTALS

A. Pretreatment Water Softening: Catalog cuts and sufficient data including flow rates, pressure drops, dimensions, weight, resin data, and material schedule.

B. RODI Equipment: Submit fully detailed shop drawings of the skid mounted RO system. Including complete assembly, anchorage, and installation drawings, together with detailed specifications and data covering materials used, parts, wiring, devices, and other accessories forming a part of the equipment furnished. Include technical information from manufacturers of all sub-components.

C. Where Contractor selects an alternate manufacturer from the listed Base Supplier, the Contractor shall list all modifications required for the alternate product to match the Contract Drawings including Shop Drawings of the alternate product with the Submittal.

D. Submit proof that installed materials will bear approved testing agency listing mark or classification markings.

E. Submit narrative on possible need for acid re-adjustment equipment and other system specific or non-specified equipment.

F. Submit factory warranty of all equipment.

G. Submit description of start-up services by the factory representative.

H. O & M Manual: Prior to acceptance of the system by the Owner, submit operation and maintenance manual covering the following items:

1. Piping & Instrumentation (P&I) diagram of packaged system.
2. Single line electrical drawing of power distribution.
3. Electrical control schematics cross referenced to PLC programming.
4. Operator interface listing and commentary.
5. General arrangement drawings.
6. List of components cross referenced to the P&I diagram and the electrical diagram(s).
7. Description of operations for commissioning, normal start-up, normal shutdown, cleaning, and storage set-up.
8. Suggested listing for collection of data and reporting to allow proper review of system performance.
9. Vendor brochures and manuals for major components.

1.5 COORDINATION

A. Coordinate power supply between selected equipment and the electrical design. Electrical contractor to provide fused disconnect switch within 5-ft. of installation.

B. Coordinate the order for “horizontal” or “vertical” RO membrane tubes at the time of the order.

1.6 WARRANTEE

A. The manufacture shall warranty the entire package assembly to be free of defects in material and workmanship for 1-years after Substantial Completion. The manufacture shall replace any components found defective within the warranty period.

1.7 FACTORY START-UP ASSISTANCE

A. Technical Start-Up: Supplier shall provide a minimum of two (2) working days, of factory trained technician to assist in the installation and start-up, and to inspect, calibrate and start-up the equipment. Shall include field-verification of all automated and programmed functions.

1.8 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 PRETREATMENT CARBON FILTRATION

A. The effluent, from carbon filtration associated with the LSS FWMU system, is anticipated to deliver water with less than 0.02 ppm free chlorine to the RODI package.

2.2 PRETREATMENT WATER SOFTENING

A. The pretreatment water softening system shall be delivered with the packaged RO System to protect the RO System from damage by contaminants in the source water. Shall have a maximum pressure drop of 15-psi across the softener vessel.

B. The effluent water hardness shall be 10 mg/l maximum and otherwise provide water in compliance at all times with requirements the RO System. The system shall not include a bypass for hard-water to be delivered to the RO System.

C. The softener system shall include duplex alternating softener tanks and one brine tank.

D. Resin Exchange Tank: The tank for exchange resins shall be a non-metallic composite vessel rated for 100 psi working pressure. The tank shall be equipped with an opening for media filling and periodic inspection.

1. Internal Distribution: The upper distribution system shall be designed to distribute water to the resin media without creating channeling.
2. Main Operating Valve: The system shall have a main operating valve mounted on top of the softening vessel. The valve shall have multi-positions to accomplish all operational steps, motor driven, piston type to positively locate the internal valve piston to route the flow of water through the softener during service, backwash, brine draw/rinse, and fast rinse/brine refill. The internal piston and seal assembly shall be of a modular cartridge design for ease of replacement and service.

E. Brine System: Provide a brine tank and related gear for completion of the pretreatment and RO process. Including a plastic tank, distribution clack traps, all required piping and fittings, and FRP strut where required for field mounting. All fasteners shall be Type 316 stainless steel. The valve for brine injection shall automatically open for eduction of brine into the softener tank, close to prevent suction of air, and allow the brine tank to be refilled with the proper amount of water. Supplier to provide initial load of salt for brine tank.

F. Softener Controls: Control function shall be performed by a programmable logic controller (PLC).

1. The softener shall regenerate based on either the volume of water treated or time and initiate as programmed. The main operating valve shall be controlled by volume-initiated regeneration. The controls shall perform the regeneration functions on the exhausted tank and return it to the service position.
2. A recharge lever, or control functions, shall be provided to permit manual regeneration initiation at any time.
3. The system shall account for routine brine injection as required.

G. Electrical Power: Shall be powered by a single 120 VAC power cable per softener vessel/controller.

H. Exchange Resin: The unit shall be supplied with 3.0 CF/gpm, cubic foot of virgin high capacity standard mesh of sulfonated polystyrene type cation exchange C-211 resin stable over the entire pH range (7.3 to 8.6 pH units) with good resistance to bead fracture from attrition or osmotic shock. Each cubic foot of resin shall be capable of removing 30,000 grains of hardness as calcium carbonate when regenerated with salt. The resin shall be manufactured to comply with the food additive regulation 21 CFR 173.25 as set forth by the USFDA. Additionally, a layer of support gravel shall be provided.

I. Flow Meters: Flow meters shall be provided to totalize the flow, initiate regeneration, and to monitor the flow rate.

2.3 RO SYSTEM

A. Skid Frame and Fasteners: The complete system shall be mounted on a steel frame with a durable corrosion protection coating. Fasteners shall be Type 316 stainless steel.

B. Booster Pump: Single-motored high-pressure vertical pump of Type 304 or superior stainless steel, and non-metallic composite materials. The motor shall be TEFC and close-coupled. Shall include the motor starter housed in a NEMA-4X enclosure.

C. Prefilter or Polishing Filter: Include either a 5-micron dual gradient polypropylene prefilter ahead of the Booster Pump, and/or a non-metallic housed cartridge polishing filter after the Booster Pump.

D. Throttling Valve: Equip the pump discharge line with an appropriately size valve designed specifically for high differential pressure throttling of flow.

E. Piping: Flexible PTFE hose with external braided stainless steel reinforcement, Schedule 80 PVC for low-pressure piping, cross linked polyethylene (PEX) tubing, Type 316 stainless steel for all high pressure piping. All piping materials to be selected by the manufacturer for best use.

F. Valves: Stainless steel construction. Sample valve shall be located on each pressure vessel and the product line for sampling of water quality.

G. Pressure Vessels: The spiral wound FRP pressure vessels, with polypropylene end caps, and FNPT fittings for installation of RO elements.

H. RO Elements: Horizontally or vertically oriented based on the Contractor order, spiral wound thin- film polyamide, ultra- low energy brackish water RO elements. For treatment of feed water with a maximum chloride concentration of 300 ppm. For ease of operator handling, the RO elements shall have a maximum length of 48-inches. Membrane elements shall have a flux less than 10 gpd/ft^2.

I. Pressure Gauges: Stainless steel housing with 2.5-inch dial, Type 316 bourdon tube, and liquid filled. Provide pressure ranges suitable for the operating conditions. Installed at the following locations:

1. Raw water inlet.
2. RO pump suction.
3. RO pump discharge.
4. RO pump throttling valve.
5. Product water outlet.
6. Reject water outlet.

J. Instrumentation: Equip with instrumentation for monitoring of all routine functions.

1. Pressure gauge (at above locations).
2. Low Feed Pressure Switch & High Pump Pressure Discharge Switch.
3. Feed Water Conductivity Sensor: Type 316 SS housing. 0-2,000 µS/cm range, temperature compensated, with digital display.

4. Product Water Conductivity Sensor: Type 316 SS housing. 0-2,000 µS/cm range, temperature compensated, with digital display.
5. Flow Indicators: For product water flow, reject water flow, and recirculation water flow.

K. Controller: Microprocessor, with LCD screen or superior HMI, for management of all routine operations and communication with the LSS ACS via ModBus TCP/IP protocol with RJ-45 connection. Shall include an audible alarm with a red alarm lamp.

1. Warning Messages:

a. High TDS/Conductivity
b. Chemical Tank Low
c. Operating Hours Exceeded

2. Shutdown Alarms:

a. High TDS / Conductivity
b. Pressure Fault. The RO shall attempt to restart upon pressure fault and shall shut down once the maximum number of restarts has been exceeded.
c. High Feed Temperature
d. Pretreatment Lockout (non-alarming, start and stop condition)
e. Storage Tank Full (non-alarming, start and stop condition)

3. Status Indications:

a. High TDS / Conductivity
b. Pressure Fault (Low Feed and/or High Membrane Feed)
c. High Feed Temperature
d. Pretreatment Lockout (non-alarming start and stop condition)
e. Storage Tank Full (non-alarming start and stop condition)
f. Operating Hours
g. Operating Status (Standby, Operating, Tank Full, Pretreat, Membrane Flush)

4. Auxiliary Relays: Two (2) 120 VAC, 5 Amp minimum, relays.

L. Electrical: Shall be configured to receive power from a single 120 VAC 1-phase power cable with all requirements to lower power components of the system provided with the unit. Power supply to the skid shall be furnished and installed by the Contract 3B. Provide all necessary power transformation from single-phase supply, relays, motor starters, and circuit protection. Equipped with a single main disconnect switch designed for lock-out/tag-out. All wiring shall be in rigid corrosion-resistant conduit.

2.4 DE-IONIZED (D.I.) CYLINDERS

A. Flow and Capacity: Shall deliver a minimum water flow of 0.25 gpm with an expected water use of 15 gallons per day or as required.

B. Number and Size: Three 8” diameter by 20.5” high D.I. cylinders or as required.

C. Provide a pre-filtration cartridge filter if the cylinder service provider determines the requirement for the given water source.

D. Three (3) filtration cylinders shall provide demineralization of domestic water:

1. Cylinder with granular activated carbon (GAC) media.
2. Cylinder with resin beads for removal of cation ions.
3. Cylinder with resin beads for removal of anion ions

2.5 EQUIPMENT SUPPLIER

A. All equipment specified herein shall be supplied a single supplier.

B. Base Suppliers:

1. *Evoqua Water Technologies LLC* (518) 256-9225, contact David Flood, email david.flood@xylem.com; 6713 Collamer Road, East Syracuse, NY 13057

C. Alternate Suppliers: The Contractor may optionally suggest an Alternate. This listing of potential manufacturers shall not compromise the above specified requirements and may require the Contactor to make adjustments in power supply, equipment layout, and pipe routing from what is shown on the Drawings. Potential alternate manufactures include the following:

1. Pure Aqua www.pureaqua.com telephone (714) 432-9996, contact May Higazy, may@pureaqua.com;
2. Water Works Ultrapure Solutions San Diego, CA (858) 499-0119.
3. Lakeside Water Treatment, Inc., email: info@lakesidewater.com phone: (414) 365-0787. Supplied by Commercial Water, contact Tom Beggs, email tom@commercialh2o.com

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall install, the package of equipment with all interconnections, where indicated on Life Support drawings according to manufacturer's recommendations, in a neat and orderly manner, to result in a complete, safe, and functional system.

B. Install interconnect to confirm that the pretreatment equipment is available to deliver water to the RO unit.

C. If an Alternate Manufacture is selected by the Contractor, make all necessary modifications for a complete functional system including, modified concrete supports, piping changes, additional valves, modified electrical power supply, and other required changes for a complete installation.

D. Contractor shall ensure electrical equipment is in conformance with a approved testing laboratory listing and bears certification labeling.

E. Install wiring between the RO controller and each softener controller.

F. Technical Start-Up: The Contractor shall make arrangements with the RO supplier for technical start-up by a factory representative and schedule the session with the Owner’s staff. RO supplier shall assume 4 hours of onsite training time with the Owner’s staff.

G. Thoroughly test all operations of installed unit and demonstrate operations to the Owner’s staff.

END OF SECTION

SECTION 170805 - PRESSURE OZONE CONTACTOR

PART 1 - GENERAL

1.1 USAGE

A. For contacting a solution of ozone gas bubbles with water. See “Ozone Schedule” on the Drawings.

1.2 SUMMARY

A. Pressurized fiberglass vessels with ozone resistant liner. The base design is configured for the *Pentair* “Structural Composite” tank product with a special custom diffuser provided by the specified Ozone Equipment Supplier.

B. The tank must be supplied with a special diffuser, as specified below, available from Ozone Equipment Supplier and may not be available from the manufacturer of the vessel.

C. Contractor shall verify the following dimensions against information given on the Drawings:

1. 63-inch diameter by 86-inch height.
2. 8500-gallon capacity.
3. 16-inch diameter top manway.
4. 6-inch dimeter flanged bottom port.
5. Tripod base support.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The FRP fabricator shall have at least 5-years of experience in the manufacture of similar items with a record of successful installations.

1.4 COORDINATION

A. Internal mixing nozzles are to be provided the ozone equipment supplier specified in Section 170720.

1.5 TESTING

A. The supplier shall perform an in-shop hydrostatic pressure test.

B. The supplier shall log as-tested data for each vessel and deliver copies of the test data to the customer for approval before shipment.

1.6 SUBMITTALS

A. Submit the Complete set of scale shop drawings indicating all dimensions and a complete material take-off.

B. Copies of pressure testing log for each individual vessel.

C. Submit detailing of diffuser attached to top opening.

D. Manufacturer's certified "Final Inspection Report" addressing completion of resin cure, finish workmanship, and other quality control aspects.

E. Warranty (described below) including warranty against failure from ozone solution.

1.7 WARRANTY

A. Supplier shall warranty each vessel to be free from defects in manufacturing, workmanship or materials and agree to repair or replace any fabrication within five years from date of delivery. Five-year warranty against failure of internal liner against attack from no less than 4 mg/liter ozone in water.

PART 2 - PRODUCTS

2.1 Requirements

A. Contactor Vessel:

1. Contactor Design: Vessel shall have appurtenances for downflow of water and release of gas out a top port.
2. Contactor Vessel Materials: Ozone-resistant polymer liner, with helically wound exterior fiberglass strand for resistance to internal pressures.
3. The fabricator shall be responsible for the design of all shell thicknesses, joint details and all other structural detailing. All resins used in construction of the vessel shall be vinyl ester.
4. Design Pressure: The unit shall be designed for no less than 75 PSI positive working stress. Designed for a negative (vacuum pressure) of 5-inches Hg. Design temperature shall be 100 deg. F.

B. Materials:

1. Inner Shell: Polyethylene (PE) seamless one-piece tank liner.
2. Outer Shell: Continuous strands of fiber-glass with vinyl ester resin.
3. Bottom Base: FRP reinforced tripod base.
4. Alloy Backup Flanges: Type 316 stainless steel.

C. Base support may be a "tripod" design or a cylinder with necessary access ports and shall be of non-metallic construction. Base shall maintain a minimum clear dimension between floor slab and face of bottom flange to allow for installation and service of piping beneath the vessel and shown on the project's scale drawings.

D. Top 16-inch Manway: Shall include a customize flange fitting necessary for water entry and air release connections:

1. Shall allow for pipe connection for incoming two-phase solution of water and ozone gas.
2. Shall include a second connection for release of ozone gas.

E. Bottom 6-inch Port: Shall allow for connection of outgoing water piping with size to match piping on the Drawings.

F. Internal Diffuser: Shall be equipped with a specially designed diffuser to promote mixing of the two-phase solution of ozone gas bubbles and incoming water.

G. Custom Parts: The ozone equipment supplier shall provide a customized flange fitting necessary for water entry connection and air release connection. The custom top port shall include a pipe stub for distribution of water below the air release port.

H. Tank Manufacturer:

1. "Composite Pressure Vessels" by *Pentair,* (800) 279-9404 www.pentair.com; Search for "Composite Tanks" at *Pentair* website.
2. *Canature HuaYu Environmental Products Co., Ltd*. Yixing City Wuxi Jiangsu, China +86 (0510) 8789-9558.

I. Diffuser Manufacturer: The special diffuser inlet shall be provided by the Ozone Equipment Supplier specified in Section 170720.

2.2 OZONE GAS RELEASE VALVES

A. Ozone Gas Release Valves: Specially designed saltwater service gas-relief valve constructed of exceptionally corrosion resistant materials. Housing shall be Type 316L SS or better, or ozone-resistant plastic materials. Internal springs and pivots shall be of Hastelloy C or better.

B. Gas Release Valves at Saltwater Locations: Specially designed gas-relief valve constructed of materials resistant to corrosion by saltwater. Housing shall be Type 316L SS or better, or ozone-resistant plastic materials. Internal springs and pivots shall be of Hastelloy C or better.

PART 3 - EXECUTION

3.1 INSTALLATION - CONTRACTOR

A. Contractor shall not release contacting vessels for shipment until manufacturer's certified Final Inspection Report has been submitted and reviewed by the specifying engineer.

B. Provide or coordinate with Structural for provision of structural concrete house-keeping pads as required for leveling.

C. Tank shall be leveled and bearing support surfaces packed with cement grout. Tank shall be anchored to structural concrete, with stainless steel anchor bolts.

D. Connect piping after setting and leveling of the contactor tank.

E. Install gas-release valve and connect piping to off-gas destruct.

END OF SECTION

SECTION 170810 – LARGE FRACTIONATORS

PART 1 - GENERAL

1.1 USAGE

A. The large fractionator vessels are used in 70 deg F ozonized saltwater containing debris and large particles of uneaten food. In addition to protein skimming, the fractionators serve as ozone contactors. Ozone gas is injected in to the fractionator vessels in concentrations as high as 0.30 ppm ozone in water solution and gas bubbles with much higher gas ozone concentration are also injected in to the fractionator vessels.

B. Large Fractionators" shall be per this specification Section. For "Small Fractionators" see specification Section 170811.

1.2 SUMMARY

A. The specified equipment shall be supplied as a package of equipment by a single source supplier.

B. The work includes the furnishing and installation of the fractionation tower, including support braces, bolts, plates, process piping connections, non-potable sprinkler piping, discharge to floor drain, and other work as shown and noted on the drawings and as specified. The General Conditions apply to this Section as fully as if repeated herein.

1.3 QUALITY ASSURANCE

A. The plastic products shall be designed for stresses to which these products will be subjected during fabrication, erection, and continuous operation as shown on the drawings. All HDPE and plastic components shall be backed by a non-prorated three (3) year factory warranty.

B. Testing Laboratory Requirements for Electronic and Electrical Equipment: Acceptable qualified testing laboratories shall be amongst those accredited by the NCBCC (North Carolina Building Code Council) for Labels on Electrical & Mechanical Equipment. Acceptable listing agencies include Canadian Standards Association (CSA), Intertek Testing Services ITS-ETL, and Underwriters Laboratory (UL). Depending on the "Equipment Category" other testing agencies may be qualified by the State of North Carolina; such as NSF International and other approved research laboratories. The manufacturer shall be fully responsible for compliance with this requirement. If field approval is necessary to meet listing requirements, it shall be completed without delay to the project and at no additional cost to the Owner.

1.4 SUBMITTALS

A. Submit fully detailed shop drawings of all units giving sizes; details of fabrication and construction; methods of assembly and bracing; and locations of hardware, anchors, and all accessories. Submit warranty.

B. Submit product information on all appurtenances including pumps, injectors, valves and sprinkler wash-down timers.

C. Submit proof that installed electrical equipment will bear approved testing agency listing mark or classification markings.

1.5 COORDINATION

A. Electrical: Power connection are made at the pump motor contact points and to the timer/controller for the rinse-down cycles. See Electrical documents for motor starter and wiring requirements. Provide 120 VAC power to wash-down timer controller where 120 VAC controllers are provided.

B. Plumbing: Coordinate work with non-potable water supply, sewer discharge (at floor sink).

C. ORP Sensors: Connection of ORP sensor shall be made on piping included with the packaged fractionators where applications for ozone are identified on the drawings.

D. Vents:

1. Standard Air Vent: Units without ozone gas shall include manufactures standard air vent.
2. Additional Vents: Units operated with ozone gas shall be supplied from the factory with an addition top-vent and check valve for letting in outside air for ozone applications. The standard vent shall be connected to off-gas piping.

1.6 WARRANTY

A. The manufacture shall warranty the body of the fractionator to be free of defects in material and workmanship for 3-years after startup in the water treatment system, or 3-years after Owner acceptance of the units from the installing Contractor, whichever is less.

B. The manufacture shall warranty pumps, and all components attached to the body of the fractionator, to be free of defects in material and workmanship for 1-year after startup in the water treatment system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever is less. The manufacture shall replace any components found defective within the 1-year warranty period.

1.7 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 BASIC FRACTIONATOR DESIGN & CONSTRUCTION

A. Design: The fractionator shall be designed by the manufacturer for the optimum removal or surfactants by air floatation. The vessels shall be of the capacity and dimensions indicated on the drawings, self-supporting of gravity loads, cylindrical structure, with flat bottom. The body of

the large diameter fractionators shall be made of a molded, single piece, thick-walled HDPE. The body of small diameter fractionators shall be made of clear acrylic.

B. Chemical Resistance: Main body shall be fabricated with material thicknesses and construction to allow for a long service life with ozonized air injected into the main vessel. Note, while the hypothetical concentration of ozone in solution is 300 ppb or less, bubbles containing 2% (20,000 ppm) ozone may impinge surfaces of the vessels.

C. Influent: Equip with inlet nozzle(s) located high on the water chamber for downward water flow counter-current to the flow of air being injected into the fractionator.

D. Effluent: Discharge water from bottom outlet equipped with a vortex plate to prevent drafting in of bubbles.

1. Equip with a vented “Hartford Loop” piping circuit to maintain a constant head pressure at the effluent.
2. Provide a level control valve in the lower portion of the Hartford Loop.

E. Provide base hold down clips.

1. Body Anchor Clips: Where clips are used for securing the body of the fractionator, clips shall be heavy-duty Type 316 SS clips attached to the side wall of the main body for anchorage to the base or anchorage directly to the structural concrete slab.
2. Base Anchor Studs: Base anchorage for fractionators less than 60-inch diameter shall have no less than four (4) anchor points for 1/2” diameter anchor studs. Base anchorage for fractionators 60-inch diameter shall have no less than four (4) anchor points for 5/8” diameter anchor studs.

F. Venturi Injector Circuit:

1. Pump(s): Factory equipped with recirculation pump(s) for operation of venturi injectors. Pumps shall be of materials with proven saltwater resistance and selected or modified to perfectly match requirements of the venturi injectors.
2. Air Inlet: Equip with inlet specifically for air feed. Air inlet shall have gas flow rate rotometer, needle valve for air flow control, and check valve to prevent back-flow of ozone gas when power is out.
3. Ozone Inlet: Provide fitting for induction of ozone gas downstream of the air inlet.
4. Injectors: Equip with Mazzei educator injectors.
5. Pump shall be co-brand label by RK2/MDM“

G. Wash-Down Systems: Provide the following for each fractionator:

1. Freshwater Sprinklers: Provide spray jets oriented to wash down foam from the top collector. Build unit with external non-potable supply piping to spray jets.
2. Chimney Sweep: Provide a spray jet for cleaning of the interior of the chimney with saltwater when the foam control sprinklers are activated.
3. Provide industrial quality timer/controller, with a built-in HMI touch screen, for programming and activation of sprinkler cleaning cycles. Timer/controller shall be 120 VAC powered.
4. Electric actuated ball valve by *ASAHI America* or *Hayward*. Manufactuer shall match other valves on project

H. Top Foam Collector: Shall include a foam collection cylinder, fabricated from clear acrylic plastic, for easy observation of foam production and collection of foam prior to automatic wash-down to the sewer.

I. Top Vents:

1. Standard Vent: Used for connection to off-gas piping and used as a gas outlet.
2. Additional Inlet Vent: Factory equipped with an additional gas inlet vent and *Spears* brand check valve with low cracking pressure. 1" size check valve for 14" diameter fractionators and smaller. 2" size check valve for 16" diameter fractionators and larger. This is to allow outside air into the top of the unit and prevent a vacuum inside the fractionator from air being drawn to the off-gas destruct unit.

J. Pro-Model Features: Delivered units shall be the "Pro-Models" by the specified manufacturer, including the following features:

1. Plumbed with Sch 40 piping instead of Sch 80 thou.
2. Upgraded wash down system.
3. True union PVC ball valves at all locations.
4. Bulkhead fittings for tank water piping connections (instead of rubber grommets).
5. Asahi manufacturer Valves

2.2 MANUFACTURER

A. Model & Manufacturer: Standard RKPE Models, with HMI wash system controller and actuated ball valve, with additional check valve in the venturi air inlet and additional top inlet vent and check valve. *RK2 Systems* San Marcos, CA (760) 746-7400 www.rk2.com; or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Coordinate anchoring with job requirements and install in accordance with Contract Drawings and manufacturer's recommendations.

B. Secure to concrete slab or concrete housekeeping pad.

C. After anchoring, align piping and make piping connections.

D. Install ORP sensor, per specification Section 170455, in water-flooded portion of vertical outlet pipe.

E. All connecting piping shall be specially supported so no external forces are applied on the polyethylene tank. Install support at base of outlet to support vertical load of piping while allowing horizontal movement of fractionator PE shell and outlet piping.

F. Complete electrical power wiring to the injector pump and 120 VAC power to the timer/controller.

END OF SECTION

SECTION 170811 - SMALL FRACTIONATORS

PART 1 - GENERAL

1.1 USAGE

A. The fractionator vessels are used in recirculating saltwater fish aquarium reservoir systems.

B. “Small Fractionators” shall be per this specification Section. For “Large Fractionators” see specification Section 170810.

1.2 SUMMARY

A. The work includes the furnishing and installation of the fractionation tower, including support braces, bolts, plates, process piping connections, valves, and other work as shown and noted on the drawings and as specified. The General Conditions apply to this Section as fully as if repeated herein.

1.3 SUBMITTALS

A. Submit detailed information.

B. Submit warranty.

1.4 WARRANTY

A. The manufacture shall warranty all components attached to the body of the fractionator, to be free of defects in material and workmanship for 1-year after startup in the water treatment system, or 1-year after Owner acceptance of the units from the installing Contractor, whichever is less. The manufacture shall replace any components found defective within the 1-year warranty period.

1.5 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 BASIC FRACTIONATOR DESIGN & CONSTRUCTION

A. Design: The fractionator shall be designed by the manufacturer for the optimum removal or surfactants from saltwater by air floatation. Water flow shall be counter-current sending water from the top of the reaction chamber down through rising bubbles. The internal hydraulics shall be designed for maximum foam production with minimal escape of air bubbles to the outlet.

B. Body: The main body shall be made of clear acrylic plastic. The vessels shall be of the capacity and dimensions indicated on the drawings, self-supporting with a flat bottom.

C. Piping: All plumbing shall be high-quality PVC piping with no traces of primer and all PVC piping shall be cleaned of printed markings. All ball valves shall be true-union, PVC.

D. Effluent: Discharge water from bottom outlet with a hydraulic design to minimize any escape of bubbles from going out the effluent.

E. Foam Collection: The design shall include geometry to avoid collapse of foam back into the riser chimney with a foam collection cup. The unit shall be manually cleaned with no requirement for use of tools.

F. Bubble Circuit: The fractionator shall have a *Mazzei* brand injector included to production of air bubbles.

2.2 MANUFACTURER FOR SMALL FRACTIONATORS

A. Model & Manufacturer: XFLO Model, by *RK2 Systems* San Marcos, CA (760) 746-7400 www.rk2.com;

B. Approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install as indicated on the Drawings and in accordance with manufacturers recommendations.

B. When saltwater is flowing, demonstrate functionality to the Owner’s operational staff.

END OF SECTION

SECTION 170820 - FRP FABRICATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. FRP fabrications in this Section are limited to the following:

1. Square Mesh Grating.
2. Miscellaneous FRP Shapes.
3. Access Manways.
4. Vee Notch Launders.

B. The FRP fabrications are used in submerged, wet/dry, chemical spill, and/or highly oxidized locations.

1.2 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The FRP fabricator shall have at least five years experience in the manufacture of similar items with a record of successful installations.

B. Structural Requirements: Fabricators design shall comply with these Specifications and all OSHA and local safety codes. Conservative safety factors shall be used in the design of all products. Working stresses shall not exceed the lower value of one-third of the yield strength or one-fifth of the ultimate strength of the material. The fiberglass products shall be designed for stresses to which these products will be subjected during fabrication, erection, and continuous operation as shown on the drawings.

C. Verification of Resin Cure: Where custom fabrications are constructed for ozonized environments (i.e., vinyl ester resin construction), optimum resin cure shall be checked and confirmed for each product by testing surface hardness in accordance with ASTM D 2583 *Standard Test Method for Indentation Hardness for Rigid Plastics by Means of a Barcol Impresser*.

1.3 SUBMITTALS

A. Submit fully detailed shop drawings of all FRP fabrication work, giving sizes; details of fabrication and construction; methods of assembly and bracing; and locations of hardware, anchors, and all accessories. Design calculations prepared by a Registered Civil or Structural Engineer shall be provided for all fabricated products and railings substantiating the design.

B. Contractor shall be responsible for all fabrication and for correct fitting of members shown on shop drawings. No materials shall be fabricated or delivered to the site until the shop drawings have been reviewed and returned. Accomplish all work to fit field conditions as verified by the Contractor; the shop drawings will not be reviewed for exact fit based on design dimensions.

C. Where custom fabrications are constructed for ozonized environments, submit a manufacturer’s certified Final Inspection Report addressing hardness testing and other quality control aspects. Submit information from resin manufacture giving finished Barcol hardness values.

1.4 FIELD MEASUREMENTS AND TEMPLATES

A. Secure all field measurements required for proper installation. Furnish templates for exact location of items to be embedded in concrete and masonry. The intention of the designer is for this work to be field fit as required.

PART 2 - PRODUCTS

2.1 SQUARE MESH GRATING

A. Unless otherwise noted, ¼-inch nominal bar width, 1-1/2 inch bar depth, of square pattern with bars spaced at 1-1/2 inch on center each way.

B. Grating shall be designed to withstand a 165 lb. concentrated load or a 95 psf uniformly distributed load on a 4-foot span with a safety factor of ten and a deflection no greater than 0.5-inch.

C. Molded from either (a) standard, chemical resistant fiberglass, with isophthalic polyester resin (standard green IFR or standard gray FGI by *Fibergrate*); or (b) vinyl ester resin where used in intimate contact with ozone.

D. Unless otherwise noted, top surfaces smooth with no grit or contour profile and free of sharp edges. Seal cut edges or openings with appropriate resin or epoxy.

E. Submit color for approval.

2.2 MISCELLANEOUS STRUCTURAL FRP SHAPES

A. Manufacturer all components and assemblies for high resistance to corrosion from seawater and saltwater spray.

B. Primary structural components of pultruded premium grade resin meeting ASTM E-84 Class 1 Flame Rating and self-extinguishing requirements of ASTM D-635. Resin material shall have a maximum glass content of 50% and utilize a synthetic surfacing veil for maximum chemical and ultraviolet protection.

1. Use vinyl ester resin for "ozone" applications:
2. "Extren 625"
3. "Creative Pultrusions 1625";
4. or approved substitute.

C. Either vinyl ester or polyester ("Extren 525" or "Creative Pultrusions 1525") resins for general purpose applications.

D. FRP fabrications shall conform to NBS Voluntary Product Standard PS15-69.

1. Custom fabrications used in non-public outdoor areas shall use resilient resin, such as AROPOL 7334 isophthalic polyester by Ashland Chemical, where resistance to impact damage is desired.
2. Custom fabrications used indoors and in public areas shall be constructed of Class I flame retardant resins.

3. Custom fabrications used in public and utility areas shall use *Hetron FR 992* vinyl ester resin by Ashland Chemical or approved substitute flame-resistant resins.
4. Fabrications in submerged or wet/dry ozonated environments shall use vinyl ester resins such as *Hetron* 980 by Ashland Chemical or *Durakane* by Dow Chemical. The particular resin product number used shall be the commodity specifically recommended by the resin manufacture for the actual ozone related application.

E. Manufacturers of grates and FRP shapes:

1. *Aickinstrut/TYCO* Seattle, WA www.alliedeg.com;
2. *Bedford Reinforced Plastics* Bedford, PA (814) 623-8125 www.bedfordplastics.com;
3. *Champion Strut,* Spring, TX (281) 655-8900 www.championfiberglass.com;
4. *Creative Pultrusions Inc*. Alum Bank, PA (814) 839-4186 www.creativepultrusions.com;
5. *Fibergrate Corporations* Dallas, TX (800) 527-4043 www.fibergrate.com;
6. *Seasafe* Lafayette, LA www.seasafe.com;
7. *Strongwell* Bristol, VA (703) 669-1181 www.strongwell.com;
8. *StrutTech* Seattle, WA (425) 885-4403 www.struttech.com;
9. *Ultra Fiberglass Systems* Milwaukee, IE (414) 461-5051 www.ultrafiberglass.com.

2.3 ACCESS MANWAYS

A. Access manways may be constructed of PVC per Section 170220 or of FRP.

B. Blind flange plates shall be of acrylic plastic where a clear viewing port is called out on the Drawings. Clear view-ports, or clear manway covers, shall be shall be hard-coated polycarbonate, acrylic, or approved substitute; sized for the pressure requirement by the supplier. Where clear viewing ports are not called out, the plate may be of the same material as the flange. In the case of fiberglass, the plate may be slightly domed to reduce stresses and material thickness.

C. If manways are constructed of FRP, they shall meet the following requirements:

1. Manway fitting shall be manufactured for Class 100 psi pressure, designed for pressure using AWWA C950-88 Section 2.4, of premium grade vinyl ester resin.
2. Interior pipe surface shall have a multi-layer corrosion barrier not less that than a 100 mil thickness in addition to the structural layer.
3. Flanges shall comply with tolerances given in latest version of NBS Voluntary Product Standard PS 15. All flanges shall have a 150 lb. bolt pattern and bolt holes shall straddle the vertical centerline (i.e., "two-holed," level).
4. Face Detailing: Faces of flanges must be flat, and without "O" ring grooves or other undulations, in order to be compatible with installation of the manway cover.
5. Each FRP manway fitting shall have a manufacturer's certified Final Inspection Report submitted before shipment addressing hardness testing and other quality control aspects.

D. Gaskets shall be in accordance with Section 170010.

2.4 VEE-NOTCH LAUNDERS

A. Assemblies will be used to distribute ozonized water. Constructed of fiber reinforced vinyl ester resin materials. Special attention given to optimize performance of the finished resin laminate products including post-fabrication heat curing. General construction of FRP launders, including allowable cosmetic defects, shall be in accordance with ANSI/AWWA F101 Standard for *Contact-Molded, FRP Wash Water Troughs and Launders.*

B. All troughs and launder shapes shall be designed to contain water over the entire span indicated. Torsional and lateral deflections cause by either water movement or buoyant forces shall be less than L/360. Each unit and its required support structure shall be designed for span load, buoyant load, and water impact and resonance conditions.

C. All FRP shapes, panels, and materials used in this application shall be molded or fabricated using high grade vinyl ester resins such as *Hetron* by Ashland Chemical or *Durakane* by Dow Chemical. The particular resin product number used shall be the commodity specifically recommended by the resin manufacture for the chemical environment where the weirs are to be installed. The use resins and plastic laminates over organic (wood) or metallic core materials is not allowed and will be rejected.

D. Seal all FRP edges and provide final product with smooth surfaces free of projecting glass fibers.

E. Verification of Resin Cure: Where products are constructed of fiberglass resin, optimum resin cure shall be checked and confirmed for each unit by testing surface hardness in accordance with ASTM D 2583 *Standard Test Method for Indentation Hardness for Rigid Plastics by Means of a Barcol Impressor*. Test for proper hardness after post-fabrication heat cure. Additionally, surfaces shall be carefully inspected for imperfections or holidays. The testing and inspection for each vessel will be certified by the manufacturer in a Final Inspection Report.

F. Water Seal: The water seal at each side, and the bottom, need not be “drip-tight” however, the installed seal must limit leaking water to less than 0.5 gpm per linear foot of joint. Manufacture selected solutions include sufficiently flat sealing surfaces, or EPDM rubber gaskets, or application of Dow 795 silicone sealant.

G. Manufacturers:

1. *Augusta Fiberglass* Blackville, SC (803) 284-2246;
2. *Custom Structures (CSC), LLC* Fischer, TX (830) 660-0484 email: jon@cscusa.biz;
3. *Fiberglass Fabricators, Inc*. Smithfield, RI (401) 231-3552;
4. *F R P Composites Inc.* Wisconsin Rapids, WI (715) 421-3770 www.frpcomposites.com/;
5. *Free Flow, Inc*. Omaha, NE (402) 397-8487;
6. *Gemini Fiberglass, Inc*. Colorado Springs, CO (858) 602-9465 or (719) 896 4782 or (858) 602-9465 www.geminifiberglass.com;
7. *Micro-Fab, Inc*. Thedore, AL (800) 221-1397 www.micro-fab.com;
8. *Plasti-Fab, Inc*. Tualatin, OR (503) 692-5460;
9. *Warminster Fiberglass Co*. Southampton, PA (215) 953-1260;
10. *Weirco, Inc*. Ambler, PA (800) 959-0285;
11. *World of Plastics* Fort Pierce, FL (561) 465-1222 or (800) 432-6143;
12. Or approved substitute.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Set FRP work accurately at the established lines and levels. Install in strict accordance with approved drawings and actual conditions, true to horizontal or plumb as the case may be, level and square with angles and edges parallel with related lines of the building.

B. Properly locate and build anchor bolts into connecting work. Preset bolts and anchors by the use of templates or such other methods as may be required to locate the anchors and anchor bolts accurately.

C. Set fiberglass grates with sharp edged side down or away from occupied area.

D. When installing Vee-Notch Launders: Installed with sufficiently flat and smooth surfaces to avoid excessive leaking, or install with EPDM gaskets if required to keep leakage less than 0.5 gpm per foot of joints, or install with Dow 795 silicone sealant on joint surfaces. Where installing with Dow 795 silicone sealant, use “Primer P” on concrete surfaces.

E. After assembly, align and accurately adjust various members forming parts of a completed frame before fastening.

END OF SECTION

SECTION 170821 - RAISED SAND TANK FLOORS

PART 1 - GENERAL (See Section 170010)

1.1 GENERAL

A. Used in the bottom of exhibit tanks where sub-floor water distribution is required at sand bottom areas where shown on the Exhibit Drawings. Fiberglass grate, supports and plastic screens to be provided with the Life Support System installation. Sand media to be provided per the Exhibit Design requirements.

1.2 SUBMITTALS

A. Submit information of all materials for review.

1.3 COORDINATION

A. Coordinate extent of grating with the Exhibit Design requirements. Installation of FRP grate for removability, per Detail 7 and 8 / LS8.02 requires coordination with the installation of the exhibit rockwork.

PART 2 - PRODUCTS

2.1 RAISED EXHIBIT SUB-FLOOR DESIGN

A. Sub-Floor Structure: Provide FRP grate media support structure to allow minimum six inch space underneath (or as otherwise shown on the drawings) obstructed only by support stanchions and capable of supporting uniform sand loading of 110 psf per foot of sand depth. Structure shall be molded square mesh fiberglass grate per specification Section 170820.

B. Grate Supports: Length adjustable deck support pedestals, constructed of non-metallic composite material, capacity not less than 1,000 lbs. per pedestal for maximum 36-inch length, with base levelers for up to 0.5 inch per foot floor slope. Provided with bracing system where lateral loads in involved. “Versadjust Adjustable Deck Support” by *Bison Innovative Products*, Co (800) 333-4234; or approved substitute.

C. Mesh: A multi-layer system of square net polypropylene screen shall be placed over support grate structure before placement of sand. The screens selection shall be as given in the following table:

Layer	Product	Hole Size	Thick. & % open	#/1000 sq. ft.
Top Layers (select flyscreen or Internet)	Fiberglass flyscreen or XN-6070 (two layers)	Approximate 0.025" x 0.030"	Approximate 0.014" 35%	Minimum 20.5 lb.
Middle Layer (Optional)	XN-3019	0.030" x 0.037"	0.036" 20%	86 lb.

Bottom Layer	XN-5010/8	0.285" +/- 0.015"	0.110" 45% to 50%	170 lb. to .

D. Bottom Layer: A complete base covering of heavyweight polypropylene mesh netting shall be secured on top of the support grating with nylon cable ties.

E. Middle Layer (Optional): A complete layer of mesh screen secured as necessary with Dow 795 silicone sealant. Place so laps do not match bottom layer laps of the heavyweight screen.

F. Top Layers: Two complete top layers of a fine mesh screen secured as necessary with Dow 795 silicone sealant to prevent any intrusion of sand. Place so laps do not match lapping of previous screens. Contractor may select at his option the Internet XN-6065 product or fiberglass window screen commonly available from the local hardware store.

G. Manufacturer: *Industrial Netting* Minneapolis, MN (763) 971-0871 or (800) 328-8456, www.industrialnetting.com; or *Ultra Fiberglass Systems* Milwaukee, WI (414) 461-5051 www.ultrafiberglass.com, or approved substitute; for top “Flyscreen” layers provide standard fiberglass flyscreen window screen product.

PART 3 - EXECUTION

3.1 INSTALLATION

A. FRP Grate: Fiberglass grating shall be field trimmed and epoxy sealed at edges to prevent wicking. Match walls with a tolerance of 0.5 inch or less.

B. Screens: Prior to placement of the fine mesh screen, the heavy duty mesh screen shall be secured to the fiberglass grate with plastic cable ties. Each layer of fiberglass finer mesh screen shall be secured all around the perimeter of the sand bed with copious quantities of silicone sealant. Within the sand bed, overlap the fine mesh screen to prevent seepage of sand. Arrange overlaps of second layer of fine mesh screen to avoid overlapping in the same places as the first layer.

C. Sand: Provide and install sand beds per Exhibit Design requirements. Special care shall be taken in transporting and placing the sand media to avoid the possibility of contamination and to prevent the media from becoming dirty. Any media which may have become dirty, either before or after it has been placed in the pool, shall either be washed, or removed and replaced by clean media. All media contaminated by organic matter will be rejected.

END OF SECTION

SECTION 170822 - FIBERGLASS DEAERATION TOWERS AND STORAGE TANKS

PART 1 - GENERAL

1.1 USAGE

A. The FRP tanks are used processing filtered water and dissolved gas control and storing freshwater and saltwater.

1.2 SUMMARY

A. Work includes furnishing and installing fiberglass reinforced plastic (indicated as FRP) tank including all appurtenances indicated on the drawings and/or specified herein. The General Conditions apply to this Section as fully as if repeated herein.

B. Design & Fabrication: The manufacture shall be responsible for both design and fabrication of the product to match the geometry and detailing indicated on the Drawings. The manufacture shall be responsible for determining proper material dimensions given information on the Drawings, actual material properties, and requirements of this specification.

C. Reference Drawings: General detailing for construction of the tanks are shown on LS Drawings.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The tank fabricator shall have at least 5-years experience in the manufacture of similar items with a record of successful installations.

B. Design Requirements: Design shall comply with these Specifications and all OSHA and local safety codes. Use conservative safety factors in the design of all products. Working stresses shall not exceed the lower value of one-third of the yield strength or one-fifth of the ultimate strength of the material. Design products for continuous use and stresses to which these products will be subjected during fabrication, erection (i.e., large-diameter thin-walled tanks may require stiffening ribs).

C. Material Thicknesses: All and/or any material thicknesses given on the Drawings shall be taken as a minimum thickness requirement and shall be verified by the manufacturer for low stress in the material being supplied.

D. Reference Standards:

1. Helically wound vessels shall be constructed in accordance with ASTM D 3299 Standard Specification for Filament-Wound Glass-Fiber-Reinforced Thermoset Resin Chemical-Resistant Tanks.
2. Hand laid-up vessels shall be constructed in accordance with ASTM 4097 Standard Specification for Contact-Molded Glass Fiber Reinforced Thermoset Resin Corrosion Resistant Tanks.
3. Where applicable products shall be in accordance with NBS *Voluntary Product Standard PS 15 – 69* for flange and other miscellaneous FRP construction. Unless noted otherwise, flange thickness shall be per NBS Table 5 for 150 psi design pressure.

1.4 COORDINATION

A. Refer to project drawings for burial depth and external loads.

1.5 SUBMITTAL

A. Submit fully detailed shop drawings of all fabrication work, giving sizes; details of fabrication and construction; methods of assembly; and locations of hardware, anchors, and all accessories.

B. Submit detailed design calculations on the vessels, certified by a Professional Engineer registered in the State of North Carolina.

C. Submit manufacturer's information on major materials or list product references on shop drawings. Submit information from resin manufacture giving finished Barcol hardness values.

D. Submit copy of binding warrantee.

E. After fabrication of vessels, but before shipment, submit a manufacturer's certified Final Inspection Report addressing hardness testing, finish workmanship, and other quality control aspects.

F. Submit provision of marine canvas covering of clear acrylic ports for outdoor installations.

1.6 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the project bound Operations & Maintenance Data Manual per requirements in Section 170100.

1.7 WARRANTY

A. Manufacturer shall warranty each product to be free from defects in manufacturing, workmanship or materials, and shall repair or replace any fabrication within five years from date of delivery.

PART 2 - PRODUCTS

2.1 FIBERGLASS DEAERATION TOWER

A. General: The tank shall be of the capacity and dimensions shown on the drawings. The tank shall be a vertical, self-standing, cylindrical structure of seamless construction, with flat bottom.

B. Wall Thickness:

1. Shall be designed for pressure rating with a factor of safety of 10:1 or greater on the ultimate strength of the material.
2. Tank walls shall be constructed for installation with fixed piping connections (i.e., flexible pipe couplings shall not be required to prevent damage to tank from thermal growth or fill/drain induced wall movements).

C. Deaeration Tower/Tanks shall be fabricated throughout with a premium grade, corrosion resistant vinyl ester resin such as *Hetron* by Ashland Chemical or *Derakane* by Dow Chemical.

D. The interior tank surface shall have a primary corrosion barrier consisting of a 100 mil, resin-rich vinyl ester resin layer reinforced with two-ply, ten mil, Type "C" glass surfacing veil. Underlying the surfacing veil, two layers of glass mat with 70 percent resin content.

E. Composite Side-shell Insulation: Include 2-inch layer of rigid polyurethane insulation bonded to the tank shell and cover. Finish the insulation with a 0.125-inch protective outer fiberglass layer with a pigmented resin coating. Refer to fab sheets and equipment schedule for which required towers and tanks.

F. Top: Openings at the top shall be equipped with durable insect-resistant screens.

G. Pipe Nozzles: Contact Molded or "Built-Up" type flanges per NBS Voluntary Product Standard PS 15 with thicknesses shall not be less than those listed for a design pressure of 150 psi. Filament Wound, "Slip-On," or Compression Molded type flanges shall comply with the tolerances of ASTM D 4024 for 150 psi service. Pipe end flanges shall have a 150 lb. bolt pattern and bolt holes shall straddle the vertical centerline (i.e., "two-holed," level). The fabricator shall take into account stresses typically imposed by piping attached to the flanges and provide robust gussets and/or overlay reinforcement. Flange thickness shall have 50 psi minimum rating, and bolt patten with thickness in accordance with NBS PS15-69, and wall projection to flange face length per the following table:

Pipe Nozzle Diameter per Drawings	FRP Flange Thickness	Projection	Comment
2”	11/16”		Gussets Required
3”	13/16”		Gussets Required
4”	15/16”	6”	Gussets Required
6”	1-1/16”	8”	
8”	1-1/4”	8”	
10”	1-7/16”	10”	
12”	1-3/4”	10”	
14”	1-7/8”	12”	
16”	1-15/16”	12”	
18”	2”	12””	

H. Anchor Flanges: Hold-down anchors shall be designed to transfer forces to the vertical cylinder of the vessel.

I. The tank shall be post-cured prior to shipment.

J. All FRP attachments to the tank shall be made of the same resin as that used to fabricate the tank. All appurtenances shall be as indicated on the drawings and specified herein. All appurtenances shall be subject to shop drawing review.

K. Whether indicated on the drawings or not, the deaeration tower/tanks shall have the following:

1. Minimum of three FRP lifting lugs attached to tank shell (one low on side).
2. Side-mounted flanged manway with sturdy clear acrylic cover.
3. Gaskets shall be EPDM rubber or equal where required.
4. All hardware, bolts, nuts and washers shall be 300 Series stainless steel.
5. Mount tabs for sight gauge or stilling well.
6. Minimum of four FRP tie-down lugs.

L. Top Cover: As shown on drawings.

M. Manway/Viewport: Side mounted, flanged manway/view-port with full face 3/16" gasket(s) and 316 series stainless steel bolts, nuts, and washers. Provide full face 12 ga 300 series stainless steel bolting collar with matte finish exterior surface for distribution of fastener loads. The clear cover shall be acrylic by *Reynolds Polymer* or *Nippura Co*. or approved substitute; or hard-coated polycarbonate "HYZOD AR Sheet" by *Sheffield Plastics* (800) 628-5084; or approved substitute. Thickness shall be selected by the manufacturer for less than 2.4 ksi stress at maximum hydraulic pressure, long-life, and resistance to leak development. Provided with a marine canvas cover, with gromets, and fastened with a chinch cord. Flange thickness shall have 50 psi minimum rating, and bolt patten with thickness in accordance with NBS PS15-69, and wall projection to flange face length per the following table:

Manway Diameter per Drawings	FRP Flange Thickness	Projection
16"	1-3/16"	10"
18"	1-1/4"	12"
20"	1-5/16"	12"
24"	1-1/2"	14"
30"	1-7/8"	14"

N. Color: Light grey.

O. Miscellaneous Structural FRP Shapes: Strongwell Extren 625 or Creative Pultrusions 1625 where fire resistance is required, otherwise Strongwell Extren 525 or Creative Pultrusions 1525.

P. Grating used in conjunction of the construction of fiberglass tanks shall be square mesh molded fiberglass. Grates shall be 1/4 inch nominal bar width, 1-1/2 inch bar depth, of square pattern with bars spaced at 1-1/2 inch on center each way. *Grate Manufacturers*: *IKG Borden*; *Chemgrate Corporation*; *Strongwell*; or *Fibergrate Corporation*.

Q. Structured Tower Packing Media:

1. Provide tank with packing media installed. Trim packing to fit closely to the tank radius. Align layers of structure packing perpendicular to each other.
2. Packing shall be tough virgin PVC construction designed for the purpose of scrubbing and air stripping with cross-corrugated plastic sheets for a maximum impingement of flow. Void space in excess of 95%. Specific surface area in excess of 64 ft2/ ft3. Corrugation angle of 30 degrees. Mixing and redistribution points in excess of 2400/ft3. 10 mil sheet thickness. CF 1200 "ACCU-PAC" manufactured by *Brentwood Industries Inc*.

R. Protective Grid: U.V. stabilized black polypropylene 2" x 2" grid, 1.25-thickness, designed for installation on top of structured tower to avoid damage from walking and hydraulic impact. AccuGrid manufactured by *Brentwood Industries Inc*. and available from *L.S. Enterprises*, Gainesville, FL (239) 851-1175 www.biofilters.com.

S. Drift Eliminators: Blade type drift eliminator designed to remove entrained water droplets shall be installed at the top of FRP towers. Fabricated from rigid, corrugated PVC (or CPVC) sheets conforming to ASTM D 1784. Manufactured to be field-cut, for tight fit, without sacrificing structural integrity.

1. Blade spacing of 0.86-inch (20 mm) with material gauge of 13 mil (0.33mm) thickness for up to 4-ft span or 20 mil (0.51mm) heavy duty thickness for up to 6-span.
2. Models CFUltra or CF80Max by *Brentwood Industries Inc*. www.brentwoodindustries.com ; available from *L.S. Enterprises* Gainesville, FL (352) 379-5626 www.biofilters.com; or approved substitute.

T. Tank Manufacturers:

1. *Custom Structures (CSC), LLC* Fischer, TX (830) 660-0484 email: jon@cscusa.biz;
2. *Hydro Composites,* Stockdale, TX (830) 996-0020 www.hydrocomposites.com;
3. *DT Fiberglass, Inc*. Sacramento, CA (916) 383-9012 www.dtfiberglass.com;
4. *FRP Systems, Ltd.,* Thunder Bay, ON (807) 345-2171 or (807) 345-2171 www.frpsystems.com;
5. *Gemini Fiberglass, Inc*. Colorado Springs, CO (858) 602-9465 www.geminifiberglass.com;
6. *Johnson Custom Fiberglass* Ocala, FL (352) 245-8888 www.jcfiberglass.com;
7. Approved Substitute.

2.2 MISCELLANEOUS STRUCTURAL FRP SHAPES

A. All components and assemblies shall be manufactured for high resistance to corrosion for the intended use. Extren by Strongwell, Creative Pultrusions or approved substitute.

2.3 GRATING

A. Grating used in conjunction of the construction of fiberglass tanks shall be square mesh molded fiberglass. Grates shall be 1/4 inch nominal bar width, 2-inch or 1-1/2 inch bar depth, of square pattern with bars spaced at 2-inch or 1-1/2 inch on center each way.

B. Manufacturers: *IKG Borden* Clark, NJ (201) 815-9500; *Chemgrate Corporation* Woodinville, WA; *Fibergrate Corporation* Dallas, TX.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Provide concrete house-keeping pads for all flat-bottomed fiberglass tanks; install true and level and square and anchor tank to foundation. Set tanks at established locations to align with piping and other equipment on site.

B. Tanks shall be aligned and adjusted accurately before tightening piping connections.

END OF SECTION

SECTION 170845 - RECTANGULAR FIBERGLASS TANKS

PART 1 - GENERAL

1.1 USAGE

A. See FRP Tank Schedule on the Drawings. Tanks are used with aquarium saltwater.

1.2 GENERAL

A. The work includes the furnishing and installation of custom fabricated glass fiber reinforced resin tanks.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: The tank fabricator shall have at least five years of experience in the manufacture of similar items with a record of successful installations.

B. Design Requirements: Use conservative safety factors in the design of all products. Working stresses shall not exceed the lower value of one-third of the yield strength or one-fifth of the ultimate strength of the material.

C. Shop Testing: Fabricator shall perform a hydraulic test of each tank in shop prior to shipment. Deflections in finished products shall not exceed L/360. The fabricator shall perform modifications by addition of extra materials as required to limit deflection prior to shipment.

D. Material Thicknesses: All and/or any material thicknesses given on the Drawings shall be taken as a minimum thickness requirement and shall be verified by the manufacturer for low stress in the material being supplied.

E. Reference Standard: Tanks shall be constructed using fabrication methods, materials, design and workmanship in accordance with ASTM D 3299 *Standard Specification for Filament-Wound Glass-Fiber-Reinforced Thermoset Resin Chemica-Resistant Tanks*.

1.4 SUBMITTALS

A. Submit fully detailed shop drawings of all fabrication work, giving sizes; details of fabrication and construction; methods of assembly; and locations of hardware, anchors, and all accessories.

B. Submit manufacturer’s information on major materials or list product references on shop drawings. Submit information from resin manufacture giving finished Barcol hardness values.

C. Submit copy of binding warranty.

D. After fabrication of vessels, but before shipment, submit a manufacturer’s certified Final Inspection Report addressing hardness testing, finish workmanship, shop testing and recording of deflections, and other quality control aspects.

1.5 COORDINATION

A. Coordinate finish of FRP tank, and field drilling of holes in tanks, with location pipe penetrations required in FRP tanks.

1.6 WARRANTY

A. The manufacture shall warranty the FRP tank to be free of defects in material and workmanship for 2-years after startup in the water treatment system, or 2-years after Owner acceptance of the units from the installing Contractor, whichever is less.

PART 2 - PRODUCTS

2.1 FRP RECTANGULAR TANKS

A. General: Used for storage and processing of saltwater. The tanks shall be of the capacity and dimensions shown on the drawings. The tanks shall be self-standing, rectangular structures of seamless construction, with flat bottom, vertically plumb side walls with intermediate wall stiffeners, and a top flange stiffener. The tank wall shall be solid, suitable for drilling and installation of tank adapters, and not of a hollow or composite construction other than composite construction of wall stiffeners.

B. Resin: The tank shall be fabricated throughout with a premium grade corrosion-resistant polyester resin resistant to impact damage, minimum Tensil Elongation of 3.7% per ASTM D 638, minimum Heat Distortion Temperature of 200°F, such as AROPOL 7334 resilient isophthalic polyester by *Ashland Chemical, Dow Chemical* or approved substitute with a superior vinyl ester resin.

C. Corrosion Barrier: Interior tank surface and all surfaces of fiberglass material inside tank shall have a primary corrosion barrier consisting of a 100 mil, resin-rich layer on the side exposed to the hypochlorite. Resins for sodium hypochlorite environments shall be cured using dimethylaniline (DMA), benzylperoxide (BPO), or other recommended curing systems.

1. Two plies of Type "C" glass veil, to a thickness of approximately 20 mils, consisting of 5% glass and 95% resin.
2. Two layers of chopped strand glass mat, to a thickness of 80 mils, with 70 percent resin content.

D. Thixotropes: Linings shall contain no thixotrope, for either primary or secondary laminates or reinforcements. Thixotropes shall not be used in top-coats which will be exposed to the environment. Secondary lay-ups, such as joints and flanges, shall be well cured and contain the minimum amount of thixotrope possible.

E. Wall Thickness: The fabricator of the tanks shall be responsible for determination of tank wall thicknesses. Tank walls shall be designed with working stresses not exceeding one-third of the yield strength of one-fifth of the ultimate strength of the material with the tank filled to the top rim with water. The lower value for yield or ultimate strength shall govern. The tank wall thickness shall limit deformations to less than L/360 or shall otherwise have stiffeners provided integral with the wall construction for limitation of deformations.

F. Tank Wall Stiffeners: Built with tank wall stiffeners integral with the tank wall construction, as required, to limit deformation to less L/360. Stiffeners may be solid FRP, or Balsa wood filled, or stiff EPS foam filled. Fabricator must align any stiffeners not to interfere with piping nozzles.

G. Flanges: Contact Molded or "Built-Up" type flanges per NBS Voluntary Product Standard PS 15 with thicknesses shall not be less than those listed for a design pressure of 150 psi. Filament Wound, "Slip-On," or Compression Molded type flanges shall comply with the tolerances of ASTM D 4024 for 150 psi service. Flanges shall have a 150 lb. bolt pattern and bolt holes shall straddle the vertical centerline (i.e., "two-holed," level). The fabricator shall take into account stresses typically imposed by piping attached to the flanges and provide robust gussets and/or overlay reinforcement.

H. Attachments: All FRP attachments to the tank shall be made of the same resin as that used to fabricate the tank. All appurtenances shall be as shown on the drawings and subject to shop drawing review.

I. Provide threaded drain port with PVC plug fitting.

J. Exterior Finish: A resin-rich layer shall be applied over the final structural layer of reinforcement. A pigmented, ultraviolet resistant, gloss resin shall be applied to the exterior of all portions of the vessel. The minimum acceptable level of workmanship and finish shall conform to the requirements of ASTM C 582 "Specification for Contact-Molded RPT Laminates for Corrosion Resistant Equipment."

K. Exterior Color: Light grey.

L. Curing: The tanks shall be post-cured prior to shipment at a minimum of 180 deg F for a minimum of two-hours.

M. Resin Cure Check: Prior to shipment, test surfaces for hardness in accordance with ASTM 2583 *Standard for Rigid Plastics by Means of Barcol Hardness Impressor.* All resin inside the tanks shall exceed 90% of the resin manufacturers published Barcol hardness.

N. Any metal parts (flange bolts for sectional tanks) shall be of Type 316 stainless steel.

O. Manufacturers:

1. *Augusta Fiberglass,* Blackville, SC (803) 284-2246;
2. *Custom Structures (CSC), LLC* Fischer, TX (830) 660-0484 email: jon@cscusa.biz;
3. *Hydro Composites,* Stockdale, TX (830) 996-0020 www.hydrocomposites.com;
4. *Johnson Custom Fiberglass,* Ocala, FL (352) 245-8888 www.jcfiberglass.com;
5. *Industrial Plastics* Lakeland, FL (863) 646-8551 bburhans@ips-frp.com;
6. *Micro-Fab, Inc*. Theodore, AL (800) 221-1397 www.micro-fab.com;
7. *R&B Aquatics Distribution, Inc.* TX (800) 259-9812 www.rbaquatic.com
8. *Waterdog Products*, El Cajon, CA www.waterdogproducts.com (619) 441-9688;
9. or approved substitute.

2.2 MISCELLANEOUS STRUCTURAL FRP SHAPES

A. All components and assemblies shall be manufactured for high resistance to corrosion for the intended use.

2.3 GRATING

A. Grating used in conjunction of the construction of fiberglass tanks shall be square mesh molded fiberglass. Grates shall be 1/4 inch nominal bar width, 1-1/2 inch bar depth, of square pattern with bars spaced at 1-1/2 inch on center each way.

B. Manufacturers: *IKG Borden* Clark, NJ (201) 815-9500; *Chemgrate Corporation,* Woodinville, WA; *Fibergrate Corporation*, Dallas, TX.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Provide concrete housekeeping pads for all flat-bottomed fiberglass tanks; install true and level and square. Set tanks at established locations to align with piping and other equipment on site.

B. Tanks shall be aligned and adjusted accurately before tightening piping connections.

C. Secure tanks to concrete pad/slab using Type 316 SS anchor bolts.

END OF SECTION

SECTION 170846 - SINGLE WALL MIXING TANK

PART 1 - GENERAL

1.1 SUMMARY

A. The General Conditions shall apply to this Section as fully as if stated herein. The work includes the furnishing and installing of all plastic tanks, and flexible connecting fittings, as indicated on the drawings and as specified.

1.2 EXPERIENCE

A. The plastic tank manufacturer shall have at least five year's experience in the manufacturer of similar items with a record of successful installations.

1.3 SUBMITTALS

A. Submit fully detailed shop drawings of all plastic tanks giving dimensions; details of composition and construction; methods of installation and bracing; and locations of appurtenances, hardware, anchors, and all accessories.

1.4 MAINTENANCE AND OPERATIONAL DATA

A. Include pertinent information in the product bound Operations & Maintenance Data Manual per requirements in Section 170010.

PART 2 - PRODUCTS

2.1 SINGLE WALL MIXING TANK

A. Material: Mixing tanks (the Base Mixing Tank) shall be specifically design for mixing with molded in gallon and liter markings on the side shall be rotationally-molded from Polyethylene. Color shall be natural (translucent white) with liquid level volume markings.

B. Size, shape and appurtenances shall be as indicated on the drawings. 48 inch diameter by 53-inch tall, 360-gallon capacity, included with hinged lid.

C. Accessories:

1. 12” bottom clearance poly stand.
2. Tank-wall connection fittings (may be field-installed bulkhead fittings).
3. Connecting Fittings*: Fittings external to the tank to allow for expansion and contraction may include flex couplings, “S” shaped flexible wall pipe, or flexible pipe installed for two directions of movement.
4. 2” vent
5. Hinged top cover.

*Where the tank wall radius does not allow for a mechanically fastened bulkhead fitting, the tank shall be manufactured welded gusseted fittings, or have fittings attached by a qualified plastic tank welder.

D. Manufacturer:

1. Open top total drain dish bottom tank by Snyder Industries www.snydernet.com Lincoln, NE (402) 467 5221;
2. *Chemical Containment, Inc*. Lake Wales, FL (800) 346-7867 www.chemicalcontainers.com;
3. or approved substitute.

PART 3 - EXECUTION (See also 170010)

3.1 INSTALLATION

A. Set tanks at established lines and levels.

B. After assembly, the various members forming parts of a completed frame shall be aligned and adjusted accurately before being fastened.

C. Connect piping in side walls of tanks with bulkhead adapters where nozzles are not provided with tank. See Section 170220.

D. All polyethylene (PE) tanks shall be installed with provisions, approved by the tank manufacturer, to allow for expansion and contraction.

END OF SECTION

SECTION 170933 – LSS AUTOMATED CONTROLS

DIVISION 1 - GENERAL CONTRACT REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. The General Provisions of the Contract, including General, Supplementary, and Special Conditions, the Owners Policy and General Requirements, apply to work specified in this section. Subcontractor must familiarize himself with the terms of the above documents.

B. All bidders must be control system suppliers and integrators in the business of providing life support control systems for a minimum of five (5) years. Bidders shall also have in-house experience in the operation of life support control systems for large aquariums. This operational experience shall consist of a minimum of (5) years in responsible charge of operating life support system of similar size, type, extent of automated control and complexity. Bidders shall submit an experience summary and resumes documenting installation and operating experience as part of the submittal.

C. All bidders shall have at least one (1) in-house licensed Control System Engineer with a minimum of five (5) years of experience designing life support control systems for large aquariums. Bidders shall submit a list of relevant design experience and evidence of current & valid engineering license registration.

D. All bidders shall be approved by the design engineer as listed herein. All bidders must have direct experience in life support exhibit system control similar to the system as specified.

E. All bidders must have trained and authorized representation for ongoing support and service. Third party service is not acceptable.

F. All bidders must have an in-house staff dedicated to software generation and preparation of sequences of operation for Aquatic Life Support Systems. This staff shall be used for both initial software design and implementation and be available for continued system support and service.

1.2 DEFINITIONS

ACS - Automated Control System
AI - Analog Input
AO - Analog Output
DI - Digital Input
DO - Digital Output
EIA - Electronic Industries Alliance
GUI - Graphical User Interface
HMI - Human Machine Interface
IEC – International Electrotechnical Commission
IEEE - Institute of Electrical and Electronics Engineers, Inc.
LAN - Local Area Network
LSS - Life Support System
OIT - Operator Interface Terminal
ORP - Oxidation Reduction Potential

PAC - Programmable Automation Controller
PLC - Programmable Logic Controller
PWM - Pulse Width Modulation
XML - Extensible Markup Language
W3C - World Wide Web Consortium
UL – Underwriters Laboratories Inc.

1.3 SCOPE OF WORK

A. The life support Automated Control System (ACS) shall be a stand-alone system and shall include but not be limited to the control of the following equipment and their processes:

1. Pumps
2. Electrically actuated valves
3. Flow devices
4. Water temperature control
5. Pressure transducers to monitor water level
6. Pressure transducers to monitor pipe pressure
7. Safety devices
8. Ozone equipment and devices
9. Drum filters
10. Reverse osmosis package

B. Ozone System equipment and devices

1. Analytical devices

C. The work covered under this section of the specifications and drawings include the complete installation and coordination of the life support control system.

D. The hardware and I/O control points list identifies those points that are to be addressed by the operator control workstation computer(s) and incorporated into the life support control system.

E. The Controls Supplier shall furnish a complete monitoring and control system including supplying the necessary hardware as specified and the operating and applications software necessary to perform the control sequences of operation. The software program required will be turned over to the Owner ready for use including all operation parameters, set points, and schedules.

F. The Drawings and Specifications are not intended to show all details. The Contractor shall secure satisfactory information before submitting the proposal and include in the proposal a sum sufficient to cover all items of labor and material required for the complete installation of the devices specified for the system described.

G. The Controls Supplier shall furnish all control elements associated with the control system as indicated on instrument control drawings, except those specified to be furnished by owner or other contractor. Installation of all piping hardware devices will be by the Life Support Mechanical Contractor.

H. The Electrical Contractor shall provide all conduit and wiring. Termination between all control elements and control cabinet(s) will be by the Electrical Contractor.

I. Testing laboratory requirements: All applicable equipment shall be in conformance at least one of the following product testing laboratories listed in Washington State Department Labor & Industries document WAC 296-46B-999: ASC Engineering Service (ASC), Applied Research

Laboratory (ARL), American Industrial Testing Labs, LLC (AIT), American Products Safety Co. (APS), CSA International (CSA), CSA International (CSA), Entela (Entela Mark), FM Approval (FM), Intertek Testing Services NA, Inc. (ETL), LabTest Certification Inc., MET Laboratories, Inc. (MET), NSF International (NSF), Omni-Test Laboratories, QAI Laboratories Ltd., SGS North America Inc., TÜV SÜD America Inc. (TUVAM), TUV Rheinland of North America (TUV), Underwriters Laboratories, (UL), and Wyle Laboratories, Inc. (WL).

J. The Contractor shall verify proposed ACS cabinet locations, install electrical power wiring and low-voltage control wiring, and recommend relocation of proposed ACS cabinets where economically justified by required wiring length.

1.4 COORDINATED WORK

A. The Controls Supplier shall cooperate with contractors performing work on this project necessary to achieve a complete and neat installation. To that end, each contractor shall consult the drawings and specifications for all trades to determine the nature and extent of others work.

B. It will be the duty of the Controls Supplier to work in cooperation with the Owner and with contractors and employees rendering such assistance and so arrange their work such that the entire project will be delivered complete in the best possible condition and in the shortest time.

1.5 INTEROPERABILITY

A. The Controls Supplier's ACS shall be fully compatible with the infrastructure being planned by others for the Aquarium project. The new LSS ACS GUI shall be configured to control and monitor all existing LSS ACS infrastructure, presenting both new and existing LSS in a seemless integrated user interface.

PART 2 - PRODUCTS

2.1 SUPPLIERS

A. All manufacturers listed herein shall meet all of the requirements of this specification.

B. All equipment and software proposed by the Controls Supplier shall be currently in manufacture. No custom products shall be allowed unless required by the specification. The manufacturer for parts, repairs, and software revisions shall support all products.

C. The basis of design for this project is RCK, Controls. San Diego, CA (858) 569-7141 www.rckcontrols.com, or approved equal.

2.2 OPERATING ENVIRONMENT

A. The operator control workstation computer shall operate in an environment of 32-104 degrees F and 10-90% relative humidity.

B. PLCs, PACs and I/O multiplexers shall operate in an environment of 32 to 131 degrees F. All control components shall be installed in enclosures suitable for a saltwater corrosive environment.

2.3 AGENCY APPROVALS

A. All equipment shall be in conformance with all local, state and federal codes, statutes and ordinances where they apply, including UL approvals. All Control Cabinets containing PLCs, PACs, I/O or any other devices shall be UL 508A labeled. The manufacturer of equipment shall be fully responsible for compliance with these requirements.

PART 3 - EXECUTION

3.1 SUBMITTALS

A. Drawings shall be prepared on AutoCAD or ePlan software and provided in both AutoCAD DWG and Adobe PDF formats. In addition to the drawings, the Controls Supplier shall furnish electronic media containing the identical information.

B. Drawings shall include schematics of the system showing all connected points with reference to their associated hardware. Typical will be allowed where appropriate. Drawings shall include control cabinet(s) layout and design.

C. Submittal data shall contain manufacturer's data on all hardware and software products required by the specification. In addition, submittals shall contain sequences of operation, point list, and a complete description of the graphics, reports, alarms and configuration to be furnished with the workstation software. Submittals shall include:

1. I/O points list.
2. Submit a plan of proposed ACS cabinet location and a corresponding list of I/O points for each ACS cabinet.
3. Sequence of operation using descriptive prose.
4. Complete description of graphics, reports, alarms and configuration of the workstation software.
5. Submit six (6) copies of submittal data and shop drawings to the Engineer for review prior to ordering or fabrication of the equipment. The Controls Supplier prior to submitting shall check all documents for accuracy.
6. Prior to system testing, submit complete and verified listing of actual values for all factor and field configurable setpoints, DIP switch settings, etc., along with installed firmware and software revision information for all sensors, transmitters, variable frequency drives, etc. Update the list with any changes that are made during testing and adjustment.
7. The Engineer will make corrections, if required, and return to the Controls Supplier. The Controls Supplier will then resubmit with the corrected or additional data. This procedure shall be repeated until all corrections are made to the satisfaction of the Engineer and the submittals are fully approved.

3.2 ELECTRICAL WORK

A. The Controls Supplier and contractors installing elements defined herein shall refer to the Electrical Division of the specification for electrical standards and methods for installation of this work.

3.3 CONSTRUCTION RECORD DOCUMENTS

A. During the installation phase, all changes to the scope of work must include a written change order inclusive of pricing before work is to proceed. The owner or the owner's representative must sign this change order.

3.4 OPERATING AND MAINTENANCE MANUAL

A. The operation and maintenance manuals shall contain all information necessary for the operation, maintenance, replacement, installation, and parts procurement of the entire control system.

3.5 TESTING

A. Each point in the system shall be tested for both hardware and software functionality. In addition, the system under control will be tested against the appropriate sequence of operation and will include onsite modifications to the operating system as is necessary. Successful completion of the system operational test shall constitute the beginning of the warranty period.

3.6 WARRANTY

A. The Controls Supplier shall warrant the software and process logic for 12 months after system acceptance or beneficial use by the owner. During the warranty period, the Controls Supplier shall be responsible for all necessary revisions to the software as required to provide a complete and workable system consistent with the intent of the sequence of operation for the ACS.

B. All system hardware warranties are those provided by the specific hardware manufacturer.

3.7 TRAINING

A. A minimum of 16 hours on site system training will be required. Training shall include system operation, component maintenance and software configuration. ACS provider shall agree to recording on video by Owner at time of instruction.

PART 4 - CONTROL SYSTEM

4.1 GENERAL

A. The LSS ACS shall encompass the controls and operator interfaces described herein to perform direct control of the specified equipment. In addition to the specified hardware, software and field devices, the Controls Supplier shall furnish all labor to engineer, program and provide installation of the automated control and monitoring system.

4.2 PRODUCTS

A. The LSS ACS shall consist of a Operator Control Station Computer connected with one or more distributed PLCs/PACs located within control cabinet(s) communicating with intelligent I/O and

all input and output devices necessary to accomplish complete automatic monitoring and control of the LSS processes

B. The distributed PLCs/PACs shall be the primary controlling devices for LSS operations.

4.3 OPERATOR CONTROL WORKSTATION COMPUTER DESCRIPTION

A. The Operator Control Station computer shall be an Intel® Core™ i7 class processor based computer with performance equal or better than:

1. Intel® Core™ i7 Processor or better
2. 27" Monitor, 1920 x 1080 screen resolution
3. 32 GB RAM
4. 1 TB, solid state disk drive
5. Gigabit Ethernet
6. The Operator Control Station Computer operating system shall be Microsoft Windows 11 Professional or most recent applicable software.

4.4 PROGRAMMABLE AUTOMATION CONTROLLER (PAC) DESCRIPTION

A. The PAC shall be a microprocessor based embedded controller whose kernel, OS and applications reside on solid state media and provide the following minimum software, electrical and physical characteristics:

Software

OS:	Windows 10 Embedded or comparable most recent applicable operating system.
Applications:	RCK Embedded ACS Software Suite or comparable: Alarm Controller, Datalog Controller Event Log Controller, Event Manager, PID Controller, Pump Controller, Scripting Controller, Valve Controller
Drivers:	BACnet, Ethernet/IP™, Mistic, Modbus (TCP, RTU & ASCII), SMTP, TAP, WCTP, Mistic, Modbus, Optomux, SMTP, WCTP

Hardware

Basis of Design	Phoenix Contact BL2 BPC 7000 RCK 03
CPU:	1.8 GHz Intel® ATOM ™ D525
Mounting Type:	DIN rail
Ethernet:	2 controllers: 10/100/1000 Mbps
USB 2.0:	Four ports

Serial:	4 Serial channels: RS-232/422/485 levels
Memory:	8 GB DDR2 SODIMM
Operating Temperature	-20°C to +50°C

4.5 PROGRAMMABLE LOGIC CONTROLLER (PLC) DESCRIPTION

A. PROGRAMMING

1. The programming software package must be IEC 61131-3 compliant supporting Sequential Function Chart (SFC), Instruction List (IL), Structured Text (ST), Ladder Diagram (LD) and Function Block Diagram (FBD) programming languages.

B. COMMUNICATION PORTS

1. Ethernet: 2 x 10/100 Mbps with RJ-45 connector supporting one or more of the following protocols
    a. EtherNet/IP™
    b. Modbus/TCP
    c. BACnet/IP
2. Serial: EIA/RS-485 supporting one or more of the following protocols
    a. Modbus RTU
    b. Modbus ASCII
    c. BACnet/MSTP
    d. CANOpen™

4.6 ENVIRONMENTAL

A. Minimum Operating Temperature Range: 32 - 131 °F

4.7 NETWORKS AND OPERATOR COMMUNICATIONS

A. General - the communications architecture shall support two (2) physical media links types and shall be firewalled or totally physically isolated from any other network.

B. An IEEE 802.3 “Ethernet” LAN designed to support intercommunications between the host Operator Control Workstation(s), PLC(s), PAC(s) and Internet based web services. Operator Control Workstation(s), PLC(s) and PAC(s) must therefore be furnished with network interfaces supporting Ethernet connections to the LAN. The LAN must feature a connection to the public Internet. Internet service and access to such shall be the responsibility of the owner.

C. An EIA-485 (formerly RS-485) communications fieldbus supporting binary data exchange in a multipoint network consisting of dedicated I/O hardware for the operation of the LSS. The EIA-485 bus must support a minimum data rate of 9600 baud over a maximum length of 4000 feet and 32 nodes. Extended lengths and/or extra nodes will require a network repeater or separate EIA-485 bus. The PLC/PAC must be furnished with EIA-485 serial port(s) to communicate on the dedicated I/O bus.

4.8 NETWORK AND FIELDBUS COMMUNICATION PROTOCOLS

A. General - implemented protocols shall be published, non-proprietary industry standards. Acceptable protocols include:

1. OPC-UA
2. Modbus (ASCII, RTU and/or TCP)
3. EtherNet/IP™
4. CANOpen™
5. BACnet (MSTP and/or IP)
6. Mistic
7. HTTP
8. SMTP
9. WCTP

PART 5 - INSTALLATION

5.1 CONTRACTOR RESPONSIBILITIES

A. The mechanical and electrical installation of the LSS ACS shall be performed by others. However, all installation shall be coordinated with the Controls Supplier by way of conference calls as needed and all direction and changes shall be recorded in written documentation. The Controls Supplier shall certify all work as proper and complete and shall reflect actual installation on the project record documentation as specified. Under no circumstances shall the design, scheduling, coordination, programming, training, and warranty requirements for the project be delegated to a subcontractor.

5.2 CLEANUP

A. At the completion of the work, all equipment pertinent to this contract shall be checked and thoroughly cleaned, and all other areas shall be cleaned around equipment provided under this contract.

5.3 IDENTIFICATION

A. Identify all control wires with labeling tape or sleeves using words, letters, or numbers that can be exactly cross-referenced with as-built drawings.

5.4 INSTALLATION PRACTICES

A. Install all conduits and enclosures in accordance with specifications of Division 26.

B. Conduit, in non-finished areas where possible, will be concealed in ceiling cavity spaces, plenums, furred spaces, and wall construction. Exposed conduit will run parallel to or at right angles to the building structure.

C. Where sensor wires leave the conduit system, they are to be protected by a watertight non-metallic cord grip connector.

D. All control wiring running down exposed walls to controls or control panels shall run in conduit in accordance with Division 26.

E. All control wiring in concrete walls or floors shall run in conduit in accordance with Division 26

5.5 POWER WIRING REQUIREMENTS

A. All equipment power wiring shall be the responsibility of the Electrical Division Contractor.

B. The power shall be obtained from dedicated circuits on the nearest available 120V panel and clearly labeled. Power for any control equipment that is controlling equipment that operates under emergency power shall be obtained from emergency power panels.

C. All power wiring for the control equipment shall be done with a dedicated earth ground by means of wire media only, originating at the power service source earth ground. This applies to all controllers along with workstations.

D. Power required for motorized valve actuators, and field devices shall be sourced from ACS cabinet. Controls provider shall design cabinets to accommodate powering of all devices shown on drawings calling to be powered from ACS

5.6 CONTROL WIRE & CABLE REQUIREMENTS

A. All control wiring materials and labor shall be the responsibility of the controls supplier.

B. Discrete signals shall use stranded copper wire, type THHN/THWN, single conductor, insulated to 600 V, minimum No. 14 AWG, sized and color coded as required by applicable NEC standards and codes.

C. Analog signals shall use 20 AWG twisted, shielded pair cabling with stranded tinned copper shield drain wire, Belden 8762 or equivalent.

D. Communication fieldbus data signals for EIA/RS-485 serial networks shall use twisted, shielded two pair cabling with stranded tinned copper shield drain wire. Cable shall have a characteristic impedance between 50 to 120 Ohms and the capacitance between conductors must be less than 30 pF/ft (10 – 15 pF/ft is ideal), Belden 9842 or equivalent.

E. Surge protection (Phoenix Contact DATA-PLUGTRAB or equivalent) shall be utilized on all communication cables.

F. Communication cabling for IEEE 802.3 Ethernet networks shall use CAT5E or equivalent cable with RJ-45 connectors for transmission paths under 100 m (328 ft) in length. For distances greater than 100 m and shorter than 2 km multi-mode fiber optic cable shall be used.

G. Surge protection (Phoenix Contact DATATRAB or equivalent) shall be utilized on all copper Ethernet communication cables.

H. The LSS Controls Supplier may recommend relocation of proposed ACS cabinets where economically justified by required wiring length.

5.7 WIRING INSTALLATION PRACTICES

A. Install all conduits and enclosures in accordance with specification Division 26.

B. Conduit, in non-finished areas where possible, will be concealed in ceiling cavity spaces, plenums, furred spaces, and wall construction. Exposed conduit will run parallel to or at right angles to the building structure.

C. Where sensor wires leave the conduit system, they are to be protected by a watertight non-metallic cord grip connector.

D. All control wiring running down exposed walls to controls or control panels shall run in conduit in accordance with Division 26.

E. All control wiring in concrete walls or floors shall run in conduit in accordance with Division 26.

PART 6 - FIELD DEVICES

6.1 DESCRIPTION

A. Included field devices are all analytical components, sensors, transmitters, transducers, and switches necessary for the operation of the control system, except those specified to be furnished by owner or other contractor.

B. All flow and ORP instrumentation monitors shall be fed 24 VDC power from the same ACS control cabinet the associated signal is wired to. 120 VAC power for instrumentation monitors is not allowed.

C. All electrically actuated motorized valves shall be fed 120 VAC power sourced from ACS control cabinet the associated signal is wired to. Power supply to ACS control panels shall be sufficient for powering of all actuated valves, field devices, and other items shown on LS drawings to be powered by ACS

D. All field devices shall include the associated wiring, mounting, enclosures, and includes control valves, valve actuators, and conventional controls necessary for a completely functioning system in accordance with the sequence of operation.

6.2 QUALITY ASSURANCE

A. The Controls Supplier shall provide all field devices per the performance requirements set forth in this section. All devices selected by the Controls Supplier must be contained in the Submittal documents and are subject to approval by the Engineer.

B. All sensors and signal conditioning equipment will be of the type which are universally accepted in the industry, can easily be second sourced and are compatible with all of the manufacturer's equipment.

6.3 INPUT DEVICES

A. Input devices for the LSS ACS are specified in their respective sections of Division 17. The LSS control provider shall coordinate with the LSS contractor what field devises will be purchased for installation on project that interface with the LSS ACS

B. The system shall maintain the specified analog end-to-end accuracy throughout the warranty period from sensor to readout.

C. Transducers may be supplied as an integral unit with the field sensor, or mounted separately in a field interface panel. All transducers will be calibrated.

D. Sensors (transducers) will be appropriately packaged for the location.

E. Architectural housing for space mounting

F. NEMA 4X housings and enclosures required throughout project.

G. The sensor/transducer shall be selected to withstand ambient conditions where:

H. Moisture or condensation is a factor

I. Vibration exists from ductwork, equipment, etc.

J. Reasonably expected transient conditions exist for temperatures, pressures, and humidity, outside the normal sensing range

K. Exposure to fresh and salt water is a factor

L. The sensor/transducer will be appropriately selected to most closely match the expected sensing range.

M. System accuracy of sensed conditions shall be as follows:

1. +/- 0.5 F for water temperatures in the 0 to 100 F range
2. +/- 0.25% of Full Span for pressure switches
3. +/- 3% for water flow

N. Dry contacts shall be provided for all discrete signals tied to ACS digital input I/O. The contacts will be wired normally open or normally closed as required.

O. Temperature sensors will be RTD’s with 4-20 mA transmitter. See specification Section 170430.

6.4 ELECTRIC ACTUATORS

A. See specification Section 170140.

PART 7 - FIELD INTERFACE DEVICES

7.1 INPUT/OUTPUT

A. Inputs - shall provide inputs capable of accepting information on any point in the form of a temperature, voltage, digital, contact closure, or pulse counter. All AC inputs shall be optically isolated up to 1500 V, all inputs shall be optically isolated up to 500 V.

B. Analog Inputs - the Analog Input (AI) function shall monitor each analog input, perform A/D conversion, and hold the digital value in a buffer for interrogation. The A/D conversion shall have a minimum resolution of 12 bits. Input ranges shall be within the range of the specified I/O.

C. Analog Outputs - the Analog Output (AO) function shall provide an analog output signal, perform D/A conversion, and hold the digital value in a buffer for interrogation. The D/A conversion shall have a minimum resolution of 12 bits. Output ranges shall be within the range of the specified I/O.

D. Digital Inputs - the Digital Input (DI) function shall accept dry contact closures and voltage level transitions. An LED shall be provided to indicate the state of each digital input.

E. Digital Output - the Digital output (DO) function shall provide contact closure for momentary (Pulse Width Modulation) and maintained operation of field devices. Output pulse width shall be selectable.

F. Modbus Protocols – shall provide inputs and outputs capable of communicating with field devices delivered with Modbus connection ports. The baseline system shall be programmed in CoDeSys and comply with IEC 61131-3 standard.

G. Manual overrides shall be reported to the controller at each update. An LED shall be provided to indicate the state of each digital output.

7.2 POWER SUPPLY

A. Power supplies will operate from 100-240 VAC, 50/60 Hz power, with a tolerance of ± 20%. Line voltage below the operating range of the system shall be considered outages. The power supply shall contain over voltage surge protection and require no additional AC power signal conditioning.

B. 24 VDC control logic power and field instrument power shall be fed from separate power supplies that in turn are fed from separate circuit breakers out of an emergency power backed breaker panel.

1. Primary control logic power in each ACS Control Cabinet shall be battery backed by DIN rail mount 24 VDC UPS system.
2. 24 VDC field instrument power is not required to be fed by a UPS system and shall remain isolated from all ACS control logic power.

C. The ACS package shall include a 120 VAC UPS with capacity to continuously run workstation PC for minimum of 1 hour.

PART 8 - COMPUTER and CONTROL SYSTEM SOFTWARE

8.1 DESCRIPTION

A. This section describes the software capabilities for the entire system, inclusive of process logic as required of the PLC(s)/PAC(s).

8.2 AUTOMATIC RESTART AFTER POWER FAILURE

A. Upon restoration of power, the PLC(s)/PAC(s) shall automatically and without human intervention: update all monitored functions; resume operation based on current, synchronized time and status, and implement special start-up strategies as required.

B. When utility power is restored, ACS shall automatically restart if needed.

8.3 OPERATOR CONTROL WORKSTATION SOFTWARE

A. The Control System application software shall provide a Graphic User Interface (GUI) to the operator. The GUI design will provide an intuitive interface for the operators. Included will be dynamic graphical elements representative of the physical equipment connected to the control system. The dynamic images must change appearance to match the current state of the physical equipment, e.g. piping shall indicate the presence of flow, pumps shall indicate On/Off status.

B. The GUI shall be password protected. Individual users must be assigned passwords and access permissions. Passwords shall consist of alphanumeric characters. Access permissions shall be defined by group level. A minimum of 3 user group levels shall be supported using the standard nomenclature of “Viewer”, “Operator” and “Supervisor”.

C. Viewer – Has permission view screens as prescribed by Supervisors. All control functionality is disabled for users of this level.

D. Operator – Supersedes access permissions defined for Viewers by having access to control functionality. Not permitted to tune PIDs, change set points, modify users, modify custom screens or modify I/O configuration.

E. Supervisor – Has access to all functionality included in the GUI.

F. The GUI shall be a multiple document interface displaying standard utility screens and supporting creation of customized screens. Standard utility functions shall include point control, report generation, datalog, event log, PID tuning, alarms, alarm paging/e-mail, operator log and user/password management. Customized screens shall support embedded graphics and intelligent user controls dynamically linked to I/O points and ACS processes providing a real-time graphical representation of the LSS and its subsystems in a standard P&ID format. The Controls Supplier shall initially create a set of custom screens in number and scope to adequately provide complete control and display of data pertaining to the LSS and its subsystems including overviews and individual filter control screens. The ability to add, delete and modify custom screens shall be available to users with Supervisor access permissions.

G. History Logging: The system shall be capable of storing all data for at least 5 years of operation and stored data shall be available for multiple comparisons and reports.

H. GUI application customizations and dynamic logs must be contained in external data file(s). Dynamic logs at a minimum shall be defined as event logs and data logs. Data files shall conform to the following:

1. Adhere to the Extensible Markup Language (XML) 1.0 specification as published under the W3C® Recommendation status.
2. Support editing by Supervisor level users from the GUI's XML viewer.
3. Dynamic logs at the end of each month shall be automatically archived in a standard delimited format.

I. Report Generation - the GUI shall contain report generation wizards for the creation of custom reports and displaying historical data in either a tabular or graphical format. Any point or calculated variable will be available for trending.

J. The ACS vendor shall set up specific report generating software for all related LSS processes.

K. Alarm Management - the ACS shall be capable of generating alarms based on comparison of polled I/O data to limits or conditional equations configured in the GUI. Any alarm (regardless of its origination) will be integrated into the overall alarm management system and will appear in all standard alarm reports, be available for operator acknowledgment, and have the option for displaying graphics, reports, or initiating communication to another remote computing device. Alarm management features shall include:

1. Each alarm level will establish a unique set of parameters for controlling alarm display, acknowledgment, paging and logging.
2. Alarms shall be displayed on the main workstation and potentially to remote alarms (eg. lights, sirens) depending on type of alarm. All alarms will be sent to designated list of recipients in designated order until it is acknowledged. Once first person is notified, the system shall wait a set time for acknowledgement. If not acknowledged, then the alarm condition shall be sent to the next designated person. This routine shall continue until a person acknowledges alarm. System shall allow for up to 12 people on alarm list.
3. Paging shall be configured to send text alarms to wireless digital devices supporting e-mail, WCTP and/or TAP messaging.
4. Alarm Overrides: Provide ability to override alarms for set period of time. After which, alarm is automatically re-activated.
5. Print the alarm acknowledgment by password entrant.

8.4 SOFTWARE INSTALLATION

A. The Controls Supplier shall provide all labor necessary to install, initialize, start-up and debug all system software as described in this section. This includes any operating system software or other third-party software necessary for successful operation of the system.

8.5 DATABASE CONFIGURATION

A. The Controls Supplier will provide all labor to configure those portions of the database that are required by the points list and sequence of operation.

8.6 COLOR GRAPHICS

A. Unless otherwise directed by the owner, the Controls Supplier will provide color graphic displays as depicted in the LSS drawings for each system and display. For each system, the display

shall contain the associated points identified in the point list and allow for set point changes as required by the owner.

8.7 DOCUMENTATION

A. As built software documentation will include the following:

1. I/O points list.
2. Sequence of operation using descriptive prose.

    a. GRAPHICS
    b. DESCRIPTION

3. Submit final complete and verified listing of actual values for all factory and field configurable setpoints, PIP switch settings, etc., along with installed firmware and software revision information for all sensors, transmiters, variable frequency drives, etc.
4. Submit operation and maintenance data manuals for all equipments, including cut sheets for all components, trouble shooting guides, etc. In lieu of printed materials, the controls vendor may provide organized electronic folders linked to equipment manufacturer's websites.

B. DESCRPTION

1. Submit final complete and verified listing of actual values for all factory and field configurable setpoints, PIP switch settings, etc., along with installed firmware and software revision information for all sensors, transmitters, variable frequency drives, etc.
2. Submit operation and maintenance data manuals for all equipment, including cut sheets for all components, trouble shooting guides, etc. In lieu of printed materials, the controls vendor may provide organized electronic folders linked to equipment manufacturer's websites

8.8 RECIRCULATION SYSTEM DISPLAYS

A. There will a graphic display for each of the recirculation filters in the facility controlled by the ACS. The filter graphic will display current operational data, i.e. pump status, valve position, flow information, operational mode of the filter, enabled or disabled for backwash, basin water level(s) and any additional information that is available from the system database that is requested for display by the owner.

8.9 SYSTEM STATUS DISPLAY

A. There will a graphic display for each recirculation system, pretreatment systems, and outfall system, of all pertinent operational information for quick access by plant operator. The graphic will display flow, level, temperature, filter operation information and any additional information that is available from the system database that is requested for display by the owner.

8.10 GRAPHICAL OVERVIEW DISPLAY

A. There will a graphic display for all automated components pertinent to the operation of the system for quick access by plant operator. The graphic will display the data from the system database for quick reference by the operator nested in a graphic display of the systems.

8.11 TESTING AND COMMISSIONING

A. The ACS vendor shall provide system and commissioning to prove system functionality to the satisfaction of the Owner.

1. The ACS vendor shall be responsible for testing and adjusting the entire system for full functionality.
2. Testing shall include ACS response and recovery through artificially generated fault conditions, power failures, manual and automatic restarts to thoroughly test all functions and alarms. All systems shall be tested for power failures occurring at various points in the middle of process operations.
3. The ACS vendor shall operate the entire LSS continuously for not less than one full week (168 straight hours) without system malfunction prior to punchlist checkoff and acceptance by the Owner. Trending of all parameters must be setup and available for review at any time turning and following this test, for conformation that the system is performing as designed.

END OF SECTION

SECTION 210100 - BASIC FIRE PROTECTION REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:

1. General Information Applying to all Division 21 Sections.
2. Scope of Work.
3. Substitution requests.
4. Submittals.
5. As-Built Drawings.
6. Operating and maintenance manuals.
7. Coordination.
8. Cutting and patching.
9. Access panels.
10. General electrical work.

1.3 GENERAL

A. Information specified in this section shall apply to all Division 21 specification sections.

B. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to Division 21.

C. Contractor shall provide coordination drawings for Division 01.

D. Division 21 work shall be performed as outlined in “Information for Bidders”.

E. These specifications and the accompanying fire protection drawings are intended to provide for all labor, materials and equipment necessary for the installation of a complete

1. Wet-pipe sprinkler system.
2. Dry-pipe sprinkler system.

3. Accessories including necessary apparatus, valves, and fittings hereinafter described or called for on the Contract Documents.

F. All Division 21 work shall be installed in accordance with the following Codes and all Local Ordinances. Codes shall be latest editions approved by the NC Building Code Council with North Carolina amendments. Materials, equipment and workmanship shall be as specified throughout Division 21 specification sections.

1. North Carolina State Building Code.

2. North Carolina State Fire Prevention Code.

3. National Electric Code.

4. NFPA 13.

G. All products used as part of the installation of the fire sprinkler system shall be Underwriter's Laboratories (UL) or Factory Mutual (F.M.) approved as required by NFPA 13.

H. Contractor shall secure all required permits and inspection fees necessary for this work. Permits may be secured from the Building Inspections Department.

I. The Sprinkler Contractor shall provide the Owner with a one-year warranty for all sprinkler system labor, equipment, and all other work specified in the Division 21 specifications and fire protection Contract Drawings, including the work of the Sprinkler Contractor's subcontractors. Warranty period shall begin upon Substantial Completion.

1.4 SCOPE OF WORK

A. The Contractor shall be required to perform all the following work, in general and provide a complete fire sprinkler system(s) as shown on the plans. This Contractor's scope of work begins at the sprinkler riser rough-in(s) provided by others, approximately one foot above the finished floor. The items in general are to be as follows:

1. Furnish and install complete wet-pipe sprinkler system as shown on the fire protection drawings and here-in specified.

2. Furnish and install complete dry-pipe sprinkler system as shown on the fire protection drawings and here-in specified

1.5 BIDDING PROCEDURE

A. The Contractor shall provide bidding for Alternate Bids in accordance with Division 01. Contractor shall refer to Division 01 for any required unit prices and allowances.

1.6 SUBSTITUTION REQUESTS

A. The Sprinkler Contractor shall obtain written approval from the Engineer/Architect for the use of substitute materials claimed as equal to those specified. Substitution requests must be sent as soon after contract awards as possible and before any materials are ordered. Substitution requests are subject to deadlines posed by the Architect and/or Owner, as well as the requirements of Division 01.

B. Applications approval of substitutions shall be made by the Sprinkler Contractor and not by subcontractors or manufacturer representative.

C. Substitution requests shall be manufacturer's original published material.

D. Once the allowable period for substitution requests has ended, no further substitutions will be permitted except in unusual or extenuating circumstances.

1.7 SUBMITTALS

A. Submittals shall be sent to the Architect after the contract has been awarded and before any materials, fixtures, and equipment to be incorporated in the work has been ordered. Contractor is also required to submit shop drawings, hydraulic calculations, and materials submittal data as required below to the Authority Having Jurisdiction, including the NC State Construction Office.

B. Sprinkler system design submittal, including shop drawings, hydraulic calculations, and materials, shall be performed by a Professional Engineer registered in the State of North Carolina, or an individual who has Level III or IV certification from the National Institute for Certification in Engineering Technologies (NICET) in Fire Protection Engineering Technology: Water-Based Systems Layout in accordance with NICET 1014.

C. Shop Drawings:

1. The Sprinkler Contractor shall submit a set of installation plan drawings to the Architect before any materials, and equipment to be incorporated in the work has been ordered. **FAXED COPIES WILL NOT BE ACCEPTABLE**. Installation plan drawings shall include:

    a. Hydraulic design data, including remote area designation(s), and locations of nodes.

    b. All piping, included mains, cross mains, branches, and armovers with sizes indicated.

    c. Locations of couplings on grooved piping.

    d. Location of Riser(s).

    e. Riser Details.

    f. Hanger Details.

    g. U.L. Listed fire barrier penetration details.

    h. Locations of sprinkler heads.

    i. Sprinkler head legend, indicating the manufacturer, model number, temperature rating, and response characteristics of each type of sprinkler head.

    j. Location of existing fire department connection.

    k. Location of existing test header.

    l. Location of existing fire pump.

m. Location of inspector's test connection(s).

n. Location of auxiliary drains.

o. Site diagram indicating water supply piping location, sizes, and hydraulic calculation nodes.

p. Preparer's NICET Certification ID or Professional Engineer Seal.

q. Coordination Drawings per Division 1.

D. Hydraulic Calculations:

1. The Sprinkler Contractor shall submit a set of hydraulic calculations to the Architect before any materials, and equipment to be incorporated in the work has been ordered. Hydraulic Calculations shall be performed using computer-based software, such as HydraCALC or HASS. **FAXED COPIES WILL NOT BE ACCEPTABLE**. Hydraulic Calculations shall include:

a. Required water density and size of remote area(s), in accordance with NFPA and the Authority Having Jurisdiction.

b. Pressure and flow required for the system(s) to operate properly (after hose allowance has been added).

c. Pressure and flow available from reservoir.

d. Node by node analysis of required pressure, required flow, friction losses, and elevation.

e. Flow vs. pressure curves, indicating that sprinkler system curve(s) are sufficiently below supply curve.

E. Materials:

1. The Sprinkler Contractor shall submit a set of manufacturer's submittal data to the Architect before any materials, and equipment to be incorporated in the work has been ordered. **All sprinkler system components shall be UL listed and/or FM approved as required by NFPA 13.** Shop drawings shall include the name and address of the manufacturer and their catalog numbers and trade names clearly marked. All items shall be referenced to the specifications by **specification paragraph number on an index tab**. One complete set of submittal data shall be manufacturer's original published material. **FAXED COPIES WILL NOT BE ACCEPTABLE**. Approval of materials will be based upon the manufacturer's published ratings. Submit shop drawings and/or catalog data for the following material and equipment:

a. Sprinkler Heads.

b. Piping, Fittings, and Couplings.

c. Corrosion-resistant paint.

d. Valves.

e. Gauges.

f. Hangers.

g. Riser Check Valve.

h. Flow Switch.

i. Air Compressor.

j. Air Maintenance Device.

k. Nitrogen Generator.

l. UL Details.

m. Alarm/Control Panel for Water Reservoir.

2. Submittals shall include the name and address of the manufacturer and their catalog numbers and trade names clearly marked.

3. Submittal data shall be manufacturer's original published material.

F. If data submitted deviates from the contract documents, the Sprinkler Contractor shall point out such deviations in writing and also state reasons for same.

G. Review of materials will be based upon the manufacturer's published information.

H. Once submittals are reviewed and no exceptions are taken, no changes in materials will be permitted except in unusual or extenuating circumstances.

I. The Sprinkler Contractor shall review and stamp the submittals as being in accordance with his/her bid and the Contract Documents.

J. Prior to submitting information, the Sprinkler Contractor shall field verify all necessary dimensions to ensure that all items will fit within designated rooms and/or spaces with proper clearances.

K. Shop drawings and/or submittal review comments shall not relieve the Sprinkler Contractor of the responsibility to comply with the requirements and intent of the plans and specifications with regard to dimensions, capacities, quality, quantity, performance characteristics, etc.

1.8 OPERATING AND MAINTENANCE MANUAL

A. The Contractor shall deliver one complete set of bookmarked manuals in electronic PDF format to the Owner through the Designer, which shall include all operation and maintenance manuals, two (2) weeks before the pre-final inspection is held. The manuals shall be bookmarked to a minimum of one level – i.e.: each major piece of equipment (chiller, boiler switchboard, water closet, water heater, etc.) or document category (warranties, parts lists, contact information, etc.) The manuals shall be delivered by one of the following:

1. USB Drive

2. CD/DVD

3. Downloadable file from FTP Site

B. All operation and maintenance manuals **shall** be delivered by the Contractor to the Owner thru the Architect. The manuals **shall** contain the following items as a minimum:

1. Index and page numbers.
2. Sprinkler Contractor's signed one-year warranty.
3. Sprinkler Contractor's contact information.
4. List of subcontractors and suppliers with names, addresses, and phone numbers.
5. Backflow preventer certificate of operation and test reports.
6. All documented results of preliminary and system acceptance testing, including NFPA 13, NFPA 14, NFPA 20, and NFPA 24 forms, as applicable.
7. Submittal data and manufacturer's warranty info for all sprinkler heads, piping, hangers and supports, valves, flow switches, alarm bells, fire department connections, test headers, and each piece of equipment specified under Division 21.
8. Operation manuals, installation manuals, and parts list for all installed equipment.
9. Complete set of Sprinkler Contractor's record drawings and hydraulic calculations. Hydraulic calculations shall be updated to reflect any changes to system layout during installation, as applicable.
10. Copy of NFPA 25, edition to match that which is currently enforced by the Authority Having Jurisdiction.

C. ***FAXED COPIES WILL NOT BE ACCEPTABLE***.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

1.10 COORDINATION

A. Sprinkler Contractor shall be responsible to coordinate all work with the work of all other trades.

B. The Contractor shall coordinate with all other trades.

C. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for sprinkler system installation.

D. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

E. Coordinate requirements for access panels and doors for sprinkler system items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 08 Section "Access Doors and Frames."

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2. **MANUFACTURERS MODEL NUMBERS ARE PROVIDED FOR GENERAL INFORMATION ONLY.** Description of product shall take precedence over model numbers.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 21 Sections for pipe, tube, and fitting materials and joining methods.

2.3 JOINING MATERIALS

A. Refer to individual Division 21 Sections for joining materials.

PART 3 - EXECUTION

3.1 PIPING SYSTEMS - COMMON REQUIREMENTS

A. Install piping according to the following requirements and Division 21 Sections.

B. The accompanying drawings are schematic only and are not intended to show all fittings, couplings, hangers, offsets, etc., unless specifically dimensioned. The layout shown on the drawings is a conceptual layout only. This contractor shall provide complete installation drawings for the sprinkler systems defined herein, per the Contract Drawings and these specifications. Provide all adjustments as necessary to conform to the structural conditions, machinery, equipment, work of other contractors and the intent of the drawings, without additional cost to the Owner. Fire protection consultant drawings should not be scaled. Secure dimensions from Architectural drawings. Refer to drawings of other trades and coordinate with other contractors. All equipment shall be installed in accordance with the manufacturer's published installation instructions and diagrams.

C. All cutting and patching shall be in accordance with Division 01.

D. Furnish and install all necessary sleeves, inserts, bolts, etc., for concrete floor slabs, roof, walls, and partitions. Failure to install such items in time to avoid delaying the project schedule shall result in the Sprinkler Contractor doing all cutting and repairing at his/her own expense.

E. All equipment shall be installed in accordance with manufacturer's written installation instructions.

F. All equipment shall be installed such that components do not provide a safety hazard to occupants who come within a close proximity.

G. The Sprinkler Contractor shall provide access doors in accordance with Division 08 of these specifications. Access doors shall be provided for all valves located behind hard ceilings and in walls to provide access. Ceiling access doors shall be stainless steel and a minimum of 24" x 24". All access panels shall be labeled with a metal sign indicating what is behind the access panel. Sign shall have white background with red letters.

H. The Sprinkler Contractor shall be responsible for all work damaged by him or her. Any fire sprinkler system work damaged by any other contractor shall be replaced by the Sprinkler Contractor and placed in perfect working condition without extra cost to the Owner. All sprinkler heads, valves, pipe, fittings, and equipment shall be adequately protected before, during and after installation.

I. The Contractor shall be responsible for all sprinkler heads, valves, pipe, fittings, and equipment at time of final inspection. Any broken items will be replaced by the Contractor at no cost to the owner regardless of by whom the item was broken.

J. The Sprinkler Contractor, shall maintain a set of the Engineer's Contract Drawings marked up to show the work as installed. Contractor shall initial and date all changes to the approved shop drawings. The Architectural Observer may check this set of documents monthly for compliance. Upon completion of the work, Sprinkler Contractor shall use these as-built drawings to create a set of record drawings which shall be delivered to the Architect.

3.2 PIPING CONNECTIONS

A. Make connections according to the following, unless otherwise indicated:

1. Wet and Dry Piping Systems: Install dielectric coupling and nipple fittings to connect piping materials of dissimilar metals.

3.3 EQUIPMENT INSTALLATION - COMMON REQUIREMENTS

A. Install equipment and piping to allow maximum possible headroom unless specific mounting heights are indicated.

B. Install piping level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated.

C. Install sprinkler system components to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations.

3.4 ELECTRICAL WIRING

A. Equipment and valve connections to alarm and/or signaling systems, including but not limited to wiring of flow switches, pressure switches, and tamper switches, shall be provided by Fire Alarm Contractor.

B. Power to Air Compressor, Nitrogen Generator, and any other equipment provided by Division 21 shall be provided by the Electrical Contractor.

3.5 PLACING IN SERVICE

A. Upon completion of the entire system installation, the entire system and all equipment shall be tested as described in individual Division 21 specification sections to ensure that it will function as intended.

B. The Sprinkler Contractor shall furnish Owner’s representative with Contractor’s Material and Test Certificate, per NFPA.

C. The Sprinkler Contractor shall place the entire system in a satisfactory operating condition and shall furnish all assistance and instructions required by the Owner's representative during initial operating period.

D. The Sprinkler Contractor shall provide a hard copy of final record drawings and final hydraulic calculations in a closed tube located in the main sprinkler riser room.

END OF SECTION 210100

1 THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 210517 - SLEEVES AND SLEEVE SEALS FOR FIRE-SUPPRESSION PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Sleeves.
2. Grout.
3. Sealants.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

PART 2 - PRODUCTS

2.1 SLEEVES

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, with plain ends.

B. Pipe sleeves located in areas that are indicated on the Contract Drawings to be “Corrosion Resistant” shall be field painted using marine grade paint designed by the manufacturer for protecting metal surfaces from corrosion. Paint color by architect.

2.2 GROUT

A. Description: Nonshrink, for interior and exterior sealing openings in non-fire-rated walls or floors.

B. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

C. Design Mix: 5000-psi, 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

2.3 SEALANTS

A. Watertight sealants as manufactured by Holdrite, Proset, Metacaulk, or 3M.

2.4 FIRE/SMOKE BARRIER PENETRATION SYSTEMS

A. Provide U.L. listed systems by Metacaulk, 3M, or Hilti.

PART 3 - EXECUTION

3.1 SLEEVE INSTALLATION

A. Install sleeves for piping passing through penetrations in **ALL** floors, partitions, roofs, and walls.

B. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.

1. Cut sleeves to length for mounting flush with both surfaces.

a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas **2 inches** above finished floor level.

2. Using **grout**, seal space outside of sleeves in slabs and walls without sleeve-seal system.

C. Install sleeves for pipes passing through interior partitions.

1. Cut sleeves to length for mounting flush with both surfaces.

2. Seal with watertight sealant.

D. Pipe sleeves shall be two pipe sizes larger than piping passing through the sleeve.

E. Install sleeves concentric and centered on pipes.

F. Ream all sleeves to prevent cutting of piping.

G. Core drill openings for all floor openings may be utilized in lieu of sleeved openings. All openings shall be sized two pipe sizes larger than pipe passing thru the opening. All cored openings shall be fireproofed as required and shall be made water tight.

H. All openings through floors shall be protected by watertight sealant.

I. Fire-Resistance-Rated Penetrations, Horizontal Assembly Penetrations, and Smoke Barrier Penetrations: All penetrations in rated floors, firewalls and any other rated separations shall be protected using a through-penetration firestopping method with an “F” rating equivalent to the rating of the membrane being penetrated for particular piping materials used and membrane construction type. Floor penetrations shall additionally have a “T” rating equivalent to the rating of the floor being penetrated. Through–penetration firestop systems shall be installed and tested in accordance with ASTM E814 or UL 1479 with a minimum positive pressure differential 0.01 inch w.g. Comply with requirements for firestopping and fill materials specified in Section 078413 "Penetration Firestopping." All openings through horizontal fire separations shall be protected by U.L. listed systems.

3.2 SLEEVE AND SLEEVE-SEAL SCHEDULE

A. Use sleeves and sleeve seals for the following piping-penetration applications:

1. Concrete Slabs above Grade:

a. Steel pipe sleeves.

2. Interior Partitions:

a. Steel Pipe Sleeves.

END OF SECTION 210517

1 THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 210518 - ESCUTCHEONS FOR FIRE-SUPPRESSION PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Escutcheons.
2. Floor plates.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

PART 2 - PRODUCTS

2.1 ESCUTCHEONS

A. One-Piece, Cast-Brass Type: With polished, chrome-plated finish and setscrew fastener.

B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with polished, chrome-plated finish and spring-clip fasteners.

C. One-Piece, Stamped-Steel Type: With polished, chrome-plated finish and spring-clip fasteners.

D. Split-Casting, Brass Type: With polished, chrome-plated and rough-brass finish and with concealed hinge and setscrew.

E. Escutcheons that are noted on the Contract Drawings as “Corrosion Resistant” shall have factory-applied corrosion resistant coating.

2.2 FLOOR PLATES

A. One-Piece Floor Plates: Cast iron flange with holes for fasteners.

B. Floor plates that are noted on the Contract Drawings as “Corrosion Resistant” shall have factory-applied corrosion resistant coating.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install escutcheons for piping penetrations of walls, ceilings, and finished floors.

B. Install escutcheons snug against room finish.

C. Install escutcheons with ID to closely fit around pipe and with OD that completely covers opening.

1. Escutcheons for New Piping:

a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep pattern.

b. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece cast brass or split-casting brass type with polished, chrome-plated finish.

c. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece stamped steel type.

d. Bare Piping in Unfinished Service Spaces: One-piece cast brass or split-casting brass type with polished, rough-brass finish.

e. Bare Piping in Equipment Rooms: One-piece cast brass or split-casting brass type with polished, rough-brass finish.

D. Install floor plates for piping penetrations of equipment-room floors.

E. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.

1. New Piping: One-piece, floor plate.

3.2 FIELD QUALITY CONTROL

A. Using new materials, replace broken and damaged escutcheons and floor plates.

END OF SECTION 210518

SECTION 210553 - IDENTIFICATION FOR FIRE-SUPPRESSION PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Equipment labels.
2. Riser Placards.
3. Fire Pump Testing Placards.
4. Zone Coverage Information.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

PART 2 - PRODUCTS

2.1 EQUIPMENT LABELS

A. Metal Labels for Equipment, Control Valves, Main Drain:

1. Letter Color: Red.
2. Background Color: White.
3. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
4. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
5. Fasteners: Stainless-steel rivets or self-tapping screws, or chain.
6. Adhesive: Not permitted.

B. Metal Riser Placard:

1. Letter Color: White (information shall be filled in by Sprinkler Contractor with Black Letters).

2. Background Color: Red.

3. Fasteners: Stainless-steel rivets or self-tapping screws, or chain.

4. Adhesive: Not permitted.

5. Each placard shall contain the following data:

    a. Location of area protected by riser.

    b. Total number of sprinkler heads connected to riser.

    c. Design density and design area, as approved.

    d. Required flow rate and pressure at the base of the riser, as approved.

C. Fire Pump Testing Placard:

1. Letter Color: White (information shall be filled in by Sprinkler Contractor with Black Letters).

2. Background Color: Red.

3. Fasteners: Stainless-steel rivets or self-tapping screws, or chain.

4. Adhesive: Not permitted.

5. Each placard shall contain the following data:

    a. Minimum suction pressure that the fire pump is allowed to be tested at (30 psi per the local water utility).

    b. Required flow rate at the minimum suction pressure.

D. Zone Coverage Information:

1. Sprinkler Contractor shall provide floor plans with areas affected by each sprinkler system zone valve indicated by highlighting, shading, hatching, or outlines.. Floor plans shall be individually framed below glass and mounted in sprinkler riser room.

PART 3 - EXECUTION

3.1 EQUIPMENT LABEL INSTALLATION

A. Install or permanently fasten labels on each major item of equipment, control valves, main drain, auxiliary drains, and inspectors test connections.

B. Locate labels where accessible and visible.

C. Locate adhesive label on ceiling grid below valves or auxiliary drains located above ceilings. Label shall describe the item above (i.e. “AUXILIARY DRAIN”). Letter height shall be per ANSI.

3.2 PLACARD INSTALLATION

A. Each individual riser shall be marked with a metal hydraulic placard.

B. Fire Pump Testing placard shall be located on the wall in a visible location near the fire pump.

END OF SECTION 210553

1 THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 211313 - WET-PIPE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Pipes, fittings, and specialties.
2. Specialty valves.
3. Sprinklers.
4. Alarm devices.
5. Pressure gages.

1.3 ACTION SUBMITTALS

A. Sprinkler Contractor shall provide delegated design submittals, including materials, shop drawings, and hydraulic calculations, as indicated in Section 210100 “Basic Fire Protection Requirements.”

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For wet-pipe sprinkler systems and specialties to include in emergency, operation, and maintenance manuals.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Sprinkler Cabinets: Finished, wall-mounted, steel cabinet with hinged cover, and with space for minimum of six spare sprinklers plus sprinkler wrench. Include number of sprinklers required by NFPA 13 and sprinkler wrench for each type of sprinkler used on Project.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Sprinkler system equipment, specialties, accessories, installation, and testing shall comply with the following:

1. NFPA 13.

2. All components shall be listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide." for the proposed application, as required by NFPA 13.

B. Piping system components shall be listed for 300-psig minimum working pressure.

C. Delegated Design: Engage a qualified professional engineer, as defined in Section 210100 "Basic Fire Protection Requirements," to design wet-pipe sprinkler systems.

1. Sprinkler system design shall be approved by authorities having jurisdiction.

a. Sprinkler Occupancy Hazard Classifications: As indicated on Contract Drawings.

2. Minimum Density for Automatic-Sprinkler Piping Design: Per NFPA 13 and as indicated on Contract Drawings.

3. Maximum Protection Area per Sprinkler: Per NFPA 13, Contract Drawings, and in accordance with listings of sprinkler heads.

2.2 STEEL PIPE AND FITTINGS

A. Schedule 40, Black Steel Pipe: ASTM A 795 and ANSI/ASTM A 53. Pipe ends may be factory or field formed to match joining method.

B. Schedule 10, Black-Steel Pipe: ASTM A 795 and ANSI/ASTM A 53.

C. Fittings for threaded black steel piping shall be cast iron threaded fittings by Anvil or Viking.

D. Fittings for grooved black steel piping shall be ductile iron grooved fittings conforming to ASTM A 536. Fittings shall be Victaulic “Firelock” joined with Victaulic “Firelock” rigid ductile iron couplings or approved equal by Grinnell or Reliable.

E. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.

F. Pipe, fittings, and couplings indicated on the Contract Drawings to be “Corrosion Resistant” shall be field painted using marine grade paint designed by the manufacturer for protecting metal surfaces from corrosion. Paint color by architect.

2.3 HANGERS

A. Hangers for vertical piping shall be Riser Clamp design and shall be by Afcon, Viking, or Anvil.

1. Hangers located in areas designated on the Contract Drawings to be “Corrosion Resistant” shall be stainless steel.

B. Hangers for horizontal piping shall be hanger rings attached to top beam clamps using 3/8” threaded rod. Provide Afcon, Viking, or Anvil.

1. In areas with concrete beams fasteners designed for concrete may be used instead of top beam clamps.

2. Hangers, beam clamps, fasteners, and threaded rod located in areas designated on the Contract Drawings to be “Corrosion Resistant” shall be stainless steel.

2.4 SPECIALTY VALVES

A. Listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide."

B. Pressure Rating:

1. 300-psig minimum, unless otherwise noted.

C. Body Material: Cast or ductile iron.

D. Size: Same as connected piping.

E. End Connections: Flanged or grooved.

F. Riser Check Valves:

1. Reliable Model G, or approved equal by Tyco or Victaulic

2. Design: For vertical installation.

3. Features: Grooved connections, rated for 250 psi, with upstream and downstream pressure gauges, and main drain valve piped to exterior of the building.

G. Control Valves shall be ductile iron butterfly valves.

1. Standard: UL 1091 and FM Global standard for indicating valves, (butterfly or ball type), Class Number 112.

2. Minimum Pressure Rating: 300 psig.

3. Body Material: Ductile iron with nylon, EPDM, epoxy, or polyamide coating.

4. Seat Material: EPDM.

5. Stem: Stainless steel.

6. Disc: Ductile iron.

7. Actuator: Worm gear or traveling nut.

8. Supervisory Switch: Internal or external.

9. Body Design: Grooved-end connections.

H. Trim and Drain Valves:

1. Type: Ball valve

2. Minimum Pressure Rating: 300 psig.

3. Body Material: Forged Brass of Bronze.

4. Actuator: Hand Lever.

5. End connections: Threaded.

I. Valves not specified elsewhere in Division 21 shall be UL listed and/or FM approved as required by NFPA 13, and shall be listed specifically for fire protection service.

2.5 SPRINKLER PIPING SPECIALTIES

A. Flow Switch:

1. Description: Electric vane-type water flow alarm switch. Activation shall be accomplished by the continuous flow of water against a non-corrosive paddle attached to a non-corrosive stem operating a field replaceable instantly recycling adjustable retard with a 0-90 second range and visual indication of activation. Expiration of the retard time shall result in the simultaneous operation of two sets of single pole double throw (SPDT) switch contacts rated at 10A, 125VAC and 2A, 30VDC. Each switch contact shall have a separate wiring chamber and separate conduit entrance to comply with the separation of power limited and non-power limited conductors without the need for special wire or wire methods.

2. Potter (Viking) VSR or approved equal by System Sensor or Tyco.

3. Pressure Rating: Up to 450 psi.

4. Maximum Water Surge Listing: 18 fps.

5. Alarm Activation Flow: 10 gpm maximum.

6. Features: U bolt and saddle with non-corrosive insert for mounting to the pipe, a non-corrosive vane and trip stem assembly for detecting waterflow, and a retard time delayed switch to prevent false alarms from water surges. It shall be possible to install an optional cover tamper switch to detect removal of the enclosure.

7. Enclosure: NEMA 4 rated, held captive by tamper resistant screws.

2.6 SPRINKLERS

A. Sprinkler heads shall be listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide." for the proposed application.

B. Sprinkler head types shall be as indicated on the Contract Drawings.

C. All sprinkler heads shall be quick response type, unless otherwise indicated on the Contract Drawings.

D. All sprinkler heads shall be glass bulb type.

E. Sprinkler heads shall have ordinary temperature classification, unless otherwise indicated on the Contract Drawings, or required by NFPA 13.

F. K-Factor of sprinkler heads shall be 5.6, 8.0, or 11.2.

G. Sprinklers that are noted on the Contract Drawings as “Corrosion Resistant” shall be factory coated with Victaulic VC-250 or Tyco Poly-Stainless. Escutcheons shall also have factory-applied corrosion resistant coating.

2.7 ALARM DEVICES

A. Alarm-device types shall match piping and equipment connections.

B. Valve Supervisory Switches:

1. Standard: UL 346.

2. Type: Electrically supervised.

3. Components: Single-pole, double-throw switch with normally closed contacts.

4. Design: Signals that controlled valve is in other than fully open position.

5. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.8 PRESSURE GAGES

A. Standard: UL 393.

B. Dial Size: 3-1/2- to 4-1/2-inch diameter.

C. Pressure Gage Range: 0- to 250-psig.

PART 3 - EXECUTION

3.1 SERVICE-ENTRANCE PIPING

A. Install per Contract Drawings and Division 21 specifications.

3.2 PIPING INSTALLATION

A. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of sprinkler main piping. Install piping as indicated on approved shop drawings.

1. Deviations from approved shop drawings for piping require written approval from authorities having jurisdiction. File written approval with Architect before deviating from approved working plans.

2. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, HVAC equipment, and partition assemblies.

B. Piping Standard: Comply with NFPA 13 requirements for installation of sprinkler piping.

C. All piping shall be NPS 1 or larger.

D. Use listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.

E. Install unions adjacent to each valve in pipes NPS 2 and smaller.

F. Install couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 and larger end connections.

G. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, and sized and located according to NFPA 13.

H. Piping shall be installed level, without slope, unless otherwise indicated on Contract Drawings.

1. Exception: Piping installed immediately below sloped roofs shall match the slope of the roof.

I. Install sprinkler piping with drains for complete system drainage.

1. Exception: Trapped water in the amount of 5 gallons or less is acceptable per NFPA 13. The amount of trapped water in the system shall be minimized.

J. Install all piping as directly as possible, avoiding unnecessary bends and turns so as not to interfere with proper installation of work of other Divisions.

K. All piping shall be routed with a minimum clearance of ten (10) feet from any electrical switchboards, panel boards or telephone backboards.

L. Piping shall be concealed in walls, or above ceilings, unless otherwise indicated on Contract Drawings.

1. No sprinkler piping shall be covered or concealed until inspected by the Authority Having Jurisdiction.

M. Piping shall not be installed underground.

N. Install alarm devices in piping systems.

O. Alarm bell shall be surface mounted on exterior of building.

P. Install hangers and supports for sprinkler system piping according to NFPA 13. Comply with requirements for hanger materials in NFPA 13.

Q. Support horizontal black steel pipe with hangers located every 12 feet for piping 1-1/4” or smaller and every 15 feet for all piping 1-1/2” or larger.

R. Armovers longer than 24” shall be supported by hangers per NFPA 13.

S. Top beam clamps shall only be attached to the top portion of structural members. All hangers shall permit adequate adjustment after erection while still supporting the load.

T. Trapeze hangers are allowed only where it is necessary due to the required piping layout and structure.

U. Trapeze hangers shall attach to the structure using top beam clamps located on both sides of trapeze hanger. Top beam clamps shall only be attached to the top portion of structural members.

V. Hangers **SHALL NOT** be fastened to joist bridging or roof deck.

W. Hangers shall only be hung with drilling into the slab with drop-in anchors or with concrete screws into concrete beams with the approval of the Structural Engineer of record. Sprinkler Contractor shall provide complete dead and operating load information for each location.

X. Install pressure gages on riser or feed main, and at each sprinkler test connection. Include pressure gages with connection not less than NPS 1/4 and with soft-metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they are not subject to freezing.

Y. Fill sprinkler system piping with water.

Z. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 210517 "Sleeves and Sleeve Seals for Fire-Suppression Piping."

AA. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 210517 "Sleeves and Sleeve Seals for Fire-Suppression Piping."

BB. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 210518 "Escutcheons for Fire-Suppression Piping."

3.3 JOINT CONSTRUCTION

A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

D. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.

E. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads.

2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

F. Steel-Piping, Roll-Grooved Joints: Roll rounded-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe grooved joints.

3.4 VALVE AND SPECIALTIES INSTALLATION

A. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.

B. Install listed fire-protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections.

C. Specialty Valves:

1. Install valves in vertical position for proper direction of flow, in main supply to system.

3.5 SPRINKLER INSTALLATION

A. Install sprinklers in suspended ceilings in center of ceiling tiles.

B. Sprinkler heads shall be installed on armovers to allow their locations to be adjusted to the center of ceiling tiles.

C. Sprinkler heads may be installed using flexible sprinkler hose fittings. Install hose into bracket on ceiling grid.

D. Install dry-type sprinklers with water supply from heated space. Do not install pendent or sidewall, wet-type sprinklers in areas subject to freezing.

3.6 IDENTIFICATION

A. Install labeling on components according to requirements in NFPA 13.

B. Install hydraulic placard on each riser.

3.7 FIELD QUALITY CONTROL

A. All equipment and components located on site shall be protected from the weather and damage from construction equipment.

B. The Contractor shall notify the Engineer forty-eight (48) hours in advance of all tests. The Contractor shall make all necessary preliminary tests to ensure a functional system, which shall include flushing, testing, and inspection of sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.

C. All tests shall be applied before any work is concealed or covered in any manner.

D. All tests shall be conducted with regard to safety of all personnel on site.

E. The Authority Having Jurisdiction shall be alerted to and invited to witness all Division 21 tests.

F. Preliminary Tests:

1. All sprinkler piping shall be made tight under a hydrostatic test pressure of 50 psi greater than the required design pressure, or 200 psi, whichever is greater. Hydrostatic test pressure shall be maintained without pressure loss for a minimum of two (2) hours. No

caulking of joints will be permitted. Test pressure shall be read from a gauge located at the low elevation point of the system that is under test pressure. Any joint found to leak under this test shall be broken, remade and a new test applied.

2. Waterflow detecting devices, including associated alarm circuits, shall be flow tested using the inspector's test connection. Alarm bell must be audible on premises within five (5) minutes of fully opening inspector's test connection. Each water-operated alarm device shall be tested to verify proper operation.

3. Each tamper switch shall be tested by operating the associated valve.

4. Following flushing of the underground piping, a main drain test shall be made to verify the adequacy of the water supply. Static and residual pressures shall be recorded and submitted. In addition, a main drain test shall be conducted each time after a main control valve is shut and opened.

5. Energize circuits to electrical equipment and devices.

6. Verify that equipment hose threads are same as local fire department equipment.

7. Main drain valves shall be opened until the system pressure stabilizes.

8. All control valves shall be fully opened and closed under system water pressure to ensure proper operation.

9. All alarms, supervisory signals, and trouble signals that are related to the sprinkler system shall be activated and verified.

G. A final acceptance test shall be conducted, only after all above tests have been successfully conducted and reports have been submitted and approved, in which a technician employed by the installing Sprinkler Contractor shall provide a complete demonstration of the operation of the system. This demonstration shall include operation of control valves and flowing of inspector's test connections to verify operation of associated waterflow alarm switches, as well as a subsequent main drain test to verify that the control valves are in the open position. The technician shall have a copy of all "as-built" drawings, as well as certificates of previously conducted tests listed above. The sprinkler system installation shall not be considered accepted until as identified problems have been corrected, and the system is successfully retested. It is also required that the test documentation is properly completed and received prior to system acceptance.

H. Prior to making a request of Beneficial Occupancy the Sprinkler Contractor shall submit written test reports and certificates as required by NFPA 13 and 24. Submittals shall include system acceptance forms copyrighted by NFPA which shall bear the NFPA copyright symbol. No other forms shall be considered.

I. Sprinkler piping system will be considered defective if it does not pass tests and inspections. Replace damaged and malfunctioning controls and equipment, and retest as necessary.

J. The Contractor shall furnish all necessary equipment, materials and labor to perform the above-specified tests. All equipment and materials shall be in excellent condition.

K. Prepare test and inspection reports.

3.8 CLEANING

A. Clean dirt and debris from sprinklers.

B. Only sprinklers with their original factory finish are acceptable. Remove and replace any sprinklers that are painted or have any other finish than their original factory finish.

3.9 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain wet pipe sprinkler system.

3.10 PIPING SCHEDULE

A. Standard-pressure, wet-pipe sprinkler system, NPS 2 and smaller, shall be the following:

1. Schedule 40 black steel pipe with threaded ends, cast iron fittings, and threaded joints.

B. Standard-pressure, wet-pipe sprinkler system, NPS 2-1/2 and larger, shall be the following:

1. Schedule 10 black steel pipe with roll-grooved ends, ductile iron fittings, and grooved joints.

3.11 SPRINKLER SCHEDULE

A. Per Contract Drawings.

END OF SECTION 211313

SECTION 211316 - DRY-PIPE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Pipes, fittings, and specialties.
2. Specialty valves.
3. Nitrogen Generator.
4. Air Compressor.
5. Sprinklers.
6. Pressure gages.

1.3 ACTION SUBMITTALS

A. Sprinkler Contractor shall provide delegated design submittals, including materials, shop drawings, and hydraulic calculations, as indicated in Section 210100 “Basic Fire Protection Requirements.”

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For dry-pipe sprinkler systems and specialties to include in emergency, operation, and maintenance manuals.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Sprinkler Cabinets: Finished, wall-mounted, steel cabinet with hinged cover, and with space for minimum of six spare sprinklers plus sprinkler wrench. Include number of sprinklers required by NFPA 13 and sprinkler wrench for each type of sprinkler used on Project.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Sprinkler system equipment, specialties, accessories, installation, and testing shall comply with the following:

1. NFPA 13.

2. All components shall be listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide." for the proposed application, as required by NFPA 13.

B. Piping system components shall be listed for 300-psig minimum working pressure.

C. Delegated Design: Engage a qualified professional engineer, as defined in Section 210100 "Basic Fire Protection Requirements," to design wet-pipe sprinkler systems.

1. Sprinkler system design shall be approved by authorities having jurisdiction.

a. Sprinkler Occupancy Hazard Classifications: As indicated on Contract Drawings.

2. Minimum Density for Automatic-Sprinkler Piping Design: Per NFPA 13 and as indicated on Contract Drawings.

3. Maximum Protection Area per Sprinkler: Per NFPA 13, Contract Drawings, and in accordance with listings of sprinkler heads.

2.2 STEEL PIPE AND FITTINGS

A. Schedule 40, Black Steel Pipe: ASTM A 795 and ANSI/ASTM A 53. Pipe ends may be factory or field formed to match joining method.

B. Schedule 10, Black-Steel Pipe: ASTM A 795 and ANSI/ASTM A 53.

C. Fittings for threaded black steel piping shall be cast iron threaded fittings by Anvil or Viking.

D. Fittings for grooved black steel piping shall be ductile iron grooved fittings conforming to ASTM A 536. Fittings shall be Victaulic “Firelock” joined with Victaulic “Firelock” rigid ductile iron couplings or approved equal by Grinnell or Reliable.

E. Steel Flanges and Flanged Fittings: ASME B16.5, Class 150.

F. Pipe, fittings, and couplings indicated on the Contract Drawings to be “Corrosion Resistant” shall be field painted using marine grade paint designed by the manufacturer for protecting metal surfaces from corrosion. Paint color by architect.

2.3 HANGERS

A. Hangers for vertical piping shall be Riser Clamp design and shall be by Afcon, Viking, or Anvil.

1. Hangers located in areas designated on the Contract Drawings to be “Corrosion Resistant” shall be stainless steel.

B. Hangers for horizontal piping shall be hanger rings attached to top beam clamps using 3/8" threaded rod. Provide Afcon, Viking, or Anvil.

1. In areas with concrete beams fasteners designed for concrete may be used instead of top beam clamps.

2. Hangers, beam clamps, fasteners, and threaded rod located in areas designated on the Contract Drawings to be "Corrosion Resistant" shall be stainless steel.

2.4 SPECIALTY VALVES

A. Listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide."

B. Pressure Rating:

1. 300-psig minimum, unless otherwise noted

C. Body Material: Cast or ductile iron.

D. Size: Same as connected piping.

E. End Connections: Flanged or grooved.

F. Control Valves shall be ductile iron butterfly valves.

1. Standard: UL 1091 and FM Global standard for indicating valves, (butterfly or ball type), Class Number 112.

2. Minimum Pressure Rating: 300 psig.

3. Body Material: Ductile iron with nylon, EPDM, epoxy, or polyamide coating.

4. Seat Material: EPDM.

5. Stem: Stainless steel.

6. Disc: Ductile iron.

7. Actuator: Worm gear or traveling nut.

8. Supervisory Switch: Internal or external.

9. Body Design: Grooved-end connections.

G. Trim and Drain Valves:

1. Type: Ball valve

2. Minimum Pressure Rating: 300 psig.

3. Body Material: Forged Brass of Bronze.

4. Actuator: Hand Lever.

5. End connections: Threaded.

H. Valves not specified elsewhere in Division 21 shall be UL listed and/or FM approved as required by NFPA 13, and shall be listed specifically for fire protection service.

2.5 NITROGEN GENERATOR

A. South-Tek, General Air Products, Potter, Tyco.

B. Sized by Contractor based on combined volume of all connected dry systems.

C. Floor mounted with integral controls.

D. Dry contacts for “common alarm” and “bypass” alarm to allow remote monitoring by fire alarm panel.

E. May be factory installed in same cabinet as air compressor.

2.6 AIR COMPRESSOR

A. South-Tek, General Air Products, Potter, Tyco.

B. Sized by Contractor based on the largest connected dry system volume.

C. Floor mounted with vertical tank.

D. Include air pressure maintenance device.

E. May be factory installed in same cabinet as nitrogen generator.

2.7 SPRINKLERS

A. Sprinkler heads shall be listed in UL's "Fire Protection Equipment Directory" or FM Global's "Approval Guide." for the proposed application.

B. Sprinkler head types shall be as indicated on the Contract Drawings.

C. All sprinkler heads shall be quick response type, unless otherwise indicated on the Contract Drawings.

D. All sprinkler heads shall be glass bulb type.

E. Sprinkler heads shall have ordinary temperature classification, unless otherwise indicated on the Contract Drawings, or required by NFPA 13.

F. K-Factor of sprinkler heads shall be 5.6, 8.0, or 11.2.

G. Sprinklers that are noted on the Contract Drawings as “Corrosion Resistant” shall be factory coated with Victaulic VC-250 or Tyco Poly-Stainless. Escutcheons shall also have factory-applied corrosion resistant coating.

2.8 ALARM DEVICES

A. Alarm-device types shall match piping and equipment connections.

B. Pressure Switches:

1. Standard: UL 346.

2. Type: Electrically supervised water-flow switch with retard feature.

3. Components: Single-pole, double-throw switch with normally closed contacts.

4. Design Operation: Rising pressure signals water flow.

C. Valve Supervisory Switches:

1. Standard: UL 346.

2. Type: Electrically supervised.

3. Components: Single-pole, double-throw switch with normally closed contacts.

4. Design: Signals that controlled valve is in other than fully open position.

5. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application

2.9 PRESSURE GAGES

A. Standard: UL 393.

B. Dial Size: 3-1/2- to 4-1/2-inch diameter.

C. Pressure Gage Range: 0- to 250-psig.

PART 3 - EXECUTION

3.1 SERVICE-ENTRANCE PIPING

A. Install per Contract Drawings and Division 21 specifications.

3.2 PIPING INSTALLATION

A. Locations and Arrangements: Drawing plans, schematics, and diagrams indicate general location and arrangement of sprinkler main piping. Install piping as indicated on approved shop drawings.

1. Deviations from approved shop drawings for piping require written approval from authorities having jurisdiction. File written approval with Architect before deviating from approved working plans.

2. Coordinate layout and installation of sprinklers with other construction that penetrates ceilings, including light fixtures, HVAC equipment, and partition assemblies.

B. Piping Standard: Comply with NFPA 13 requirements for installation of sprinkler piping.

C. All piping shall be NPS 1 or larger.

D. Use listed fittings to make changes in direction, branch takeoffs from mains, and reductions in pipe sizes.

E. Install unions adjacent to each valve in pipes NPS 2 and smaller.

F. Install couplings for grooved-end piping on valves, apparatus, and equipment having NPS 2-1/2 and larger end connections.

G. Install "Inspector's Test Connections" in sprinkler system piping, complete with shutoff valve, and sized and located according to NFPA 13.

H. Piping shall be installed with slopes to drains. Slopes shall be as indicated on Contract Drawings.

I. Install sprinkler piping with drains for complete system drainage.

J. Install sprinkler control valves, test assemblies, and drain risers adjacent to standpipes when sprinkler piping is connected to standpipes.

K. Connect compressed-air supply to dry-pipe sprinkler piping.

L. Connect air compressor to the following piping and wiring:

1. Pressure gages and controls.

2. Electrical power system.

3. Fire-alarm devices, including low-pressure alarm.

M. Install air compressor and nitrogen generator with minimum clearances required by the manufacturer(s).

N. Install all piping as directly as possible, avoiding unnecessary bends and turns so as not to interfere with proper installation of work of other Divisions.

O. All piping shall be routed with a minimum clearance of ten (10) feet from any electrical switchboards, panel boards or telephone backboards.

P. Piping shall be concealed in walls, or above ceilings, unless otherwise indicated on Contract Drawings.

1. No sprinkler piping shall be covered or concealed until inspected by the Authority Having Jurisdiction.

Q. Piping shall not be installed underground.

R. Install alarm devices in piping systems.

S. Install hangers and supports for sprinkler system piping according to NFPA 13. Comply with requirements for hanger materials in NFPA 13.

T. Support horizontal black steel pipe with hangers located every 12 feet for piping 1-1/4” or smaller and every 15 feet for all piping 1-1/2” or larger.

U. Armovers longer than 24” shall be supported by hangers per NFPA 13.

V. All hangers shall permit adequate adjustment after erection while still supporting the load.

W. Trapeze hangers are allowed only where it is necessary due to the required piping layout and structure.

X. Trapeze hangers shall attach to the structure on both sides of trapeze hanger.

Y. Hangers **SHALL NOT** be fastened to joist bridging or roof deck.

Z. Install pressure gages on riser or feed main, and at each sprinkler test connection. Include pressure gages with connection not less than NPS 1/4 and with soft-metal seated globe valve, arranged for draining pipe between gage and valve. Install gages to permit removal, and install where they are not subject to freezing.

AA. Drain dry-pipe sprinkler piping.

BB. Pressurize and check dry-pipe sprinkler system piping and air-pressure maintenance devices and air compressor.

CC. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 210517 "Sleeves and Sleeve Seals for Fire-Suppression Piping."

DD. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 210517 "Sleeves and Sleeve Seals for Fire-Suppression Piping."

EE. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 210518 "Escutcheons for Fire-Suppression Piping."

3.3 JOINT CONSTRUCTION

A. Install couplings, flanges, flanged fittings, unions, nipples, and transition and special fittings that have finish and pressure ratings same as or higher than system's pressure rating for aboveground applications unless otherwise indicated.

B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

C. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

D. Flanged Joints: Select appropriate gasket material in size, type, and thickness suitable for water service. Join flanges with gasket and bolts according to ASME B31.9.

E. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Apply appropriate tape or thread compound to external pipe threads.

2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

F. Steel-Piping, Cut-Grooved Joints: Cut square-edge groove in end of pipe according to AWWA C606. Assemble coupling with housing, gasket, lubricant, and bolts. Join steel pipe and grooved-end fittings according to AWWA C606 for steel-pipe joints.

3.4 VALVE AND SPECIALTIES INSTALLATION

A. Install listed fire-protection valves, trim and drain valves, specialty valves and trim, controls, and specialties according to NFPA 13 and authorities having jurisdiction.

B. Install listed fire-protection shutoff valves supervised open, located to control sources of water supply except from fire-department connections.

C. Specialty Valves:

1. Install valves in vertical position for proper direction of flow, in main supply to system.

2. Install dry-pipe valves with trim sets for air supply, drain, alarm connections, and pressure gages.

a. Install air compressor and compressed-air-supply piping.

b. Install air-pressure maintenance device with shutoff valves to permit servicing without shutting down sprinkler system; bypass valve for quick system filling; pressure regulator or switch to maintain system pressure; strainer; pressure ratings with 14- to 60-psig adjustable range; and 175-psig maximum inlet pressure.

3.5 SPRINKLER INSTALLATION

A. Install dry-type sprinklers with water supply from heated space. Do not install pendent or sidewall sprinklers in areas subject to freezing.

3.6 IDENTIFICATION

A. Install labeling on components according to requirements in NFPA 13.

B. Install hydraulic placard on each riser.

3.7 FIELD QUALITY CONTROL

A. All equipment and components located on site shall be protected from the weather and damage from construction equipment.

B. The Contractor shall notify the Engineer forty-eight (48) hours in advance of all tests. The Contractor shall make all necessary preliminary tests to ensure a functional system, which shall include flushing, testing, and inspection of sprinkler systems according to NFPA 13, "Systems Acceptance" Chapter.

C. All tests shall be applied before any work is concealed or covered in any manner.

D. All tests shall be conducted with regard to safety of all personnel on site.

E. The Authority Having Jurisdiction shall be alerted to and invited to witness all Division 21 tests.

F. Preliminary Tests:

1. All sprinkler piping shall be made tight under a hydrostatic test pressure of 50 psi greater than the required design pressure, or 200 psi, whichever is greater. Hydrostatic test pressure shall be maintained without pressure loss for a minimum of two (2) hours. No caulking of joints will be permitted. Test pressure shall be read from a gauge located at the low elevation point of the system that is under test pressure. Any joint found to leak under this test shall be broken, remade and a new test applied.

2. Dry sprinkler systems shall also be subjected to an air pressure leakage test at 40 psi for a minimum of twenty-four (24) hours.

3. Waterflow detecting devices, including associated alarm circuits, shall be flow tested using the inspector’s test connection. Alarm bell must be audible on premises within five (5) minutes of fully opening inspector’s test connection. Each water-operated alarm device shall be tested to verify proper operation.

4. Each tamper switch shall be tested by operating the associated valve.

5. Following flushing of the underground piping, a main drain test shall be made to verify the adequacy of the water supply. Static and residual pressures shall be recorded and submitted. In addition, a main drain test shall be conducted each time after a main control valve is shut and opened.

6. Energize circuits to electrical equipment and devices.

7. Verify that equipment hose threads are same as local fire department equipment.

8. Dry pipe valves shall be tested using the inspector’s test connection. The time it takes for the dry pipe valve to trip, as well as the time it takes for water to flow from the inspector’s test connection after inspector’s test connection is fully opened shall be measured.

9. Main drain valves shall be opened until the system pressure stabilizes.

10. All control valves shall be fully opened and closed under system water pressure to ensure proper operation.

11. All alarms, supervisory signals, and trouble signals that are related to the sprinkler system shall be activated and verified.

G. A final acceptance test shall be conducted, only after all above tests have been successfully conducted and reports have been submitted and approved, in which a technician employed by the installing Sprinkler Contractor shall provide a complete demonstration of the operation of the system. This demonstration shall include operation of control valves and flowing of inspector's

test connections to verify operation of associated waterflow alarm switches, as well as a subsequent main drain test to verify that the control valves are in the open position. The technician shall have a copy of all “as-built” drawings, as well as certificates of previously conducted tests listed above. The sprinkler system installation shall not be considered accepted until as identified problems have been corrected, and the system is successfully retested. It is also required that the test documentation is properly completed and received prior to system acceptance.

H. Prior to making a request of Beneficial Occupancy the Sprinkler Contractor shall submit written test reports and certificates as required by NFPA 13 and 24. Submittals shall include system acceptance forms copyrighted by NFPA which shall bear the NFPA copyright symbol. No other forms shall be considered.

I. Sprinkler piping system will be considered defective if it does not pass tests and inspections. Replace damaged and malfunctioning controls and equipment, and retest as necessary.

J. The Contractor shall furnish all necessary equipment, materials and labor to perform the above-specified tests. All equipment and materials shall be in excellent condition.

K. Prepare test and inspection reports.

3.8 CLEANING

A. Clean dirt and debris from sprinklers.

B. Only sprinklers with their original factory finish are acceptable. Remove and replace any sprinklers that are painted or have any other finish than their original factory finish.

3.9 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain wet pipe sprinkler system

3.10 PIPING SCHEDULE

A. Standard-pressure, wet-pipe sprinkler system, NPS 2 and smaller, shall be the following:

1. Schedule 40 black steel pipe with threaded ends, cast iron fittings, and threaded joints.

B. Standard-pressure, wet-pipe sprinkler system, NPS 2-1/2 and larger, shall be the following:

1. Schedule 10 black steel pipe with cut-grooved ends, ductile iron fittings, and grooved joints.

3.11 SPRINKLER SCHEDULE

A. Per Contract Drawings

END OF SECTION 211316

SECTION 220000 - GENERAL PLUMBING

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. Furnish all labor, materials and equipment and incidentals required to make ready for use complete plumbing systems as shown on the Drawings and specified herein.

B. Where Sub-Contracts are used to perform portions of the work, division of labor between sub trades is the responsibility of the Contractor.

C. Furnish all labor, materials and equipment and incidentals required to make ready for use complete plumbing systems as shown on the Drawings and specified herein.

D. Work includes furnishing, installing and testing the equipment and materials specified in other sections of the Division Specifications and shown on the Plumbing Drawings. It is the intent of these Specifications that the plumbing systems shall be suitable in every way for the intended usage. All material and all work which may be reasonably implied as being incidental to the work of this Division shall be furnished at no extra cost.

E. The general scope work includes, but is not limited to, furnishing, coordinating, and installing the following.

1. Domestic waste and vent systems with connection to site utilities.
2. Domestic water distribution systems with connection to site utilities.
3. Roof drainage systems with connections to site utilities.
4. Plumbing fixtures, specialties and equipment.

F. Visit all areas of the existing site, buildings and structures (as applicable) in which work under these sections is to be performed. Inspect carefully the existing conditions prior to bidding. Bid submission is evidence that the Contractor has examined the site and existing conditions, understands conditions under which the work will be performed, and takes full responsibility for complete knowledge of all factors governing the work.

G. Schedule all service interruptions in existing facilities at the Owner's convenience with 24 hours (minimum) notice. Obtain prior approval for each interruption.

H. Thoroughly test all plumbing systems after installation and make any minor corrections, changes or adjustments necessary for proper functioning of the systems and equipment. All workmanship shall be of the highest quality; substandard work will be rejected.

1.2 SUBMITTALS

A. Procedures for submittals: Submit under provisions of relevant sections of the General and Supplemental General Conditions and Division 01 Specifications Sections.

Transmit each shop drawing submittal with provided Shop Drawing Submittal Cover Form, attached herewith for each item of equipment/material or each specification section/paragraph.

B. Clearly indicate proposed equipment and/or materials substitutions in shop drawings. Summarize all deviations from the specified quality, functionality, appearance or performance of proposed equipment and/or materials in the preface of each submittal. Include documentation to support deviations.

C. Provide descriptive data on all materials and equipment as required to ascertain compliance with Specifications.

D. The design layout shown on drawings is based on physical sizes of reputable equipment manufacturers. If equipment other than the models indicated is installed, any resulting conflicts with space, maintenance access, clearances or codes are the responsibility of the Contractor to correct at his expense.

E. Where specific models and manufacturers of materials and equipment are specified, substitutions as allowed by the specifications and State law will be considered. Substitutions must be equivalent in quality, function, suitability and arrangement to specified equipment. Architect/Engineer to have final authority as to equivalency of substitutions.

F. Equipment model numbers noted in these specifications or in the drawings are intended to establish a minimum standard of quality and do not necessarily relate to specific options or arrangements as shown. Provide equipment with all standard features and optional features as stated and arranged as shown on the drawings.

1.3 REGULATORY REQUIREMENTS

A. Perform Work in accordance with all applicable state and local codes, standards and regulations.

B. Furnish all materials and labor which is required for compliance with codes, standards and regulations, whether specifically mentioned in these specifications or shown on the drawings.

C. Obtain the required construction permit from the authority having jurisdiction and arrange, at the proper time, for all inspections required by such authority. Pay all permit and inspection costs required.

1.4 COORDINATION OF WORK

A. The contractor is responsible for coordination of work between trades. Provide fully complete and functional systems.

B. Compare plumbing drawings and specifications with the drawings and specifications for other trades.

C. Coordinate plumbing installation with the work of other trades. Report any pertinent discrepancies to the Architect/Engineer and obtain written instructions for any necessary revisions. Before starting any construction, make proper provisions to avoid interferences in a manner approved by the Architect/Engineer. No extras will be allowed for rework of uncoordinated installations.

D. Determine the exact route and location of each plumbing item prior to fabrication and/or installation. Adjust location of piping and equipment, etc., to accommodate interferences anticipated and encountered.

E. Right of Way: General priority for right of way is as follows:

1. Items located per regulatory requirement.
2. Piping with pitch requirement (plumbing drains, etc.).
3. Ductwork.
4. Piping without pitch requirement.
5. Electrical wiring (conduits, etc.).

F. Arrange all work to permit removal (without damage to other parts) of any equipment requiring periodic replacement.

G. Provide clearance and easy access to any equipment which requires periodic maintenance. Arrange ducts, piping and equipment to permit ready access to valves, cocks, traps, starters, motors, control components, etc., and to clear the opening of swinging doors and access panels.

1.5 EQUIPMENT AND MATERIALS (GENERAL)

A. Provide all new materials unless specifically indicated otherwise.

B. Manufacturers and models listed in drawings and specifications are used for layout and to convey to bidders the general style, type, character and quality of product desired. Listed examples are used only to denote the quality standard of product desired and are not intended to restrict bidders to a specific brand, make, manufacturer or specific name.

C. Adjust layout, system connections and coordinate with other trades as required to properly install equivalent products.

D. Where equivalent products are submitted, include all associated costs related to substitution in bid.

E. Furnish materials bearing the manufacturer's name and trade name. Provide UL label where a UL standard has been established for the material.

F. Furnish standard products of manufacturers regularly engaged in production of equipment types required for the work. Use the manufacturer's latest approved design.

G. Use the same manufacturer for equipment and materials of the same general type throughout the work to obtain uniform appearance, operation and maintenance.

H. Protect equipment and materials from dirt, water, chemical or mechanical injury and theft always during construction. Provide covers or shelter as required.

I. If materials or equipment are damaged at any time prior to final acceptance of the work, repair such damage at no additional cost. If materials or equipment are damaged by water, provide replacement no additional cost.

J. Follow manufacturers' directions completely in the delivery, storage, protection and installation of all equipment and materials. Notify the Architect/Engineer in writing of any conflicts between any requirements of the contract documents and manufacturer's directions. Obtain written instructions before proceeding with the work. The Contractor is responsible for correction of any work that does not comply with the manufacturer's directions or written instructions from the Architect/Engineer at no additional cost.

K. Repair any damage to factory applied paint finish using touch-up paint furnished by the equipment manufacturer. Repaint the entire damaged panel or section per the field painting specifications in Division 09 at no additional cost.

1.6 OPERATION AND MAINTENANCE MANUALS

A. Refer to individual plumbing sections and Division 01.

1.7 SEISMIC REQUIREMENTS

A. No requirements. The project is Seismic Design Category B.

1.8 PAINTING

A. Refer to Division 09.

B. Protect fixtures, valves, trim, etc. from field painting operations. Do not install escutcheons and trim until painting is complete.

1.9 LOCATIONS AND MEASUREMENTS

A. Location of plumbing work is shown on the drawings as accurately as possible. Field verify all measurements to insure that the work suits the surrounding trim, finishes and/or construction. Provide adjustment as necessary.

B. Make minor relocations of work prior to installation as required or as directed by the Architect/Engineer at no additional cost.

1.10 SUPERVISION

A. The contractor must provide an authorized and competent representative to constantly supervise the work from the beginning to completion and final acceptance. Insofar as possible, keep the same foreman and workmen throughout the project duration.

B. Representatives of Architect/Engineer, Owner, and local inspection authorities will make inspections during the progress of the work. Contractor to accommodate such inspections and correct deficiencies noted.

1.11 QUALITY AND WORKMANSHIP

A. Contractor to employ skilled tradesmen, laborers and supervisors. Final product to be neat, well finished, and professional installation.

B. Remove and replace any work considered substandard quality in the judgment of the Architect/Engineer.

1.12 EXCAVATION, TRENCHING AND BACKFILLING

A. Provide all excavation, trenching and backfilling as required to complete the work under this Division.

B. Contractor is responsible for investigating conditions prior to excavating and to exercise care during the excavation to avoid any utilities or other objects which may or may not be shown on the drawings.

C. Excavate so as not to endanger or damage existing utilities and structures. If damage occurs, repair damage to the satisfaction of the Architect/Engineer at no additional cost.

D. Lay out location of all ditching at grade and obtain approval from the Architect/Engineer prior excavating.

E. Remove and dispose of all surplus earth from the site.

F. Provide suitable backfill materials as required.

G. Perform excavation, trenching and shoring in accordance with rules and regulations set forth in Article XXI, Bulletin 1 “Trenching” as published in a separate bulletin by the North Carolina Department of Labor, Division of Standards and Inspection Construction Bureau.

H. Bid excavation work as unclassified with no extra payment for removal of rock, unsuitable soils, etc.

1.13 CLOSING IN WORK

A. Do not cover up or enclose work until it has been inspected, tested and approved by authorities having jurisdiction over the work. Uncover any such work for inspection and/or test at no additional cost. Restore the work to its original condition after inspection and/or test at no additional cost.

1.14 CUTTING AND PATCHING

A. Perform all cutting and patching necessary to install work under this Division.

B. Perform cutting and patching in professional, workmanlike manner.

C. Arrange work to minimize cutting and patching.

D. Do not cut joists, beams, girders, columns or any other structural members without written permission from the Architect/Engineer.

E. Cut opening only large enough to allow easy installation of piping, wiring or ductwork.

F. Patching material to match material removed.

G. Restore the patched surface to its original appearance at completion of patching.

H. Where waterproofed surfaces are patched, maintain the integrity of waterproofing.

I. Remove rubble and excess patching materials from the premises.

1.15 INTERPRETATION OF DRAWINGS

A. Drawings and specifications under this Division are complementary to each other. Provide any work specified herein and/or indicated on the drawings.

B. Drawings are diagrammatic and indicate generally the location of fixtures, piping, devices, equipment, etc. Follow drawings as closely as possible but arrange work to suit the finished surroundings and/or trim.

C. The words “furnish”, “provide”, and/or “install” as used in these drawings and specifications are interpreted to include all material and labor necessary to complete the item, system, equipment, etc.

D. Any omissions from either drawings or specifications are unintentional. The contractor is responsible for notifying the Architect/Engineer of any pertinent omissions before submitting a bid. Complete working systems are required, whether every small item of material is shown and specified or not.

1.16 ACCESSIBILITY

A. Locate all equipment which must be serviced, operated, or maintained in fully accessible positions. Equipment includes, but not be limited to, valves, traps, cleanouts, motors, controllers and drain points. If required for accessibility, furnish access doors for this purpose. Minor deviations from drawings may be made to allow for better accessibility.

B. Coordinate exact locations and size of access panels for each concealed device requiring service.

C. Access panels: Steel construction with 16-gauge frames and 18-gauge panels, factory primed with rust inhibiting paint, finish paint by Contractor. Provide suitable UL listed doors where installed in rated construction.

D. Coordinate access panel locations with architectural construction.

E. Access panels are not required for access to work located above a lift-out “T” bar type ceiling.

1.17 ELECTRICAL WORK IN CONNECTION WITH PLUMBING WORK

A. Comply with Division 26.

1.18 PLUMBING WORK IN CONNECTION WITH OTHER CONTRACTS

A. Provide plumbing services as required for items furnished by other contractors or vendors as shown on the plumbing drawings. Include rough-ins and final connections to equipment. Locations of connections shown on the drawings are approximate and some adjustment of actual connection locations should be anticipated. Coordinate exact connection requirements. Make final connections only after approval of the other contractor or vendor, in the contractor's or vendor's presence.

1. Site Utilities- In general, work under this Division covers work to five feet outside buildings. Extend and connect work under this Division to site utilities as required.

2. Owner Furnished Equipment- Obtain exact plumbing requirements and rough-in locations for Owner furnished equipment. Provide complete plumbing installation for proper operation of equipment.
3. Kitchen Equipment- Obtaining exact plumbing requirements and rough-in locations for kitchen equipment. Provide complete plumbing installation for proper operation of equipment.

1.19 CONSTRUCTION IN EXISTING BUILDINGS

A. Note that work performed under this contract is to be accomplished in an existing building. See Section 220010, Section 220020 and Division 01 Specifications Sections for additional requirements.

B. Provide safety barriers, protective devices, screening, etc., as required to maintain the safety of visitors in or near the work area.

C. Maintain clean work area. At the end of each working period, remove all debris, boxes, waste, etc. from the premises and dispose of properly.

D. Coordinate installation of new mechanical work in the existing building. Arrange piping, ductwork and equipment to avoid interference with existing architectural, structural, plumbing, mechanical and electrical work.

E. The contractor is responsible for all damage to existing buildings, grounds, walkways, pavement, etc. occurring during the course of his work. Repair any such damage to finish equal to that prior to damage to the satisfaction of the Architect/Engineer.

1.20 ALTERNATE BIDS

A. Alternate Bids are described in relevant sections of the General and Supplemental General Conditions and Division 01 Specification Sections.

1.21 PROJECT RECORD DRAWINGS

A. Submit under provisions of relevant sections of the General and Supplemental General Conditions and Division 01 Specification Sections.

B. As the work progresses, legibly record all field changes on a set of project contract drawings, herein after called the “record drawings.”

C. Accurately show the installed condition of plumbing work on record drawings.

1.22 PHASING OF THE WORK

A. Schedule work in accordance with the relevant sections of the General and Supplemental General Conditions and Division 01 Specifications Sections.

1 1.23 PROJECT CLOSEOUT

2 A. Submit under provisions of relevant sections of the General and Supplemental General Conditions
3 and Division 01 Specifications Sections.

4 PART 2 - PRODUCTS (Not Applicable)

5 PART 3 - EXECUTION (Not Applicable)

6 END OF SECTION 220000

SECTION 220010 - EXISTING PLUMBING CONDITIONS

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Procedures for plumbing work in existing building.

1.2 PROJECT CONDITIONS

A. Conform to the requirements of Division 01 for cutting and patching. Conform to the requirements of Division 2 and Section 220020 for demolition.

B. Conduct work to minimize interference with adjacent and occupied building areas.

C. Cease operations immediately if structure appears to be in danger and notify Architect/Engineer. Do not resume operations until directed.

PART 2 - GENERAL

2.1 PATCHING MATERIALS

A. As specified in individual Sections.

PART 3 - GENERAL

3.1 PREPARATION

A. Coordinate plumbing service interruptions with the Owner.

B. Provide temporary and/or permanent plumbing as shown and/or as required by conditions to maintain existing systems in service during construction. Use hot-tapping valves if required.

C. Existing Plumbing Systems: Maintain existing plumbing systems in service. Disable systems outside construction area only to make tie-ins or switchovers. Obtain permission from the Owner at least 24 hours before partially or completely disabling plumbing. Minimize duration. Make temporary connections as required to maintain service in areas adjacent to work area.

D. Drawings are based on casual field observation and existing record documents. Survey the affected areas before submitting a bid proposal. Report discrepancies to the Architect/Engineer before disturbing the existing installation.

E. Field-verify existing conditions as related to interconnection of New Work. Determine exact methods of interface to obtain proper operation.

F. Coordinate existing and New Work interface prior to beginning any work. Adjust work to suit existing conditions. Some deviations in plan layout vs. actual conditions should be expected.

G. Provide, erect, and maintain temporary dust screens, safeguards, barricades, signage and similar measures, for protection of the public, Owner, Contractor=s employees, and existing construction to remain. Provide protective barriers indicated in the contract drawings.

3.2 EXISTING CONDITIONS

A. Verify existing conditions in field and determine which affect plumbing work. Secure utilities as required to prevent spills, leakage, etc.

B. Protect existing work to remain. Do not cut or remove any structural members.

C. Rework existing services to remain which interfere with new work.

END OF SECTION 220010

SECTION 220020 - PLUMBING DEMOLITION

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Selective plumbing demolition.

B. Conform to the requirements of Division 01 for cutting and patching.

C. Conform to the requirements of Division 02 for selective demolition

1.2 PROJECT CONDITIONS

A. Conduct demolition to minimize interference with adjacent and occupied building areas.

B. Cease operations immediately if structure appears to be in danger and notify Architect/Engineer. Do not resume operations until directed.

1.3 DEFINITIONS

A. Remove: Detach items from existing construction and dispose of them off-site unless indicated to be salvaged or reinstalled.

B. Remove and Salvage: Detach items from existing construction, in a manner to prevent damage, and deliver to Owner ready for reuse.

C. Remove and Reinstall: Detach items from existing construction, in a manner to prevent damage, prepare for reuse, and reinstall where indicated.

D. Existing to Remain: Leave existing items that are not to be removed and that are not otherwise indicated to be salvaged or reinstalled.

E. Dismantle: To remove by disassembling or detaching an item from the surface, using gentle methods and equipment to prevent damage to the item and surfaces; disposing of items unless indicated to be salvaged or reinstalled.

PART 2 - GENERAL

2.1 PATCHING MATERIALS

A. As specified in individual Sections.

PART 3 - GENERAL

3.1 PREPARATION

A. Demolition Drawings are based on casual field observation. No record documents are available. Survey the affected areas before submitting a bid proposal. Report discrepancies to the Architect/Engineer before disturbing the existing installation.

B. Provide, erect, and maintain temporary dust screens, safeguards, barricades, signage and similar measures, for protection of the public, Owner, Contractor's employees, and existing construction to remain. Provide protective barriers indicated in the contract drawings.

C. Protect existing materials and existing improvements which are not to be demolished.

D. Prevent movement of structure; provide temporary bracing and shoring required to ensure safety of existing structure.

3.2 DEMOLITION

A. Disconnect, remove, cap, and identify plumbing work as indicated. Secure utilities as required to prevent spills, leakage, etc.

B. 'Dead Ends' (a branch leading from a soil, waste or vent pipe; a building drain; or a building sewer and terminating at a developed length of 2 feet or more by means of a plug, cap or other closed fitting) shall be prohibited. Abandoned piping is not considered a dead end if a cleanout is installed instead of a cap.

C. Demolish in an orderly and careful manner. Protect existing work to remain. Do not cut or remove any structural members.

D. Terminate all demolition work in a neat, finished manner.

E. Conceal or enclose abandoned work within building construction except as specifically noted.

F. Remove demolished materials from site except where specifically noted otherwise. Do not burn or bury materials on site.

G. Remove materials as Work progresses. Upon completion of Work, leave areas in clean condition.

H. Coordinate cutting and patching requirements.

END OF SECTION 220020

SECTION 220500 - COMMON WORK RESULTS FOR PLUMBING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Sleeves without waterstop.
2. Sleeves with waterstop.
3. Stack-sleeve fittings.
4. Grout.
5. Silicone sealants.
6. Escutcheons.
7. Thermometers, bimetallic actuated, lead free.
8. Pressure gauges, dial type, lead free.
9. Gauge attachments, lead free.
10. Test plugs, lead free.

B. Related Requirements:

1. Section 331415 "Site Water Distribution Piping" for domestic water meters and combined domestic and fire-protection water-service meters outside the building.

1.2 DEFINITIONS

A. Existing Piping to Remain: Existing piping that is not to be removed and that is not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

1.3 ACTION SUBMITTALS

A. Product Data:

1. For each type of product, excluding motors which are included in Part 1 of the plumbing equipment Sections.

    a. Include construction details, material descriptions, and dimensions of individual components, and finishes.
    b. Include operating characteristics and furnished accessories.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each type of [**expansion joint,**] [**and**] [**gauge**] to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Domestic water for plumbing piping intended to convey or dispense water for human consumption are to comply with the U.S. Safe Drinking Water Act, with requirements of authorities having jurisdiction, and with NSF 61 and NSF 372, or be certified in compliance with NSF 61 and NSF 372 by an ANSI-accredited third-party certification body, in that the weighted average lead content at wetted surfaces is less than or equal to 0.25 percent.

B. Compatibility: Provide products suitable for piping service fluids, materials, working pressures, and temperatures.

C. Capability: Provide products and installations to accommodate maximum axial movement as scheduled or indicated on Drawings.

2.2 SLEEVES AND SLEEVE SEALS

A. Sleeves without Waterstop:

1. PVC Pipe Sleeves: ASTM D1785, Schedule 40. Use for non-fire rated assemblies.
2. Molded-PE or -PP Sleeves: Removable, tapered-cup shaped, and smooth outer surface with nailing flange. Use for fire-rated assemblies.

B. Sleeves with Waterstop:

1. Description: Manufactured PVC/HDPE, sleeve-type, waterstop assembly made for imbedding in concrete slab or wall.

C. Stack-Sleeve Fittings:

1. Description: Manufactured, Dura-coated or Duco-coated cast-iron sleeve with integral clamping flange for use in waterproof floors and roofs. Include clamping ring, bolts, and nuts for membrane flashing.

    a. Underdeck Clamp: Clamping ring with setscrews.

D. Grout:

1. Description: Nonshrinking, for interior and exterior sealing openings in non-fire-rated walls or floors.
2. Standard: ASTM C1107/C1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
3. Design Mix: 5000 psi, 28-day compressive strength.
4. Packaging: Premixed and factory packaged.

E. Silicone Sealants:

1. Silicone Sealant, S, NS, 25, NT: Single-component, nonsag, plus 25 percent and minus 25 percent movement capability, nontraffic-use, neutral-curing silicone joint sealant.

2. Silicone Foam Sealant: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

2.3 ESCUTCHEONS

A. Escutcheon Types:

1. One-Piece, Stainless-Steel Type: With polished stainless steel finish.

2.4 METERS AND GAUGES FOR PLUMBING PIPING

A. Thermometers, Bimetallic Actuated, Lead Free:

1. Source Limitations: Provide lead-free bimetallic-actuated thermometers from a single manufacturer.
2. Standard: ASME B40.200.
3. Case: sealed type(s); stainless steel with 3-inch nominal diameter.
4. Dial: Nonreflective aluminum with permanent scale markings and scales in deg F.
5. Connector Type(s): Union joint, adjustable angle; with ASME B1.1 or ASME B1.20.1 screw threads to fit thermowell.
6. Stem: 0.25 or 0.375 inch in diameter; stainless steel.
7. Window: Safety glass.
8. Ring: Stainless steel.
9. Element: Bimetal coil.
10. Pointer: Dark-colored metal.
11. Accuracy: Plus or minus 1.5 percent of span.

B. Thermowells, Lead Free:

1. Standard: ASME B40.200.
2. Description: Pressure-tight, socket-type fitting made for insertion into piping tee fitting.
3. Material for Use with Copper Tubing: Lead-free copper.
4. Material for Use with Steel Piping: Type 316 stainless steel.
5. Type: Stepped shank unless straight or tapered shank is indicated.
6. External Threads: NPS 1/2, NPS 3/4, or NPS 1, or as required to match threaded opening in pipe.
7. Internal Threads: Size and thread type as required to match thermometer mounting threads.
8. Bore: Diameter required to match thermometer bulb or stem.
9. Insertion Length: Length to extend to center of pipe.
10. Lagging Extension: Include on thermowells for insulated piping and tubing. Extension is to be of sufficient length to extend beyond finished insulation surface.
11. Bushings: For converting size of thermowell's internal screw thread to size of thermometer connection.
12. Heat-Transfer Medium: Mixture of graphite and glycerin.

C. Pressure Gauges, Dial Type, Lead Free - Direct Mounted, Metal Case:

1. Source Limitations: Provide dial-type, lead-free, direct-mounted, metal-case pressure gauges from single manufacturer.
2. Standard: ASME B40.100.
3. Case: Sealed Solid-front, pressure-relief type(s); Type 316 stainless steel; 4-1/2-inch nominal diameter.
4. Pressure-Element Assembly: Lead-free Bourdon tube.
5. Pressure Connection: Lead-free brass, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
6. Movement: Mechanical, with link to pressure element and connection to pointer.

7. Dial: Nonreflective aluminum with permanent scale markings graduated in psi.
8. Pointer: Dark-colored metal.
9. Window: Safety glass.
10. Ring: Stainless steel.
11. Accuracy: Grade B, plus or minus 2 percent of middle half of span.

D. Gauge Attachments, Lead Free:

1. Snubbers: ASME B40.100, lead-free brass; with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and porous-metal-type surge-dampening device. Include extension for use on insulated piping.
2. Valves: Lead-free brass or stainless-steel needle, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads.

E. Test Plugs, Lead Free:

1. Source Limitations: Provide lead-free test plugs from single manufacturer.
2. Description: Test-station fitting made for insertion into piping tee fitting.
3. Body: Lead-free brass or stainless steel with core inserts and gasketed and threaded cap. Include extended stem on units to be installed in insulated piping.
4. Thread Size: NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe thread.
5. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F.
6. Core Inserts: EPDM self-sealing rubber.

PART 3 - EXECUTION

3.1 INSTALLATION OF SLEEVES - GENERAL

A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.

B. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.

1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.
2. Cut sleeves to length for mounting flush with both surfaces.

    a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.

3. Using grout or silicone sealant, seal the space outside of sleeves in floors/slabs/walls without sleeve-seal system. Select to maintain fire resistance of floor/slab/wall.

C. Install sleeves for pipes passing through interior partitions.

1. Cut sleeves to length for mounting flush with both surfaces.
2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
3. Seal annular space between sleeve and piping or piping insulation; use joint sealants that joint sealant manufacturer's literature indicates is appropriate for size, depth, and location of joint.

D. Fire-Resistance-Rated Penetrations, Horizontal Assembly Penetrations, and Smoke Barrier Penetrations: Maintain indicated fire or smoke rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with fire- and smoke-stop materials. Comply with requirements for firestopping and fill materials specified in Section 078413 "Penetration Firestopping."

3.2 INSTALLATION OF SLEEVES WITH WATERSTOP

A. Install sleeve with waterstop as new walls and slabs are constructed.

B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange centered across width of concrete slab or wall.

C. Secure nailing flanges to wooden concrete forms.

D. Using grout or silicone sealant, seal space around outside of sleeves. Select to maintain fire resistance of floor/slab/wall.

3.3 INSTALLATION OF STACK-SLEEVE FITTINGS

A. Install stack-sleeve fittings in new slabs as slabs are constructed.

1. Install fittings that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
2. Secure flashing between clamping flanges for pipes penetrating floors with membrane waterproofing. Comply with requirements for flashing specified in Section 076200 "Sheet Metal Flashing and Trim."
3. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level.
4. Using silicone sealant, seal space between top hub of stack-sleeve fitting and pipe.

B. Fire-Resistance-Rated Penetrations, Horizontal Assembly Penetrations, and Smoke Barrier Penetrations: Maintain indicated fire or smoke rating of floors at pipe penetrations. Seal pipe penetrations with fire- and smoke-stop materials. Comply with requirements for firestopping specified in Section 078413 "Penetration Firestopping."

3.4 INSTALLATION OF ESCUTCHEONS

A. Install escutcheons for piping penetrations of walls, ceilings, and finished floors.

B. Install escutcheons with ID to closely fit around pipe, tube, and insulation of insulated piping and with OD that completely covers opening.

3.5 INSTALLATION OF METERS AND GAUGES

A. Install thermometer with thermowell at each required thermometer location.

B. Install thermowells in vertical position in piping tees.

C. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.

D. Install thermowells with extension on insulated piping.

E. Fill thermowells with heat-transfer medium.

F. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.

G. Install direct-mounted pressure gauges in piping tees with pressure gauge located on pipe at most readable position.

H. Install valve and snubber in piping for each pressure gauge for fluids.

I. Install test plugs in piping tees.

J. Install thermometers in the following locations:

1. Inlet and outlet of each water heater.
2. Inlet and outlet of each domestic hot-water storage tank.
3. Outlet side of hot-water-balancing valve.
4. Each main hot-water-recirculating line return pipe.

K. Install pressure gauges in the following locations:

1. Building water service entrance into building.
2. Inlet and outlet of each pressure-reducing valve.
3. Suction and discharge of each domestic water pump.

3.6 CONNECTIONS

A. Install meters and gauges adjacent to machines and equipment to allow space for service and maintenance of meters, gauges, machines, and equipment.

3.7 ADJUSTING

A. After installation, calibrate meters according to manufacturer's written instructions.

B. Adjust faces of meters and gauges to proper angle for best visibility.

3.8 FIELD QUALITY CONTROL

A. Sleeves and Sleeve Seals:

1. Perform the following tests and inspections:

a. Leak Test: After allowing for a full cure, test sleeves and sleeve seals for leaks. Repair leaks and retest until no leaks exist.
b. Sleeves and sleeve seals will be considered defective if they do not pass tests and inspections.

2. Prepare test and inspection reports.

B. Escutcheons:

1. Using new materials, replace broken and damaged escutcheons and floor plates.

3.9 SLEEVES APPLICATION

A. Use sleeves and sleeve seals for the following piping-penetration applications:

1. Exterior Concrete Walls above and below Grade:

a. Sleeves with waterstops.

1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

2. Concrete Slabs-on-Grade:

a. Sleeves with waterstops.

1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

3. Concrete Slabs above Grade:

a. Sleeves with waterstops or stack-sleeve fittings.

4. Interior Wall and Partitions:

a. Sleeves without waterstops.

3.10 ESCUTCHEONS APPLICATION

A. Escutcheons for New Piping and Relocated Existing Piping:

1. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep pattern.
2. Piping:

a. One-piece, stainless steel with polished stainless-steel finish.

3. Bare Piping at Wall and Floor Penetrations in Finished Spaces:

a. One-piece, stainless steel with polished stainless-steel finish.

4. Bare Piping at Ceiling Penetrations in Finished Spaces:

a. One-piece, stainless steel with polished stainless-steel finish.

5. Bare Piping in Unfinished Service Spaces:

a. One-piece, stainless steel with polished stainless-steel finish.

6. Bare Piping in Equipment Rooms:

a. One-piece, stainless steel with polished stainless-steel finish.

B. Escutcheons for Existing Piping to Remain:

a. Two-piece, stainless steel with polished stainless-steel finish.

C. Install floor plates for piping penetrations of equipment-room floors.

D. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.

1. New Piping and Relocated Existing Piping: One piece, floor plate.
2. Existing Piping: Split floor plate.

3.11 THERMOMETER, LEAD FREE, APPLICATION

A. Thermometer stems are to be of length to match thermowell insertion length.

3.12 THERMOMETER, LEAD FREE, SCALE-RANGE APPLICATION
